The House of Keys of the Isle of Man has adopted an electoral reform bill, by which the franchise is extended to women who are householders or owners of property, and a burial bill, based upon similar provisions to those of the English burial bill, but granting larger liberties to nonconformists.

GREECE, a kingdom of Southeastern Europe. Reigning King, George I, born December 24, 1845, second son of the reigning King of Denmark; elected King of the Hellenes by the National Assembly at Athens, March 18 (30), 1863; accepted the crown June 6, 1863; declared of age by a decree of the National Assembly, June 27, 1863; married October 27, 1867, to Olga, daughter of the Grand Duke Constantine of Russia, born August 22, 1851. Their children are: Constantinos, Duke of Sparta, born August 2, 1868; George, born June 24, 1869; Alexandra, born August 30, 1870; Nicholas, born January 21, 1872; Maria, born March 3, 1876; Princess Olga, who was born April 6, 1880, died a few months later.

The area is 50,123 square kilometres; the

population, according to the census of 1879, is 1,679,775.*

The movement of population was as follows:

YEARS.	Marriages.	Births, exclusive of still-births.	Deaths.	Excess of births.
1875.....	10,250	44,886	30,986	13,450
1876.....	9,758	47,248	31,088	16,165
1877.....	9,472	46,355	31,280	15,075
1878.....	8,003	44,921	30,588	14,333

In the budget for 1880 the receipts were estimated at 46,716,857 drachmas, and the expenditures at 52,655,455 drachmas (1 drachma = 19·3 cents).

The foreign debt, in 1880, amounted to 196,293,611 drachmas, and the home debt to 118,906,400 drachmas—in all, 315,200,011 drachmas.

The strength of the army on a peace footing, according to a law passed in 1877, is to be as follows:

Infantry.....	16,186
Chasseurs.....	4,032
Cavalry.....	845
Artillery.....	1,959
Engineers.....	1,104
Sanitary troops.....	800
Total.....	24,876

There is in addition a corps of gendarmes comprising 2,508 men.

According to a statement made by Minister Trikoupis, the army can be raised within twenty days to 35,000 men. The total number of men capable of bearing arms amounts to 228,649 men. The fleet in 1880 consisted of two ironclads, six screw-steamers, three schooners, two cutters, and one royal yacht; total, fourteen vessels.

The only railroad is the line connecting Athens with the Piræus, which was built in 1868, and has a length of twelve kilometres. The telegraphic lines were of a total length of 3,068 kilometres in 1878, and carried 315,771 telegrams. Of post-offices there existed 145 in 1877. The number of letters carried was 2,683,000, of postal cards 4,600, of newspapers 1,867,000.

The negotiations with Turkey concerning the territorial cession to be made to Greece, in accordance with the Treaty of Berlin, did not lead to a satisfactory result. In February, M. Delyannis, the Minister of Foreign Affairs, stated in the Chamber that they had failed. The claims of Greece were warmly supported by France and Italy, and the accession of the Liberal party to power in England also gave them the powerful patronage of the latter country, which even took the lead in new measures for coercing the Turks to come to terms with the Greeks. When the Turkish Government continued to yield to the joint representations made by the great powers, a

conference of plenipotentiaries met at Berlin on June 15th, which unanimously agreed upon a new line of demarkation between Turkey and Greece. By the adoption of this line, Greece would receive an accession to her territory of 8,500 square miles, with 535,000 inhabitants. The Greek Government at once accepted the decision of the Conference, and addressed a note to that effect to the powers, at the same time paying a tribute to the spirit of justice by which they had been guided. At Athens there were three days' festivities in honor of the decision of the Conference. The ancient monuments, the surrounding hills, and the city were illuminated, and enthusiastic demonstrations made before the legations of the six powers whose plenipotentiaries attended the Conference. Hundreds of telegrams were received, expressing the universal joy and gratitude of all classes of the people. As the Turkish Government showed a resolute resistance to the decision of the Conference, the King of Greece in July signed a decree ordering the mobilization of troops. The population of the districts to be ceded intimated that, if Greece would not move very soon, they would be obliged to withdraw their offers of assistance. The King personally visited the sovereigns of Russia, England, Germany, Austria, and Italy, in order to secure their further assistance in the Greco-Turkish dispute. The army was rapidly increased, and at the beginning of September 42,000 men of the active army were reported to be under arms. On September 21st the King, in opening the new session of the Chamber of Deputies, stated in his speech from the throne that the execution of the decision of the powers imposed action upon the Government, and that he was firmly resolved to effect as speedily as possible the object for which he had made great naval and military preparations. A decree was issued at the same time, ordering the formation of fifty battalions of infantry each of nine hundred and sixty men. The extraordinary reserves were to number 10,000 men, and their time of service was to be a year and a half. At a council of war held in Athens in October, under the presidency of M. Coumoundouros, it was resolved to send an army of 24,000 men against Thessaly, and another of 36,000 against Epirus. There were to be, further, 20,000 troops held in reserve. On December 4th the Prime Minister, M. Coumoundouros, stated that the Government intended to continue the military and naval preparations, so as to be able to execute the decisions arrived at by the Berlin Conference; at the same time, he would endeavor to attain this object with the help of the European concert, but would, in every case, reserve his liberty of action.

The strife of parties in the Chamber of Deputies, proceeding mostly from personal, not political, differences of opinion, continued to be as violent and unceasing as in former years. At the beginning of January, the Ministry was

* For a table showing the area and population of each of the nomarchies into which the kingdom is divided, see "Annual Cyclopædia" for 1879.

reconstituted as follows: M. Coumoundouros, President of the Council and Minister of the Interior; M. Augherinos, Minister of Education; M. Papamichalopoulos, Minister of Finance; M. Delyannis, Minister of Foreign Affairs; M. Valamakis, Minister of Justice; M. Bouboulis, Minister of Marine; M. Valtinos, Minister of War. On January 26th the Chamber, by 97 against 73 votes, refused to grant to the Ministry 2,500,000 drachmas of a new loan of 60,000,000 for the defrayal of current expenses. The Ministry consequently resigned, but when M. Trikoupis informed the King that the Opposition agreed that the vote did not raise a Cabinet question, the King requested M. Coumoundouros to remain in office. The Chamber subsequently voted the grant demanded by the Ministry. On March 18th M. Coumoundouros again resigned, as the Chamber adopted, by 99 votes against 93, a resolution moved by the Opposition that the budget was not adapted to the financial condition of the country, and expressly disapproved of the policy of the Government. A new Ministry was formed under the presidency of M. Trikoupis, who took the portfolio of Foreign Affairs, and for a time that of Finance also. M. Trikoupis resigned in his turn, in August, when the Chamber of Deputies elected, by 92 votes against 55, the Opposition candidate as its President, and M. Coumoundouros became once more Prime Minister.

GREEK CHURCH. The aggregate population connected with the Greek or Orthodox Eastern Church was estimated in 1880 at about 78,000,000.* It is the predominant Church in seven countries in the following order: Greece, where 98·9 per cent. of the total population belong to it; Servia, 94·5 per cent.; Roumania, 87·4 per cent.; Montenegro, 82·5 per cent.; Russia, 68·6 per cent.; Bulgaria, 67·7 per cent.; and Eastern Roumelia, 60·6 per cent. In the Austro-Hungarian monarchy it numbers about 8 per cent. of the total population.

The plan of holding a General Conference of Eastern Orthodox Bishops was discussed in several Russian and Greek newspapers. It was originally proposed by the "St. Petersburg Section of the Society of Friends of Religious Enlightenment" to the Holy Synod of Russia. The patriarchs of the East and other Orthodox bishops were to be invited to attend the consecration of the Church of the Saviour at Moscow, August 12 to September 7, 1880, and to consult together with the Russian bishops concerning many important questions relating to the Orthodox Church. As subjects well worthy of engaging the attention of the Eastern bishops were designated, in Russian papers, the Bulgarian question, the Rascolniks of Russia and the liturgical books, the general administration of the Eastern Church, the establishment of a patriarchate in Russia, and church unity. A paper of Athens, the "Threskeutike

Phone," remarked on this plan: "Doubtless a synod of representatives of all the autocephalous Orthodox Churches, with equal rights, saving only the precedence of honor reserved to the oecumenical and other patriarchs of the East, meeting from time to time at Constantinople as the first in honor of the churches, or in any other city that might be determined on, would contribute greatly to the settlement of questions of general interest, and would have in its hands the supreme administration of the whole Eastern Church."

The "Threskeutike Phone," referred to above, is the first religious newspaper of Greece. It was established at the beginning of 1880, and is edited by A. Diomedes Griacus, Professor of Theology in the University of Athens, and Ignatius Moshake, a theological instructor in the same institution. The editors are well acquainted with the literature of Western Europe, and by the establishment of the first Church newspaper, will endeavor to give to their Church an institution which has long been in a flourishing condition in the Protestant and Catholic Churches of America and Europe. Even in its first numbers it discussed several important reform questions, as the convocation of an Oecumenical Council of the Orthodox Church, and the reestablishment of a patriarchate in Russia.

An important event in the history of the Russian Church is the resignation of Count Demetrius Andreevitch Tolstoy as chief procurator of the Holy Synod. Count Tolstoy, who was made chief procurator June 3, 1865, and Minister of Public Instruction the following year, had but one predecessor who held the two offices at once, Prince Alexander Nicolaevitch Galitzin, in 1816-'17. He was the twenty-second chief procurator since the Holy Synod was established, in 1721. He is succeeded as chief procurator by the Privy-Councillor Constantine Petrovitch Pobedonostchev, who, however, will not be at the same time Minister of Public Instruction.

The "Tserkovnaia Vaistnik" says of the new procurator that some years ago the Ecclesiastical Academy of St. Petersburg counted him one of its most honored members. The St. Petersburg "Vaidomosti" says that he "is known, not only as a man of high culture and much learning, but also, in the best and fullest sense, a thorough Russian. Not long since a university professor, he has attained, in a comparatively short time, the position of a member of the Emperor's Council. In the wider sphere of duties opened up before him he has not fallen behind in literary labor. And, withal, he has occupied a position of activity and influence in the new enterprise of the volunteer fleet, which seems likely to play an important part in Russia's future. What he has done in the past is a pledge that in the new post to which he has been called he will discharge its duties, not in a merely formal way, but with an earnestness and zeal so needful at this time for the orthodox world." The Russian Church continues to be

* For detailed statistics, see "Annual Cyclopædia" of 1879.

in the widest sense of the word a state Church. The Holy Synod in 1880 caused a manifesto to be read in the western and central provinces, solemnly consigning the revolutionists to eternal punishment. "Russia being ruled by the anointed of the Lord," says the manifesto, "it is the sacred duty of every subject to obey the behests of the sovereign, and to contribute to the extermination of the rebels." An official list of the Russian episcopate for the year 1880 gives the following statistics: Of the prelates in active service, there are in Russia proper three metropolitans, thirteen archbishops, thirty-six bishops in charge of dioceses, and twenty-two assistant bishops (entitled vicar-bishops). The Exarchate of Georgia has one archbishop, two bishops, and three vicar-bishops. In America there is the bishop of the Aleutian Islands and Alaska. These, then, number in all eighty-one. There are retired, two archbishops and eleven bishops. The entire number of Russian bishops is therefore ninety-four. In Russia, with very few exceptions, the bishops, on their first entrance upon the episcopal office, serve for a few years as vicar-bishops, and are then transferred to the charge of a diocese—very rarely being, in case of survival, the successors of the bishops to whom they were assistants. The Orthodox Missionary Society for Russia, of which the Metropolitan of Russia is president, has had for years a special missionary paper, called "The Missioner." It has now been deemed best to suspend for the present the publication of a special missionary journal, and "The Missioner" has been joined to the "Moscow Diocesan Gazette."

The "Golos" of Moscow stated in January, that in the prison of Suzealya there were at that time an archbishop and two bishops of the Starobryatsi, or Old Believers, their only crime being that of having held to their faith and performed their office accordingly. One had been in prison twenty-six years, another twenty-two, and the third seventeen years.

In Turkey, the Patriarchate of Constantinople has suffered a considerable loss in its ordinary revenues in consequence of the troubled times; and the Patriarch, who is trying to improve the education of the clergy, finds himself straitened in his designs for lack of means. The Greek community in London, therefore, sent the Patriarch in 1880 a voluntary contribution of £104, that of Manchester £40, that of Marseilles 1,810 francs, and that of Vienna 1,077 francs. In Asia Minor, also, several persons have determined to pay for the education, at the Theological School of Chalde, of theological students from their own part of the country.

The Bulgarians endeavor to carry through the nationality principle in the organization of a national church as well as in the building up of a state embracing all Bulgarian districts of the Balkan Peninsula. They desire every Bulgarian, wherever he lives, to be under the jurisdiction of the Bulgarian Exarch, so that in

one and the same city there could be two Orthodox bishops, a thing quite contrary to the canons of the Orthodox Church. The Greek ecclesiastics think that a Bulgarian priest living at Constantinople ought not to be subject to any other than the œcumenical Patriarch, just as a Greek priest, living in St. Petersburg, would be subject to the Metropolitan of St. Petersburg. The Bulgarians do not want any fellowship with the Greeks, and the Greeks bitterly complain of the hostilities displayed by the Bulgarians toward them. In March, 1880, the Greek Patriarch of Constantinople directed the attention of the Porte to the outrages committed by the Bulgarian population of Eastern Roumelia toward the Greek population.

The Bishops of Bosnia and Herzegovina were officially notified by the Patriarch of Constantinople of a convention concluded between the Patriarch and the Government of Austro-Hungary. The convention was signed on April 6th at the Patriarchate in the Fanar, between the Patriarch and Count Dubski, the Austrian representative. Some difficulties were raised at first by the Porte, on account of the undetermined character of the occupation; but these were between the Porte and the Patriarch, and not between the former and the Austrian Government, and were finally overcome.

As the population connected with the Greek Church of Bosnia and Herzegovina belongs to the Serbian nationality, the occupation of the two provinces by Austria naturally awakened a wish among the Servians of Hungary for the consolidation of all the churches of the Serbian nationality under the jurisdiction of the Patriarch of Carlovitz.* The Serbian nationalists hoped in this way to obtain a strong reinforcement in their struggle against the Magyars. The central Government of Austro-Hungary was urged to avail itself of the advantages which the submission of the churches of the two provinces would have for the confirmation of the Austrian rule, and for the extension of Austrian influence on the Balkan Peninsula. The Hungarian Government of Budapest did not ignore the dangers which an increase of the Serbian element of the monarchy might involve for the predominance of the Magyars, and therefore made greater efforts than ever before to secure for the highest offices in the Serbian Church men devoted to the Hungarian interests. On December 11, 1879, the Patriarch of Carlovitz, Iratchkovits, was relieved "at his own request" from the administration of the Serbian patriarchate, and in his place the Bishop of Bacz (German Andjelits) was appointed "administrator of the Serbian patriarchate." Bishop Andjelits was regarded by the Serbian nationalists as the most devoted partisan of the Magyar Government, and it was expected that the Serbian Congress would not elect him Patriarch. Many

* See "Annual Cyclopædia" of 1879 for an historical sketch of the Serbian Church.

of the prominent Servians protested against his appointment as an illegal act, because they denied the right of the Government to appoint an administrator of the patriarchate. In October, 1880, the assemblies of the eparchies (dioceses) generally demanded the immediate convocation of the Servian Church Congress. The majority of the bishops have been gained over by the Magyar Government, and take side against the demands of the national Servian party. The Greek Church of the Roumanian nationality in the lands of the Hungarian crown has, until 1880, been on better terms with the Magyar Government. But the new elections, held in 1880, for the Roumanian Church Congress resulted in favor of the nationalists, and the Hungarian Government has now adopted the same hostile policy against the Roumanians which has for several years been pursued with regard to the Servians. The Roumanian Church Congress was to have met on October 13, 1880, at Hermannstadt. But a few days before, the Metropolitan Miron countermanded the convocation of the Church Congress, and the Roumanian nationalists generally denounce him as a tool of the Magyar Government.

In the Synod of the Municipality of Roumania, which met in November, 1880, Bishop Ghenadie, of Argesh, moved the establishment of a theological faculty, and declared his readiness to devote a considerable portion of his revenues for this purpose. The lower clergy of Roumania are generally in a deplorable condition. Their income is utterly insufficient, and they are generally destitute of theological knowledge.

Russian papers give the following statistics as to the number of persons belonging to the Orthodox Eastern Church in the western part of the United States: There are in the diocese of the Aleutian Islands and Alaska, including about 200 Slavs and Greeks at San Francisco, 11,572 members of the Eastern Church. The church-buildings are nine in number, including one at San Francisco.

The head of the Russian mission in Japan, the Rev. Nicolas Kassatkin, was, in 1880, consecrated as missionary bishop for Japan. He has been laboring in Japan as a missionary since 1861, when he was sent there for the avowed purpose of exploring the country with a view to religious propaganda. He gave eight years' preparation to this work, studying the language and manners of the country, and translating into Japanese several of the sacred books of the Russian Church. In 1869 he had, however, converted only three persons. As his confidence in the success of his work was unbounded, he returned to Russia for the purpose of soliciting the establishment in Japan of a religious mission. He obtained it, and since his return to Japan the conversions have for ten years continued to increase. In 1875 there were already in the empire 500 Orthodox-Greek Christians; a year after, more than 1,000; in 1878, 4,115; and in 1880 they numbered

more than 6,000. In the summer of 1878 there were six priests and 88 unconsecrated Japanese preachers working for the propagation of the Orthodox-Greek faith. Among the native priests, the most prominent, from his influence and the persecutions to which he has been subjected, is a converted bonze, named Paul Savabé.

GUATEMALA (REPÚBLICA DE GUATEMALA), the most westerly of the five independent states of Central America. For statistics relating to area, population, etc., reference may be made to the "Annual Cyclopædia" for 1875. Here follows a list of the twenty-two departments into which the republic is divided, and their capitals:

DEPARTMENTS.	Capitals.
Guatemala.....	Guatemala.
Amatitlan.....	Amatitlan.
Escuintla.....	Escuintla.
Sacatepéquez.....	Antigua Guatemala.
Chimaltenango.....	Chimaltenango.
Sololá.....	Sololá.
Totonicapán.....	Totonicapán.
Suchitepéquez.....	Mazatenango.
Retalhulén.....	Retalhulén.
Quezaltenango.....	Quezaltenango.
San Marcos.....	San Marcos.
Huehuetenango.....	Huehuetenango.
Quiché.....	Santa Cruz del Quiché.
Santa Rosa.....	Cuajiniquilla.
Jutiapa.....	Jutiapa.
Jalapa.....	Jalapa.
Chiquimula.....	Chiquimula.
Zacapa.....	Zacapa.
Izabal.....	Izabal.
Alta Verapaz.....	Cobán.
Baja Verapaz.....	Salamá.
Peten.....	La Libertad, or Saculuc.

The President of the Republic is General Rufino Barrios, elected May 7, 1873, and re-elected in 1880 for a period of six years. The Cabinet was composed of the following Ministers: Interior and Justice, Señor Don Fernando Cruz; Foreign Affairs, Dr. L. Montúfar; War, Finance, and Public Credit, Señor Don J. M. Barrundia; Public Instruction, Señor Don Delino Sanchez; Public Works, Señor Don M. Herrera.

The Guatemala Minister to the United States is Señor Don A. Ubico, accredited in 1880; and the Consul-General (for the Union) at New York is Señor Don Jacobo Baiz.

The United States Minister (resident in Guatemala and accredited to the five Central American republics) is Dr. Cornelius A. Logan; and the United States Consul (at Guatemala City), Mr. J. F. Medina.

The armed force of the Republic comprises 3,200 men in active service, and 15,225 militia.

The finances of the country are by general report in a prosperous state. The revenue has of late years fallen little short of \$5,000,000, while the ordinary expenditures are for the most part below that limit. The total amount of the national debt on January 1, 1879, was set down at \$5,369,529. According to returns published in 1880, by the manager-general of the Treasury, the portion of the home debt redeemable by forty per cent. of the customs' receipts (import branch) had been reduced by \$66,617.85, and stood at \$1,408,578.68 on July

ANTIGUA GUATEMALA AND THE VOLCAN DE AGUA.

81st. The consolidated debt at the same date was set down at \$1,218,408.85, having increased by \$11,500.34 during the month mentioned.

The following statements relating to the commerce of Guatemala are from official returns published in 1880. The subjoined table shows the value of the imports and exports for each of the five years 1875-'79:

YEARS.	Imports.	Exports.
1875.....	\$2,173,573 62	\$3,217,244 66
1876.....	2,264,531 90	3,767,471 04
1877.....	2,571,677 86	3,773,183 84
1878.....	2,787,350 62	3,918,912 32
1879.....	2,929,461 50	4,605,628 77

The increase of the exports, as here seen, has been constant, and the imports have varied little, thus showing the development of producing power, and maintaining an ever-growing balance of trade in favor of the republic. The exports for 1879 were to the following countries in order of importance: United States, Great Britain, Germany, France, Balize, the other Central American states, Belgium, South America, Spain, Italy; and the staples shipped were: bullion, cochineal, hides, woolsens, sugar, maize, indigo, cocoanuts, sarsaparilla, timber, Spanish beans, cacao, vanilla, skins, horses, and India-rubber. The most important of these was coffee, the value of which stood at \$4,032,269.60, against \$2,617,278.24 for 1875. The quantity of coffee exported in 1879 was 25,-

201,685 pounds; the several countries to which it was sent, and the value of the shipments respectively, having been as below:

COUNTRIES.	Values.
Great Britain.....	\$1,281,033 44
France.....	521,650 24
Germany.....	678,672 00
United States.....	1,130,812 00
Balize.....	267,075 04
Belgium.....	102,337 60
Italy.....	1,955 28
South America.....	48,017 60
Spain.....	1,186 40

Total.....\$4,032,269 60

The imports for the same year were from the sources and of the respective values expressed in the annexed tables:

COUNTRIES.	Values.
Great Britain.....	\$574,935 42
France.....	487,664 18
California.....	478,744 82
Germany.....	392,129 97
New York.....	207,437 95
China.....	145,568 59
Belgium.....	94,347 12
Spain.....	88,570 09
Japan.....	76,701 55
Cuba.....	81,818 26
Ecuador.....	24,694 17
Mexico.....	9,581 32
Italy.....	8,124 44
Nicaragua.....	8,695 66
Costa Rica.....	1,722 15
Colombia.....	1,539 67
Peru.....	1,456 40
	699 38

Total.....\$2,929,461 59
Duties.....1,501,697 84

Grand total.....\$4,431,169 13

This last item indicates an average rate of duty of over 50 per cent., the distribution of which is exhibited in the following schedule of the different articles imported, together with the values of these:

COMMODITIES.	Values.	Duties.
Provisions.....	\$386,432 78	\$158,372 10
Wines, etc.....	48,636 22	45,171 45
Manufactured goods.....	1,263,281 52	893,322 97
Wearing-apparel.....	199,465 39	145,011 88
Fancy wares.....	174,648 78	65,927 24
Raw material, and agricultural, artistic, and scientific appliances.....	821,718 88	198,505 89
Specie and precious metals...	573,623 80
Sundries.....	7,634 74	5,886 81
Total.....	\$2,929,461 56	\$1,501,697 84

On June 18, 1880, was opened to traffic the branch of the Guatemala Central Railway extending from the Pacific port of San José to

Escuintla, the occasion having been solemnized in due form, and celebrated with brilliant *fêtes*, attended by the Presidents of Guatemala, Honduras, and Salvador. It is confidently stated that the line will be completed to the capital at an early day.

Education continues to be the object of sedulous attention on the part of President Barrios, who has brought the system of public schools to its present prosperous condition. The amount expended on public instruction in 1879 was \$800,000, against \$1,440 in 1871! Education is compulsory, and parents or guardians not providing for the mental culture of their children in private schools, or by private tuition, are required to send them to the public schools. There are at present eighteen graded primary schools in the capital. Active measures are being taken for the education of the Indian population.

H

HALDEMAN, SAMUEL S., naturalist and philologist, was born of Dutch ancestry near Columbia, Pennsylvania, in 1812. He was educated at Dickinson College, Carlisle, devoting himself chiefly to the scientific course. In 1836 he was assistant to the geological survey of New Jersey; in 1837 to that of Pennsylvania. In the course of this year he discovered the *Scolithus linearis*, the earliest fossil then found. In 1851 he was Professor of Natural History in the University of Pennsylvania, and, later, Professor of Comparative Philology. At different times he held professorships in Delaware College and in the Agricultural College of that State. He wrote essays for the American Association for the Advancement of Science, American Philosophical Society, and other societies, including the Philological Association, of which he was a founder and President. He was a contributor to "Silliman's Journal," the "Literary World," the "Iconographic Cyclopædia," and "Johnson's Cyclopædia," of which he was associate editor. He wrote the zoological portion of Trego's "Geography of Pennsylvania" (1843), and Rupp's "History of Lancaster County" (1844). He was an advocate of spelling reform, and, besides several manuals of orthography, orthoëpy, and etymology, he gained in 1858, over eighteen competitors, the Trevelyan prize, by a treatise on "Analytical Orthography." He made extensive researches into Indian antiquities and "Pennsylvania Dutch." He published in 1849 "Some Points in Linguistic Ethnology," dealing with Indian dialects, and, in 1856, "Relations of the English and Chinese Languages." Besides these, he was the author of "Fresh Water Univalve Mollusca," the "Zoology of Invertebrate Animals" (1850), and other works of scientific value. He died near Columbia,

Pennsylvania, September 10th, at the age of sixty-eight.

HANCOCK, WINFIELD SCOTT, an American soldier, was born February 14, 1824, in Montgomery Square, a small village in Montgomery County, Pennsylvania. His grandfather, Richard Hancock, of Scottish birth, was one of the 2,500 impressed American seamen of the War of 1812, who were incarcerated in the Dartmoor Prison in England. His father, Benjamin Franklin Hancock, was born in Philadelphia, and when quite a young man was thrown upon his own resources for a livelihood, having displeased his guardian by not marrying in the Society of Friends. He married the daughter of a Revolutionary soldier, Elizabeth Hayworth, whose ancestry was English and Welsh. He supported himself and wife by teaching, while studying law; was admitted to the bar in 1828, and removed to Norristown, where he practiced his profession forty years, earning the reputation of a well-read, judicious, and successful lawyer.

Winfield S. Hancock and his brother Hilary B. had the combined advantages of home instruction and a course in the Norristown Academy and the public high-school, which afforded the educational facilities of the better class of academies of that day. He early evinced a decided taste for military exercises. At the age of sixteen he entered the Military Academy at West Point, having obtained his cadetship through the unsolicited influence of his father's friend, John B. Sterigere, who represented his district in Congress. Among his contemporaries as cadets in the Academy were Grant, McClellan, Reynolds, Buell, Franklin, Rosecrans, and Lyon, who afterward became distinguished generals in the Union army, and Longstreet, Pickett, and "Stonewall" Jackson,

Wm. A. Hancock

J. Appleton & Co.

of the Confederate service. He graduated at West Point, June 30, 1844; was brevetted second-lieutenant in the Sixth Infantry, July 1, 1844, and assigned to duty at Fort Towson, in the Indian Territory, June 18, 1846; he received his commission as second-lieutenant in a company of his regiment which was stationed on the frontier of Mexico, where the difficulties which afterward resulted in the Mexican War had already begun.

He was ordered to active service in the field in the summer of 1847, and reached his regiment at Puebla, under the command of General Pierce, in time to join the army of General Scott in its advance upon the Mexican capital. He participated in the four principal battles (Contreras, Churubusco, Molino del Rey, and Chapultepec), which resulted in the capture of the city of Mexico, and was brevetted first-lieutenant for gallant and meritorious conduct in the battles of Contreras and Churubusco. From 1848 to 1855, he was stationed at St. Louis, acting as aide-de-camp to Brigadier-General N. S. Clarke. Lieutenant Hancock was married, January 24, 1850, to Almira Russell, daughter of Samuel Russell, a merchant of St. Louis. November 7, 1855, he was appointed quartermaster with the rank of captain, and ordered to Fort Myers, Florida, where General Harney was in command of the military forces operating against the hostile Seminoles. He served under this officer during the troubles in Kansas in 1857 and 1858, and afterward accompanied his expedition to Utah, where serious complications had arisen between the Gentiles and Mormons. From 1859 to 1861 Captain Hancock was quartermaster of the Southern District of California. At the breaking out of the civil war in 1861 he asked to be relieved from duty on the Pacific coast, and transferred to more active service at the seat of war. He reported himself for duty at Washington early in September. In a letter to a friend at this time he said, "My politics are of a practical kind—the integrity of the country, the supremacy of the Federal Government, an honorable peace, or none at all." He was commissioned a brigadier-general of volunteers by President Lincoln, September 23, 1861, and at once bent all his energies to aid in the organization of the Army of the Potomac. During the Peninsular campaign under General McClellan he was especially conspicuous at the battles of Williamsburg and Frazier's Farm. He took an active part in the subsequent campaign in Maryland, at the battles of South Mountain and Antietam. He was assigned to the command of the First Division of the Second Army Corps, on the battle-field, during the second day's fight at Antietam, September 17, 1862. He was soon after made a major-general of volunteers, and commanded this division in the attempt to storm Marye's Heights, at the battle of Fredericksburg, December 13, 1862. In this assault General Hancock led his men through such a fire as has rarely been encountered in warfare.

In the three days' fight at Chancellorsville in May, 1863, Hancock's division took a prominent part. While on the march through western Maryland after the invading army of General Lee, on June 25th, he was ordered by the President to assume command of the Second Army Corps. On the 27th, General Hooker asked to be relieved from the command of the Army of the Potomac; and orders from the War Department reached his headquarters near Frederick, Maryland, assigning Major-General George G. Meade to its command. On the 1st of July the report reached General Meade, who was fifteen miles distant, that there was fighting at Gettysburg, and that General Reynolds was killed. General Meade, who knew nothing of Gettysburg, sent General Hancock with orders to take immediate command of the forces and report what should be done; whether to give the enemy battle there, or fall back to the proposed line at Pipe-clay Creek. He reported that he considered Gettysburg the place to fight the coming battle. He continued in command until the arrival of General Meade. In the decisive action of July 3d he commanded on the left center, which was the main point assailed by the Confederates, and was shot from his horse. Though dangerously wounded, he remained on the field till he saw that the enemy's assault was broken, when he dispatched his aide-de-camp, Major W. G. Mitchell, with the following message: "Tell General Meade that the troops under my command have repulsed the enemy's assault, and that we have gained a great victory. The enemy is now flying in all directions in my front." General Meade returned this reply: "Say to General Hancock that I regret exceedingly that he is wounded, and that I thank him in the name of the country and for myself for the service he has rendered to-day." In a report to General Meade, after he had been carried from the field, he says that, when he left the line of battle "not a rebel was in sight upright, and if the Fifth and Sixth Corps are pressed up, the enemy will be destroyed." Disabled by his wound, he was not again on active duty until March, 1864, being meanwhile engaged in recruiting the Second Army Corps. He resumed command of this corps at the opening of the spring campaign of that year, and bore a prominent part in the battles of the Wilderness, where the fighting was almost constant from May 5th to the 26th. In the fight at Spottsylvania Court-House, where General Lee's right center formed a sharp salient, "the Angle," General Hancock on the night of the 11th moved to a position within 1,200 yards of it, and early in the morning of the 12th stormed it. His heavy column overran the Confederate pickets without firing a shot, burst through the abatis, and after a short hand-to-hand conflict inside the intrenchments captured "nearly four thousand prisoners, twenty pieces of artillery, with horses, caissons, and material complete, several thousand stand of small-arms, and up-

ward of thirty colors" (Hancock's official report). The fighting at this point was as fierce as any during the war, the battle raging furiously and incessantly along the whole line throughout the day and late into the night, General Lee making no fewer than five separate assaults in his attempts to retake the works, but without success.

In the subsequent operations of the army, at the crossing of the North Anna, the second battle of Cold Harbor, and the assault on the lines in front of Petersburg, he was active and indefatigable till the 17th of June, when his Gettysburg wound, breaking out afresh, became so inflamed and dangerous that he was compelled to go on sick-leave, but resumed his command again in ten days. The battles at Deep Bottom, Ream's Station, and of Boydton Plank-road, were conducted by him. He was appointed a brigadier-general in the regular army, August 12, 1864, "for gallant and distinguished services in the battles of the Wilderness, Spottsylvania, and Cold Harbor, and in all the operations of the army in Virginia under Lieutenant-General Grant."

On November 26th he was called to Washington to organize a veteran corps from the honorably discharged soldiers who had served two years. He continued at that duty till February 26, 1865, when he was assigned to the command of the Middle Military Division, and ordered to Winchester, Virginia, to relieve from the command of the Army of the Shenandoah General Sheridan, who started the next morning with a large force of cavalry on his expedition down the Shenandoah Valley. General Hancock now bent all his energies to organizing and equipping a force as powerful as possible from the mass at his command. His success is attested by the following extract from a dispatch from the Secretary of War: "I am very much gratified by your energy in organizing and administering the military force of your important command. Your dispatch of this evening to General Halleck vindicates my judgment in assigning you to that position, and shows that you could not in any other render service so valuable and urgent to the Government. I would be glad to have a detailed report of the force and its location, a thing I have never been able to procure. For what you have done already, you have the thanks of this Department."

After the assassination of President Lincoln, April 14, 1865, General Hancock's headquarters were transferred to Washington, and he was placed in command of the defenses of the capital. July 30th he was assigned to the command of the Middle Department, with headquarters in Baltimore. A resolution approved April 21, 1866, tenders him with other officers and soldiers the thanks of Congress, "for the skill and heroic valor which, at Gettysburg, repulsed, defeated, and drove back, broken and dispirited, the veteran army of the rebellion," and for himself, "for his gallant, meritorious, and con-

spicuous share in that great and decisive victory." July 26, 1866, he was appointed a major-general in the regular army.

August 6th General Hancock was assigned to the command of the Department of Missouri, where he conducted a successful warfare against the hostile Indians on the Plains, till relieved by General Sheridan, September 12, 1867. He was in command of the Fifth Military District, comprising Louisiana and Texas, from November, 1867, to March, 1868; the Division of the Atlantic from March, 1868, to March, 1869; and the Department of Dakota from 1869 to 1872. On the death of General George G. Meade, he was again assigned to the command of the Division of the Atlantic, November 25, 1872, his headquarters being in New York City, till 1878, when they were transferred to Governor's Island, New York Harbor.

General Hancock's name was favorably mentioned in 1868 and 1872 as a candidate for Presidential honors. He was unanimously nominated the candidate of the Democratic party in the Cincinnati Convention, June 24, 1880. On the first ballot he received 171 votes, in a convention containing 738 members, and Senator Bayard, of Delaware, 153½. The remainder of the votes were scattered among twelve candidates. On the second ballot General Hancock received 320 votes, Senator Bayard 111; and Speaker Randall, of the House of Representatives, advanced from 6 to 128½ votes. On the next ballot General Hancock received 705 votes, and the nomination was made unanimous.

HARCOURT, Sir WILLIAM GEORGE GRANVILLE VERNON, the Secretary of State for the Home Department in the new Liberal English Cabinet, was born in 1827. He is the second son of the Rev. William Harcourt, of Nuneham Park, Oxfordshire, and grandson of the late Archbishop of York. He was educated at Trinity College, Cambridge, and graduated there in honors in 1851. Three years later he was called to the bar at the Inner Temple, and in 1866 became a Queen's Counsel. He was elected Professor of International Law at Cambridge University in 1869, and was a member of the Royal Commission for amending the Neutrality Laws. He was appointed Solicitor-General in November, 1873, being knighted on his appointment, and held this office until the resignation of Mr. Gladstone's Ministry in February, 1874. He wrote various political pamphlets and letters on international law in the "Times," under the pseudonym "Historicus." He represented Oxford in the Liberal interest from 1868 to 1880. He was successful at the general election of 1880, but, when he accepted an office in the Cabinet and offered himself for a new election, he was defeated on May 8th by the Conservative candidate. On May 25th he was, however, returned for Derby, which seat Mr. Plimsoll resigned in his favor. His second wife, to whom he was married in 1876, was a daughter of the late J. L. Motley, of the United States.

HARTINGTON, SPENCER COMPTON CAVENDISH, Marquis of, the Secretary of State for India in the new Liberal English Cabinet, was born July 23, 1833, and is the eldest surviving son of William, seventh Duke of Devonshire. He graduated at Cambridge in 1854, and was made LL. D. in 1862. In 1856 he was attached to Earl Granville's special mission to Russia. (See **GRANVILLE**.) In 1857 he was returned to the House of Commons as one of the members in the Liberal interest for North Lancashire. In 1859, at the opening of the new Parliament, he moved a vote of no confidence in Lord's Derby's Government, and it was carried by 323 votes against 310. He took office as a Lord of the Admiralty in March, 1863; a month afterward became under-Secretary for War; and, when Earl Russell reconstructed his Cabinet in 1866, he received the appointment of Secretary for War. He lost his seat at the general election of 1868, but was returned soon afterward for the Radnor Boroughs, having first received the office of Postmaster-General in Mr. Gladstone's Cabinet. In 1871 he succeeded Mr. Chichester Fortescue as Secretary for Ireland, and remained in that post until the dissolution of the Cabinet in 1874. On Mr. Gladstone renouncing the leadership of the Liberal party, shortly before the assembling of the Parliament in 1875, he was unanimously chosen by the members of the opposition as their acknowledged leader in the Commons. At the general election held in 1880 he was returned both for the Radnor Boroughs and Northeast Lancashire. He chose to sit for the latter, and was reelected on his being appointed Secretary of State for India. In 1877, and again in 1879, he was elected Lord Rector for Edinburgh University. Two of Lord Hartington's brothers, Lord Frederick Charles Cavendish and Lord Edward Cavendish, are likewise Liberal members of the House of Commons, Lord Frederick representing the northern division of West Yorkshire, and Lord Edward North Derbyshire. Lord Frederick was private secretary to Earl Granville, when the latter was Lord-President of the Council, 1859-'64; to Mr. Gladstone, 1872-'73; a Lord of the Treasury, 1873-'74; and Financial Secretary to the Treasury in 1880.

HAVEN, GILBERT, was born near Boston, September 19, 1821; died January 3, 1880, at Malden, Massachusetts. He graduated at the Wesleyan University in 1846, and for two years taught Greek and Latin in Amenia Seminary, of which, in 1848, he became the principal. In 1851 he joined the New England Conference of the Methodist Episcopal Church, and was stationed successively at Northampton, Wilbraham, Westfield, Roxbury, and Cambridge, Massachusetts. In 1861 he was appointed Chaplain of the Eighth Massachusetts Regiment, the first commissioned chaplain after the breaking out of the civil war. In 1862 he made a tour in Europe and the East; and on his return was sta-

tioned for two years as pastor in Boston. His earnest advocacy of the cause of the colored people, before and during the war, led to his appointment, in 1865, to the supervision of the interests of destitute freedmen and whites in the State of Mississippi. In 1867 he became the editor of "Zion's Herald," Boston, and continued in this office until 1872, when he was elected Bishop of the Methodist Episcopal Church. He was afterward assigned by the General Conference to the superintendence of the Methodist Episcopal Church in the extreme Southern States, his residence being Atlanta, Georgia. He was a persistent advocate of Protestant missions in Italy and among Spanish-speaking peoples, and in 1872-'73 visited Mexico in this cause. He published "The Pilgrim's Wallet" in 1864, and "National Sermons; Sermons, Speeches, and Letters on Slavery and its War," in 1869. A man of strong intellect and will, he was also vigorous in his prejudices.

HÉBERT, PAUL O., ex-Governor of Louisiana, was born at Bayou Goula, Iberville Parish, Louisiana, in 1818. He graduated from the Jesuit College, St. James Parish, in 1836, and went to West Point, where he graduated in 1840, in the same class with Generals Hancock, Thomas, Sherman, and other officers of distinction. He was Assistant Professor of Engineering at the Military Academy in 1841-'42. He was employed in the construction of the Western Passes of the mouth of the Mississippi until 1845, when he resigned and was appointed Chief Engineer of the State of Louisiana. This office he held until the Mexican War, when he was reappointed to the United States Army, with the rank of lieutenant-colonel of the Fourteenth Infantry. He was at the battle of Contreras, at the storming of Chapultepec, and at the taking of the city of Mexico. He was brevetted colonel for gallant conduct at Molino del Rey. In 1848 the army was disbanded, and Colonel Hébert returned to his plantation at Bayou Goula. In 1851 he went as commissioner to France. In 1852 he was a member of the Convention which framed a new Constitution for Louisiana. He was Governor of the State from January 1, 1853, to January 1, 1856. One of the notable appointments of his term was that of General W. T. Sherman as President of the Louisiana Military Academy. In 1861 he was appointed one of the five brigadier-generals in the Provisional Confederate Army, the others being Robert E. Lee, Albert Sidney Johnston, Beauregard, and Magruder. He was in command of the trans-Mississippi Department until relieved by General Magruder, when he took charge of the defenses at Galveston. Very shortly after the surrender, Governor Hébert applied for the removal of his disabilities. He was then appointed on the Board of State Engineers. In 1873 President Grant appointed him Commissioner of Engineers for the Mississippi Levee. He died in New Orleans, August 29th.

HERING, Dr. CONSTANTINE, President of the American Institute of Homœopathy, was born in Oschatz, Germany, January 1, 1800. He was educated at the University of Leipsic and at the Surgical Academy of Dresden. He was engaged to write a book confuting homœopathy. In order to do this, he read Hahnemann's works, and he finally became a convert to the doctrine "*similia similibus curantur*." He sought out Hahnemann, studied under him, and became his personal friend. He had filled the position of Instructor in Mathematics and Natural Sciences in Berckmann's Institute, Dresden, and the King sent him to Surinam to make a zoological collection. He practiced medicine for a time in Paramaribo, and then sailed to Philadelphia, arriving there in January, 1833. He was head of the Homœopathic School, the first of its kind established anywhere. From 1845 to 1869 he was Professor of Institutes and Materia Medica in the Philadelphia College of Homœopathy. He edited the "American Journal of Homœopathic Materia Medica." He published many works, including "Condensed Materia Medica," "Guiding Symptoms and Analytical Therapeutics," and "Hering's Domestic Physician." He developed many of Hahnemann's theories, and ranks only second to him with the members of his school. He died in Philadelphia, July 23d.

HOME HYGIENE. *Baths and Bathing*.—The use of the bath in some form has been common to all races, in all ages. Homer, in the "Odyssey," has left a vivid description of the several baths taken by Ulysses at his principal halting-places, while pursuing his zigzag journey from the grotto of Calypso to his native Ithaca, and from those descriptions we may conclude that the method in use by the ancient Greeks was not materially different from that in use at the present day. The water was heated in a brass basin, upon a tripod over a fire, and thence poured into a larger basin or vase of brass or marble to temper the water therein contained. Cold water was rarely used, although sea-bathing was common, not only as a means of cleansing and refreshing the body after fatigue, but as a remedy in disease, and persons who lived at a distance from the sea were frequently removed thither for the sake of recovering their health, mainly to "the most pleasant city Ostia, to enjoy the benefit of bathing in the sea, which is an easy and expeditious method of drying up the superfluous humors of the body." Hot baths were long known, but were indulged in only after great fatigue; the tepid bath, prepared as indicated above, being that usually employed, the Greeks considering the hot bath effeminate. During the last illness of Alexander the Great, he was bathed very frequently, having a greater reliance upon the curative virtue of the bath than in that of medicine, and finally he caused his bed to be brought near the bath, that it might be more easy of access.

The knowledge of the hot springs, or *therma*,

is not confined to the moderns, as Homer commends the fountains of Scamander for their hot water; Pindar mentions "the hot baths of the nymphs"; and Minerva or Vulcan is said to have discovered to Hercules a hot spring, in which to refresh himself after one of his labors; the famous pass of Thermopylae derives its name from the warm springs in its vicinity; the *Therma* of Sicily, near Selinus, have been known for a long period, and the grammarian Solinus in his "Polyhistor" has given a description of Bath, England. Traditional legends and mythological lore weaved a potent spell about the old *therma*, and doubtless added to their other beneficial effects upon invalids, that of powerfully stimulating the imagination. Thus it is said that the curative powers of the waters of Bath were discovered by accident, during the reign of Hudibras the son of Liel, who is alleged to have been contemporaneous with Solomon. It is related, with superabundance of detail, that the Prince Bladud, the son of Hudibras, having been driven in disgrace from the court in consequence of his leprosy, engaged himself to a swineherd, and communicated the disease to his swine. The amateur swineherd and his herd wandered about until by accident one of the animals wallowed in the warm spring at Bath and was healed, whereupon the example was followed by Prince Bladud, and the resulting cure established the efficacy of the waters for all succeeding time.

The Romans, as might be expected from the perfection of the water-supply of the city, brought the practice of bathing to its highest perfection; indeed, no modern essay upon balneology is deemed complete without a description of the Roman baths. By the term Roman baths, the public baths are meant, although bath-rooms in all grades of magnificence were common in the houses of the wealthy. (A description of the public baths of ancient Rome and Pompeii may be seen in the "American Cyclopædia," vol. ii, pages 382-384.) The *balnea pensilia* (hanging-baths) introduced by Sergius Orata, about which there has been much dispute, appear, from the directions given for their construction by the architect Vitruvius, to have been nothing more than baths supported upon pillars or arches. All Roman baths, of which there were upward of eight hundred, included the *cella frigidaria*, the cold bath-room; the *frigidarium* (the cold bath); the *cella caldaria* (the hot bath-room); the *caldarium* (the hot bath); the *cella tepidaria*, the *tepidarium*; the *sudatoria*, or sweating-rooms; *apoditeria*, or undressing-room; and the *unctuaria*, or perfuming-rooms. The bath-keeper (*balneator*) had slaves under his command (*capsarii*), who took care of the garments of the bathers, and other slaves (*aliptæ* or *unctores*) whose duty it was to rub the body of the bather with the *strigilis*, a sort of curry-comb made of horn, brass, silver, or gold, and at the conclusion of the bath to apply the oil. Air-baths were in most cases attached, statuary and bril-

liant frescoes met the eye of the bather, and libraries were commonly in the same building. Scholars composed or dictated, and poets read their compositions to the concourse gathered at the baths in the hot season. In our day, there is no civilized nation that attaches the same importance to public baths as the Romans did, and the baths are nowhere constructed with a title of the ancient splendor. The Turkish baths, perhaps, approach more nearly those of ancient Rome, and the process of bathing according to the Turkish method is simply a modification of that of the Romans. Turkish baths are now quite common in European and American cities, but they are little frequented here except by invalids.* Among all Mohammedans the bath forms an important religious ceremony, as also among the Hindoos. Bayard Taylor thus described the ceremony as practiced at Allahabad:

Several boats, containing flower-decked shrines with images of the gods, were moored on the Jumna side, the current of the Ganges being exceedingly rapid. The natives objected to our getting upon the platforms, as they were *kana*, or purified, and our touch would defile them; so we stood in the mud for a short time and witnessed the ceremony of bathing. The Hindoos always bathe with a cloth around the loins, out of respect for the goddess Gungajee.† There were about a dozen in the water, bobbing up and down, bowing their heads to the four points of the compass, and muttering invocations; others, standing on the bank, threw wreaths of yellow flowers upon the water.

Dr. Dudgeon informs us that there are numerous public baths in Peking. They are known by a lantern lighted at night and raised on a lofty pole. The buildings are damp, dirty, and filled with a rank, steamy atmosphere; there are three apartments, viz.: 1. Undressing-room. 2. Bathing-room. 3. Lounging or smoking room. The same water is used for several bathers; at any rate, it is changed but once daily, except during the hottest weather, when it is changed twice. As the Chinese dread the effect of water applied to the surface of the body, the "bath" of the better classes usually consists of "a teacupful of warm water applied with a silk handkerchief"; the public baths, therefore, are mainly used by the lower orders of people. "An ordinary bath costs a penny, but during the last month of the Chinese year, the price is raised to about three pence." In bathing, "many wash the upper half of the body who refuse to wash the lower, being afraid of the lower vapor ascending and injuring the upper." The Chinese dread of water is somewhat embarrassing to foreign practitioners of medicine, resident in China, as it is said that when called to attend Chinese patients they are obliged to eschew water-dressings, baths, fomentations, and the like, if they desire to retain the confidence of their patrons. There are several hot springs in China, much used as a resort for invalids; those near Chefoo, according to Dr. Myers, supply the baths at a

temperature of 112° to 120° Fahr. These baths are at a village (Loong-Chuen-Tang) about thirty-three miles east from Yentai. There are also hot sulphur-baths at I San Tang, fifty miles from Chefoo. The temperature of these baths is higher, being 124° Fahr., and Dr. Myers suggests that as foreigners are not well treated there, persons visiting them should take their tubs with them. There are two celebrated baths near Peking; one at Piyünze, a Buddhist temple, twelve miles from Peking. There are two springs near each other, which have been built round with marble, and inclosed in a park. The southern spring is the warmest, standing at a temperature of 120° Fahr. These baths, however, are not open to the public, being held as an imperial reservation. The public baths of Japan have been described in the "American Cyclopædia," vol. ii, page 385. The private bath is thus described by Dr. G. Henderson: "In the bottom of an ordinary wooden or metal bath-tub, a hole is cut six inches in diameter, and about an inch distant from the side; into this hole is fitted a copper cylinder closed at the bottom by a very open grating; the cylinder is contracted at the top so as to resemble somewhat a large beer-bottle; this shape increases the draught.

"The bath-tub being ready and filled with cold water, in order to heat it we have only to drop into the copper cylinder from one to two pounds of hot coals, and in half an hour the water will be raised in temperature forty or fifty degrees."

The North American Indians, when sick, have resorted to vapor-baths from time immemorial, but in health they bathe only during the warm season, and then in the rivers and lakes. The vapor-bath is made by placing some hot stones in a small lodge or tent, previously made air-tight by covering the lodge with skins or blankets; then water is poured upon the stones, and a hot steam is the result. A similar practice prevails in Lapland.

An account of the different European and American resorts for persons desiring the benefit of baths in natural mineral waters, as well as the effect of the various medicated baths as a remedial measure in disease, is foreign to the purpose of this paper; indeed, the mere enumeration of the treatises upon the subject of medical balneology would occupy nearly the entire space assigned to this article. It may not be out of place, however, to say that no person in the United States need go beyond its borders to find mineral springs of any desired composition and of any required temperature, and that the remedial effect of any particular waters can not be obtained anywhere else than at the spring, since waters prepared of identical chemical composition and temperature do not produce the same effect elsewhere. It follows, therefore, that there are other elements entering into the causation of the curative effect, such as the atmosphere of the place, its elevation and consequent barometric pressure,

* Vide "American Cyclopædia," vol. ii.

† The river deity.

the careful regulation of diet, the relaxation from business, and change of scene.

Free public baths are not as common either in Europe or America as they should be. In the city of New York there are only eight; in Brooklyn three; in Philadelphia two; in Boston twenty. There are none in Baltimore, New Orleans, Cincinnati, Chicago, St. Louis, or San Francisco. These baths are floating baths for men and boys in one compartment, and for women and girls in the other; they are usually moored near some of the public docks; in Boston they are near the bridges, which are numerous in that city; in any event, they are necessarily near one or more of the sewer outlets. When intercepting sewers shall have been established for the better purification of our great harbors, this disadvantage will be obviated. It has been alleged, not without a show of reason, that the absorption of sewage matters, by reason of the immersion of the body in the waters of our harbors, was itself more harmful than the uncleanness of the bather; but this is certainly an exaggeration; and, moreover, absorption by the skin is very slow, and the great reduction of the temperature of the body consequent upon the saline bath compensates in some measure for the evil. It is not, however, irremediable. Mr. Charles Slagg, C. E., of England, has proposed a very ingenious scheme for providing filtered-water swimming-baths in impure rivers. He proposes to place floating baths in the current of a river, "and by means of tide-wheels to utilize the motive power of the current to pump water into the bath from a well into which the river-water enters through a filter in the bottom of the vessel." This scheme is doubtless practicable, but has not been tried in this country, and the writer has seen no account of its having been tried elsewhere. The public baths have not as yet been heated, nor have any been constructed except floating baths. Dr. Bell suggested some years ago that large manufacturing establishments could easily furnish the necessary facilities for heating the water for public baths. He estimated that the waste water of a five hundred horse-power steam-engine would be sufficient to "furnish baths for twenty-six hundred persons daily, at an average temperature of 70° to 75° Fahr." It is not probable that this plan could be made available. Since the city assumes the responsibility of providing free public baths at all, it would seem eminently proper that it should provide them with the necessary appliances for accomplishing their intended purpose. The furnishing of a suitable tank, and a steam-boiler for hot water, would not appear to present an insuperable obstacle. The greatest difficulty consists in obtaining the necessary appropriation from the city treasury.

Without special discussion of the physiology of the human skin, or particular mention of the details of its anatomy, it may be stated that all living animals cast off and renew their

cutaneous appendages in some way. Reptiles cast off the entire skin each year, quadrupeds shed their hair and portions of their epidermis, the "molting" process is more or less constant in birds, crustaceans cast off their shells in whole or in part, according to species, and fishes their scales. The epidermis of man, although more gradually thrown off, is yet as constantly undergoing that process. The blood circulating through the skin is cooled by indirect contact with the air, and it parts with certain of its salts and water by means of the sweat-glands, with which it is numerously supplied; if, then, from any cause the sweat-ducts (pores) become obstructed, a local sore or a general disease is the result: a local sore if but few are obstructed, and general disease in exact and definite proportion to the number of glands involved. Numerous experiments have been made by physiologists tending to show the effect of closure of the sweat-ducts upon lower animals, by covering the skin with an impermeable coating, and death was the invariable result, the duration of life after the coating only varying according to the thoroughness of the application. Dr. Flint quotes from Lasehkwitch the case of a child who was covered with gold-leaf in order to represent an angel in the ceremonies attending the coronation of Pope Leo X. This child died a few hours after the coating had been applied. The effect of the closure of a smaller number of sweat-ducts is, as before stated, to produce a local sore, which is manifested in the form of a cutaneous eruption. It follows, then, that the application of water has a general tendency to assist the natural process of throwing off the epidermis, and, by dissolving and carrying off the perspiration, assists in keeping open the pores of the body, which, although not the only drains, are yet highly important ones. So in all ages its use has been accounted a great benefit. There are, however, thousands of human beings who do not bathe, except, perhaps, the hands and face; such persons are usually of the laboring-classes, whose perspiration is very free, sufficient in quantity to enforce its passage through the ducts, and prevent obstruction. In towns and villages throughout the United States not furnished with a general water-supply, bath-rooms are the exception, and in winter the only bath taken is a sponge or towel bath. In summer the male inhabitants of such villages usually seek the nearest lake or watercourse.

Baths are divided first, according to the medium employed, as air, vapor, sand, mud, or chemicals, etc.; second, a subdivision of the media; but, as the water-bath only is within the scope of this article, the first need not engage our attention. Water-baths are classed as plunge-baths, foot-baths, hip-baths, shower-baths, and sponge-baths; they are divided into cold baths, 42° to 70° Fahr.; tepid baths, from 72° to 82° Fahr.; warm baths, from 83° to 98° Fahr.; hot baths, from 99° to 112° Fahr. and

upward. Dr. Forbes has given a more complicated division, viz., cold, cool, temperate, tepid, warm, and hot; it is evident that such divisions are purely arbitrary, and can easily be multiplied until there are as many divisions as there are degrees upon the scale. The four divisions first named will be found to answer every practical purpose, since in reality all baths are relatively cold or hot according to the sensations of the bather, if he be in health; but even in health there is considerable variation in the temperature of the skin, and a still greater range in disease. A bath the water of which is 22° below the temperature of the skin may fairly be considered a cold bath, although as high as 75° Fahr. The cold baths used by the Romans were not usually of a very low temperature, as appears from Vitruvius, the "chill" being taken off by the fires beneath the bath-room.

The first effect of a plunge into a cold bath is that of a shock to the system; the skin hardens and contracts, and the minute blood-vessels, being compressed, are diminished in size; to this stage succeeds that of reaction, a stimulant impression upon the cutaneous nerves—the blood-vessels again dilate, a general glow appears upon the surface of the body, and this reaction continues for a longer or shorter period, according to the degree of temperature of the water in which the body was immersed. If the immersion be long-continued, and the stage of reaction passed, a general feeling of chilliness comes on, the lips become blue, the teeth may chatter, and the skin again contracts, leaving little hillocks around the point of insertion of the hairs. This appearance is commonly known as "goose-flesh."

Sea-bathing is a cold bath in mineral waters; it differs from the ordinary cold bath only in being more stimulant; the "shock" and the "reaction" are each more distinct than in a cold fresh-water bath. In surf-bathing there is a mechanical force added by the action of the waves, which still heightens the shock and the reaction.

A certain amount of exercise, as preliminary to a cold bath in fresh or salt water, is beneficial; in fact, if the heat of the body be great at the time of the plunge, the shock will be less marked and the reaction will be more lasting. The practice of waiting to "cool off" before taking the plunge in the sea is a bad one, and founded neither on experience nor reason. The ancients always used the cold bath immediately after coming from the hot, as a means of contracting the open pores, and preventing the bather from taking cold.

Delicate persons, invalids, and children under ten years of age, should not use the cold bath except by advice of a physician, and no bath should be taken immediately after a full meal, nor should it be prolonged. It may be added that, immediately upon quitting the bath, the skin should be rubbed with a towel until a ruddy, healthful glow is produced, and the bath

can not be refreshing unless this shall have been accomplished. Persons taking sea-baths should be guided by this rule, and the not uncommon habit of taking repeated baths within a few hours of each other, or that of spending the interval between the rapidly recurring baths in wet garments, can not be too pointedly condemned. Nature has shown her abhorrence of such practices, as is well attested by the blue lips, the shivering, and the bleached appearance of those following them.

The *shower*-bath, when used with cold water, is objectionable, and should only be taken in accordance with the advice of a physician.

Warm baths, as may be inferred from the statements made concerning cold baths, are at first stimulating and then relaxing in their tendency. They have been employed from time immemorial as a means of refreshing the body after fatigue, as well as for the power of solution of the various substances obtaining a lodgment on the skin, which power is greater in hot than in cold water. The oily secretion usually present on the skin is almost insoluble in cold water, but soluble in hot water. The *débris* of the epidermis, the saline products from the evaporation of the perspiration, and the impurities collected from without the body, are more easily removed. Invalids and delicate persons can bathe in warm or tepid water without injury, providing the skin be sponged with cold water immediately afterward, and then rubbed with the towel. Fleishy persons can reduce much of their superfluous weight by the protracted use of the warm bath, and it follows that persons naturally thin should not remain long in the water, but that their bath should be limited to that necessary for cleanliness. It should be remembered that thousands live without the bath, and to all appearance are reasonably healthy, and that, however valuable it may be as a factor in the problem of how to live long and comfortably, it is not an absolutely indispensable one.

Whatever form of bath be used, it is proper that it should be followed by the application of a warm oil. It is difficult to give a satisfactory reason why this practice should have been omitted after having been used by all nations for countless ages. The particular oil to be used may be according to individual preference, but olive-oil, which can easily be perfumed, would appear to be the least objectionable.

In the use of soap there is great danger of obtaining soap manufactured from diseased animal fat on the one hand, or of being so strongly alkaline as to affect the epidermis on the other. These difficulties are best avoided by the selection of soap made from olive-oil, the white castile soap being taken as the type. The construction of the bath-room and its appliances will be discussed under the head—CONSTRUCTION OF DWELLINGS.

CONSTRUCTION OF DWELLINGS. 1. *Selection of a Site*.—The selection of a healthful site for the building of a city has been deemed of the

greatest importance in all ages except our own; indeed, the ancients were especially solicitous in that regard, as is shown in the historical narratives of the laying out of ancient cities, from the founding of Lycosurus in Arcadia, as described by Pausanias, to the building of Alexandria by Dinocrates under the orders of Alexander. In Hippocrates's "Airs, Waters, and Places," the relative healthfulness of building sites is thus laid down:

"Those [cities] which lie to the rising of the sun are all likely to be more healthy than such as are turned to the north, or those exposed to the hot winds, even if there should not be a furlong between them. In the first place, both the heat and cold are more moderate. Then such waters as flow to the rising sun must necessarily be clear, soft, and delightful to drink in such a city, for the sun in rising and shining upon them purifies them by dispelling the vapors which generally prevail in the morning. The persons of the inhabitants are, for the most part, well colored and blooming. The inhabitants have clear voices, and in temper and intellect are superior to those which are exposed to the north, and all the productions of the country in like manner are better; . . . but such cities as lie to the west, and which are sheltered from winds blowing from the east, and which the hot winds and the cold winds of the north scarcely touch, must necessarily be in a very unhealthy situation: in the first place, the waters are not clear. . . . And in summer cold breezes from the east blow and dews fall; and in the latter part of the day the setting sun particularly scorches the inhabitants, and therefore they are pale and enfeebled, and are partly subject to all the aforesaid diseases, but no one is peculiar to them. Their voices are rough and hoarse, owing to the state of the air, which in such a situation is generally impure and unwholesome, for they have not the northern winds to purify it; and these winds they have are of a very humid character, such being the nature of the evening breezes" (Sydenham Society's translation, London, 1849). And Vitruvius has laid down in the clearest manner his opinion upon this subject in his work on architecture, written about twenty-five years before the Christian era: "In setting out the walls of a city, choice of a healthy situation is of the first importance; it should be on high ground, neither subject to fogs nor rains; its aspects should be neither violently hot nor intensely cold, but temperate in both respects. The neighborhood of a marshy place must be avoided; for in such a site the morning air, uniting with the fogs that rise in the neighborhood, will reach the city with the rising sun; and these fogs and mists, charged with the exhalations of the fenny animals, will diffuse an unwholesome effluvia over the bodies of the inhabitants, and render the place pestilent. A city on the seaside, exposed to the south or west, will be insalubrious, for in summer mornings a city thus

placed would be hot, and at noon it would be scorched. A city, also, with a western aspect would even at sunrise be warm, at noon hot, and in the evening of a burning temperature. Hence the constitutions of the inhabitants of such places, from such continual and excessive changes of the air, would be much vitiated. This effect is likewise produced on inanimate bodies: nobody would think of lighting his wine-cellar from the south or west, but from the north, an aspect not liable to these violent changes. In granaries whose aspects are south of the east or west, the stores are soon ruined; and provisions, as well as fruits, can not long be preserved unless kept in apartments whose aspects are north of the east or west. . . . Those who change a cold for a hot climate rarely escape sickness, but are soon carried off; whereas, on the other hand, those who pass from a hot to a cold climate, far from being injured by the change, are generally strengthened. Much care, then, should be taken so to set out the walls of a city that it may not be obnoxious to the pestilential blasts of the hot winds" (Gwilt's translation, London, 1860). The science of pathology was brought into requisition as an aid in the determination of the healthfulness of proposed sites for cities and permanent encampments. Animals were killed after they had for some time drunk the waters and fed upon the herbage grown upon the site. The livers were inspected, and if diseased the site was rejected. As the ancients were thus particular in the selection of sites for a city, it is reasonable to suppose that they were equally careful in choosing sites for their public buildings and dwellings. Vitruvius, with his usual minuteness, has left us his recommendations: "Natural consistency arises from the choice of such situations for temples as possess the advantages of salubrious air and water; more especially in the case of temples erected to Æsculapius, to Hygeia, and such other divinities as possess the power of curing diseases. For thus the sick, changing the unwholesome air and water to which they have been accustomed for those that are healthy, sooner recover; and a reliance upon the divinity will be therefore increased by proper choice of situation. Natural consistency also requires that chambers should be lighted from the east; baths and winter apartments from the southwest; picture and other galleries which require a steady light, from the north." It is proper to note that a marsh-site is not necessarily unhealthy, provided it can be thoroughly drained. Many places in America are now free from malaria that were once very miasmatic, owing to the better drainage adopted in late years. The great prairies of Illinois, that were once checkered with ponds and marshes, and very unhealthy, have, owing to the cultivation of the soil, and subsoil drainage, materially changed in character. The height at which the "ground-water" or residual moisture in the alluvium becomes station-

ary, determines in great part the healthfulness of the site, and therefore no building-site should be chosen where the ground-water is not stationary at a point lower than the proposed foundation of the new house, or where it can not be made so by drainage.

2. *Foundations.*—All loam should be removed, and the bed-stone laid down to the solid earth whenever possible. If the earth be at all damp, a drain-pipe should be laid outside the wall a few inches lower than the bed-stone, and the basement covered with four or five inches of good concrete, upon which the floor may be laid. It is obvious that the drain-pipe should not be laid so near the bed-stone as to affect the security of the wall. If the ground-water still remain in the soil near the concrete, no amount of that material will make a dry cellar; the only remedy in such a case is to lay additional pipes for ventilation which shall be connected with the kitchen or other regularly heated flue. "Damp-proof courses" of impervious bricks are frequently used to keep out the external wet from basements, but are practically useless where the moisture rises inside the foundation-walls.

3. *Walls.*—Impervious bricks should not be used for outside walls, above the ground-courses, for it is quite necessary that transudation of moisture and carbonic oxide should take place from within outward. It is, however, an excellent practice to use impervious bricks for party walls, for precisely the opposite reason. An area should be constructed about the outer wall, of greater or less extent according to the amount of space available, extending down to the level of the bed-stone. A dry-area wall has been recommended where the space is limited, but it is obvious that the "dry" area, which is really an additional wall, is itself objectionable unless ventilated at the top and bottom, and it is therefore clear that the wall would be quite as well without it. In the construction of walls the aim should be, not only to exclude the external moisture from the dwelling, but by means of the porosity of the

don, 1874) recommends that the hollow walls be constructed as shown in the cut, with Mr. Jennings's patent bonded bricks.

4. *Heating and Ventilation.*—It is not known when houses were first artificially heated; there are, however, numerous legends concerning the discovery of fire, of which one of the best is that given by Vitruvius: "A tempest, on a certain occasion, having exceedingly agitated the trees in a particular spot, the friction between some of the branches caused them to take fire; this so alarmed those in the neighborhood of the occurrence that they took to flight. Returning to the spot after the tempest had subsided, and finding the warmth which had thus been created extremely comfortable, they added fuel to the fire excited, in order to preserve the heat, and then went forth to invite others, by signs and gestures, to come and witness the discovery."

It is doubtful if the present century has added very much to the long list of inventions of heating apparatus proposed by Franklin and Rumford, with the exception of the inventions of Galton and Morin, although for many years the subject has been faithfully studied. Mr. Pepys informs us under date of February 15, 1664-'65, that he went "with Creed to Gresham College. . . . But it is a most acceptable thing to hear their discourse, and see their experiments; which were this day on fire, and how it goes out in a place where the ayre is exhausted, which they showed by an engine on purpose."

The subjects of heating and ventilation are perceived, upon reflection, to be intimately connected with each other, and are therefore properly treated of at the same time. The methods of heating dwellings, in use in America at the present time, consist of open grates or "fireplaces," furnaces, heaters, and stoves. Warm water and steam, although much used in heating public buildings, are but little used for dwellings. Parkes states that heat is communicated by radiation or convection. Heat is radiant where it is directly emitted from the flame or incandescent substance. Convective heat is that transmitted by the motion of the particles of a heated object. Radiation is accomplished by means of open fires, and convection by the various patterns of stoves and heated pipes. The open fire is at the same time the most pleasant to the eye, and that most healthful of all methods now in use. Its superiority in a sanitary point of view arises from the fact that the open fire is one of the best-known means of ventilation, and at the same time it is admitted that radiant heat is more beneficial in its effects upon the human body than the convective. The success of an open fire depends largely upon the care with which the grate and chimney have been constructed. The grate may be, and usually is, dispensed with, where wood is burned in the large fireplaces. There is great diversity in the relative velocity of air-currents in different chimneys, out of proportion to any apparent difference in their

FIG. 1.—HOLLOW WALL FROM EASSIE. *a*, vamped brick; *b*, *d*, straight; *c*, rafter drip.

wall to allow the escape of internal moisture. Hollow walls are therefore recommended as fulfilling the necessary conditions. Mr. Eassie ("Sanitary Arrangements for Dwellings," Lon-

shape. The location of the house, the prevailing winds, the height of the chimney with respect to the surrounding buildings, govern the "draught" in a high degree. The direction of the air-current is quite likely to be downward in an unheated chimney. Some examinations recently made by the writer gave the following results: In a chimney with one side connected with the flue of a furnace, on a still day, there was a slight downward current of thirty-five cubic feet per minute. The current was not sufficient to turn the fan of the anemometer, when placed a few inches in front

FIG. 2.—FRONT ELEVATION, SHOWING SMOKE AND AIR FLUES. (Galton.)

of the fireplace. At this time the inward current from the register alongside the chimney showed a velocity of 130 feet per minute. On a windy day the *upward* current in the same chimney was 400 cubic feet per minute. In a building in process of construction, examined March 10, 1881, an unheated chimney on the first floor showed a feeble downward current; the same chimney showed a downward current in the basement of 75 cubic feet per minute. On the first floor of the same house, a chimney which was only slightly heated (the plumber having a fire-pot in the fireplace) showed an upward current of 239 cubic feet per minute. In an adjoining building, an unheated chimney on the first floor showed a downward current of 115 cubic feet per minute, with the doors and windows open. The same chimney, with the doors and windows closed, showed a downward current of 140 cubic feet per minute. These chimneys were to all appearance precisely similar in construction, and it is evident that the direction of the current in the chimney is largely determined by the amount of heat within, and the prevailing winds without. Various forms of cowls, or hoods, have been devised to protect against downward draughts in chimneys, many of which are excellent, and should by all means be supplied to a chimney which when heated does not show an upward current of at least

130 to 200 cubic feet per minute. The amount of ventilation in an ordinary house being almost wholly dependent upon the chimney, it is therefore of the utmost importance that it should be properly constructed and finished. An open grate requires from 500 to 600 cubic feet per minute of fresh air. This is usually supplied through the crevices of the doors and windows. No other form of heating apparatus has as yet been devised which will abstract the same quantity of air from a room; it is consequently the best system of ventilation. The objections urged against it are, in the first place, the dust from the coal and ashes, and, in the second place, its greater expense. As the advantage to be derived from it is so much greater than its attendant evils, the first argument can have but little weight; and, as to its expense, it has been well said that any system of ventilation at all worthy of the name costs something, and the expense is therefore a necessary

FIG. 3.—SECTION OF GALTON FIREPLACE AND CHIMNEY. (Lincoln.)

one. Should the house be provided with double sashes, and the doors be close-fitting, as is the custom in cold climates, it may be advisable to secure the entrance of a sufficient quantity of

fresh air by means of an inlet pipe extending from the outside of the building to the grate. This is usually best laid alongside of the joists on which the floor rests; but, in case the joists have a direction toward the fire, the necessary notching would weaken them too much, and Mr. Eassie has recommended that they be laid in the ceiling and descend alongside of the chimney to the grate. A valuable adjunct to the grate is a piece of Russia iron, well fitted to the upper portion, which may be in horizontal sections, to be fastened upon hinges, or so placed as to be entirely removed. This prevents the access of smoke to the room during the ignition of the fire, and also increases the vitality of the flame.

5. *Furnaces*.—The ordinary furnace is too well known to require a particular description. It consists of a cast-iron pot with a smoke-flue, and a series of air-pipes above the level of the fire-pot, the whole being surrounded with Russia or galvanized iron. The air-pipes are continuously supplied with fresh air by means of a shaft or air-box extending from the outside of the building.

As the lower portion of these furnaces is usually left open, whenever the ashes are raked from the fire, the fine ash-powder is sucked in the pipes and flues and is thence distributed through the house by means of the registers.

Alongside the hot-air pipes are usually placed cast-iron receptacles for water. These are intended to supply to the air passing out of the registers the moisture of which it has been deprived by the process of heating; this is usually imperfectly accomplished. Furthermore, the air-pipes become warped and affected by the heat, so that after a few weeks' or months' use the coal-gas, and frequently smoke, gains access to them and is thus distributed through the house. Indeed, in many city houses coal-gas is ever present in the rooms from this cause.

Parkes states that "the coal of 'average quality' gives off in combustion: 1. *Carbon*. About 1 per cent. of the coal is given off as fine carbon and charred particles. 2. *Carbonic acid*. In Manchester, Angus Smith calculated, some years ago, that 15,000 tons of carbonic acid were daily thrown out. 3. *Carbonic oxide*. The amount depends upon the perfection of combustion. 4. *Sulphur, sulphurous and sulphuric acids*. The amount of sulphur in coal varies from one half to 6 or 7 per cent. In the air of Manchester, Angus Smith found one grain of sulphuric acid in 2,106 cubic feet. 5. *Carbon bisulphide*. 6. *Ammonium sulphide or ammonium carbonate*. 7. *Sulphuretted hydrogen*. 8. *Water*."

These compounds are highly deleterious. Not only do they exhaust the oxygen of the air, by entering into new combinations, but they exert a distinct toxic effect on the human system. It should be remembered in this connection that the air-cells of the lungs are, *par excellence*, the absorption surface of

the body. Each air-cell being lined with a delicate membrane in almost direct contact with the blood, the conditions are highly favorable to the transudation of gases. The surgeon and dentist take advantage of this circumstance in producing the effect of insensibility on their patients by the almost instantaneous absorption of vapor of chloroform or ether, and, when directly absorbed, the fumes of charcoal speedily produce death. That sickness is not more frequently caused in furnace-heated houses by the products of coal-combustion, is due to the large dilution of the gaseous substance in the atmosphere of the rooms. It is obvious that great care is necessary not only in the original construction of the furnace, but in its management while in operation. Furthermore, the water-basins in the furnace need frequent replenishing, or the air of the rooms becomes speedily deprived of its moisture, and considerable suffering may be caused the inmates.

6. *Stoves*.—Of the various patterns of stoves no general or special description need be given, except, perhaps, to mention that those are the most objectionable which admit the air directly to the fire-heated iron. It has been repeatedly shown that red-hot iron allows the gases from combustion of coal to pass through it readily. Dr. Derby, of Boston, states that the injurious effect of passing air over a cast-iron surface heated with anthracite coal is due to carbonic oxide, a highly poisonous gas. The nearer the approach, therefore, to the open grate, as shown in the Franklin or Galton (modified from the Franklin) stove, the stronger the recommendation it can receive on hygienic grounds. The self-feeding or "base-burning" stoves are highly objectionable unless due care be taken to keep the vertical tube filled with coal, thus partially preventing the escape of gas. Its escape can not, however, be entirely prevented by this means.

Warm water has been but little used as a means of heating dwellings in this country, although it has been proved to be of value in various public buildings. The Barnes General Hospital at the Soldiers' Home, Washington, District of Columbia, is heated in this way.

Steam-heat has also been little used for dwellings, but it has lately been proposed to use steam on a large scale to heat an entire village or block of city houses, simultaneously supplying the steam to separate householders in such quantities as may be required. Although steam and warm-water heating are free from the objections of dust and coal-gas, they have yet to be made practicable for small householders. Furthermore, experience has shown the writer that the wood-work in the vicinity of heated steam-pipes shrinks badly, so much so as to render this a highly objectionable method of heating, unless some special measures be taken to prevent it in the location of the pipes.

Ventilation.—As regards house-ventilation in general, it is not too much to say that, in

the construction of the average dwelling, ventilation is absolutely neglected. It is even worse than if left to the care of Heaven, for, in that event, the vitiated air from the exhalations of the body, the coal-gas, and the sewer-air, would be largely diluted, if not blown away by the surrounding winds. But human ingenuity has been taxed to its utmost not only to keep in the house all the gases produced, but to actually increase their production. As a consequence, we witness the fact that no provision is made for the ventilation of bedchambers and living-rooms, except in occasional instances. Bath-rooms, closets, and the like, are rarely ventilated.

It is proper to mention in this place the necessity for ventilation of closets wherein wearing-apparel is kept. In the section on baths and bathing, mention was made of the functions of the skin as an excretory organ, and the vast amount of matters exhaled during the course of twenty-four hours. It is apparent, therefore, that the clothing worn must be more or less saturated with these exhalations, which, if not properly exposed to air-currents, take on fermentative action; and bacteria, fungi, and fermentative products result which, when inhaled, are highly deleterious. It is within the experience of almost every one that clothing packed away in a trunk, chest, or other close receptacle, on being brought to the air after confinement of a greater or less period, throws off a strong, musty odor; this may be almost entirely prevented by thorough exposure to the air, and, whenever practicable, to the sunlight. Closets, therefore, in the place of being dungeons, in the darkest portions of the house, should be well lighted, by a skylight whenever practicable, and thoroughly exposed to a current of air. This practice not only adds to the comfort of persons afterward wearing the clothing, but it prevents the entrance into the room

adjacent to the closet of stagnant air from it. There are various means of ventilating these closets; the most practicable is that by means of an air-shaft communicating directly with the outside of the building. Where the building is heated by a furnace, a register may be placed in the closet, with an opening near the ceiling for the exit of the heated air. This plan is, perhaps, the best that can be devised.

In providing for the ventilation of bedchambers and other rooms in the dwelling, if the fireplace, or Franklin or ventilating stove, be used, other exit for the air will be unnecessary except at the upper opening in the chimney-flue, and that through the fire; but, in case the householder decides to heat by means of a stove, openings for the exit of the heated and vitiated air will be necessary. It is a mooted point whether in cases of this kind the openings should be near the ceiling or near the floor, some holding that the better means of removing the vitiated air, especially that charged with carbon dioxide, is at the bottom of the room, and, as the air which is heated ascends toward the ceiling, as it cools it falls again to the floor, when that portion of the air nearest the exit of the shaft may be withdrawn. On the other hand, if the opening be near the ceiling, the current is continuous and is always in the same direction, depending for its velocity upon the amount of heat thrown out in the room. This method, therefore, will usually be found that most practicable and the best. Openings for the exit of air from a room should communicate with the outside of the building, usually to the roof, and if placed near a heated chimney (they are sometimes placed in it) the velocity of the current will be considerably increased. As, in the construction of a chimney, it is necessary to adopt means to prevent downward currents, it is also necessary to prevent them in ventilation-shafts. This is accom-

FIG. 4.—FORMS OF COWLS. (Dr. F. H. Brown.)

PECLET'S CHIMNEY-CAP. (Dr. Lincoln.)

plished by some one of the various cowls constructed to turn in each case to leeward. When the cowl is turned in this way, an aspiration-current is produced.

7. *Bath-rooms.*—In America at the present day the bath-room is the neglected room of the

household. As has been previously mentioned, in the section on "Baths and Bathing," it was the ancient Roman custom to so construct the bath-rooms as to appeal to the æsthetic senses; they were luxurious in every particular, being supplied with statuary and paintings, plants and

flowers, and the bather was regaled with music. Under such circumstances the bath was calculated to produce its full effect, soothing and quieting the system, and leading the bather to luxurious repose; but in our day the bath-room is one that the average American desires to get out of as speedily as possible, the air being tainted with sewer-gas, the room itself small, dark, and cheerless, and in winter frequently unheated. In other houses, it will be discovered that a corner of the bath-room is made the receptacle for brooms, mops, slop-buckets, etc.—a sight calculated to produce disgust instead of pleasure—and the water-closet is at another corner, on a true level with the bather's nose. Moreover, these rooms are almost wholly unventilated. These evils need only to be recognized by the builder, to enable him to provide a satisfactory remedy. The ventilation of the bath-room may be accomplished in the same way as that of other closets heretofore mentioned.

Many and various are the forms of bathtubs, and the materials of which they are made; earthenware, porcelain, galvanized iron, enameled iron, copper, and planished copper, being the materials used. Of these, the planished copper is that most used. This "planished" or tinned copper is used of different weights; in the poorer class of work, the quality is known as eight ounces—that is, weighing eight ounces to the square foot of surface. Ten, twelve, fourteen, and sixteen ounce copper is also used, the latter in the better class of houses. But slight reflection is needed to show the advantage in having the heavier weight, as, the heavier the copper, the less the liability to indentation and ultimate leakage. The bath-tub waste-pipe is usually connected to the waste-pipe from the water-closet, and a joint is made just above the trap in the sewer-pipe. This is done as an economic measure, although it would be a better sanitary principle to provide that the waste should be carried out of the building by a separate waste-pipe, and the water-closet be constructed in a different apartment. When the bath waste-pipe is connected with that from the water-closet, whatever confined and contaminated air be in the upper portion of the soil-pipe above the trap, is certain to pass backward through the bath-tub waste, and thus escape into the interior of the room. The different patterns of water-closets are very numerous, and there is not sufficient space to enumerate them here. What is known as the pan-closet is that more commonly used. This closet, while a very good one, is not, in the opinion of the writer, equal to the Demorest, or to that known as the "all-earthen" closet of Mr. Jennings. This closet is made in a single piece of earthen or delf ware, and is therefore the less likely to have attached to it the remains of fecal matter and decomposing material, and it is evident that the more perfectly the closet can be cleansed, the more completely it will fill its purpose as a san-

itary appliance. Whatever form of closet be used, the trap should be ventilated. The trap should have a separate vent-pipe communicating with the outside of the building and lead-

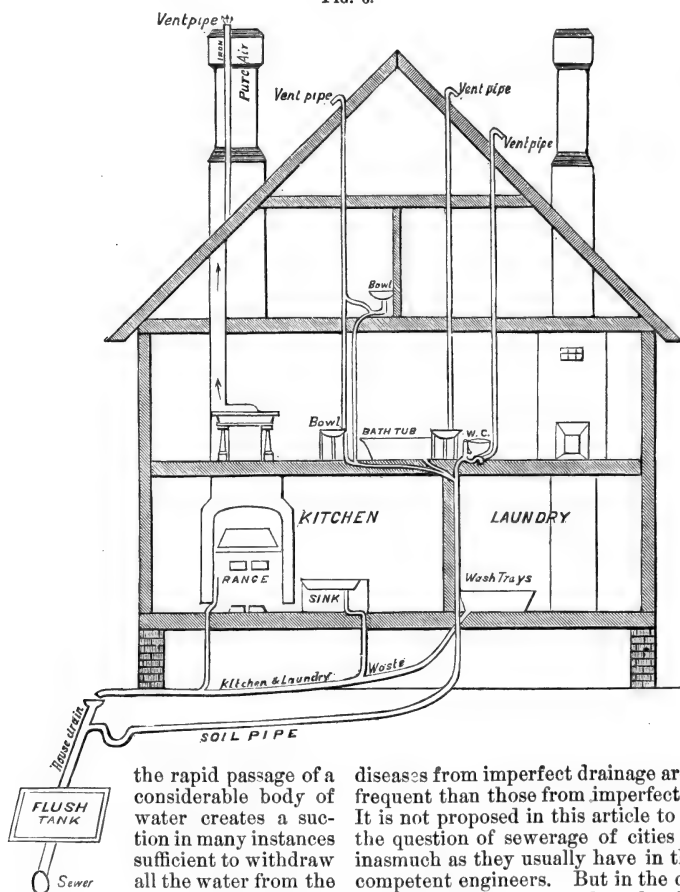

FIG. 5.—JENNINGS'S CLOSET, CLOSED.

ing above the roof. The soil-pipe should also be continued, without diminution in size, directly through the roof. These ventilation-pipes are necessary to prevent the introduction of what is known as "sewer-gas," or more properly sewer-air, a compound gaseous body mingled with atmospheric air, which is produced from the decomposition of organic and saline matters contained in sewage. Sewer air or "gas," when analyzed, is found to consist principally of carbonic acid, sulphuretted hydrogen, and ammonium sulphide, in addition to the common air. It appears, however, that the production of these gases in the larger sewers depends almost entirely upon the thoroughness with which they are ventilated and flushed, as the health of the sewer-men in London and Paris is not shown to be seriously affected by reason of their occupation. It may be considered as fairly proven that the air of house-drains is more impure than that of the larger sewers, provided the latter be ventilated. With regard to the production of typhoid fevers and other specific diseases from sewer-gas and sewer-air, it may well be doubted whether a single well-authenticated case of typhoid fever or diphtheria has ever originated from this cause, although it is presumed that the sewer-air may afford a vehicle or means of transmission of the seeds or the so-called specific "germs" of the disease. It has been proved that the small-pox poison can be transmitted to herds of cattle when feeding to the windward of infected textile fabrics. (*Aitken*.) It is therefore reasonable to suppose that the specific germs of the diseases mentioned may be carried in the same way. If, then, these specific diseases be excluded from those produced *de novo* by sewer-gas, it only remains to consider the effect of sewer-gas uncontaminated by any specific "disease-germ" or virus. In a case at Clapham, cited by Parkes, "the clearing-out of a privy produced in twenty-three children violent vomiting and purging, headache, great prostration, and violent twitching

of the muscles. Two died in twenty-four hours." These cases are clearly extreme. The common effects of the admission of sewer-gas into bedchambers and dwellings are noticed in a feeling of languor, depression of spirits, salowness of the skin, and loss of appetite, and if the cause be long continued, great debility, and finally anæmia, due to a changed condition of the blood. These effects are analogous to those produced by that indefinable poison known as "malarial"; and if the city in which the house is situated be located in a malarious district, these symptoms may indeed be referred to malaria—a convenient catch-word for all diseases of obscure origin. Sewer-air, being usually but little charged with carbonic acid, is lighter than the atmosphere, and in conse-

quence it ascends. Its ascension is materially hastened when there is pressure from behind, as is the case where sewers located on the seashore are affected by the tides. The back pressure is the important factor in forcing the sewer-air through the water-seal of the trap, and it is this which renders it necessary that the soil-pipe should be continued through the roof in order to allow its escape without bubbling through the water-seal. The trap ventilation-pipe need not be of very large size, as it is only necessary as a means of outlet for the gases escaping from the trap, the mephitic gases from the closet-bowls, and to prevent the accident known as siphoning. This accident occurs frequently in private dwellings where the soil-pipe is of small size, as

FIG. 6.

possible when the soil-pipe is continued upward, and communicates with the external air.

8. *House-Drainage.*—If it be important that the house shall be well ventilated, it is essentially important that it shall be well drained, as

diseases from imperfect drainage are even more frequent than those from imperfect ventilation. It is not proposed in this article to touch upon the question of sewerage of cities and towns, inasmuch as they usually have in their employ competent engineers. But in the construction of dwellings it is rare that the drainage receives the consideration that it should, as in building ordinary houses an architect is too rarely consulted—the plans of the building being devised by the householder himself, or by the mechanic who is to construct the work.

This is almost invariably the case in country villages, and, as might be expected, it is in villages where the drainage is most imperfect. In making the plans for the drainage of a dwelling the object should be, in the first place, to have as few openings into the house as possible; and, in the second, that all waste-pipes from sinks, water-closets, and bath-tubs should be carried out of the building at the nearest possible point of exit. The English method of breaking the connection between the waste-pipe and the house-drain is doubtless the best that can be devised, but it can not be adopted in severe winter climates, although the emanations from a drain or sewer are of a much higher temperature in winter than the surrounding air. When disconnections are made, as shown in the cut (Fig. 6), the introduction of sewer-air into the house will be absolutely prevented. By this plan the waste-pipe coming out of the house empties into a catch-basin at the head of the drain, which is covered by a small grating. The sewer-air from the drain by this method passes directly out into the atmosphere, and, becoming instantaneously diluted, is almost innocuous. This practice, however, can not extend to any waste-pipes except those from kitchen-sinks, stationary wash-stands, and bath-tubs. As the night-soil from the water-closet consists so largely of solid matter, it is desirable that it should be carried farther from the house before the connections are broken. For this reason it is proper that the drain empty into a flush-tank, that known as Field's being the most commonly used. The manner of making this connection and the construction of the flush-tank are shown in the cut (Fig. 7).

FIG. 7.—FIELD'S FLUSH-TANK. (Waring.)

It can not be too often repeated or too clearly stated that the more waste-pipes there are in a dwelling, however complicated the system of traps, and however perfect the ventilation, the greater will be the danger of contamination of the air, not only from sewer-air, but from the particles of organic matter adhering to the

sides of the different waste-pipes constantly undergoing decomposition. It is therefore apparent that bath-rooms, stationary wash-stands, and the like, should never communicate directly with the sleeping or living room.

If the connection between the waste-pipes and the house-drain be broken, the drain is less likely to become obstructed. The necessity for care in the construction of house-drains is at all times urgent, but in practice it is made to depend upon whether the householder obtain his water-supply from a well, or whether he be supplied from public water-works. In the former event the drain will usually be constructed with considerable care, but it is not common that the effect of soil contaminated and rendered poisonous by means of a broken or leaking house-drain is appreciated. In fact, there is some doubt, even in the minds of sanitarians, as to the extent of the effect produced by decomposing excrementitious matters in soil. The statistics on this point are those from the cities of Eastern Asia, where it is the practice to throw all slops and night-soil upon the surface of the earth, and leave its disposal to the care of Heaven. Some have even asserted that the death-rate from zymotic diseases was not in excess of that in European villages where the like conditions do not prevail. But mortality statistics must be furnished with greater accuracy, and the population of the cities established by a census rather than by loose "estimates," before any trustworthy conclusions can be reached. If, therefore, these assertions be left out of the account, and the experience of European nations be taken as the guide, we shall find a general and widespread belief as to the deleterious effect of these poisonous emanations. Indeed, modern sanitary procedures rest entirely on the basis that uncared-for house excreta are poisonous and dangerous to health, and all appliances are constructed with a view to removing them as far from human vicinity as possible. It is, however, to be considered that excrement allowed to decompose in the open air is less dangerous than that mixed with earth away from the air and sunlight. House-drains should be constructed of vitrified earthenware-pipe, it having been found impossible to prevent the old-fashioned square-brick drain from leaking and contaminating the soil. The size of the house-drain should be governed by the size of the waste-pipes and amount of sewage to be carried. Colonel Waring is of the opinion that these drains are usually constructed too large. If the drain be small enough so that the volume of water keeps it constantly filled, it is not liable to allow cryptogamic fungi to be attached to its sides, nor is it so liable to the production of sewer-gas. If the flush-tank be used, as is here recommended, it will be necessary that the size of the drain should correspond to the outlet of the flush-tank, and, as the flush-tank is so constructed as to be easy of access, the drain itself is unlikely

to become obstructed. If the flush-tank be not used, the lidded opercular or access pipe will be found that most convenient, as, in case of obstruction of the pipe, access can be gained

immediately to the point of obstruction. The construction of the access-pipe will be readily understood by reference to the cut.

9. *Inspection.*—The following points in ref-

FIG. 8.—“ACCESS” PIPES.

erence to the inspection of houses suspected of being in an unsanitary condition are proper to be observed:

The inspector will note the location of the dwelling with reference to its surroundings, and the character of the soil on which the house is built. It is also to be noted whether or not the walls be damp, and whether the basement be free from odor. During the inspection of the basement, the location of the house-drain should be noted if practicable. In proceeding to the upper floors, the inspector will note any odors that may exist indicating the presence of escaping coal-gas or illuminating gas; the means of ventilation, whether natural or artificial, should also be observed. The closets should be inspected, and each stationary wash-stand, or other point for the possible entrance of sewer-air, carefully examined. If the soil-pipe extend through or above the roof, an assistant should empty half an ounce of oil of peppermint into the soil-pipe. In two or three minutes the inspector should visit the bath-room and other places where there are waste-pipes and traps, and if these be in a leaking condition the smell of the oil will soon pervade the apartment. This should in no case be done by the inspector himself, as he will then be unable to detect the presence of the oil, owing to the saturation of his garments with the effluvia. In case the soil-pipe does not extend above the roof, the oil may be placed in the house-drain just below the outlet of the soil-pipe, and the drain speedily covered over to prevent a diffusion of the perfume through the air.

In case a pipe be obstructed from any cause, the point of obstruction may be determined by the use of small canes or rattans, screwed together like the joints of a fishing-rod. A sample of the drinking-water should be taken for purposes of analysis. In case the water-supply be from a well, and there are sinks emptying into the yard, or a privy near, a gallon or two of strong brine should be thrown into them, and another visit made after two or three days, for the purpose of securing a second sample of the well-water for analysis.

10. *Drinking-Water.*—Drinking-water is obtained from wells, springs, streams, ponds, lakes, or cisterns. Wells furnish drinking-water for the major portion of the inhabitants of the earth, although among the Western civilized nations the cities and larger towns are supplied from natural streams, ponds, or lakes, by means of

aqueducts. At first sight it would appear that water which is pleasant to the taste and inoffensive to the eye, and without odor, would be that most healthful, but this does not appear to be the case. Indeed, science has not yet furnished us with a satisfactory solution of the extent to which water must be polluted in order to make it absolutely unwholesome. The Hindoos habitually drink the most disgusting water, especially those who derive their water-supply from tanks. These tanks are simply reservoirs which are filled during the rainy season, and it is stated by Dr. Simmons, in the “Chinese Customs Medical Reports,” 1880, that “the water of these tanks is used not only to quench thirst, but is said to be drunk in additional quantities as a sacred duty. At the same time the reservoir serves as a large washing-tub for clothes, no matter how dirty, or in what way soiled, as well as for personal bathing.” And we are informed by the same authority that the Hindoo “can not be made to use a latrine. In the cities he digs a hole in his habitation; in the country the fields, the hill-sides, the banks of streams or rivers. . . . Hence it is that the vicinity of towns, the banks of the watercourses, reek with filth of the worst description, which is of necessity washed into the public water-supply with every rainfall.”

Although thousands of Hindoos annually perish from epidemic diseases, yet their fruitfulness is such that it does not appear that the population has materially diminished. The water-supply of China, as compared with India, is comparatively uncontaminated, yet it is highly charged with organic matter. Many wells are cemented for a considerable distance for the purpose of keeping out the surface-drainage, but it is obvious that this is only a makeshift and does not fulfill the purpose, inasmuch as the ground-water will rise in the bottom of the well and its sides below the cemented wall. It is an almost universal custom of the Chinese to boil the water before drinking, even when tea is not drunk. Their immunity from diseases produced by bad drinking-water is attributed to this fact. Experiments have recently been made by a scientific enthusiast in Europe upon himself, by drinking ditch-water teeming with infusoria, and, as he alleges, without harmful result. It is to be remembered in this connection that an investigation of the towns and villages in civilized nations where the water-supply is derived from wells has developed the fact that the privy is usually placed within a

few feet of the well. As has been graphically described, "the householder digs two holes in the back yard; one is used for the privy-vault, the deeper one is that from which he obtains his supply of drinking-water."

So large a proportion of the human family being supplied with drinking-water more or less contaminated, without visible harm, it follows that the dangers have either been greatly overrated, or else sickness, alleged to be produced by other causes, must be attributed to bad drinking-water. That wells thus situated are contaminated, chemical analysis has abundantly proved, and as privies must continue to be used in connection with country-houses, it is better to recognize the fact of the well-water contamination and take means to prevent it. Fortunately, this is sufficiently easy to accomplish. The house-sink should be drained as before described, and the privy drained by a separate drain entirely disconnected from the house-drain. This drain should be tight and connected with the waste-water carriage, if practicable, and it is usually practicable, as suitable tanks for catching and storing rain-water can be attached to every house. The privy-drain should be laid with great care, and the joints made absolutely perfect, and, where the ground at the disposal of the householder is plenty, it should be at as great a distance from the well as is compatible with convenience. While it is not possible to fix upon the proportion of organic admixture in drinking-water which will render it absolutely poisonous, yet it is clear that any contamination is more or less injurious, and if excreta from a typhoid-fever or cholera patient are placed in conditions favorable for admixture with drinking-water, those diseases are likely to be communicated. In a recent epidemic at Caterham, England, the total number of cases was 342, and there were 21 deaths. The epidemic originated from the water supplied by the Caterham Company being contaminated with the excreta from a single typhoid-fever patient ("Marine Hospital Service Bulletin," No. 43, May 3, 1879).

A case equally in point is that of a severe outbreak of typhoid fever at Clifton, England, which was traced to the use of milk from a farm where the pump was five yards from the privy-vault. Previous to the outbreak a young lady had been carried to the farmhouse to complete her convalescence from typhoid fever ("Ibid., No. 8, August 31, 1878).

Owing to the great and increasing difficulty of preserving well-water from contamination, it is a question worthy of serious consideration whether wells ought not to be abandoned as a means of furnishing drinking-water in all countries where the rainfall is heavy enough to allow the storage of a sufficient quantity for household purposes.

In addition to the contamination of well-waters from house-slops, sinks, and privies, it is well known that the ova of many parasites

are conveyed by means of drinking-water, and this can only be prevented by boiling.

Cisterns.—In the construction of cisterns, it is necessary to take into consideration the size of the roof, with reference to the amount of water that can be furnished. Mr. Bayles ("House Drainage and Water Service," New York, 1878) has given the following rule: "To calculate the amount of water which will drain from a roof, multiply the area of the roof in feet by the average rainfall in a month in inches, and the product by .623. This gives the number of gallons which will drain from a roof in a month. With a regular consumption for domestic purposes, cistern capacity for one quarter to three eighths this amount of water will be ample. When a roof has a steep pitch, its size should be determined by the area of ground it actually covers." The city of Venice, until recently, has been cited as a city where the cisterns reached the highest type of perfection; but an additional water-supply has lately been provided, and the cisterns are not so much used as formerly. Cistern-water to be fit for drinking should be filtered, or the cistern should be so constructed as to be in itself a filter. They are usually placed in the ground, but in many cases are in the attics of houses, or a tank is constructed supported upon pillars or posts. Cisterns are commonly walled with brick, laid in hydraulic cement, and plastered smoothly on the inside with the same material. In some instances the water from the roof is received through a charcoal tank, the overflow of which empties into the main cistern. In this case the water is pumped without any additional filtration; in others the cistern is so constructed that the rain-water is obliged to pass successively through charcoal, coarse gravel, fine gravel, and sand before reaching the pump-reservoir. A method which has the merit of cheapness, and is at the same time efficient, is as follows: The cistern is finished in any desired shape and capacity, after which a wall consisting of selected soft-burned bricks is laid across one corner, if the cistern be square, or a segment if it be a circle. The rain-water is received into the larger cavity, and its gravity forces it into the smaller one directly through the bricks. This renders the filtration as perfect as can be, and at the minimum expense. The rapidity with which the water permeates and passes through the partition-wall is such that in practice it has been found that, after a short time in use, the water will stand in both reservoirs at the same level.

Public Water-Supply.—In public water-supplies the danger of contamination with organic matter is in inverse ratio to the total amount of water furnished. The experience of the Rivers' Pollution Commissioners, in England, and experiments in this country, have shown how rapidly organic filth was oxidized and rendered harmless when largely diluted. Indeed, there is as yet but little danger in America from pollution of the rivers, and it will be

many years before the population is sufficiently dense to render it a source of alarm, except in the smaller streams where the sewage emptied into them is more highly concentrated. In such cases the question of the disposal of sewage is one of great importance. This discussion, however, does not fall within the scope of this paper.

From what has been said, it will appear that the water-supply derived from large bodies of water is that most wholesome, but as the streams from which it is usually obtained are subject to periodical rise and fall, owing to the rains or drought, and in the former event contain a large amount of soil suspended in it, "settling reservoirs" are usually constructed. It is in these reservoirs that certain fresh-water algæ or aquatic plants have their origin and growth, and, when abundant, they impart a color to the water.

The effect upon the human system of vegetable organic matter deserves consideration. Professor Farlow, of Harvard University, in a recent paper on the subject (Massachusetts Board of Health Reports, 1880), states:

"Considered from a sanitary point of view, we may say that the grass-green algæ have no injurious effect upon the water in which they grow. On the contrary, we may regard their presence as an indication of its purity, for they do not grow in impure water. If almost any river or pond water, no matter how clear it appears, is placed in a covered glass jar, in a few days or weeks there will be formed a greenish expansion on the sides and at the bottom, which, on examination, will be found to consist principally of the young stages of development of some of the algæ."

Professor Farlow, while thus pronouncing in favor of the harmlessness of the grass-green algæ, is equally decided in his opinion that the bluish-green algæ which sometimes assume a purple tinge, at other times dark and almost black, are injurious in their effect upon water. Of this class he has discovered that the *Nostoc* family "are the cause of certain disagreeable conditions of our drinking-water. So long as they are living, and not excessively abundant, they produce no perceptibly bad effect on the water; but, when large quantities of them decay, they give rise to the pig-pen odor, as it is called, which has in recent years caused considerable trouble, and still more alarm."

However interesting in a botanical point of view the study of the fresh-water algæ may be, information is certainly wanting to show that they exert any deleterious or even material influence upon the health. It is, however, a matter of prudence that, when the fresh-water algæ are sufficiently numerous in any specimen of water to give off a disagreeable odor, the water should be filtered before drinking it, as either vegetable or animal organic matter while in a decomposing state must be more or less injurious to health.

It may be stated, in conclusion, that when any given specimen of drinking-water is under the ban of suspicion, it should in all cases be submitted to a chemical analysis and microscopical examination by the proper health officer of the city or village, and if it be desired in the mean time to continue the use of the water, it should be filtered, and, if necessary, boiled, previous to filtration. The various forms of filters, almost any of which are suitable for use, will be found at the first-class house-furnishing establishments.

JOHN B. HAMILTON,
Supervising Surgeon-General,
U. S. Marine Hospital Service.

HUNGARY, a kingdom of Europe, and one of the two principal divisions of the Austro-Hungarian Monarchy. (See AUSTRO-HUNGARY.) The Hungarian Ministry at the close of 1880 was composed as follows: President of the Ministry and Minister of the Interior, Kolomon Tisza de Borosjenő; Minister near the King's Person (*ad latus*), Baron Bela d'Orézy; Minister of Education and Worship, Augustus de Trefort; Minister for the Defense of the Country, Colonel B. Szende de Keresztes; Minister of Public Works, Paul d'Ordödy; Minister for Croatia and Slavonia, Gabriel Baron de Prónay; Minister of Justice, Dr. Theodor Pauler; Minister of Finances, Count Szapary; Minister of Agriculture, Commerce, and Industry, Baron Kemény.

The area and population of the countries of the Hungarian crown are as follows, according to the "Statistische Handbuch der österreichisch-ungarischen Monarchie":

COUNTRIES.	Square kilometres.	Population in 1876.
Hungary and Transylvania	280,480·04	13,724,442
Fiume (free city)	19·82	18,178
Croatia and Slavonia.	23,263·57	1,218,180
Military Frontier	20,332·01	693,738
Total	324,045·44	15,654,538

The movement of population was as follows in 1876 and 1877:

NUMBER OF	1876.	1877.
Marriages	154,305	178,389
Births	718,156	678,421
Deaths { inclusive of still-births. }	561,279	570,144
Excess of births	151,877	108,277

The budget for the countries belonging to the Hungarian crown for 1880, as voted by the Diet, was as follows (1 florin = 48 cents):

RECEIPTS.	Florins.
1. Direct taxes	83,964,880
2. Indirect taxes	90,769,412
3. Receipts from Government property and state institutions	23,961,080
4. Extraordinary receipts of the Ministry of Finance	13,200,787
5. Receipts of the other Ministries	21,560,252
6. Other receipts	8,700,000
Total ordinary receipts	287,156,011
Extraordinary receipts	2,427,146
Total	289,583,157

EXPENDITURES.

Florins.

1. Royal household	4,650,000
2. Royal cabinet chancery	69,492
3. Diet	1,274,741
4. Council of Ministers	308,690
5. Ministry ad latus	50,563
6. " for Croatia and Slavonia	33,880
7. " of the Interior	7,514,938
8. " of Public Defense	6,393,000
9. " of Education and Worship	4,835,437
10. " of Justice	9,949,178
11. " of Agriculture and Commerce	11,157,961
12. " of Communications	14,027,494
13. " of Finance	39,542,060
14. Administration of Croatia and Slavonia	5,353,718
15. " of Fiume	84,655
16. Pensions	8,989,446
17. Public debt	48,404,117
18. Disencumbrance of real estate	16,651,844
19. Contributions to the common expenditure of the empire	30,320,000
20. Contribution to the Austrian debt	30,320,000
21. State Court of Accounts	130,000
22. Redemption of vineyard tithes	2,264,740
23. Guaranteed interest to private railroads	10,942,000
24. Miscellaneous	1,133,745
Total ordinary expenditures	248,933,574
Extraordinary expenditures	8,094,704
Extraordinary expenditure for Bosnia	2,526,139
Total ordinary and extraordinary expenditures	259,499,403
Deficit	19,916,251

In the budget for Croatia and Slavonia for 1879 the receipts and expenditure were estimated each at 3,270,637 florins.

The public debt of Hungary at the beginning of 1878 amounted to 662,404,801 florins, exclusive of the common debt of the empire. Hungary also has a share in the public debt of Austria proper, about 30 per cent. of its amount previous to 1863. This debt is regarded as exclusively Austrian, but Hungary pays annually a fixed sum for interest and for amortization. The assets of the state were estimated in 1878 at 851,800,000 florins.

The budget for 1881, as presented toward the close of the year by the Minister of Finance, in the Diet, showed a deficit of 24,765,381 fl., for covering which 7,800,000 fl. of rente not yet issued were still available. The result of the new taxes and duties was estimated at 6,500,000 fl.; and the remaining deficit of 10,500,000 fl. was to be covered by an issue of new gold rente.

On October 18th the new session of the Delegations was opened at Pesth. On receiving the Delegations, the Emperor Francis Joseph referred to the part which his Government had taken in regard to affairs in the East, and said that, as heretofore, his Government would make it its duty to keep the monarchy out of complications, and would do its utmost for the maintenance of peace and treaty rights; but, under the circumstances, its first task would be the defense of Austro-Hungarian interests. The Hungarian Delegation elected M. Ludwig Tisza, President, and Cardinal Haynald, Vice-President. M. Tisza, in his opening speech, emphasized the necessity of affording the means of maintaining the position of the monarchy among other powers to the utmost limit of possibility. The Hungarians had to ask a number of questions relating to Bosnia and Herze-

govina, but, after the common Minister of Finance had replied to all these questions, the Hungarian Delegation adopted all the proposals of the military committee in reference to the extraordinary grants for the troops in Bosnia and Herzegovina.

The sessions of the Hungarian Diet were often the scene of violent conflicts between the Government and the Opposition. The Prime Minister, Tisza, retained control of the majority, and repeated motions to express a want of confidence in the Government were defeated. On February 21st a long speech against the financial policy of the Government was made by M. Koloman Szell, the former Minister of Finance, who stated that, although he was willing to vote for the budget, he could not support a vote of confidence in the Ministry. M. Tisza, in reply, said the tasks to be undertaken by the Legislature in the immediate future were a revision of the laws relating to industry, the classification of the railways, and the establishment of railway lines of the second rank in as great a number as possible. On February 22d Count Szapary, the Minister of Finance, defended the financial bills which had been presented to the House by the Government against the attacks of the Opposition. He declared that M. Szell took too pessimistic a view of the present state of the country, which was in reality already progressing in the path of improvement.

On March 6th the Diet rejected, by 222 votes against 174, a motion of want of confidence in the Ministry. The budget law for 1880 was adopted by a large majority. In April the Lower House adopted a resolution brought forward by M. Iranyi for the introduction of civil marriages; but the second part of the motion, enunciating the principle of religious freedom, was rejected by 107 votes to 94. In the course of the debate M. Tisza said that freedom of worship already existed in Hungary, and with regard to civil marriage he expressed his intention of submitting a bill on the subject, if possible, during the current session, but said that great difficulties stood in the way of such a measure.

In November the Emperor addressed an autograph letter to M. Tisza, in which he announced that the Grand Cross of the Order of St. Stephen had been conferred upon the Premier in recognition of his eminent services, and in token of the Emperor's confidence.

The conflicts between the different nationalities into which the population of the kingdom is divided continue to be very fierce. The Magyars, although the predominant race, do not constitute more than one third of the entire population, and are almost equaled by the Slavic population, which, however, is divided into several tribes. According to A. Ficker, one of the standard writers on the ethnographic relations of the Austro-Hungarian Monarchy, the people of Hungary, who are estimated by him at 16,297,200, are divided with regard to their mother-tongue as follows:

Magyars	5,650,000
Germans	1,800,000
Slavs, divided into	
Slovacks, Czechs, and Moravians.....	2,000,000
Ruthenians	600,000
Croats and Servians	2,570,000
Slovens	60,000
Bulgarians	80,000
Total Slavs	5,260,000
Roumanians	2,800,000
Italians	8,000
Israelites	580,000
Gypsies	150,000
Others	15,200
Total	16,297,200

It will be seen that the Magyars, the predominant race, number only a little more than one third of the entire population. They are displaying, however, a marvelous energy in extending the prevalence of their tongue, and toward elevating it to the position of the only official language of the kingdom. This is especially the case in the Department of Public Instruction. The Minister of Public Instruction, in a speech made in the Hungarian Diet, on November 27th, declared that during the eight years of his official position he had done more for Hungarian culture and science than any of his predecessors. It is admitted by all parties in Hungary that this claim is undoubtedly true with regard to the Magyar schools. Their number is rapidly increasing, at the expense of the schools of other nationalities, especially of the German. According to the official report of the Minister of Public Instruction, for 1879, there were in that year, among the 1,644,803 pupils of public schools, 794,915 Magyars, 271,513 Germans, 205,374 Roumanians, 263,624 Slovacks, 36,716 Servians, 27,076 Croats, and 45,591 Ruthenians. Among 15,715 national schools, there were 7,179 Magyar, 953 German, 2,848 Roumanian, 1,837 Slovack, 260 Servian, 66 Croatian, 471 Ruthenian, and 2,083 were mixed. Thus, there was one Magyar school for every 110 pupils of that nationality, one Roumanian for every 80, one Servian for every 140, one Slovackian for every 150, and one German for every 300. The Germans complain that the Minister of Public Instruction avails himself of every opportunity to suppress the German national schools, and substitute Magyar schools for them. They also complain that in many cities acts of great violence were committed against their nationality. Thus in Pesth and other places the municipal councils refused to authorize the opening of a German theatre. In the Servian and Roumanian districts the Government endeavored to put at the head of the Greek Church, to which these classes of the population chiefly belong, men devoted to the Magyar tendencies, and thereby called forth a violent agitation in the Greek Church. (See GREEK CHURCH.)

A new compromise (*Ausgleich*) was brought about in 1880 between the former kingdom of Croatia and the Government of Hungary. When the reconciliation between the Imperial Government of Austria and the Magyars was

effected in 1867, Croatia, inclusive of Slavonia, was made part of the lands of the Hungarian crown. It is, accordingly, represented in both Houses of the Hungarian Diet. It has, however, a special provincial Diet which has control of all matters relating to the Departments of the Interior, of Worship and Instruction, and of Justice. At the head of the provincial administration is a "Ban," who is appointed by the Government of Hungary. The Croatian Diet consists of the Catholic Archbishop and the Bishop of the Greek Oriental Church, the Provost of Aurana, eight Obergespanns (chief magistrates of counties), the Comes of Turofolje, two counts, and 77 deputies, elected partly directly and partly indirectly. Fully 97 per cent. of the population are Croats and Servians, who really belong to the same nationality, being only distinguished by religion, the Croats belonging to the Catholic and the Servians to the Greek Church, and by the use of different alphabets in writing. The financial relations between Croatia and the Hungarian Monarchy were regulated by a compromise in 1868, which was to be renewed in 1879. As the two deputations were, however, unable to agree, the old compromise was prolonged for one year. Before the negotiations concerning a new compromise were resumed, the Hungarian Government caused the appointment of a new "Ban," Count Pejacevich, who was considered as being entirely devoted to the Magyar interest. The new "Ban" succeeded, indeed, in obtaining in August the consent of the Croatian Diet to this compromise, which was adopted by the large majority of 65 against 13. In November it was also adopted by the Hungarian Diet. Although Count Pejacevich is a devoted adherent to the Hungarian Government, he found it necessary to make important concessions to the Croatian nationalists. He officially stated in a speech made to the Croatian Diet that all attempts to Magyarize the country should be resisted, and that he would make the greatest efforts to have the former Military Frontier, which the Hungarian Government wishes to place under the direct administration of Hungary, incorporated with Croatia. The Military Frontier had, at the time of its greatest extent, before the union of some districts with Hungary had begun, a population of over 1,000,000 inhabitants, of whom more than 78 per cent. were Croats and Servians, and 15 per cent. Roumanians. A union of these people with Croatia would, of course, greatly strengthen the nationality feeling of the Croato-Servians. The outspoken nationalists in Croatia are, however, not satisfied with the demand for the incorporation of the Military Frontier, but clamor for the reconstruction of the so-called "Triune" kingdom, consisting of Croatia, Slavonia, and Dalmatia, with the further annexation of Bosnia and Herzegovina. In Dalmatia, which now forms part of Cisleithania, the Croato-Servians constitute fully 87 per cent. of the inhabitants, while in Bosnia and Herzegovina

nearly the entire population belong to the same nationality. A realization of these hopes would create a state of fully 3,600,000 inhabitants, under the absolute control of the Croato-Servian nationality, and which would not fail to be a center of gravitation for the remainder of that nationality which partly live in the principality of Servia and partly in south Hungary. At all events, there exists an irrepressible conflict between the tendencies of the Magyar and the Croato-Servian nationalities, the further progress and final solution of which will have a marked influence upon the reconstruction of Eastern Europe.

The southern part of Austria, in November, severely suffered from an earthquake which was felt as far south as Pola and Serayevo. At Agram more than 200 private houses were irreparably damaged, while two churches were in so dangerous a state that they had to be pulled down. Part of the cathedral required to be reconstructed. The palace and country-seat of the Cardinal-Archbishop of Agram, the military school, and the Government cigar-manufactory were half destroyed by the earthquake-shocks, and terrible damage was done to the farm-buildings in the neighborhood within a radius of about fourteen miles. There were no less than nine shocks felt between midnight on Monday, November 8th, and five o'clock on Tuesday morning. On Thursday, November 11th, a fresh shock of so violent a character occurred that the hall in which the Diet was assembled was severely shaken. Nearly half the population of the city fled in panic. About

five miles from Agram a number of fountains of hot water burst from the earth, but their duration was only temporary. According to an official statement made by the Burgomaster of Agram, two persons were killed and twenty-three injured. Four hundred persons were without shelter, and many of them lacked the necessaries of life.

On May 23d the statue of Count Stephen Szechenyi was unveiled at Pesth, amid the enthusiastic participation of all classes. Among those present were Archduke Joseph and other members of the royal family, the two sons of Szechenyi, and a most brilliant assembly of magnates and high functionaries of state. Count Stephen Szechenyi, who was born in 1792, and died April 8, 1860, is generally regarded as one of the greatest statesmen of Hungary. He was indefatigable and eminently successful in his labors for the material and intellectual progress of his country. He was opposed to the separation of Hungary from Austria, but aimed at a regeneration of the country chiefly through the aristocracy and in connection with Austria. When the Cabinet of Bach, of which he was a bitter opponent, ordered his house to be searched for documents which were to prove him the author of a book directed against the Ministry, he was thrown into such a state of excitement that he committed suicide. Count Emeric Szechenyi, who was appointed in 1878 Austrian ambassador at Berlin, and still represented that empire in December, 1880, is a nephew of Count Stephen. He is regarded as an intimate friend of Prince Bismarck.

I

IDE, JACOB, was born at Attleboro, Massachusetts, March 29, 1785, and died in West Medway, January 7, 1880, aged ninety-four years and nine months. He settled in West Medway as a Congregational minister in 1814, and retired from his pastorate in March, 1879. His early life was spent in hard labor upon the farm of his father, who opposed his obtaining a public education: after one year of preparation amid the interruptions of labor and teaching, he was admitted to Brown University, and graduated in 1809, at the age of twenty-four. At Andover he graduated as a theological student, and continued in the ministry for over sixty years. He was an antislavery man of decided convictions, but never violent or excessive in the expression of his opinions; on the contrary, preserved a calm demeanor and judicial balance which commanded respect and inspired confidence. In his sympathy with his unfortunate son-in-law, Torrey, he deprecated the rash measures urged by the latter for curing the evil of slavery. Even when age had enfeebled his bodily powers, the clearness of his thought and judgment survived.

ILLINOIS. The history of the public debt of Illinois commenced with the establishment of the State Bank in 1821, whose issue depreciated to 33½ cents on the dollar. The first funded loan was created in 1831 to retire these notes. To complete the Lake Michigan and Illinois River Canal, for which the State had received a grant of lands from the Government in 1827, and to carry out an extensive scheme of other public works, the second State Bank was created in 1835, and money was borrowed on the State's bonds, until in 1839 and 1840, when the State's credit was broken down and this rash policy was suddenly arrested, the debt, funded and unfunded, amounted to about \$12,000,000. From that time the struggling State directed its efforts to honestly extricating itself from its financial embarrassments. The canal was surrendered to the trustees of the bondholders, and the unfinished railroads were offered for sale. In 1848 a plan of adjustment was incorporated in a new Constitution. Arrears of interest were funded. In the year 1853 the debt was at its maximum, and amounted to about \$17,000,000. In 1857, for the first time,

interest was paid on the entire debt. From that period the process of redemption has been going on. New loans, amounting to \$2,050,000, were raised to equip soldiers for the civil war. A large portion of this war debt has been reimbursed into the State Treasury by the United States Government. At the close of 1880 the State was able to redeem the last balance of its huge debt, and in the beginning of January the entire amount of the money was in the Treasury to meet it.

The only debt now standing on the books of the Treasury is one due from the general revenue fund to the school and the college and seminary funds, amounting to \$1,165,407. This transfer originated as follows: At different times the State used, for general revenue purposes, funds which had been dedicated to the school fund, being portions of the three per cent. fund, the college and seminary land fund, and the surplus revenue of the United States, which was divided among the States in 1836. By repeated declarations the faith of the State is pledged to for ever pay for school purposes an amount equal to six per cent. per annum on the sum above stated. So long as it remains the policy of the State to make appropriations in aid of education, the existence of this nominal debt does not increase the amount to be raised by taxation, nor does its existence negative the statement that Illinois is now out of debt.

The following table, giving the amount of the public debt at different periods according to the computations of the State Auditor, shows the magnitude of the financial efforts with which the State has been able to discharge so huge a mass of liabilities in so short a time:

STATE DEBT.	
January 1, 1840.....	\$12,000,000 00
January 1, 1850.....	15,000,000 00
January 1, 1858.....	16,724,177 41
January 1, 1858.....	18,994,614 98
January 1, 1857.....	12,854,144 85
January 1, 1859.....	11,138,458 98
November 30, 1860.....	10,846,017 06
December 1, 1869.....	5,124,995 64
December 1, 1870.....	4,890,987 30
December 1, 1872.....	2,060,150 63
December 1, 1874.....	1,730,972 15
October 1, 1876.....	1,480,600 27
October 1, 1878.....	802,312 59
October 1, 1880.....	281,059 11
January 1, 1881.....	None.

The total disbursements from the Treasury for all purposes have been compiled by the Auditor from the year 1839 to January 1, 1881, and amount for the forty years to \$91,707,975, distributed among the following objects: Legislative expenses, \$4,217,086; executive, \$4,777,663; judicial, \$3,613,220; debt for public works, \$30,276,307; educational purposes, \$26,027,132; miscellaneous, \$22,803,565.

The expenditures for each of the biennial periods or single years since 1839, as stated by the Auditor, exhibiting the increase of the fiscal resources of the State, are given in the following table:

YEARS.	Total expenditures.
1840.....	\$208,743
1841-42.....	873,868
1843-44.....	332,886
1845-46.....	380,164
1847-48.....	670,449
1849-50.....	640,287
1851-52.....	1,199,908
1853-54.....	2,117,999
1855-56.....	3,687,306
1857-58.....	5,094,688
1859-60.....	5,023,061
1861-62.....	3,438,559
1863-64.....	4,568,774
1865-66.....	6,514,858
1867-68.....	7,411,056
1869.....	3,816,881
1870.....	2,994,884
1871-72.....	11,023,863
1873-74.....	8,749,312
1875-76.....	5,618,011
1877-78.....	6,561,804
1879-80.....	6,311,605
Total.....	\$91,707,975

The expenditures of the executive department have been comparatively uniform, but those of the legislative and judicial departments have been variable, both being nearly or quite trebled since the adoption of the Constitution of 1870. The largest aggregate was in 1870-'72, covering a period when the State Constitutional Convention and Legislature were in session a considerable portion of the time, and there was an increase of the public improvement debt in consequence of the enlargement of the Illinois and Michigan Canal. The total expenditures for the next two years—1872-'74—were \$8,749,312.79, being some \$300,000 in excess of the highest year during the war, when the State was equipping troops for the field. The total amount expended from the war fund is computed to amount to \$3,899,311.78; which expenditures were distributed from 1861 to 1868.

The biennial report of the State Treasurer, J. C. Smith, gives the following statements of the balance of the various funds in the State Treasury at the close of the fiscal year 1878, the revenue receipts for the two years, the disbursements for the same period, and the balance remaining October 1, 1880.

The amount of all funds in the State Treasury, October 1, 1878, was as follows:

General revenue fund.....	\$1,750,503 67
State school fund.....	275,432 77
Illinois Central Railroad fund.....	12,821 68
Illinois River Improvement fund.....	367 99
Military fund.....	7,214 88
Delinquent land-tax fund.....	881 06
Unknown and minor heirs' fund.....	6,981 22
Local bond fund.....	423,740 37
Total.....	\$2,589,398 49

The receipts from all sources from October 1, 1878, to September 30, 1880, inclusive, were as follows:

General revenue fund.....	\$3,822,146 66
State school fund.....	2,040,710 23
Illinois Central Railroad fund.....	660,467 23
Military fund.....	138,216 92
Unknown and minor heirs' fund.....	550 82
Local bond fund.....	2,291,057 23
Total.....	\$8,475,149 09
Balance October 1, 1878.....	2,589,398 49
Total receipts.....	\$11,064,547 58

The disbursements from October 1, 1878, to September 30, 1880, inclusive, were as follows:

General revenue fund.....	\$3,689,038 50
State school fund.....	2,921,240 78
Illinois Central Railroad fund.....	587,237 45
Illinois River improvement fund.....	867 99
Military fund.....	127,444 29
Unknown and minor heirs' fund.....	75 57
Local bond fund.....	2,220,478 02

Total expenditures.....	\$8,595,935 69
Balance of all funds in State Treasury October 1, 1880.....	2,468,606 89

Which balance was made up as follows:

General revenue fund.....	\$1,438,611 74
State school fund.....	816,902 22
Illinois Central Railroad fund.....	198,001 61
Military fund.....	17,987 21
Delinquent land-tax fund.....	331 06
Unknown and minor heirs' fund.....	7,433 47
Local bond fund.....	494,319 58
Total balance.....	\$2,468,606 89

The balance in the Treasury on account of the general revenue, the school fund, the Illinois Central Railroad, and the military funds, on October 1, 1878, was \$2,112,223; the receipts for the two years on account of the same, \$6,183,541; total receipts, \$8,295,765; expenditures for two years from these funds, \$6,365,989; balance, October 1, 1880, \$1,929,775. The \$281,059 bonds outstanding, called in for payment on January 1, 1881, by the proclamation of the Governor, consisted of \$103,000 refunded stock bonds, payable after 1877; \$154,459 new internal improvement interest stock, also payable in 1877 or thereafter; and \$23,600 in bonds previously called in for redemption, but not presented. The special fund derived from the gross earnings of the Illinois Central Railroad, which was reserved for the payment of the State debt, is applicable under the Constitution of 1870 to the payment of the ordinary expenses of the State government after the extinction of the debt. The \$198,001 balance in the Treasury on account of this fund was sufficient to meet the balance of the debt, and leave about \$100,000 to be turned over to the general revenue account. The amount paid into the State Treasury by the Illinois Central Railroad in accordance with the conditions of its charter, being seven per cent. of the gross earnings, in lieu of all other taxes, has been from the date of its charter, March 24, 1855, to April 30, 1880, in all \$8,104,656. Of the balance in the Treasury on October 1, 1880, \$502,104 consisted of trust funds, held for the payment of local bonds, etc., and \$1,966,502 consisted of State funds, \$1,433,611 belonging to the general revenue fund, and being applicable for the expenses of the State government. The different classes of expenses for which warrants were drawn on the Treasury, and the amounts of the same, for the two years, were as follows:

EXPENDITURES.	Amount.
Legislative.....	\$295,010 27
Executive.....	273,230 12
Judicial.....	557,994 20
Educational.....	2,273,053 76
Charitable.....	1,417,072 72
Penal and reformatory.....	568,917 28

Amount.	
Agricultural and piscicultural.....	\$43,296 50
Commerce.....	57,141 41
Military.....	215,807 80
State indebtedness.....	587,237 45
Refunding and transfer warrants.....	55,824 63
Monumental.....	13,125 00
Local bond disbursements.....	2,216,429 67
Minor heirs'.....	75 57

Total.....	\$8,533,909 88
------------	----------------

The estimate of the expenses from October 1, 1880, to July 1, 1881, at which date the appropriations made by the Legislature become available, is as follows: For legislative, executive, and judicial expenses, \$603,369; balance of appropriations for educational and charitable purposes, \$741,952; State debt and interest, \$290,000; miscellaneous and special appropriations, \$233,033; militia, \$13,105; total, \$1,881,461.

For a series of years back there has always been at the meeting of the Legislature a surplus in the Treasury to the credit of the revenue fund above the amount required to meet the appropriations made by the previous Legislature. The appropriations made by the last Legislature absorb this surplus and perhaps leave instead a small deficit. To pay the per diem of the members of the Assembly and the salaries of State officers, \$117,000 will have to be appropriated, to cover the deficiency of the appropriations available for these purposes up to July 1st, by the next Legislature. The surplus remaining from the Illinois Central Railroad fund, and the unexpended balances of other appropriations, will probably cover all deficits.

The Governor's estimate of the amount required to be raised by taxation during the coming two years is as follows:

FOR GENERAL STATE PURPOSES.

Legislative.....	\$272,000
Executive.....	430,000
Judicial.....	554,000

Total departments.....	\$1,256,000
Ordinary expenses and necessary repairs, and improvements of State charitable institutions.....	1,300,000
Eastern Insane Asylum—construction.....	200,000
Expenses of universities.....	125,000
Joliet Prison—working capital.....	50,000
Chester Prison—expenses and construction of Hospital for Insane Convicts.....	300,000
Canal contingent fund.....	60,000
For conveying convicts and arresting fugitives.....	90,000
Illinois National Guard.....	150,000
Printing, binding stationery, and paper for General Assembly and executive departments.....	110,000
Commission of Claims.....	5,000

Total.....	\$3,646,000
------------	-------------

For State school purposes:	
One million dollars per annum.....	\$2,000,000

The total assessment of taxable property as equalized by the State Board was \$784,623,550 in 1879, and \$786,616,394 in 1880, being considerably less than the assessed State valuation for the preceding two years, which was \$931,199,308 in 1877, and \$857,235,762 in 1878. The returns of taxable property laid before the Board of Equalization by the Auditor aggregated \$5,281,937 less in 1880 than in 1879.

The following table exhibits the changes in the assessment returns for the different classes of property in the year:

PROPERTY.	1879.	1880.
Personal property.....	\$151,629,968	\$165,091,710
Lands and lots.....	589,775,876	571,599,696
Railroad property.....	8,387,507	2,769,508
Total.....	\$744,742,846	\$739,460,909

The aggregate value of each item as returned by the assessors in 1880, for the whole State, is shown by the following table:

PERSONAL PROPERTY.	Assessed value.
Horses of all ages.....	\$24,229,954
Cattle of all ages.....	19,895,454
Mules and asses.....	3,461,169
Sheep.....	1,246,822
Hogs.....	4,500,864
Steam-engines.....	991,957
Pire-proof safes.....	264,265
Billiard-tables, etc.....	75,976
Carriages and wagons.....	6,406,175
Watches and clocks.....	395,114
Sewing and knitting machines.....	1,452,583
Piano-fortes.....	1,317,206
Melodeons and organs.....	667,585
Franchises.....	39,201
Annuities and royalties.....	42,100
Patent-rights.....	5,042
Steamboats, sailing-vessels, etc.....	375,436
Merchandise.....	25,548,825
Materials and manufactures.....	2,708,149
Manufacturers' tools and machinery.....	1,790,835
Agricultural tools and machinery.....	4,686,808
Plate and plated ware.....	100,056
Diamonds and jewelry.....	67,398
Monies of banks, brokers, etc.....	2,192,126
Credit of banks, brokers, etc.....	1,414,971
Monies of other than bankers, etc.....	13,014,803
Credit of other than bankers, etc.....	17,680,302
Bonds and stocks.....	946,196
Shares of capital stock of companies not of this State.....	284,471
Pawnbrokers' property.....	22,730
Property of corporations.....	542,834
Property of saloons, etc.....	379,892
Household and office property.....	12,126,917
Real-estate investments and improvements.....	327,024
Bank shares.....	3,206,051
All other personal property.....	8,062,569
Bridge property.....	15,928
Grain.....	5,454,839

RAILROAD PROPERTY.	
Class C.—Personal property.....	\$749,045
Class D.—Lands.....	776,609
Class D.—Lots.....	1,943,799

LANDS.	
Improved lands.....	\$7,320,932
Unimproved lands.....	3,178,185

TOWN AND CITY LOTS.	
Improved town and city lots.....	\$1,728,235
Unimproved town and city lots.....	176,731

The assessments of the different classes of property, as equalized by the State Board, were as follows:

Personal property.....	\$163,667,594
Lands.....	390,594,627
Lots.....	182,805,923
Total.....	\$737,071,089
Railroad property.....	2,764,030
Total.....	\$739,835,119
Railroads and equipments.....	44,001,815
Stock shares, not railroad.....	2,179,460
Grand total.....	\$756,616,394

There is an increase of about \$2,000,000 over the aggregate assessment of 1879. This comes

entirely from the railroads, which are assessed \$7,000,000 in excess of the equalization of 1879, while other property bears an aggregate assessment of \$5,000,000 less than that of 1879.

The Governor, in his inaugural address, gave the following gratifying account of the public-school system of the State:

The progress which has been made in the development of our system of popular education in the past twenty years, has placed Illinois in the very front rank among the States of the Union in this regard. It vies to-day with Massachusetts, Connecticut, and other New England States, which were but recently regarded as pioneers in the cause of popular education, in the liberality of the support given to the public schools and higher institutions of learning. A comparison of the cost of tuition per pupil in the various States, and of the aggregate sums expended for the support of schools and the erection of schoolhouses, shows that among the richer and more populous States of the Union, Illinois surpasses the great States of Pennsylvania, Ohio, and Indiana, and is only surpassed by New York and Massachusetts, whose pre-eminence in the excellence and efficiency of their common-school system have attracted the attention and elicited the admiration of the world. While the statesmen, political economists, and even the professional teachers of other lands, have been debating the question whether the masses can be educated with safety to society and the State, we have gone forward in the practical solution of the problem until it is no longer an open question.

The report of the Joliet Penitentiary shows an improved condition in the prison affairs in the last two years. The prison is almost self-supporting, and would be so if the cost of supplying clothes and money to discharged convicts were not borne by the prison authorities. The contracts for the labor of the convicts were most of them made during times of lower prices than could be obtained now; otherwise this charge also could be defrayed out of the income of the penitentiary. During the two years ending September 30, 1880, 1,575 prisoners were discharged. These were supplied with \$23,293 in money, and clothing of the value of \$9,399, together \$32,697. Of \$50,000 appropriated by the last Legislature for the ordinary expenses of the prison, only \$22,830 were used during the two years. The large proportion of prisoners who are sentenced for short terms necessitates the conclusion of less favorable contracts than could be made if the men remained longer at the service of the contractors. During the two years 487 of the convicts received were sentenced for terms of one year or less, and 336 for from one to two years. The new prison at Chester is being completed as fast as appropriations are available. The location has proved a healthy one, and is well adapted for the employment of the prison labor. Work has been commenced upon a hospital for insane convicts in connection with the Southern Prison, for which funds were appropriated by the last General Assembly. An agency for looking after and assisting discharged convicts is recommended by the Prison Commissioners, who also advise the abolition of life-sentences.

The amount appropriated for running ex-

penses of the State charitable institutions, exclusive of the Eastern Insane Hospital at Kankakee, was for the two years ending June 30, 1880, \$1,021,500. The amount of appropriations asked for by the State Board of Charities for the following two years is \$1,041,000, besides which there is a cash surplus on hand of \$100,000, and uncollected debts to the amount of \$40,000. The appropriations demanded are as follows: for the Northern Insane Hospital, \$200,000; for the Central Insane Hospital, \$194,000; for the Southern Insane Hospital, \$156,000; for the Institution for the Deaf and Dumb, \$170,000; for the Institution for the Blind, \$47,000; for the Asylum for the Feeble-Minded, \$102,000; for the Soldiers' Orphans' Home, \$85,000; for the Eye and Ear Infirmary, \$32,000; for the State Reform School, \$55,000. The appropriations demanded for the State institutions for special purposes amount to \$618,220. The average cost of maintenance in the State institutions has been reduced from \$330 per capita per annum in 1874 to \$200 in 1880. The care and provision for the inmates of the Illinois insane hospitals are said to be exceptionally good, while the cost of maintenance is less than in any similar institutions in the country excepting one or two.

Governor S. M. Cullom, in his biennial message to the Legislature, contrasts the material condition of the State in the early days of its settlement with its present wealth and commercial independence. The Government land laws were less favorable than the present homestead law during the period when Illinois was devoid of transport facilities to convey its surplus products to outside markets, and were such that, while the public lands were being taken up, all the money which came into the State was paid into the land-office. Now, railroads are built in advance of settlement, and the settler receives his farm as a free gift from the nation. In the second decade of the State's existence, a system of canals and general internal improvements, many of them injudicious and over-costly, burdened the State with a heavy debt, which reduced it to an insolvent condition. It has never been sought to shake off this debt by repudiation; but all the obligations have been faithfully discharged. The growth of the State in the last decade, though not showing as high percentages of increase as in the earlier stages, has been of a healthy and permanent character. A large proportion of the gains have been of a kind which does not show on the assessment rolls, but which is manifested in the visible prosperity of the people. A great mass of mortgage indebtedness has been paid off, and real-estate titles held by non-residents have been purchased. The farming lands especially have been relieved in this way from a drain of interest and rent.

Illinois is the leading agricultural State in the Union. The marketable farm products of 1880 are estimated at over \$300,000,000. The values of the different products reported by

the Department of Agriculture were as follows:

Corn	\$38,757,039
Winter wheat	44,457,428
Hay	22,559,691
Fat hogs	22,187,461
Fat cattle	17,026,130
Pastures	14,491,114
Oats	12,558,247
Orchards	8,176,480
Irish potatoes	8,659,643
Spring wheat	2,000,732
Flax	1,579,684
Rye	1,513,587
Sorghum	1,676,630
Fat sheep	652,465
Barley	560,703
Total	\$286,205,689

To these are to be added the value of the dairy products, estimated at \$27,000,000, the value of the horses sold, and of other crops. The corn-crop of 1880 was 250,697,036 bushels, which has been exceeded only in 1879, when the crop aggregated 305,913,377 bushels; in 1875, when it was 280,000,000 bushels; and in 1877, when it was 269,899,742 bushels. The yield per acre in 1880 was 33 bushels, there having been eight more productive years in the last twenty-one: 1862, when the average yield was 40 bushels; 1872, when it was 39·8 bushels; 1871, 38·3 bushels; 1879, 38 bushels; 1865, 35·25 bushels; 1870, 35·2 bushels; 1875, 34·3 bushels; and 1868, 34 bushels. The largest yield is obtained from low lands lately reclaimed by drainage. The value of the crop of 1880 was exceeded in 1879, when the crop aggregated \$97,483,052 in value; in 1875, when it amounted to \$95,200,000; and in 1864, when the crop sold for seventy-five cents a bushel, and brought \$103,767,101. In 1860 there were 3,839,159 acres under corn, producing 115,174,770 bushels, of the aggregate value of \$48,944,277. In the last twenty-one years the area devoted to this crop has not increased steadily, but has several times diminished on account of partial failures in the crops of the preceding years to some extent, but oftener on account of superabundant crops and great reductions in the price. After the high prices of 1864 the acreage increased to 5,023,996 acres in 1865, and then gradually decreased to 3,928,742 acres in 1868; rising then pretty steadily to 8,935,411 acres in 1877. Since then the high prices of wheat have caused a large portion of the corn area to be given up to the more profitable crop. In 1878 the corn acreage was reduced to 8,672,089 acres; in 1879 to 7,918,881 acres, and in 1880 to 7,574,545 acres. The large yield of 1879 and 1880 was obtained through improved methods of culture. In 1880 dry weather, the chinch-bug, and early frosts greatly injured the crop. Owing to the drought, the quality of much of it was inferior. The average price for the twenty-one years has been thirty-nine cents a bushel. In some years the culture was attended by a net loss; but the profits, taking all the years together, have been enormous. The aggregate value of this crop for twenty-one years was \$1,372,515,323; the cost of

production, \$299,284,127; the losses in unfavorable years, \$127,081,829; the aggregate net profit, \$946,149,367.

According to the returns made to the Railroad and Warehouse Commissioners, there have been 346,74 miles of road built during 1879, making the total mileage of the State 7,917 miles, not including 1,063 miles of sidings and 314 of double track. The total length of track of the lines running through the State is 22,863 miles; their capital stock \$408,745,914, of which \$7,841,700 is held in the State, being \$638,481 less than in 1879. The average amount of stock issued per mile is \$22,257; the total indebtedness is \$759,320,460, an average per mile of \$41,147. The average cost per mile, as shown in the construction and equipment accounts, is \$40,309. The number of persons employed on the railroads is reported as 94,561; of which number 34,443 are laborers, 29,169 section-men, 4,392 brakemen, 4,940 firemen and wipers, 3,812 engineers, 3,259 conductors, 7,688 machinists, 4,437 clerks, etc. The aggregate sum reported as paid to employees is \$49,427,729. the number of men employed within the State is estimated at 40,650, and their aggregate wages and salaries \$21,250,000. The average yearly pay of different classes of employees ranges on the leading roads within the following extremes: section-men, \$243 to \$422; station-agents, \$341 to \$900; passenger engineers, \$862 to \$1,530; passenger conductors, \$721 to \$1,160. The gross earnings reported by fifty companies were \$140,949,675, of which \$34,717,367 was from passengers, and \$102,096,367 from freight. The gross earnings for 1879 of the lines running through the State were 28 per cent. smaller, and the net income 30 per cent. smaller. The gross income within the State was \$48,461,221, \$12,781,745 coming from passengers, and \$36,678,476 from freight. The operating expenses of all the roads were reported as \$77,093,738, \$14,173,695 more than in 1879. The taxes reported as paid in Illinois were \$1,607,570. The net profit was \$32,061,768. The total freight tonnage was 53,837,586 tons, against 37,193,464 in 1879; the Illinois freight, 23,297,544, against an estimated quantity of 15,621,254 carried in 1879. The passenger traffic increased in 1880 about 50 per cent. over that of 1879, which is due, it is supposed, principally to the reduction in fares. The passenger traffic amounted to over a million passengers each for ten lines. The average rate per passenger per mile was 2-5 cents on the main lines, and 2-89 cents on all lines, against 3-14 cents in 1879. The average number of cars in a train was 21½, the average number of tons of freight in a car nine. The average freight rate per ton per mile was 1-38 cents, the rate in 1879 having averaged 1-92 cent.

The Railroad Commissioners comment as follows on the increase in railroad traffic and the greatly improved financial condition of most of the roads:

The returns before us reveal the fact that the past year has been one of extraordinary activity and prosperity for railroads generally. The revival of business has given an impetus to traffic and travel hitherto unprecedented. Freight traffic has furnished the roads all that they could do, while the figures show an increase of passenger traffic in this State of 50 per cent., owing, as we believe, to the reduction of fare.

Notwithstanding the fact of lower rates, the net earnings of the leading roads in this State have nearly doubled. Many roads, in consequence of this increased income, have been enabled to build anew their shattered financial condition. Others, seriously threatened, have escaped the courts, while still others have been taken out of the hands of receivers.

The past year has also been remarkable for the many cases of consolidation of different lines of road, and the evident tendency on the part of large owners toward centralization of management. While the war among the railroad owners may not as yet have resulted in any serious injury to the rights of the people, the facility with which immense interests have been controlled with money, as we have seen, and monopolies created, naturally excites grave apprehensions. It affords an additional reason for State control and just supervision. With uniform and steady rates, under proper legal restriction, the consolidation of different organizations, upon an honest basis of *bona fide* interests, reducing the number of employees and bringing under one management divergent interests, ought to give the internal commerce of the country a quicker transit, more security and safety to passengers, and afford the people lower rates.

The long-pending test case of the Illinois Central Railroad Company *vs.* the People, in which the final decision on the constitutionality of the railroad law of 1873 was to be rendered by the Supreme Court, was ended in June by the bench of Judges affirming the judgment of the Circuit Court. The opinion was prepared by Chief-Justice Dickey, who himself dissented from the decision. Upon the decision of this case the powers of the Railroad and Warehouse Commissioners to enforce their schedule rates depended. This case was an agreed one, and has been pending a long time. In the Ruggles case the Court affirmed the constitutionality of the railroad law, but there are a number of perplexing questions in relation to the manner of executing the law, which the Railroad and Warehouse Commissioners have been hoping for years that the Supreme Court would pass upon. For instance, the law provides that a schedule of reasonable maximum rates shall be prepared by the Railroad Commissioners for each of the railroads of the State, and that such schedules shall be *prima facie* evidence in the courts that the rates fixed in them are reasonable. But the Court has failed to determine to what extent the railroad companies are bound by the rates fixed by the board, or to settle other important questions involved in the execution of the law. The suit was an action brought in the name of the people against the Illinois Central. Judgment was rendered by the Douglas County Circuit Court against the defendant, who appealed, and insisted that the count in the declaration under which judgment was given was defective. By agreement, the case was tried upon an agreed state of facts. No pleas were filed, both par-

ties submitting the case on the agreed statement of facts under that single count of the declaration. The Supreme Court decided that the count was sufficient to sustain the judgment. Judge Dickey in the written opinion said that the proofs clearly show a violation of the statute, and the only question as to the propriety of the judgment depends upon the constitutional power of the General Assembly to pass the law. He then discussed the claim that the act is a violation of a contract between the State and the corporation, the company having been granted a charter authorizing the directors to establish rates of tolls for the conveyance of persons and property, concluding the opinion as follows:

The charter of this corporation is, beyond a doubt, a contract under the adjudged cases in this and other States, by which the corporation acquires the powers and functions to transact such business in the mode prescribed, but it is the opinion of a majority of the Court that all this is, by necessary implication, subject, as all citizens are, to the legislative power of the State to define, prohibit, and punish extortion. The reasons and authorities leading to this conclusion are presented and discussed in the case of *Ruggles vs. the People*, 91 Illinois, 255, 256, and the case must be governed by that.

The railroads of group first, after holding out a long time, have all accepted the maximum passenger rate fixed by the Commissioners, charging three cents a mile, and many of the railroads have changed their freight rates to make them conform to the schedules of the Commissioners. A revision of the schedules of the Railroad and Warehouse Commissioners is in progress, to which they hope all the railroads in the State will be disposed to conform, and cease their long contention. The Commissioners state in their report that they have avoided entering into litigation with railroad companies, among other reasons because it is difficult to find parties directly interested to make charges against the railroads, while those who do complain are seldom willing to support the prosecution with the necessary evidence. In accordance with the usage in other States, the Commissioners have made it a practice to examine into complaints brought to them against railroads, and seek to obtain an amicable settlement between the parties. Their decisions in that capacity as a court of reference have established precedents for future action in similar premises, and have actuated the roads to adjust their rules and tariffs in accordance with them.

The evils which result to shippers from sudden changes in the freight tariffs, the Commissioners recommend, should be averted by an act of the Legislature requiring sixty days' notice to be published by the railroads before any rise in their tariffs can go into effect. The prohibition contained in the Constitution and laws of the State against the issuance of fictitious stock, declaring that "all stock dividends and other fictitious increase of the capital stock or indebtedness of any such corporation shall be

void," has not been effective. As shown in the statistics given above, the stock of nearly every road is largely in excess of the cost of construction. The original amount of stock first issued has in some instances been doubled, and in many largely increased. The principal way in which this is accomplished is by converting accumulated earnings, and issuing stock dividends to represent them. The effect of this is to enlarge the basis on which future dividends are to be earned at the expense of the public. The Commissioners sum up the results of their past work in the following terms:

When the present law of this State, to prevent extortion and unjust discrimination, was passed in 1873, but few States had ventured to thus respond to a popular and just demand of the people. Now, fourteen States have established Commissions with powers similar to those of this State, or have conferred like powers upon other State officers.

Since that time most of the questions at issue between the railroad corporations and the people, growing out of the doctrine of supervision and control, have been decided by our highest courts in favor of the latter.

The work thus far accomplished on behalf of the people is as remarkable as it is satisfactory, and, as hereinbefore stated, passenger rates have been reduced from three and a half and five cents per mile, to a uniform rate of three cents per mile on all the leading roads in this State. Although the returns for 1880 show a gratifying diminution of passenger rates, the saving to the people will more fully appear next year, as the reduction above mentioned was not made generally until after the time for making the returns for 1880 had expired. The amount saved to the people by the reduction of freight rates in 1880 over 1879 was \$12,530,673.

When this Commission was first organized, it was difficult to procure returns from the railroads. Many of them refused outright to make returns, or to acknowledge the right of the Commission to require them. Those that were made were meager and unsatisfactory. Now, nearly every road in the State, particularly the leading ones, readily and cheerfully respond to the calls of the board in this respect.

The railroads and their patrons are nearer arriving at an agreement as to the basis upon which rates shall be established than ever before. But, while great advancement has been thus made toward solving the question of restrictive legislation, consistent with the rights of owners and low tariffs, complicated questions, relating to rebates, poolings, through, local, and competitive rates, are constantly arising for settlement, and will continue to demand our attention and investigation.

In 1859, the first year of the official inspection of grain in Chicago, the total number of bushels inspected was 29,222,225; in 1872 the total inspection covered 139,625,887 bushels; in 1880 there were 138,896,368 bushels inspected in and 103,154,466 out, the total inspection amounting to 242,050,834 bushels. The storage capacity of the Chicago warehouses has increased from 4,090,000 bushels in 1858 to 20,000,000 bushels in 1880. There was an addition of elevator-room for 2,000,000 bushels made in 1880. The aggregate quantity of grain handled is estimated at 161,000,000 bushels in 1880, against 138,000,000 bushels in 1879, and 68,000,000 bushels in 1870. The increased receipts were in corn and oats, other cereals showing a falling off, the old stocks having

been exhausted by the grain corner of 1879. The receipts embraced 3,000,000 barrels of flour, 23,000,000 bushels of wheat, 95,000,000 bushels of corn, 22,000,000 bushels of oats, and 7,000,000 bushels of rye and barley. The shipments of 1880 aggregated 156,000,000 bushels of grain, about the same as in 1879. In nearly every article dealt in on the Produce Exchange there was a very large increase in aggregates in 1880. The sales of grass-seed were 52,000,000 pounds in 1880, against 48,000,000 pounds in 1879; of flaxseed, 188,000,000 pounds, against 118,000,000; of butter, 65,000,000, against 54,000,000 pounds. There were 5,375,000 hogs slaughtered, against 5,089,000 in 1879, in spite of strikes which lasted during the larger part of the packing season. The average capacity of the packing-houses of the city is 100,000 hogs. The pork-packing industry of Chicago has grown up since 1853, in which year the first hogs were slaughtered. The business of 1880 amounted to \$62,000,000, \$20,000,000 more than that of 1879, the aggregate weight of the year's killing amounting in 1880 to 1,100,000,000 pounds. The number of live animals received during the year included 7,000,000 hogs, 1,354,000 cattle, and 32,000 sheep; the shipments of live animals included 138,000 hogs and 860,000 cattle. The growth of Chicago was remarkable in many directions in 1880. Great numbers of new dwellings and factories were erected, and hundreds of new industries started. The bank clearings exceeded the enormous total of 1879, aggregating \$1,693,000,000.

During the two years of the administration, 741 corporations have been organized for purposes of pecuniary gain, and 359 for other objects. Of the former, 229 were manufacturing, 267 mining, 112 miscellaneous companies, and 18 were building and loan associations; of the latter, 167 were benevolent associations. Since the law of corporations went into force, in 1872, there have been 3,140 companies incorporated.

The statement of local bonds registered in accordance with the provisions of the different acts, together with the amounts paid and canceled, shows that there were outstanding, September 30, 1880, under the act of 1869, \$12,127,978.31; under the original act of 1865, \$2,015,511.62; under the amended act of 1865, \$4,096,285. There has been a large increase over the amount registered in 1877-'78, but this is because of the large amount of refunding bonds issued. The average rate of interest on the bonds registered during the past two years was 7-99 per cent., while for the preceding two years it was 8-4 per cent.

The insurance report of the Auditor of the Treasury shows that 189 insurance companies were doing business in Illinois in 1880, twenty-two having been admitted since the previous report. Of the total number, eight joint-stock and four mutual associations are Illinois companies. The amount of fire risks written in

the State in 1879 was \$479,675,409; premiums received thereon, \$4,727,080; marine and inland risks written, \$54,609,032; premiums received, \$224,976. The losses paid in the State were \$1,927,595; deducting which amount from the total premiums paid, with 80 per cent. on these for expenses, the apparent profit on the year's business amounts to \$539,143. The average premium rate charged is 93 cents on \$100; the ratio of losses to risks taken, 86 cents on \$100; to premiums, 39 cents on every dollar received. The aggregate amount of the risks written in Illinois for eleven years is \$4,919,894,698; the aggregate amount of premiums paid to the companies, \$57,149,368; the aggregate losses incurred, \$47,985,714. Of the losses incurred, \$25,763,723 fall within the year of the Chicago fire; the losses in that year were over seven and one half times as great as the amount of premiums taken in. During the five years succeeding 1871, the year of the fire, the average premiums charged exceeded \$1.30 on \$100 of risk, and three times as much was received as was paid out for losses. Leaving out the year of the great fire, the losses paid have averaged about 41 per cent. of the premiums received; including that year, about double this percentage.

The laws regulating life insurance have been complied with by 29 companies of other States, which issued 3,860 policies, amounting to \$8,898,906, in 1879; the total number of policies in force at the end of the year being 4,084, amounting to \$9,442,160. The premiums received during the year amounted to \$127,767; the losses paid, \$30,047. The Auditor has endeavored to test in the courts the claimed right of cooperative life-insurance associations of other States, organized on the plan of the assessment of members to pay death-losses, to transact business in Illinois without complying with the insurance laws. Upon threatening them with the penalties of the law, these companies have discontinued business, and none of them embraced the proposal of the Auditor to carry the question into the courts for decision on an agreed case. The Auditor denies to these organizations the character of benevolent enterprises, and defines the position taken regarding them as follows:

It is the intention of the Auditor to prevent, by all available means, those so-called cooperative insurance companies of other States from entering this State and selling to its citizens their policies or certificates of supposed insurance until the proper tribunal shall have decided that the true construction of the law will permit them to do so. This course is adopted from a sense of public duty, and is demanded by a regard for the intent and meaning of the law, and for the true interest of the people of this State, as those who are solicited are, to a large extent, without the information necessary to judge of the merits of the various schemes, and without available means of redress for wrongs.

The State Board of Health was organized in 1878. Its principal work has been the protection of the public against unqualified and incompetent medical practitioners. The number of practitioners in the State on July 1, 1878,

when the law regulating the practice of medicine went into force, was 7,400, of whom 3,600 were graduates and licentiates, and 3,800 non-graduates. The number of graduates and licentiates practicing in the State at the close of 1880 was 4,950, the number of non-graduates 1,100, making the total number practicing 1,350 less than when the law went into force. The number of certificates issued in 1880 was 610. Fraudulent medical colleges have been suppressed by the board, and a higher standard introduced in some of the legitimate schools. The diploma of no college is sufficient to secure a certificate unless it requires a college or high-school education in literature and science before entrance, and unless it obliges candidates for the doctoral degree to attend two courses of lectures on medicine and all the allied branches given in different years, together with clinical and hospital instruction and practice in the dissecting-room. Subjects to which the board is expected to extend its attention are the prevention of contagious diseases of men and animals, the study of the water-supply of cities, and general sanitation; also the collection of vital statistics. Quarantine regulations were enforced by the board to prevent the introduction of the yellow fever into Cairo.

Fish-Commissioner S. P. Bartlett, in his report, states that 251 bushels of native fry, estimated at 5,000,000 individuals, were taken from drying-up streams and ponds, where they would have perished. Bass and wall-eyed pike were sorted out and used to stock new waters, and the rest were placed in deep water.

A movement has been inaugurated which looks to the enlargement of the Illinois and Michigan Canal by the General Government to the dimensions of a ship-canal, so as to establish steamboat communication between the lakes and the Mississippi River. A convention for the furtherance of this scheme was held at Ottawa, March 18th. The importance and advantages of the improvement were described by Governor Cullom and others, and resolutions were addressed to Congress urging its speedy consideration. The enlargement of the canal has already been commenced by the construction of the Henry Lock, which was completed in 1872 at a cost of \$400,000, and the one at Copperas Creek, which was finished in 1877, at a cost of \$410,000. The two locks give ninety miles of water seven feet deep, while the depth before was not over two feet in many places. These locks are 350 by 75 feet each, and will accommodate boats 300 feet long, and of 2,000 tons burden. The cost of completing the work on the present plan, so as to furnish 226 miles of navigation to steamboats drawing six feet of water, is estimated at \$1,350,000. For the two locks already built Congress appropriated \$80,000. The establishment of ship navigation between Chicago and the Mississippi is desired chiefly as a check upon the railroad companies, affording an alternative route for the exports of the upper Mississippi

Valley and the lake-region, and of all the grain of the West, which, as well as provisions, flow to Chicago, the central market for these products. The other benefit which would come from the enlargement, would be the improvement in the sanitary condition of Chicago, affording a sufficient outlet for its sewage. It is thought that such a passage between the lakes and the Mississippi would partly supply the place of the proposed reservoirs for regulating the navigation of the Mississippi, and that the water which could be drawn from Lake Michigan through the canal would be sufficient in quantity to improve the navigation of the great river in the dry season. Another plan which has been broached is to make a great cutting as much as one thousand feet wide and twenty feet deep, which should more than answer the purpose of the reservoirs, carrying enough of the overflow of Lake Michigan into the Mississippi to add four feet to its average depth.

In the Governor's message the situation of the canal and the project for its completion by the Government are described as follows:

The demand for the enlargement of the canal and the completion of the Illinois River improvement grows more urgent every year, and it is a matter which by no means interests Illinois alone, but is of equal importance to all the States which border on the Mississippi River, and to all those which depend upon the great Valley for food-supplies. While this water-way happens to be wholly within the territory of Illinois, its improvement is not a question of local or State interest.

The State has reimbursed the city of Chicago for its advances in deepening the canal, and it is now the property of the State without incumbrance. The Constitution contains the following provision: "The Illinois and Michigan Canal shall never be sold or leased until the specific provision for the sale or lease thereof shall first have been submitted to a vote of the people of the State at a general election, and have been approved by a majority of all the votes polled at such election." I earnestly recommend that you provide for the submission to the people of the State of a proposition which will allow the canal to be turned over to the United States, on proper conditions and limitations, and that you provide for the presentation of the whole matter to our delegation in Congress and to the nation in such light as will secure early and favorable action.

Whatever special advantage may accrue to Illinois by reason of her having the canal within her borders, will be fully her due in return for the millions she has already expended on this work. The advantage to the nation resulting from connecting the lakes with the Mississippi River, the North and East with the West and South, by a water-way through which can pass the bulky products of the Mississippi Valley, will be infinitely more than the cost of such improvement.

The deepening of the canal, so as to give a steady southerly current of the waters of Lake Michigan into the Illinois River, has been of immense sanitary advantage to the city of Chicago, and its effect has been to purify the Chicago River, and in a great measure save the sources of water-supply of that great city from contamination by sewage. But, in consequence of the enormous increase of population and manufactures in Chicago, the supply of water flowing through the canal does not sufficiently dilute the sewage to make it innocuous, and the result is a serious injury to the populous districts which border on the canal in the counties of Will, Grundy, and La Salle. The evil consequences of the insufficient supply of water are most keenly felt in winter, and such representations

have been made to me by the authorities and citizens of Joliet, Lockport, and other towns, that I have caused investigation to be made by the Canal Commissioners and by the State Board of Health, whose reports on these questions will be placed before you, with suggestions as to the best means of remedying the evils complained of. It is represented to be perfectly feasible to so increase the flow of water through the present canal as to make its bed and borders healthful and pure. The subject should receive your immediate and careful consideration. There can be no discussion as to the duty of the State to see that its own property is not maintained or operated in such a condition as puts in peril the health and lives of its citizens; and that such is the present condition, in winter, at least, of the Illinois and Michigan Canal seems to be clearly established.

In the latter part of June a destructive inundation occurred along the margin of the Mississippi. The river rose over seventeen feet above low-water mark at Quincy, and still higher at some points farther up, subsiding in the beginning of July. Although not so high as the flood of 1876, when the water gauge at Quincy stood at nineteen feet above low water, or that of 1851, when it marked 22·8 feet, it was sufficient to break through the Warsaw Levee, which protects 18,000 acres, and the great Sny Levee, which redeemed 100,000 acres of rich bottom alluvium; and, opening wide crevasses, overflowed hundreds of square miles of most valuable farming-lands of the State, destroying the standing corn and great quantities of the wheat, which had just been harvested. The Sny Levee is fifty-two miles in length, beginning at a point between Quincy and Hannibal, and ending near Alton. A crevasse occurred at a point about fifteen miles below Hannibal, on the 30th of June, and three other breaks were made later. A new levee, in process of construction above Quincy, was nearly ruined. Much injury was done to railway property, and traffic was arrested. The Sny Levee was commenced in 1873, and completed in 1875, at a cost of \$650,000. It starts in Adams County and extends through Pike and into Calhoun County. The land reclaimed by it was occupied by renters almost exclusively. About one half the area was planted to corn and wheat at the time of the inundation. The soil is exceedingly fertile, the average wheat-crop being twenty-five to thirty bushels to the acre. This levee was built under the drainage act of 1871, which has been pronounced unconstitutional by the Supreme Court. This decision made the bonds which were issued for the construction of the levee void. The heaviest holder commenced a suit in the United States Court against the property-owners, seeking to make the bonds an equitable lien on the lands benefited.

A decision of the Supreme Court has established the constitutionality of the militia law of May 28, 1879. The power of Congress to provide for the organization and discipline of the militia, it was decided, is not exclusive. The act in question is not repugnant to the national militia law. The State has the right to organize such portion of its militia as may be

deemed necessary for the execution of its laws and the preservation of the peace. Such organization is not keeping troops in time of peace in the sense of the prohibitory clause of the Federal Constitution. The requirement of an oath of obedience to the Commander-in-Chief, and the provision that no militia company shall leave the State with arms without the consent of the Commander-in-Chief, the Governor, have reference to the service of the State, and do not apply when the militia are in the service of the United States. The adoption of the discipline of the United States regular army would not render the law invalid. The exemption of an active member of a company from jury service is constitutional. With regard to the provision in the law prohibiting armed men not of the militia from parading, the head-notes of the decision run as follows:

The provision of the militia law making it unlawful for any body of men, other than the regularly organized volunteer militia of this State and the troops of the United States, with an exception in favor of students in educational institutions where militia service is taught, to associate themselves together as a military company or organization, or to drill or parade with arms in any city or town in this State without the license of the Governor, is not inconsistent with any paramount law of the United States, and is a binding law.

It is a matter within the regulation, and subject to the police power of the State, to determine whether bodies of men with military organizations or otherwise, under no discipline or command by the United States, or of this State, shall be permitted to parade with arms in populous communities and in public places.

In matters pertaining to the internal peace and well-being of the State, its police powers are inalienable. It is a power coextensive with self-protection. Everything necessary for the protection, safety, and best interests of the people of the State may be done under this power. Persons and property may be subjected to all reasonable restraints and burdens for the common good.

Where mere property interests are involved, this power, like other powers of government, is subject to constitutional limitations; but where the internal peace and health of the people are concerned, the only limitations imposed are that such "regulations must have reference to the comfort, safety, and welfare of society." What will endanger the public security must, as a general rule, be left to the wisdom of the legislative department.

The question of reading the Bible in the public schools came up in the Supreme Court on appeal. A boy named McCormick, acting under the orders of his father, a Catholic, had refused to refrain from studying during the fifteen minutes devoted to the reading of the Bible, thus disobeying an order of the directors, and was expelled. The father brought an action against the teacher and the directors, and the case was decided in their favor by Judge Pillsbury, in Livingston County, whose decision was affirmed by the Supreme Court.

In the case of *McKee vs. the Germania Insurance Company*, it was ruled by Judge Zane, of Springfield, that when it is agreed by the parties to a number of cases that they will abide by the decision of one of the cases, and when but one case is tried, witness-fees and similar costs shall not be taxed more than once.

Several cases regarding the validity of city and town bonds and the enforcement of judgments against municipal corporations came up in the courts during the year. Judge Drummond, of the United States Circuit Court, decided that each of the several series of bonds of the city of Springfield were valid, the bonds amounting altogether to \$856,646. In the case of George B. Ellery *vs.* the Town of Hickory, it was pleaded by ex-Governor Palmer, counsel for the defendant, that certain railroad-construction bonds issued by the town were invalid because the Governor had signed the charter of the railroad after the adjournment of the Legislature.

Bonds issued to the Indianapolis, Bloomington and Western Railroad by Blue Ridge, Urbana, and other townships of Champaign County, were pronounced void by the United States Supreme Court. In the case of the Niantic Savings Bank *et al. vs.* the Town of Douglas *et al.* on appeal, the decision of the Effingham Circuit Court was reversed by the State Supreme Court. The lower Court had directed that certain bonds issued in aid of railroad construction should be canceled on the ground of fraud, because certain of them were owned by the bank and D. T. Littler. The Supreme Court ruled that as the bonds were regularly registered and issued, and had passed into the hands of innocent purchasers, and as the town had been benefited by the sale, it was debarred from avoiding the payment of the bonds on technical grounds, and could not be assisted by a court of equity to accomplish an inequitable act. Bonds of the town of Lincoln issued to the Havana, Mason City and Eastern Railroad, were decided legal and binding by the United States Supreme Court, and a mandamus issued to compel the town officers to levy a tax for their payment. Citizens of the town, being of the view that the bonds were invalid under the decisions of the State courts, applied for and obtained an injunction restraining the officers from levying and collecting the tax before the sitting of the Court. The bondholders thereupon procured a writ from the United States Court, citing certain citizens before it to show cause why they should not be held guilty of contempt of Court. The city of Quincy was incorporated in 1840, under a special charter, and an amendment was adopted in 1863 which limited the tax-levy to \$1.03 on \$100. In 1878 a tax was assessed under the general revenue law which amounted to 1½ cent on the dollar. On a bill of equity filed by Frederick G. Jansen and others against the county collector, praying for an injunction forbidding the collection of the excess, which was levied for the payment of interest on city bonds, it was decided by the Supreme Court on appeal that the city has no right to exceed the limitation in its charter; so that it must take advantage of the general incorporation act and change its charter if it requires to levy higher taxes, in order to meet

its liabilities and pay its expenses. A mandamus was issued by Judge Treat, in another case, brought by the holders of Mississippi and Missouri Air-Line Railroad bonds, ordering the authorities of the city to levy and collect taxes to pay overdue coupons on these bonds; and the plea of the limitation of the charter was not sustained in this case.

A batch of interesting trespass suits, known as the Levi cases, came up in the State Circuit Court at Springfield, before Judge Zane. The defendants were a United States marshal and persons who accompanied him at his request, and the plaintiffs were L. S. Ensel, Charles Seaman, and Samuel Levi, whose premises were entered, searched, and property therein was seized by defendants in virtue of a writ in bankruptcy delivered to Edward R. Coe, United States Marshal, issued by the United States Bankrupt Court upon the affidavit of G. W. Plummer, one of the defendants, attorney for Field, Leiter & Co., and other creditors of Samuel Levi, an adjudged bankrupt, averring upon belief that goods of said bankrupt had been fraudulently removed and were secreted upon the premises of Ensel and Seaman, and of another warrant authorizing the marshal to take possession of the estate of Samuel Levi. The close of the plaintiff Ensel, which was entered by the United States officer and Plummer, was a store. The Court held that such forcible entrance and seizure was in violation of the fourth amendment to the United States Constitution, requiring a warrant to particularly describe "the place to be searched or the persons or things to be seized." In this warrant the only description of the things to be seized was "goods and property of Samuel Levi." The warrant was not in the nature of a search-warrant, as none can issue in civil process. The second case was of the same nature as the first, except that it was the dwelling of Seaman which was entered, not a storehouse. The third case was that of a forcible entry into the dwelling of Samuel Levi to take possession of his property, real and personal, as directed in the bankruptcy warrant. The Court, giving to the doctrine of the inviolability of a man's home its full force, laid down the principle that no bankruptcy or other execution warrant authorizes a constable to force his way into a person's dwelling-house when the outer entrance is barred.

The validity of the section of the revenue law imposing one per cent. per month interest on delinquent taxes was affirmed by Attorney-General James K. Edsall in an opinion given in answer to inquiries of Thomas B. Needles, the Auditor of Public Accounts. He considers the one per cent. to be interest, as defined in the act, and not in the nature of a penalty, which could only be enforced by virtue of the judgment of a court; and that it is therefore collectable by ministerial officers, such as tax-collectors, and without judicial proceedings.

The Republican State Convention assembled

in Springfield, May 19th. A division of the party in Chicago caused two rival delegations to appear at the Convention from Cook County—called, from their places of meeting, the Palmer House and the Farwell Hall delegates. The former party was headed by Senator Logan, and the latter, which opposed the nomination of Grant, was led by Messrs. Medill and Farwell. The Farwell Hall delegates were not allowed a voice or a sitting in the Convention. The delegates elected to the National Convention were instructed to vote as a unit for Grant. The nominees for State officers were as follows: For Governor, Shelby M. Cullom; for Lieutenant-Governor, John M. Hamilton; for Secretary of State, Henry D. Dement; for Auditor of Public Accounts, Charles P. Swigart; for State Treasurer, Edward Rutz; for Attorney-General, James McCartney.

The following platform was adopted by the Democrats in convention:

Patriotic duty and interest demand peace and reconciliation through all the land. We pledge ourselves to the following principles:

1. No tariff for protection.
2. No third term.
3. A substantial reform of the civil service, so that Federal officers shall be the servants of the people and not of a party.
4. Equal rights to all the States, and no Federal interference with the constitutional functions of the States.
5. A constitutional currency of gold and silver, and of paper convertible into coin.
6. No more land grants to monopolies.
7. The will of the people must be supreme, and majorities must be the rule under the constitutional methods; no more such frauds as that of 1876.
8. That laws shall be enacted to protect laborers in the more prompt and certain collection of their wages.

A resolution was adopted instructing delegates to Cincinnati to favor the two-thirds rule.

At a Convention of the Prohibition party no candidates for State officers were set up, but a movement was organized to secure a majority favoring prohibition in the Legislature, and procure the adoption of an amendment in the State Constitution forbidding the manufacture or sale of intoxicants. To this end a plan of action was embodied in the resolutions adopted by the Convention. The resolutions were as follows:

Resolved, That we deem it inexpedient at this time to nominate any State or national ticket, and recommend to prohibitionists of Illinois, by voting with the old political parties to which they respectively belonged in the past, to thus secure the nomination and election of members of the Legislature of this State, this fall, pledged to submit to the legal voters of this State a constitutional amendment, to be voted upon at the general election in the fall of 1892, prohibiting the manufacture, sale, or importation of all intoxicants for beverage purposes, if the same shall be petitioned for by the voters of this State; and in pledging candidates for the Legislature to submit such amendment to the voters of this State, we accord to the candidates agreeing to submit said question to the voters of this State, in common with everybody else, the right to oppose the same by voice and vote when the question is up before the people to be voted upon, asking of them only the privilege of voting upon the question, pledging ourselves to abide by the will of the majority as legally expressed at the polls.

Resolved, That if the Senator and Representative to be elected this fall in each senatorial district of this State, or either one of them, which are nominated by the old political parties to which preference is to be given under the foregoing resolution, will not pledge themselves to the measure expressed in the foregoing resolution, that then we recommend that candidates to fill up the representation required to be elected, be nominated solely upon that issue, and leaving them free to vote with their old political parties for all the other offices to be filled at this coming election.

The State Convention of the Greenback-Labor party was held on the 28th of April. A full State ticket was nominated, as follows: Governor, A. J. Streeter; Lieutenant-Governor, Andrew B. Adair; Secretary of State, J. M. Thomson; Auditor, W. T. Ingram; Treasurer, G. W. Evans; Attorney-General, H. G. Whitlock. The platform they adopted ran as follows:

The Greenback-Labor party of Illinois, in convention assembled, adopt the following platform of principles:

1. That all money, whether metallic or paper, should be issued and its volume controlled by the Government, and not by or through banking corporations, and when so issued should be a full legal tender for all debts, public and private.
2. That the bonds of the United States should not be refunded beyond the power of the Government to call and pay them at any time, and they should be paid as rapidly as practicable. To enable the Government to meet these obligations, legal-tender currency should be substituted for the circulating notes of national banks, and that the free, unlimited coinage of gold and silver be established by law.
3. That railroad and all other public corporations should be held amenable to law, so that they shall subserve the interests of the public.
4. That the lands now owned or that may hereafter be acquired by the Government by treaty or otherwise, should not be granted to corporations or sold to speculators, but should be reserved for actual occupants, and to them in limited quantities; and in all cases where corporations to whom grants have heretofore been made have failed to comply with the terms and conditions of such grants, the lands should revert to the Government.
5. That the Government should improve all such practicable watercourses as may be necessary and feasible to utilize the great natural advantages afforded by our navigable rivers and lakes; and that the connection (by way of the Illinois River and Illinois and Michigan Canal) between the lakes and the Mississippi River is a natural necessity.

6. That there shall be a fair, free, and absolutely secret ballot, subject to no intimidation by bulldozers or employers.

7. That as labor is the source of all wealth and the foundation of all prosperity, it should be so protected as to equalize its burdens and insure a just distribution of its results; therefore, the hours of labor and sanitary condition of industrial establishments should be placed under rigid legal control; the competition of contract convict-labor abolished; a bureau of labor statistics established; factories, mines, and workshops inspected; the labor of children under fourteen years of age in factories, mines, and workshops restricted, and wages paid in cash.

We are to embody in civil government the divine right of every laborer to the results of his toil, thus enabling the toiling producers of wealth to provide themselves with the means for physical comfort and the facilities for mental, social, and spiritual culture, condemning as unworthy our civilization the barbarism which would impose upon the wealth-producers a state of perpetual drudgery as the price of bare animal existence.

An amendment to the State Constitution which was submitted to the people at the State election on the 2d day of November, was to the following effect:

In each county there shall be elected the following officers at the general election to be held on the Tuesday after the first Monday in November, A. D. 1882: A County Judge, County Clerk, Sheriff, and Treasurer; and at the election to be held on the Tuesday after the first Monday in November, A. D. 1884, a Coroner and Clerk of the Circuit Court (who may be *ex-officio* Recorder of Deeds, except in counties having sixty thousand and more inhabitants, in which counties a Recorder of Deeds shall be elected at the general election 1884). Each of said officers shall enter upon the duties of his office, respectively, on the 1st Monday of December after his election, and they shall hold their respective offices for the term of four years, and until their successors are elected and qualified: *Provided*, That no person having once been elected to the office of Sheriff or Treasurer shall be eligible to re-election to said office for four years after the expiration of the term for which he shall have been elected.

The amendment was ratified by the popular vote. Its principal object is to do away with frequent elections, and lessen their cost. It makes the term of office of the Sheriff and Treasurer uniform with the other county offices.

The November election gave the Republicans 32 Senators in the new Legislature, the Democrats 18, and the Socialists 1, making the Republican majority in the Senate 13; and in the House it gave the Republicans 83 members and the Democrats 70—a Republican majority of 13 in the House, and on joint ballot a Republican majority in the Legislature of 26. The Republican candidates for the State offices were elected.

INDIA,* a British viceroyalty in Asia. Viceroy and Governor-General of Bengal, Marquis of Ripon, appointed in 1880. Commander-in-Chief of the Army, Sir Frederick P. Haines. The Executive and Legislative Council is composed as follows: The Viceroy, the Commander-in-Chief, Sir John Strachey (appointed in

1876), Whitley Stokes (1877), A. Rivers Thompson (1878), J. Gibbs (1880), Lieutenant-General Sir D. W. Stewart (1880), and C. H. Aitchison (1880). The lieutenant-governors of the provinces are honorary members of the Council, when it meets in their respective provinces. Government Secretaries: For the Interior, C. E. Bernard; for the Finances, R. B. Chapman; for Foreign Affairs, A. C. Lyall; for Military Affairs, Colonel A. B. Johnson; for Public Works, Colonel A. Fraser; for Legislative Affairs, D. Fitzpatrick. The governors of the different provinces are as follows: Bengal, Lieutenant-Governor, Sir A. Eden (1877); Northwestern Provinces, Lieutenant-Governor, Sir G. E. W. Couper, Bart.; Punjab, Lieutenant-Governor, R. E. Egerton; Central Provinces, Chief Commissioner, J. H. Morris; British Burmah, Chief Commissioner, C. U. Aitchison; Madras, Governor-General, William Patrick Adair; Bombay, Governor-General, Sir James Fergusson (1880).

The area and population of British India, according to the census of 1872, were as follows:

PRESIDENCIES AND PROVINCES.	Square miles.	Population.
Presidency of Bengal:		
Lower Bengal.....	156,200	60,502,897
Assam.....	45,302	4,162,019
Northwest Provinces.....	103,896	42,001,486
Punjab.....	104,975	17,611,498
Central Provinces.....	84,208	8,201,519
British Burmah.....	83,556	2,747,148
Ajmeer and Mairwara.....	2,711	396,889
Berar.....	17,711	2,226,496
Mysore.....	29,325	5,055,412
Coorg.....	2,000	168,312
Presidency of Madras.....	138,856	31,672,613
“ of Bombay.....	124,102	16,849,206
Under British administration..	899,341	191,095,445
Fendatory states.....	557,938	49,203,053
Total.....	1,457,244	240,298,498

The receipts and expenditures for the years 1876-'79 were as follows:

YEARS.	Gross receipts.	EXPENDITURES.			Surplus (+) or Deficit (-).
		In India.	In England.	Total.	
1876-'77.....	£35,995,785	£14,710,800	£13,467,763	£28,178,563	- £2,182,778
1877-'78.....	58,969,301	48,464,083	14,048,850	62,512,933	- 3,543,057
1878-'79.....	63,207,694	49,092,539	14,160,764	63,163,303	+ 2,044,391

The progress of the Parliamentary elections in Great Britain was watched with great interest by both English residents and natives. The "Times of India" remarked that the interest taken in Bombay was nearly as keen as in England itself, and that for the first time, perhaps, the contest was followed almost as closely by the natives as by the Europeans. The Indian public, in fact, were more excited by the news of the results of the first two days'

polling than they were over the declaration of war against Afghanistan, or even over the commencement of hostilities between Russia and Turkey. The leading vernacular paper of the country, describing the feeling in the Eastern Presidency, said:

Even mudies' shops, where the village people generally collect for gossip, are being converted into political clubs for the nonce. Any village schoolboy who has read something about the British Constitution, and who can read the newspaper, is pressed into the service and invited to dwell on the mechanism of parliamentary government. Among English-educated natives the excitement seems to be as great and real as if they were themselves concerned in the elections. Like the British constituencies, they seem to be divided into Conservatives and Liberals. There are

* For a full account of the area and population of the different provinces, the distribution of the population according to religion and sex, and the population of cities, see "Annual Cyclopædia" for 1876. For late statistics on the emigration of coolies, on the public debt, on imports and exports, on movements of shipping, on railroads, posts, and telegraphs, see "Annual Cyclopædia" for 1879.

among them admirers of Lord Beaconsfield and Mr. Gladstone, and the intensity of feeling is so great that we have heard instances of high words among them on this account.

Generally, the natives were inclined to favor the Liberal party. The news of the result of the elections was unpleasantly received by the English residents, for it was accompanied by a report that Lord Hartington had intimated that one of the first acts of the new administration would be to withdraw the troops from Afghanistan. The unpleasant impression wore away after authentic reports of the declarations of the Liberal leaders were received, showing that the new administration would not make an abrupt change of policy with reference to Afghanistan. Lord Lytton offered his resignation as Viceroy of India immediately on hearing of the result of the elections, and it was received at the British India Office early in April. He afterward went to Simla, and remained there, still performing the duties of a Viceroy till the new Viceroy arrived. In the constitution of the new British Government, the Marquis of Hartington was appointed Secretary of State for India, and the Marquis of Ripon was appointed Governor-General of India. The Marquis of Ripon had served in Mr. Gladstone's former Cabinet as Under-Secretary, and afterward as Secretary of State for India, and had approved himself in both positions a capable administrator and an energetic man. Some surprise was expressed at his appointment, on account of his being a Roman Catholic, because there had never been a Roman Catholic Viceroy in India, and objections were made to it at first in England on the same ground; but these were dispelled under the recognition of the fitness of his lordship in other respects for the position, and of the fact that the religious question could not be mixed in any of the relations of his office. The new Viceroy arrived at Calcutta, May 31st. On the next day he received an address from the Corporation of Bombay, in reply to which he expressed his desire to contribute to the prosperity of India, and said that it would be his utmost endeavor to bring the Afghan war to an early and honorable conclusion, in the hope that with returning peace the Government of India might again devote itself to works of internal improvement. On his way to Simla he stopped to have a private interview with the Halkar of Khandata. He arrived at Simla, June 7th, was entertained at a state dinner by Lord Lytton, the retiring Viceroy, and at once assumed office. One of his first official acts was to issue an order for the discontinuance of work on Sundays in all the departments of the Government. The Viceroy left Simla in the latter part of October for Lahore, where he arrived November 10th. On the 13th he reviewed bodies of about ten thousand troops, among which were included several regiments that had returned from Afghanistan. At the end of the review he made a long speech in which he passed a eulogium on the conduct of

the troops during the campaign in which they had been engaged, and at the close of it announced that her Majesty had been pleased to grant, in addition to the Afghan medal, six clasps for Ali Musjid, Peiwar Kotal, Charasiab, Cabool, Ahmed Khel, and Candahar, and a special decoration of a bronze star for those who had taken part in General Roberts's march to Candahar. On the 15th he invested Generals Stewart and Maude with the insignia of the Bath, and held a grand durbar, which was attended by the chiefs of the Punjab. In his address on this occasion, the Viceroy expressed his satisfaction at the signs of prosperity and progress in the Punjab, and pointed out that no such durbar as the present had been held since that held by Lord Lawrence in 1864. It would be his endeavor to walk in the footsteps and apply the principles of that officer; he could not give a better assurance than this declaration of his earnest desire to promote the prosperity and welfare of the people. A grand durbar was held at Jacobabad on the 18th, when the Khan of Kelat and the Nawab of Bhawalpoor were invested with the Grand Cross of the Star of India. The Viceroy reached Kurrachee, November 22d, and inspected the harbor and breakwaters on the next day. The municipality and Chamber of Commerce presented addresses to him, strongly urging the completion of railway communication with the Punjab, by bridging the Indus, and representing the necessity of harbor improvements and increased postal facilities. At Poonah, on the 2d of December, Lord Ripon said that it was the intention of the Government to base its educational policy on the dispatch of 1854, which he characterized as the charter of Indian education, and added that, in dealing with this question, due regard would be shown for the changed conditions which had been brought about by the progress of the age. He hoped that more would be done for the education of the masses. In reference to the native states, the Government intended to adhere to the proclamation issued on the 1st of November, 1858, by Lord Canning, declaring the Queen's supremacy throughout India, and to continue to recognize the powers defined and granted under it. It was to the advantage, not only of the native princes, but also of Great Britain, that native states should continue to exist. India wanted peace and rest, in order to devote itself to the improvement of its agriculture and commerce. Lord Ripon was attacked with a fever during his tour, which caused much anxiety for a time, and an apprehension that he would be obliged to return to England. He, however, became convalescent during December, and was able to retain his office.

The budget was laid before the Legislative Council of Calcutta, February 25th, by Sir John Strachey, who considered the results highly favorable. He represented that the accounts of the financial year 1878-'79 showed a surplus of £2,044,000, and those of the year 1879-'80

a surplus of £119,000, and that the estimate for 1880-'81 would show a surplus of £417,000. These figures, he said, were arrived at in each case after allowing for the payment from the ordinary revenue of all charges on account of the famine, the Afghan war, and the frontier railways. The total net war expenses to the end of 1880-'81 were estimated, after setting off the increased railway and telegraph revenue, at £5,750,000. The total net expenditure under the head of frontier railways during the present and the next financial years was fixed at £3,500,000. The expenditure on productive works had been £3,381,000 in 1878-'79, and £3,700,000 in 1879-'80, and would be £2,500,000 in 1880-'81, aside from the outlay on the East Indian Railway. The Council bills on India would amount during the present financial year to £15,750,000, and during the next year to £16,900,000. According to the present intention of the Government, no loans would be required during the coming year, unless unforeseen events should occur, but full powers were reserved to borrow in case of need. The closing cash balances at the end of 1879-'80 amounted to £14,193,000, and were estimated for 1880-'81 at £11,444,000. The extension of taxation to official and professional classes had been abandoned for the present, and fresh taxation was considered undesirable under existing financial circumstances. The license-tax, therefore, remained unaltered, except that all incomes below 500 rupees would be exempted; the export duties on indigo and lac were abandoned; no export duty remained on rice; no change was proposed at present in the cotton duties, but the prolonged maintenance of those duties was declared to be impossible. Notwithstanding the salt-tax had been reduced in the greater part of India, the revenue from salt, as well as the consumption of the article, had been increased. The measures with relation to the army, recommended by the Army Commission, included an estimated annual saving of £1,250,000 which was not credited in the budget. The object of the famine insurance fund had been thoroughly fulfilled. The restriction of the expenditure on productive public works to £2,500,000 had, however, checked the efforts of the Government to protect the country from famine by the construction of cheap railways and canals. The war estimates had hitherto proved and were believed to be ample for all contingencies at present contemplated. A comparison between the present total net ordinary expenditure, compared with that of twelve years back, showed, apart from the loss by exchange, only a trifling increase either in the civil or military charges.

The bill amending the license acts, the chief feature in which was the exemption of poor traders from taxation, was passed in the Legislative Council, March 2d, without opposition. General satisfaction was expressed in the Council at the condition of the finances; but some

of the members objected to charging the war expenses upon the revenues of India, and advocated a loan and the abolition of the famine taxation. The Viceroy reviewed the whole financial policy of the Government, referred especially to the success of the measures which had been adopted for the reduction of taxation, and hoped that further reductions might be effected, and the cotton duties be ultimately wholly abolished. In reply to comparisons which had been made by Mr. Gladstone and Mr. Forster of the expenditures of the last four years with those of a corresponding period under Lord Northbrook, he showed that practically no increase in the actual expenditure had been incurred, while the average net revenue in 1878-'79, and in 1879-'80, had exceeded that of 1868-'69, and of 1869-'70, by more than £6,500,000. Notwithstanding the reduced taxation, the actual charge for interest on the debt had been increased by only £2,500,000 during the last forty years; yet, during that period, five provinces with 42,000,000 people had been added to the empire, and the cost of six wars, the suppression of the mutiny, and several great famines, had had to be met. Lord Lytton denied that the proceeds of the taxes for the relief of the famine had been devoted to any other purpose, asserting that the financial object for which this taxation was proposed had been accomplished, and expressed astonishment at the charge which had been brought against the Government of concealing the real cost of the war. So far from this being the case, the Government had included under the head of the charges for the war the cost of the frontier railways and permanent telegraphs, and other similar items of expenditure. The Viceroy, all the members of the Executive Council, and Sir Ashley Eden, Lieutenant-Governor of Bengal, opposed the proposal to throw any part of the charges for the Afghan war upon England.

The measure decided upon by the Army Commission related to the reorganization rather than the reduction of the army, and provided for the formation of four territorial army corps: one for employment in Bengal, Assam, the Northwest Provinces, and Oude; the second for the Punjab, the trans-Indus frontier, and advanced posts; the third for Bombay, the Central Provinces, Central India, Rajpootana, and Sindh; the fourth for Madras, Hyderabad, and Burmah—each to be commanded by a lieutenant-general, with a complete staff. By their operation the Commander-in-Chief would lose his seat in the Council, and hold a position toward the office of military secretary similar to that of the Duke of Cambridge toward the British War Department, while the Viceroy would be the supreme head of the army, and the military member of the Council would be a Cabinet Minister in charge of the War Department. No local army was recommended, but a modification of the short-service system was advised, and the location of European troops

on the hills as much as possible. Native states should be induced to reduce their armies gradually, their troops should be forbidden to carry small-arms of precision, and their field-artillery be reduced to the smallest limits. The report deprecated unnecessary interference with Scindia, but recommended that the Nizam be induced gradually to curtail his forces. It advised that the civil employment of military officers be discontinued; that staff corps be gradually abolished; that the medical department be recast by separating the civil medical service from the military, and amalgamating the latter with the British Army Medical Department so as to form one list, and that volunteering be encouraged but not made compulsory on government servants.

At the beginning of May it was discovered that the cost of the Afghan war would probably exceed the estimates by at least four million pounds sterling. Minutes were appended to the dispatch of the Indian Government communicating this fact to the British Secretary for India, explaining the manner in which the estimates were framed, and the reasons for which the Military Department had believed them to be sufficient, and had officially recommended to the Finance Department to adopt them in the Indian budget. The minute declared the Military Department to be responsible for the estimates. Among the chief reasons, as stated in it, which had led to the increased expenditure, and which were unforeseen when the estimates were made, were the necessity of buying instead of merely hiring a great proportion of the means of transport required, the cost of transporting to the front provisions for six months, and the enormous increase in the price of grain and all other supplies. Higher wages had to be paid to all camp-followers on account of their dread of foreign service. It became necessary to construct works for the maintenance of the positions gained and the protection of the troops, in consequence of the prolongation of the war beyond the time anticipated. Local resources were exhausted, and the means of transport had to be frequently renewed by drafts from distant provinces of India at constantly increasing cost. The dispatch declared, however, that the condition of the finances apart from the war continued to be satisfactory, that the estimates of revenue had been realized, and that the general financial position was as good as was described in the budget statement.

An official paper was published in June, recording the offers of money and warm clothing which had been made to the Government by native chiefs and others in connection with the military operations in Afghanistan. The Maharajah and Maharani of Baroda had placed at the disposal of the Government ten thousand rupees for the support of the families of the men of the Guide corps who died in defending the residency at Cabool, in September, 1879. Maharajah Holkar had offered a sum of five thousand rupees toward the same purpose, or

toward any memorial that might be determined on in honor of the defense. The Maharajah of Bulrampur had offered one hundred thousand rupees to provide allowances for the families of native soldiers killed in action, and to be distributed in prizes among those Sepoys who had distinguished themselves for gallantry in the recent engagements. The Nawab of Rampore had offered one hundred thousand rupees to be devoted to the aid of sick and wounded soldiers, both British and native. Thakoor Pratab Rudr Singh Talukdar, in the Sitapore district, had given four hundred rupees to be applied for the benefit of the families of those killed while employed during the operations in Afghanistan. These gifts, and others of goods, were accepted by the Government, and the acknowledgments of the Viceroy were given to each donor for his generous offers and sympathy with the condition of those who had suffered in the service of their country.

A large meeting, attended by the Europeans and leading natives of the station, was held at Poona in August, in behalf of the relief fund for the widows and orphans of soldiers killed in the Afghan war. Sir James Fergusson, Governor of Bombay, praised "the healthy spirit prevailing through the native community," and said that it was with a feeling of pleasure and pride that the Government could, confident in the loyalty of the population, move forward to the front an unprecedented proportion of the troops of the Presidency.

A similar meeting at Bombay, August 18th, was attended by leading representatives of all the nationalities and religions, including the Anglican and Roman Catholic bishops, Brahmans, Mussulmans, and Parsees. The sum of fifty-four thousand rupees was subscribed.

The administration of Sir Madhara Rao, who was intrusted with the government of the state of Baroda after the deposition of the late Gaikwar and during the minority of the Maharajah, has been very successful. The administrator surrounded himself with a native staff of excellent character, and retained the confidence of the Indian Government while he secured the good opinion of the subjects of the Gaikwar. A dearth almost approaching to famine made relief operations necessary during the last year; but the public works were not abandoned, and the construction of the state railways—which were already earning four per cent.—has been pushed on. Schools are being built, and education is being extended. A complete system of judicial machinery has been established, *dacoity* has been diminished if not suppressed, the city of Baroda has been supplied with fire-engines and street-lamps, and the finances are prospering. The young Gaikwar is making satisfactory progress with his studies, which include the English, Marathi, Guzerati, and Hindoostani languages, history, political economy, arithmetic, and geography.

The Rajah of Travancore died on the 30th of May. He was one of the most enlightened

native princes, and during the twenty years of his reign had succeeded in raising Travancore to a very high position among the native states. He was succeeded by his younger brother, who had been known as the first Prince of Travancore. The dynasty of Travancore traces its descent, according to Malabar custom, in the female line, for a thousand years back. The state has an area of nearly seven thousand square miles, and a population of more than two millions. Both the late prince and the new one were versed in Sanskrit learning and accurate in the use of the English language. At the ceremony of coronation the prince delivered an inaugural address, in which he said in reference to the English: "One of my illustrious predecessors, who died in the year in which that master-architect, Clive, laid the foundation of the British Empire in the East at the field of Plassey, calling his successor to his bedside, gave him as his last words of advice: 'These Englishmen appear destined to rise to power and glory unparalleled. Be it your constant aim and endeavor to secure their friendship and support.'"

The Indian Government, intending to hand over the administration of Mysore to the Maharajah at the beginning of the next year, has taken steps to substitute natives for Europeans in most official positions.

In the course of a speech, delivered at Indore, on the occasion of a banquet given by Sir Richard Meade, the Maharajah Holkar dwelt with pride on the social and industrial development which the state had undergone in the period which had just closed. He pointed to an increased revenue, increased industry, and an increased peasant population, as the result of the revenue system set on foot nearly fifteen years before, while an extended and improved cultivation had amply repaid the liberal encouragement given by the state to cultivators, in the shape of advances for irrigation, remissions in seasons of scarcity, and advice in reference to the rotation of crops, which would yield the largest return for the smallest outlay on their lands. "Our friend Sir Richard Meade," the Maharajah continued, "had left Indore to assume the chief commissionership of Mysore, before the chimney of our cotton-mill had raised its lofty head. He will now find the mill at full work, giving occupation to numbers of my poor subjects." All of this social and industrial progress was to be attributed to the continuance of tranquillity at home, which, Holkar said, was of as vital importance to his state as to the paramount power. The preservation of peace, he added, was "the one common object, the one touch of nature which makes us kin. It binds us together with adamant bonds, in close alliance and heart-felt attachment. It is this which makes us proud of General Roberts's glorious fortnight's march into Cabool, which makes us rejoice at his repeated successes, and draws forth our prayers for a victorious termi-

nation to his campaign, which I would fain hope is not very distant." The cotton-factory of the Maharajah, which was referred to in his speech, was operated during 1878-'79 at a profit of 50,083 rupees, and turned out 71,431 pieces of cloth, weighing 432,041 pounds, and 30,863 pounds of yarn. The goods of the factory have an excellent reputation for being honestly made of good material.

The experiments which were made several years ago, for naturalizing in certain parts of India the cinchona-tree, from which the Peruvian bark is produced, have been attended with a remarkable success and beneficial results. The cultivation of these trees in the government plantations in Bengal in 1879-'80, embraced 750,000 young trees, which yielded a crop of 361,590 pounds of dry bark. A new variety of cinchona, yielding the Carthagena bark of commerce, was successfully brought into cultivation. A consignment of calisaya bark was made for sale in the London market. A saving of £40,000 had been effected in the cost of the quinine consumed in Calcutta, while the saving in former years amounted to about £80,000; making a total saving to the end of 1879 of about £120,000, or about £15,000 more than the plantations had cost from their origin, including compound interest on the outlay incurred at the rate of four per cent. per annum. The cultivation of the cinchona is regarded as highly advantageous in other economical senses, not only because it offers a new branch of industry and trade, but also because of its bearing on the traffic in opium. The opium which is consumed in China is in by far the largest degree taken as a medicine by the millions of cultivators who inhabit the low, swampy tracts of country which border the great rivers, where fevers are always present. It is believed that by reason of the immense superiority of quinine over opium as a febrifuge, if it were sufficiently abundant to come into competition with that drug, and could be sold at a reasonable price, it would supplant it. Thus, the embarrassing questions which make the suppression of the opium-trade so difficult, could be settled without causing an important disturbance to Indian industries.

An interesting debate on the affairs of India took place in the British House of Commons in February, when Sir D. Wedderburn called attention to the importance of conferring on the people of the country some measure of representation, either in the Legislative Councils or otherwise, in order that the Indian Government might have greater facilities than those at present existing for ascertaining native opinion on public questions. M. E. Stanhope, on the part of the Government, while he sympathized with the desire to extend representative institutions, pointed out that the inhabitants of India were not one people, but a conglomeration of peoples, without cohesion and without any basis for representation. Nevertheless, there were at present no less than 894 mu-

municipalities, comprising twelve million people, and the governing bodies of these municipalities contained three natives to one European. Natives also sat in the Provincial Legislative Councils. But outside the centers of population there was a vast inert mass of people who had no capacity for representation at present, and wanted nothing but to be let alone and not be overtaxed. The Central Government did all in its power to elicit native opinion as to the laws which were proposed, and would be glad, wherever it was possible, to obtain the coöperation of the natives in legislation, but it would be unwise to press on this idea of representation too fast.

Mr. W. W. Hunter, Director-General of Statistics to the Government of India, delivered two addresses in England on "What the English have yet to do for the Indian People." He called attention, as two of the saddest problems with which a state can be called to deal, to the poverty of the people, and the alleged inability of the Government to pay its way. With these fundamental problems yet unsolved, it might seem a delusive optimism to speak of the success of the Indian administration. The struggle for life in many parts of India was growing harder under British rule; and in many parts the population had outstripped the food-producing powers of the land. Each square mile of land in Bengal had to feed three times as many mouths in 1880 as each square mile had to feed in 1780; and each square mile of British India (excluding the outlying provinces of Assam on the frontier, and Burmah beyond the sea) had to support nearly three times as many persons as each square mile in the native states. Under the protection from wars and the ravages of epidemics, secured by British rule, the population had so increased as to threaten the bankruptcy of the soil. The deterioration applied, however, only to the over-populated provinces; and large sections of the population were rapidly advancing in wealth and comfort. But the contented classes kept silence, while the suffering classes cried out. The cultivator got a decreasing return from the exhausted land, but of that smaller return he had to pay away a larger share in the shape of rent to his landlord. The Government could do little to avert these two penalties of a population living in defiance of economic laws, but its efforts were directed toward mitigating both of them, by administrative measures looking to the increase of the food-supply, and legislative restrictions on the enhancement of rent. The weak point in the financial condition of the English in India was, not that they took more from the people than their native rulers did, but that what they took barely sufficed to defray the cost of their administration. They took less taxation from the people, and tried to give them a much better government in return. The more extended employment of natives would not only be an act of justice,

but was a financial necessity. A large saving might be expected from the reorganization of the military establishments, as proposed by the Indian Army Commission; but the speaker believed that, in addition to such savings, a steadily increasing revenue was necessary. In a country where the people were poor, the government ought to be poor, for it must either be poor or oppressive. No financial dexterity would remove these conditions, but the natives of India must themselves reform themselves; they must restrain the increase of the population to the food-producing powers of the land, and more equally distribute the pressure on the soil by migration to the less thickly inhabited provinces.

Mr. Hunter's description of the condition and prospects of the country was confirmed by the report of Mr. Caird, who was sent out by the Government of Earl Beaconsfield to examine into the causes of the frequent famines. Mr. Caird stated that the available good land in India was nearly all occupied, while the people were not able to clear the jungle-land. As a result, the produce of the country on an average of years was barely sufficient to maintain the present population and make a saving for occasional famine. The present export of rice and corn in one year was not more than ten days' consumption of the inhabitants, and scarcity deepening into famine was becoming of more frequent occurrence, while the population was all the time increasing. No means were taken to keep up the quality of the soil, and the people were becoming more estranged from their English rulers.

The troubles which broke out with the Naga tribes on the northeastern frontier in October, 1879, were continued into 1880. The Nagas, who had long been troublesome neighbors, were distinguished from most of the other hill tribes by their skill in agriculture and their readiness to adopt the appliances of civilization. They had acquired considerable knowledge in the arts of fortification and the use of arms of precision, and by reason of this advance and their intelligence had been able to make themselves capable of creating embarrassing situations when they came in conflict with the English. The Government of Assam had for some time intended to extend the sphere of its influence over the frontier tribes, and for that purpose had posted an agent at Kohima to look after the Nagas. This agent went thence to Konom, one of their strongholds, to secure a surrender of their arms, when he was attacked and driven away. They afterward marched upon Kohima, which resisted their assaults till it was relieved; after which a force of British and Manipoori troops drove them from Konom to the Barrail Hills. On the 27th of January a party of Nagas came down and committed ravages on the gardens in Cachar, killing the manager and burning the houses of one of the gardens. About two weeks afterward, they made an unsuccessful attack on the native

guard near Samaguting. The planters in north Cachar demanded protection from the Government, and a force of infantry was dispatched to the disturbed district, and arms and ammunition were furnished to the planters. The aggressive operations were also slowly pushed against the Nagas, with the result that by the end of March their stronghold had been captured, all the chiefs had surrendered and given up their arms and forts, and the operations were brought to an end.

The rebellion in the Rumpa district, which was first provoked in March, 1879, by the exactions of a native to whom the collection of the revenue had been farmed, broke out afresh in the latter months of that year, and was also protracted into 1880. Chendriah, the leader of the insurgents, fell a victim to the jealousy of another of the leaders, and was beheaded in February by his followers. The insurgents continued to be active till quiet was restored by the troops sent against them. The military were, however, withdrawn in May, when the insurgents began to collect again and attack some police posts, and the soldiers had to be sent back.

A Eurasian youth named Deesa was arrested for an attempt to assassinate Lord Lytton by firing a pistol at him on December 25, 1879, and was brought to trial before the High Court of Calcutta. Testimony was taken, and he was examined as to the soundness of his mind. He said that he felt all right and understood the charge; that he had bought a revolver in order to defend himself in case he was attacked by robbers on his way to Cuttack; that he had no recollection of firing at the Viceroy's carriage, and had no grievance against Lord Lytton or any of his suite; and that he was very sorry for what had happened. The jury found that he was of unsound mind, and he was ordered to be confined during her Majesty's pleasure.

A serious disaster took place at Naini Tal, one of the most frequented summer resorts of the country, September 18th, when a landslip occurred which destroyed a part of the Victoria Hotel, and buried several persons. Between three and four hours afterward, the whole precipitous cliff, which had been undermined by the landslip, suddenly fell while the work of extricating those who had been killed and injured by the first landslip was still in progress. The hotel and the adjacent buildings, offices, and assembly-rooms were buried, with nearly every person who was on the premises. The actual number of the killed could not be ascertained, as many of them were coolies who had come in to work. It was estimated at from one hundred and fifty to two hundred. Among them were many officers of the civil and military service, summer visitors, and residents. The disaster was occasioned by the heavy rains which had visited the country.

According to the representations of the "Brahmo Year-Book" for 1880, a new period

of vital activity has set in for the Brahmo-Somajes of Bengal since the schism of 1878. At the same time the local activity in the independent somajes of western, northern, and southern India has decidedly increased. The theistic church of India consisted in 1880 of about one hundred and thirty small churches, scattered over the country. The several churches, however, widely differ both as to the number of members in each, and as to the quality of their Brahmoism. The number of members ranges from three or four to three hundred. In some cases, a small somaj is strong in influence; in others, a large one is weak. The most prominent societies in Calcutta are the sadharan Brahmo-Somaj, which originated in the schism of 1878, and is most active in propagandist and philanthropic work; the Adi Brahmo-Somaj, the historic remnant of the original society founded by Rammohun Roy in 1830, which is conservative in its religious character, and exercises an influence by means of the personal sympathy existing between its leading members and the provincial somajes, which have advanced to a certain point beyond the current Hindooism, but are not inclined to go further; and the Brahmo-Somaj of India, of which Keshub Chunder Sen is the leader and head.

INDIANA. The total amount of the State debt on October 31, 1879, was \$4,998,178, of which \$1,093,395 was the amount of the foreign indebtedness, and \$3,904,783 that of the domestic debt. The interest-charge for 1880 amounted to \$289,465, \$3,543 less than in 1879, and \$8,571 less than in 1878. The interest on the different loans in 1880 was to the following amounts:

BONDS.	Interest.
School fund.....	\$234,286 99
Temporary loan.....	46,530 24
War loan.....	8,348 84
Internal improvement.....	300 00
Total.....	\$289,465 57

The domestic debt, about four fifths of the total published amount of the State's indebtedness, is merely nominal, the loan being held by one of the school funds of the State. Some of the internal-improvement bonds have been presented for payment during the year, and are in litigation respecting the interest to be paid upon the bonds, which are long overdue. The reduction in the public debt, shown in the lessening of the interest-charge, has been in the temporary loan, and in paying off some of the small balance of the internal-improvement loan. The temporary loan was created in consequence of extraordinary appropriations made in 1873, after the reduction of the tax-levy to five cents on \$100 by the preceding Legislature. The loan amounted to about \$910,000. The interest-charge was at first \$67,000; \$510,000 of the loan became due April 1, 1879, and \$200,000 in December of the same year. These bonds were converted into five per cents, reducing the interest-charge to \$45,500.

The accounts of the Treasury for the fiscal year 1880 are summarized in the following tables:

RECEIPTS.

Cash balance November 1, 1879:	
General fund.....	\$226,584 91
Common school fund.....	2,692 20
School revenue for tuition.....	184,632 23
College fund.....	5,332 83
College fund, excess of bids.....	302 02
College fund interest.....	105 16
Swamp-land fund.....	549 96
Fund of unclaimed estates.....	11,948 43
Sinking-fund, excess of bids.....	2,088 52
New State-House fund.....	199,315 66

Total..... \$583,751 92

Receipts to October 31, 1880:

General fund.....	\$1,477,609 92
School revenue for tuition.....	2,010,845 61
College fund.....	18,409 14
College fund, excess of bids.....	326 16
College fund interest.....	7,023 17
Swamp-land fund.....	486 56
Fund of unclaimed estates.....	2,258 56
New State-House fund.....	175,845 47
Escheated estates.....	1,865 97

Total amount of Treasurer's receipts filed during the year..... \$3,689,170 56

Deduct amount of transfer and refunding receipts filed during year..... 236,961 54

Leaves net cash receipts to the Treasury during the year..... \$3,452,209 02

Add cash balance in the Treasury, October 31, 1879..... 583,751 92

Makes total receipts, including balance, during the year..... \$4,035,960 94

WARRANTS DRAWN ON THE TREASURY DURING THE YEAR.

General fund.....	\$1,199,299 89
School revenue for tuition.....	1,993,354 26
College fund.....	10,550 00
College fund interest.....	4,498 10
Swamp-land fund.....	11 09
Fund of unclaimed estates.....	1,118 13
New State-House fund.....	177,626 70
College fund, excess of bids.....	604 04

Total amount of warrants drawn during the year..... \$3,387,057 11

Deduct amount of transfer and refunding warrants..... 236,961 54

Leaves net cash disbursements from State Treasury during the year..... \$3,150,095 57

Which, being deducted from total receipts, leaves cash in Treasury October 31, 1880. 885,865 37

The balance of cash in the Treasury on various funds was as follows at the close of the year:

General fund.....	\$504,894 94
Common school fund.....	2,692 20
Fund of school revenue for tuition.....	152,128 58
College fund.....	8,391 97
College fund interest.....	2,635 23
College fund, excess of bids.....	34 14
Swamp-land fund.....	1,028 52
Fund of unclaimed estates.....	13,088 87
Sinking-fund, excess of bids.....	2,088 52
Escheated estates.....	13,065 97
New State-House fund.....	197,584 43

Total balance..... \$885,865 37

The following is a classified statement of the expenses of the State Government for the fiscal year 1880:

CURRENT EXPENSES.

Executive.....	\$51,319 56
Benevolent institutions.....	384,759 59
Penal institutions.....	179,831 45
Judiciary.....	182,643 75
Educational institutions.....	17,500 00
Board of Agriculture, etc.....	5,100 00
Printing and stationery.....	15,321 96
Miscellaneous.....	7,804 61

Total..... \$844,285 92

SPECIFIC AND EXTRAORDINARY EXPENSES.

Interest on public debt.....	\$259,465 57
Special appropriations.....	65,545 40

Total..... \$355,013 97

Total warrants drawn on general fund..... \$1,199,299 89

The expenses of the two State-prisons have only exceeded their receipts by \$26,633 during the last two years, while the expenses of 1878 were \$39,243 in excess of the prison revenues. The cost of the judiciary has not materially changed, though a part of the expense has been thrown upon the counties by an act of the last Legislature.

There were 542 convicts in the State-prison North on the 31st of October, 1879, and 577 at the same date in 1880, 301 having been received and three returned, and 269 having been released by pardon, expiration of sentence, and otherwise. Among the incarcerated, 43 were sentenced for murder, 67 for other offenses against the person; 80 per cent. of the convicts are citizens of the United States. All are contracted for terms of from one to five years, and 508 have been employed, 50 being in service of the State, and 19 excused and off duty. During the year 45 received medical treatment, three died, and one committed suicide. The sanitary condition was good, and is shown in the smaller percentage of deaths, and in the excused list, which is lighter than in any former year. The receipts and earnings were \$74,877, and the disbursements \$73,943, leaving \$934 remaining. The cost of each convict was 36½ cents per day. The prison-buildings will accommodate 800 convicts. The average number of convicts in the Prison South during the year ending October 31, 1879, was 600, 593 at the beginning and 562 at the close, 247 having been received and 278 discharged, pardoned, and otherwise lost. The available men on contracts were 445 at 45 cents, and 50 at 30 cents. The receipts were \$76,638; the disbursements \$74,753. With an expense of \$71,875 and an average number of 600, the average cost was 32·7 cents per day, or, excluding repairs, but 31 cents per day for each convict. That each prisoner is substantially fed appears from a curious table of weights, disclosing the fact that the average of those received is 143½ pounds and of those discharged 149½ pounds. The cell-house in process of construction will accommodate 400 convicts. There were seven deaths during the year, five from diseases of the lungs.

The Female Prison had 45 convicts at the beginning of 1879, and 41 at the close, 21 having been received, 24 discharged, and one having died; and at the end of 1880 it had 48, 34 having been received. The Reformatory for Girls contained 149 inmates at the commencement of 1879, and 147 at its close; and at the close of 1880 it contained 148, 41 having been committed during the year. The estimated cost per capita is \$126 per annum. Of the expenses one half are borne by the counties.

The House of Refuge for Juvenile Offenders was opened in 1868, and has received in all 1,384 boys. There were 329 at the beginning of 1880, and 347 at the close. Of the 134 admitted during the year, 34 could neither read nor write; 80 were sent up for incorrigibility, 43 on no specific charge, and the rest for penal offenses. Of the 1,037 who have passed through, 80 per cent. have proved useful citizens. There were 13 deaths. The cost of keeping an inmate is estimated at \$100. The counties pay one half. The commissioners express the opinion that boys who have committed no crime are not fit subjects for compulsory education and reformation, and that so much of the statute as authorizes their commitment should be repealed. It appears that of the 256 admitted during the last two years, not one half were offenders. There are now eight families and six family-buildings, two being double. They can accommodate 400 boys. The net cost of the institution to the State was \$16,994 for the year.

The Hospital for the Insane began the year with 629 inmates and ended with 1,010, having admitted 914, discharged 533, and treated during the year 1,543. Of these, 262 were cured, 69 improved, 34 unimproved, 146 died, eight were discharged as not insane and six as idiotic, and eight eloped.

A department for women was opened, and soon filled by the patients who were sent from the counties; since which only acute cases have been received. The male department was not full. The average cost per capita was \$184.64 per annum. The building for women had cost \$680,000, and was not quite completed. A change in the statutes relating to insanity inquests is asked for by the hospital authorities. The Institution for Educating the Deaf and Dumb holds property of the State valued at \$490,341. The ordinary expenses for the year were \$50,005; the per capita cost, \$154.33. The Institute for the Education of the Blind has property valued at \$374,644. The current expenses for 1880 were \$25,912, or \$211.05 per capita. The enrollment was 127 pupils, 66 male and 61 female. The reports of these three benevolent institutions show a reduction in the per capita cost as given in the following table, covering twelve years, of the average daily number of patients and annual cost of maintenance:

YEAR.	No. of inmates.	Cost per capita.
1869.....	840	\$257 49
1870.....	478	256 79
1871.....	495	261 44
1872.....	455	255 64
1873.....	452	321 88
1874.....	453	324 14
1875.....	566	255 70
1876.....	603	238 99
1877.....	612	242 56
1878.....	617	199 23
1879.....	626	188 20
1880.....	896	198 84

The new State-House is paid for out of a separate fund. The total cost must not exceed

\$2,000,000. The estimate as revised is \$1,984,890. On December 31, 1880, \$378,337 had been paid out by the Board. The fund is derived from surplus revenues and from delinquent taxes. The building is expected to be completed in 1882, and ready for use the following year. On the death of Architect May, Adolph Scherer was appointed supervising architect. The corner stone was laid on September 28th. Governor Porter insists in his inaugural that it should again be uncovered, and memorials of Indiana's action in the war placed with the other records.

The Insurance Department was subjected to a legislative investigation in 1878, and from the collections of 1880, as compared with those of the two previous years, it seems to have become more efficient in collecting the taxes and fees. The fees amounted to \$24,634 in 1880, against \$12,487 in 1879, and \$14,624 in 1878; the taxes to \$51,305 in 1880, against \$21,227 in 1879, and \$36,292 in 1878. The total receipts in 1880 were \$75,940. The following is a summary of the insurance reports for the year 1879-'80: number of fire-insurance companies of other States and foreign countries doing business in Indiana, 96, of which 21 were foreign and 75 American companies; amount of premiums received, \$1,521,591; of losses paid, \$701,293; number of extra-State life companies, 30; receipts from premiums, \$935,174; losses paid, \$535,806. The State-tax collected from the fire companies amounted to \$26,103; from the life-insurance companies, \$13,622.

The first annual report of the Bureau of Statistics and Geology contains a remarkably extensive and elaborate collection of statistical data, prepared under the supervision of the chief of the bureau, John Collett; but owing to the difficulties of obtaining correct facts, and the refusal of many of the State officials to make the inquiries and reports expected of them, the volume contains usually the framework and first rough approximation of a statistical record more complete than has been attempted in other States.

The office of Mine Inspector was created by an act of the Legislature to regulate the working of mines, passed in 1879, and the appointee, Herbert H. Richards, commenced his duties on the 1st of May of that year. The first annual report states that there are 177 mines in operation in seventeen counties. The invested capital is \$1,135,562; the number of men employed, 3,459; the year's product, 1,196,490 tons of coal. The mines were found by the inspector greatly deficient with respect to ventilation and other matters. The quantity and value of the coal mined in the State reported to the Bureau of Statistics differ, to a surprising extent, from the reported amounts in the Mine Inspector's report, being over twenty times as great.

The number of school-houses in Indiana has increased from 7,403 in 1865, valued at \$3,827,-

173, to 9,647, of the value of \$11,817,954. The school-fund has grown from \$7,193,705 in 1862 to \$9,065,254; but the increase in the school population has been relatively greater, the number of children of school age being 703,558 in 1880, against 528,583 in 1862. There were 1,090 males and 957 females between the ages of ten and twenty-one reported unable to read or write. There were 359 new school-houses erected in 1880. During the year ending August 31st, the schools were in session on an average 136 days. The number of teachers employed was 13,578. The daily attendance during the year was 321,659. The number of scholars enrolled was 511,283: 265,872 white males, 237,395 white females, and 8,016 colored. The expenditures for tuition amounted to \$3,006,432; for special purposes, \$1,485,418; total expenses for the year, \$4,491,850. Of the total number of teachers, 7,731 were white males, 5,732 white females, and 15 colored. The colored schools numbered 104, graded schools 339, township graded schools 53. The pay of the male teachers in the townships varies from \$1.35 to \$2.29 a day; of the female teachers, from 93 cents to \$2.23; in the towns male teachers receive from \$1.76 to \$5.33, and female teachers from 75 cents to \$2.33; in cities male teachers receive from \$2 to \$7.50, and female teachers from \$1.65 to \$5 a day. The township libraries contain in the aggregate 241,824 books.

The Normal School was attended by 578 scholars during the year, the average enrollment having been 283 per term, 22 more than in the preceding year, and 280 having entered for the first time; 2,665 have attended since the school was established. The annual enrollment ten years ago was 135. The students come mostly from the industrial classes, and teach afterward in the common country schools. The object of the school is to give instruction in the art of teaching. The State sets apart annually a portion of the school revenue for its support as a means of making the common school system more effective, and supplying trained teachers to meet the constant demand, as one fourth of the teachers annually abandon the profession. The school expended \$13,927.96 for tuition, and \$3,551.75 on account of the incidental fund.

The expenses of the Indiana University for two years are reported as \$27,951 for 1879, and \$24,856 for 1880. The Purdue University was established with the Government land-grant for agricultural and mechanical education. It has received large donations from John Purdue, a portion of which funds have been diverted from the purpose of the trust and applied to current expenses, and must therefore be made good by the State. The University is reported to be on a sound financial basis, and is actively fulfilling its educational objects. The endowment fund amounts to \$340,000, yielding five per cent. An annual appropriation of equal amount, \$17,000, is asked for from the State.

The grants and donations are valued at \$573,000 altogether. The number of students is 203.

The Constitution of the State was adopted nearly thirty years ago. In view of the changed conditions of the commonwealth and the many important new provisions, repeals of obsolete ones, and amendments which are demanded, the Governor recommended, in his message, the calling of a constitutional convention for the revision of the organic law, to consist of fifty members chosen from the Senatorial districts. In case the Legislature does not deem it advisable to call a convention, the Governor recommends the revision of the amendments which were submitted to the people in the April election of 1880, and which were decided to have been defeated. He also recommends a further amendment to the Constitution making the tenure of all State officers four years, and making the incumbents ineligible for two consecutive terms, the elections to be held between the Presidential elections, in order to separate State from national politics. At present the terms of the Secretary of State, Auditor, and Treasurer are two years, while the Governor, the Lieutenant-Governor, and the Clerk and Reporter of the Supreme Court serve four years. Governor Porter, in his inaugural address, expressed disapproval of Governor Gray's suggestion of a constitutional convention in the following words:

I do not believe that there is a necessity for such a convention, and the people would not, in my judgment, so soon after they have emerged from the financial crisis which has crippled their means of support, patiently incur the needless but great expense incident to its assembling. The present Constitution contains an admirable provision for its own amendment without the assembling of a convention. If two successive Legislatures shall recommend a particular amendment, it shall then be submitted to the people. This avoids two extremes: the one, of not allowing the Constitution to respond by amendment, with reasonable promptness, to the deliberate will of the people; the other, of hastily placing in the Constitution improvident provisions which it would be difficult to withdraw. By the simple means provided in the Constitution itself, ample facilities are furnished for amending that instrument as such amendments may, from time to time, be deemed necessary.

The provisions of the present Constitution are, in the main, wise and satisfactory to the people; they have generally undergone interpretation by the courts, and their construction is fixed and determined. If a new Constitution shall be framed, we shall again be launched upon a sea of doubt, and be compelled to incur the expense and inconvenience which, in practice, will be found to be great, of having the meaning of its principal provisions settled by judicial construction.

At every general election for many years, sums of money, vastly greater than has ever been suspected by the people, have been expended to prevent invasions of the ballot-box by persons not authorized to vote, which need not have been expended but for the clause in our Constitution that will not allow safeguards against fraud to be established which our own experience has shown to be necessary, and the legislation of other States has provided with respect to those States.

Bad laws seldom inflict merely a single evil. Where the facilities for fraud are so considerable, the members of each party think that their opponents will perpetrate them, and the next step is too apt to be to lay schemes by which wrong may be met by kindred wrong. The

consequence of all this is that politics become embittered; that neighbors who, in their business transactions, would place implicit confidence in each other, believe that, to obtain a party advantage, they would quarter false voters, encourage repeating, and connive at a false count of the ballots, and that the young, learning and believing that fraud is perpetrated without disgrace by the most respectable persons, in that they are taught to be the most important of transactions, are not able to draw the refined distinction which would make it wrong or disgraceful to perpetrate frauds in less important ones. Thus the foundations of private virtue are sapped by tolerance given to public fraud.

The proposed amendments to the Constitution, seven in number, explained in the "Annual Cyclopædia" for 1879, were submitted to the people in the spring elections held on the first Monday in April. The number of votes cast for and against the amendments was announced by the Governor's proclamation issued April 18. A larger number of votes having been cast in their favor than against them, it was supposed that the amendments had been carried, and were a part of the Constitution. But in a case arising from a city election in May, in which the counting of the ballot of a man who had voted in accordance with the first of the amendments was contested, it was decided by the Supreme Court that the amendment had not been ratified by the people in the manner prescribed by the Constitution, and, therefore, was not a part of the organic law. The number of votes cast for the other amendments was larger than the number for the first; but the principle laid down by the Supreme Court was held to apply in the case of all of them, and was so acted upon. The Court based its decision on the tenor of the Constitutions of 1816 and 1851, and on historical evidence as to the intention of the framers of the Constitution contained in the constitutional debates. In the election of officers a plurality vote is sufficient, but in the adoption of constitutional amendments it is decided that a majority vote of the electors of the State, which the opinion, agreed in by Judges Howk, Warden, and Biddle, construes to mean a majority of the votes cast at the election, though one of them held that the majority should be ascertained from census statistics; while Judges Niblack and Scott dissented from the opinion. The conclusion of the Court on the case in point was as follows:

This Court holds that it requires at least a majority of all the votes cast at the same election to ratify a constitutional amendment. We also hold that, as the act of March 10, 1879, is defective in not providing for the count of the aggregate number of votes cast throughout the State on the day of the election, or in not providing some means to find out the whole number of votes cast, by which it might be learned what proportion the number cast in favor of the ratification bore to the whole number, there is no source from which this Court can ascertain whether the amendment received a majority of all the votes cast at the election or not. As the amendment was submitted upon the day of the general spring elections throughout the State, and as there were, by law, officers to elect at the same time in the various counties, it must be presumed that other votes than those for or against the amendment

were cast at the same time. From the peculiar ballots used in voting upon the amendment, many electors may have voted "no" and "yes" upon the question of the amendment, which votes would not be counted; such also would be counted in estimating the whole number of electors voting. It is also held that the Constitution must remain as it was before the amendment was submitted, until it shall affirmatively appear that the amendment is ratified. As it does not thus affirmatively appear, we must hold that the amendment is not ratified by a constitutional majority. The opinion, therefore, of this Court is that it requires a majority of the electors of the State to ratify an amendment to the Constitution, but that the whole number of votes cast at the election at which the amendment is submitted may be taken as the number of electors in the State.

The decision, as interpreted by the Court, did not affirm the rejection of the amendment, but a simple act of the Legislature being required for its submission to the people again for ratification. On this point the words of the opinion are as follows:

In the opinion of this Court the consequence, spoken of in argument, of this decision can at most be but a temporary inconvenience. We perceive no irregularity in the proposal of the amendment for ratification. It has simply not been ratified, and not been rejected. The vote upon it was ineffectual for want of the constitutional majority. We see no reason why the General Assembly may not resubmit the amendment to the electors of the State, under an amended act, such as experience may prove to be sufficient to present the question to the Courts if it ever should arise again.

The question of the adoption of the constitutional amendments was implicated in the politics of the State, and the decision of the Supreme Court upon it became the subject of partisan recriminations. Amendment No. 1 requires, in addition to the six months' residence in the State demanded by the Constitution as it is, a residence of sixty days in the township and of thirty days in the voting precinct as a qualification for voting. Amendments No. 2 and 1 conform the Constitution to the United States Constitutional Amendment extending the suffrage to colored citizens, and expunging the prohibition of the immigration of colored people, and are purely formal. Amendment No. 3 changes the date of the general State elections from October to November, so as to make them fall on the same day as the national elections. The other amendments, numbered 5, 6, and 9, numbers 7 and 8 having failed to pass the Legislature, relate, the first to salaries, the sixth to the reconstruction of the judicial system, and the third to the restriction of the powers of counties, cities, and towns to make debts. Governor-elect Porter, in his inaugural, spoke of the decision of the Court and the amendments in the following terms:

The amendments to the Constitution, which at the last spring election were submitted to the electors for adoption or rejection, have been held by the Supreme Court, in opposition to what, it is believed, had, previously to the decision, been the general sense of the legal profession, not to have been constitutionally adopted.

The Court, while deciding thus, took occasion to express an opinion that another submission might take place, notwithstanding the submission and vote which

have occurred, if the Legislature shall choose to provide therefor by an appropriate enactment. The Court, though not now composed entirely of the same members as when the decision was made, will, it is believed, feel constrained to accommodate itself to this suggestion, whatever view the new judges might entertain, if the question were one of first impression. I therefore earnestly recommend that a bill be speedily passed, giving the electors of the State another opportunity to pass their judgment upon these amendments.

The amendments have been the theme of frequent and careful discussion. So general is the sentiment of unbiased men in their favor, that I believe if a vote upon them could be separated from party politics, it would be nearly unanimous for their adoption.

The expediency can hardly be questioned of limiting within reasonable bounds the debts which may be contracted by cities and townships, so that taxes may not become an intolerable burden, and of fixing a limit upon the fees to be paid to officers in the populous counties, so that while they shall be adequately compensated, estates and suitors may not be burdened with needless costs, and our politics corrupted by the expenditures made in the greedy scramble to obtain office. These reforms are provided for by two of the amendments.

Another amendment is of such extreme importance that it may be regarded as almost vital to the elective franchise. When the elector places his ballot in the box, it is a hollow and preposterous ceremony if some other person, not entitled to the franchise, may neutralize his vote by a fraudulent ballot, or if some dishonest officer may substitute a false ballot for the one he has deposited, or stuff the box with fictitious ballots. Our laws do not provide—the Constitution will not allow that they shall provide—that the person who offers his ballot shall prove, even when challenged, that he has resided a single hour or minute in the county or precinct where his vote is offered. It is enough that he shall show that at the particular instant he is such a resident, and has resided in the State for six months. No registration law can be passed; the Constitution will not allow one.

The consequence of all this is, that where even the most expensive and organized vigilance is maintained, persons from other counties and other States, not entitled to vote at the precincts where they tender their ballots, often succeed in depositing fraudulent votes; and, where this vigilance is not maintained, the feeble flood-gates against fraud fly open at the first assault, and the ballot-box is deluged with fraudulent ballots.

I find upon examination that nearly all the Northern States, except Indiana, require, as a qualification to vote, a previous residence of the voter in the precinct where his vote is offered, and that hardly a less number require a registration of voters. These laws are an expression of the people of those States, founded upon experience, that such provisions are necessary to preserve the purity of the elective franchise.

The last Legislature passed an act providing for a revision and codification of the statute laws. There had been no code of the laws compiled since 1852. The Board of Revision appointed consisted of James S. Frazer, David Turpie, and John H. Stolsenburg. The revisors classified the acts contained in the fifty-one volumes of statutes according to subjects, omitting laws which are obsolete from lapse of time or disappearance of subject-matter, and giving the decisions of the courts in foot-notes. They interpolated in the text proposed amendments to the existing laws, which they also formulated into engrossed bills, to be laid before the Legislature.

The immigration of colored people into the State, chiefly from North Carolina, was made

the subject of an investigation by a committee of the United States Senate, presided over by Senator Voorhees. The extent of the immigration was variously reported at from 500 to 2,500 persons or more. They had been sadly misinformed as to the prospects of obtaining employment, and many of them suffered severe want. Messrs. New, Martindale, and other prominent Republicans, denied that the immigration had been set on foot or encouraged for the purpose of gaining a Republican majority in Indiana. General Conway, on the other hand, who has been engaged in various schemes for the improvement of the condition of the former slaves, and particularly in the exodus movement, testified that the object of gaining a political majority in Indiana had been the principal motive for diverting the stream of immigration into Indiana after the sad results of the exodus to Kansas became apparent. Lewman, Mendenhall, Mills, and others, minor Indiana politicians, also disclosed in their testimony a concerted plan for importing negro voters.

The National Greenback-Labor party assembled in convention in Indianapolis, April 28th, and nominated the following State ticket: for Governor, Richard Gregg; for Lieutenant-Governor, Thomas F. De Bruler; for Secretary of State, Jacob B. Zeagley; for Auditor, George W. Demaree; for Treasurer, John F. Ullery; for Attorney-General, John L. Miller. The following platform was adopted:

The National Greenback-Labor party of the State of Indiana, in Convention assembled, declare:

1. That the power which issues and controls the volume of a people's currency is the absolute dictator of their financial and business interests.
2. That the people are capable of managing their own financial and business interests through their National and State Governments.
3. That the delegation of that power by the Republican party to a moneyed oligarchy has precipitated upon the country the present financial and business ruin.
4. We therefore demand that the people's Government shall immediately resume the control of their currency, and issue the same directly to the people, without the aid of bank corporations, and in sufficient volume to do the business of the country on a cash basis.
5. That all currency, whether metallic or paper, should be alike full legal-tender.
6. That the producing classes of the world are now enslaved by interest-bearing debt.
7. That we are now in the midst of a revolution, having for its object the removal of this, the greatest enemy to individual liberty and national progress.
8. That the \$870,000,000 of our national debt, soon payable at the option of the Government, should be paid as soon as practicable, according to contract, in silver coin, or non-interest-bearing notes, which shall be full legal-tender currency.
9. That the whole of our bonded debt should be paid in like manner as soon as practicable.
10. That we are unalterably opposed to another dollar of bonded indebtedness, either State or national.
11. That all wealth is produced by labor, and that all class legislation against labor is infamous.
12. That every laborer has a divine right to the legitimate fruits of his own toil, and the Government should secure to him that right.
13. That the public lands should be sacredly held to furnish homes for actual cultivators.

14. That official stealing has become an unendurable burden in our political affairs.

15. That the men who take advantage of the positions of trust and honor, to which the people elevate them, to secure illegitimate gains, are unmitigated thieves, more to be abhorred than highway robbers.

16. That all such should forfeit their positions and salaries, be disfranchised, and punished as other criminals.

17. That the most rigid economy in public affairs is especially demanded by our indebted and depressed condition.

18. That the payment of the bonds in coin, originally payable in lawful money, was a gift to the bondholder, and the payment of the soldier in depreciated paper, when by contract payable in coin, was, and is, an unjust discrimination in favor of the bondholder. Therefore we demand, in justice to the soldier, that he be paid according to contract.

19. That we demand the immediate passage by Congress of a law for the equalization of soldiers' bounties.

20. That the right of suffrage is the inalienable right of every citizen of the United States.

21. We endorse and demand the passage of what is known as the "Reagan bill" on inter-State commerce, together with such other legislation as will force the transportation companies to become what the people designed them to be when they called them into existence, namely, the servants, and not the masters, of the people; aids to the development of the nation's resources, and not a power of a few men to build up an aristocracy of wealth, by crushing out all fair and honorable competition among business men.

22. That we are opposed to the importation of the Chinese servile labor.

23. That we denounce the arrest and imprisonment of American citizens for exercising the right of free speech, as one more step toward the subversion of republican institutions, and the enslavement of the people.

The Democratic State Convention met at Indianapolis on June 9th. The nominations on the State ticket were as follows: for Governor, Franklin Landers; for Lieutenant-Governor, Isaac P. Gray, who had been elected to the same office the preceding election, and had occupied the Governor's chair since the death of Governor Williams; for Secretary of State, John G. Shanklin; for Auditor, Mahlon D. Manson; for Treasurer, William Fleming; for Clerk of the Supreme Court, Gabriel Schmuck; for Reporter of the Supreme Court, A. N. Martin, the incumbent at the time; for Attorney-General, the incumbent, J. W. Woolen; for Superintendent of Public Instruction, A. C. Goodwin. On the first ballot for Governor, Landers and Gray received nearly the same number of votes, but, on the second, Landers was nominated. The platform adopted ran as follows:

1. We, the Democracy of Indiana, in Delegate Convention assembled, congratulate the Democracy of the country upon the harmony prevailing within its organization, and upon its unanimity in the purposes to cast behind it every occasion and sentiment of discord, and to stand as one man for success in 1889; and we give assurance to the Democracy of the country that, accepting the declaration of principles and purposes that may be made at Cincinnati, and the candidates who may be there chosen, we will give to them our earnest and undivided support.

2. We believe that laws should be enacted, executed, and administered only for the public good, and all class legislation, and all favoritism in the affairs of

government, should be defeated and made odious; that taxes should be levied justly, and the most rigid economy should control public expenditures; that the elections must be freed from the control of the army, and of partisan officials, in that they shall be fair and honest as they once were; and that the rightful jurisdiction of the State Courts must be restored, in all cases where it has been usurped by the Federal authority, so that justice may be administered cheaply and speedily.

3. The coin and paper money of the country should be of uniform value, and readily convertible, and should have as great purchasing power as the money of other first-class commercial countries of the world, and the paper money, like the coin, should be furnished by the United States, and should not be in excess of such quantity as will be, and remain always, at par with coin.

4. Inasmuch as the outstanding Treasury notes are no longer necessary to the Government in the use of its credit, and are useful only as money, they should be made subject to taxation, the same as other money.

As tax-payers we declare our gratification at the action of the Democratic members of Congress in reducing public expenditure, and in cutting off the allowance and payment of questionable and fraudulent claims, resulting in a saving to the Treasury of more than \$100,000,000.

5. We will stand with all our might against the aggression of the Republican leaders upon the rights of the States, made for the purpose of building up a strong central power, dangerous to the liberty of the people.

We will in all fidelity maintain the constitutional rights and powers of the United States, and as faithfully we will maintain and vindicate the rights of the States as reserved to them in the Constitution.

6. The Legislature of 1879 is entitled to honorable mention for having redeemed the pledges of the Democratic Convention of 1876 to provide by law for the comfort and safety of laborers in the mines, and for securing their wages to the persons employed by corporations, and we are in favor of such further legislation in the premises as may be necessary and proper.

We congratulate the people of the State that by the action of the Democrats of the last Legislature in basing representation on population and contiguity of territory only, the shame and taint of fraud have been removed from the apportionment of representation, and that now the people will be equally and fairly represented.

7. The people of Indiana are justly proud of their system of free schools, and will maintain them in their full force and usefulness, and to that end we must see to it that the management thereof does not become wasteful or extravagant, and that no part of the munificent fund which they have provided shall be used for sectarian or for any other purposes whatever than the support of common schools.

8. We are gratified that the Democrats in Congress have acted in respect to bounties and pensions for soldiers and their families in the spirit of justice and liberality.

9. We hold up to public detestation the conduct of the leaders in the Republican party in placing Hayes and Wheeler, by criminal practices shocking to every honest sentiment and damaging to our institutions, in offices to which they were not elected. It was an outrage upon free government, and a crime against the elective franchise that can not be forgiven, and must not be repeated, and for which the guilty parties must be driven from power and consigned to infamy. And we hold up to public detestation the conduct of the President in rewarding the guilty parties by conferring upon them high and lucrative offices. To reward crime is itself criminal.

10. During the past few years our country has been blessed in a high degree with favorable seasons, and the production of our valuable staples has been enormously in excess of our own consumption. We have sold to foreign countries many hundred millions more

than we have purchased from them; gold and silver have come to us; business confidence has been restored, and we have the hope and promise of good times again. In all this we recognize the blessing of God upon our country, and we denounce it as false and blasphemous when partisan leaders claim that this is the work of their hands, and that the people should be thankful to them and not grateful to Heaven for our returning prosperity.

11. We approve the sentiment expressed by Governor Hendricks in his letter of acceptance in 1876, that "the iniquitous cooly system, which through the agency of wealthy companies imports Chinese bondmen, establishes a species of slavery and interferes with the just reward of labor on our Pacific Coast, should be utterly abolished."

12. Our State administration is entitled to the respect and support of the people. The government of Indiana is efficiently administered, and more cheaply than that of any other State.

13. That we recognize the right of colored citizens as well as white to immigrate into Indiana, but we condemn and denounce the action of the Republican party in importing into this State pauper negroes for the sole purpose of using them as voters.

14. We hereby instruct our delegates to the National Convention at Cincinnati to present to that body the name of Thomas A. Hendricks as a candidate for President of the United States, one who has at all times faithfully maintained the cause of Democratic truth and justice acceptably to the Democracy of the whole Union, thus assuring the election of a Democratic Legislature and United States Senator in 1881, and a fresh, pure, and constitutional administration of the General Government.

15. We favor the continuance of the two-thirds rule in the National Convention, and the delegates this day chosen are hereby instructed to vote for Hon. Thomas A. Hendricks as our candidate for the Presidency, and to vote as a unit on all questions in said Convention.

One of the marshals, Claude Matthews, of the Eighth Congressional District, failed through inadvertency to comply with the law requiring him to gather and report the election returns on the fourth Monday in November. Thinking that the fourth Monday would be the last, he was a week behind the time set by law. His report was, however, embodied in the official count. A more serious difficulty resulted from the resignation of one of the Republican electors, and the substitution of another after the names had been published, and the blanks used by the county clerks in certifying the returns printed and distributed. Several of the clerks omitted to erase the name of Thomas W. Bennett, the candidate for elector for the Sixth District, who had withdrawn, and substitute the name of Benjamin S. Parker, who took his place on the ticket. Governor Gray permitted these errors to be rectified upon receiving affidavits from the clerks recertifying the certificate; but, in the case of tally-papers which contained the wrong name, the error could not be corrected.

The October election of State officers was watched with the intensest interest all over the country, because both parties shared the belief that a Republican victory would be a decisive indication of a like result in the Presidential election. The Republican candidate for Governor was elected by a plurality of 6,953, receiving 231,405 votes to 224,452 for the Dem-

ocratic and 14,881 for the Greenback candidate. The other Republican candidates were also elected. The total vote cast was 470,738. In the November election, the total vote polled was 1,856 greater, or 470,699 votes, of which the Garfield electors received 232,164, the Hancock electors 225,522, and the Weaver electors 12,986, making Garfield's plurality 6,642. In the elections for the Legislature, 10 Democratic and 15 Republican Senators, and 47 Democratic and 53 Republican Assemblymen, were elected. There is a Democratic majority of 2 in the Senate, 16 Democratic and 9 Republican Senators holding over; the Republican majority in the House being 6, and on joint ballot 4.

IOWA. The regular biennial session of the Legislature of Iowa—that of its Eighteenth General Assembly—began on the 12th of January and came to a close on the 27th of March. Two hundred and eleven acts and fourteen joint resolutions were adopted. Among the latter was one memorializing Congress to pass a law for the regulation of inter-State commerce which should prevent abuses of management, unjust discriminations, and excessive charges on the part of railways running in more than one State. An amendment of the Constitution already proposed, the effect of which is to make colored persons eligible to the Legislature, was approved, and provision made for its submission to a popular vote. A new amendment was proposed after considerable discussion, which is as follows:

SECTION 26. No person shall manufacture for sale, or sell, or keep for sale, as a beverage any intoxicating liquors whatever, including ale, wine, and beer. The General Assembly shall, by law, prescribe regulations for the enforcement of the prohibition herein contained, and shall provide suitable penalties for the violation of the provisions hereof.

Several other propositions to amend the Constitution failed to receive the necessary vote, including one conferring the right of suffrage upon women, which passed the lower house by a vote of fifty-eight to thirty-one, and was defeated in the Senate. Provision was made for submitting to a vote of the people the question of holding a convention for a general revision of the Constitution.

Among the more important acts passed was one establishing a State Board of Health, and one providing for the appointment of a Commissioner of Immigration. The Board of Health is to consist of nine members, who are to hold office seven years. The Attorney-General is to be a member *ex officio*, and one engineer and seven physicians are to be appointed by the Governor, with the approval of the Executive Council. The general supervision of public health, collection of vital statistics, and guidance of local boards are the main functions of the new organization. The Commissioner of Immigration is to be appointed by the Governor, hold office for two years, and receive a salary of \$1,200 a year in addition to expenses.

An act was also passed discontinuing the office of Register of Lands and uniting its functions with that of Secretary of State, who is allowed an additional clerk. The law in relation to capital punishment was so modified as to empower the court to pass sentence in case of a plea of guilty, but to allow the jury to name the punishment in case of conviction by their verdict. An act was passed providing for a "badge of honor" to be given by the State to every honorably discharged soldier, and every citizen of the State who served in the navy during the civil war. An act was also passed regulating the practice of pharmacy and the sale of medicines and poisons under the supervision of three Commissioners of Pharmacy to be appointed by the Governor.

The political canvass of the year opened with a convention of the Democrats at Burlington on the 7th of April, at which delegates were chosen to the National Convention of the party to be held at Cincinnati in June. Four delegates from the State at large, and two from each of the nine Congressional districts were elected, and the following report of a committee on resolutions was adopted:

The Democrats of Iowa reassert and reiterate their faith in the principles of the Democratic party as taught by the fathers of the republic; denounce the fraud and corruption of the Republican party policy; deprecate the policy tending to imperialism, evidenced by the continued usurpation of power by the few, by which monopolies are encouraged, labor and industry oppressed, and the liberties of the people threatened. The Democrats of Iowa are now, as in the past, in favor of the two-thirds rule in the National Democratic Convention in selecting candidates for President and Vice-President of the United States.

A Republican Convention for the appointment of delegates to the national gathering of the party at Chicago was held at Des Moines on the 14th of April. The resolutions adopted were as follows:

Resolved, By the Republican party of Iowa, in State Convention assembled:

1. That adhering to the principles of the Republican party, as heretofore announced by its National Conventions, we do not deem it necessary or expedient at this time to restate them in the form of a platform.

2. That we insist on the nomination of well-known Republicans, of national reputation for ability, purity, experience in public affairs, and adhesion to the principles of the Republican party, for President and Vice-President of the United States by the National Republican Convention.

3. That as Republicans of Iowa, recognizing in the Hon. James G. Blaine, of Maine, a man of tried integrity, of uncompromising loyalty and patriotism, of commanding ability, both as a leader and statesman, and as a fearless advocate of the principles which have preserved the Union and given undying luster to the party of which he is the admired representative, we take pleasure in recording the fact that he is the preference of the Republicans of Iowa for the office of President of the United States; and while we pledge ourselves to support the nominee of the Chicago Convention, we nevertheless declare it as our conviction that no other candidate will develop the enthusiasm or call out the number of votes that would be polled by the American people for James G. Blaine as the standard-bearer of the Republican party in the National contest of 1880.

4. That the delegation of this Convention to Chicago be instructed to cast the vote of Iowa as a unit, and that the delegation be further instructed to use all honorable means to secure the nomination for President of Hon. James G. Blaine.

A convention of the National Greenback-Labor party took place at Des Moines on the 19th and 20th of May, at which delegates to the National Convention were appointed, and candidates nominated for State offices, and for Presidential electors. The nominees for State offices were: G. M. Walker for Secretary of State; Matthew Farrington for Treasurer; G. V. Swevenger for Auditor; W. A. Spurrier for Attorney-General; and Thomas Hooker for Register of the Land Office. A platform was adopted, of which the following are the material declarations:

1. *Resolved*, That all currency, whether metallic or paper, necessary for the use and convenience of the people, should be issued and controlled by the Government, and not by or through the bank corporations of the country; and when so issued shall be a full legal tender for the payment of all debts, public and private.

2. *Resolved*, That so much of the interest-bearing debt of the United States as shall become redeemable in the year 1881, or prior thereto, being in amount \$782,000,000, shall not be refunded beyond the power of the Government to call in said obligations and pay them at any time, but shall be paid as rapidly as possible, and according to contract. To enable the Government to meet these obligations, the mints of the United States should be operated to their full capacity in the coining of standard silver dollars, and such other coinage as the business of the country may require.

3. *Resolved*, That as the producing classes are now enslaved by interest-bearing debt, therefore we are unalterably opposed to all bonded indebtedness.

4. *Resolved*, That the payment of the bonds in coin, originally payable in lawful money, was a gift to the bondholder, and the payment of the soldier in paper, when by contract payable in coin, was and is an unjust discrimination in favor of the bondholder; therefore we demand, in justice to the soldier, that he be paid according to contract.

5. *Resolved*, That we are opposed to the importation of Chinese semi-barbarous labor, regarding it as a paralyzing and degrading system that will, unless checked, undermine American free labor.

6. *Resolved*, That we demand the immediate passage by Congress of a law for the equalization of soldiers' bounties similar to the one vetoed by President Grant.

8. *Resolved*, That the right of suffrage, free press and speech, are the inalienable rights of every citizen of the United States.

9. *Resolved*, That we denounce the discrimination between Government clerks and Government laborers; the clerks working six hours and the laborers ten hours.

10. *Resolved*, That we are opposed to a large standing army, either National or State, in times of profound peace, eating out the substance of the people.

Resolved, That we, as the National Greenback-Labor party, know no North, no South, no East, no West.

Resolved, That all banks of issue and all monopolies must go.

The Republican Convention for making nominations was held at Des Moines on the 25th of August. The candidates agreed upon for State offices were as follows: Secretary of State, J. A. T. Hull; Treasurer, Major E. Conger;

Auditor, W. V. Lucas; Attorney-General, Smith McPherson; and Register of the Land Office, J. K. Powers. A platform was adopted which in addition to congratulations and reaffirmations contained these declarations:

5. As the ballot is the basis of citizenship and the hope of freedom, we declare that it is the sacred duty of the Republican party to not only defend and maintain the national election laws, but to provide through appropriate Congressional legislation whatever additional safeguards and protection experience may have proved to be necessary, to the end that the ballot in every State may be as sacred and safe as life and liberty.

6. The general interests of the country require that Congress shall so regulate inter-State commerce as to prevent unjust discrimination in the transportation of freight and passengers.

The Democratic nominating convention was held at Des Moines in the early part of September. The candidates selected were A. B. Keith for Secretary of State; Martin Blim for Treasurer; Charles I. Barker for Auditor; C. A. Clark for Attorney-General; and D. Dougherty for Register of the Land Office. Brief resolutions were adopted approving the platform and candidates of the National Convention, together with the following:

3. We are in favor of a judicious license law, and condemn all efforts to legislate against those natural rights which do not trespass upon those belonging to the whole community, and we applaud the action of our representatives at Des Moines in the Eighteenth General Assembly for their manly and able opposition to the attempts at sumptuary legislation made by a Republican legislature.

The choice of State officers was made on the same day with the Presidential election in November, although ordinarily the State election occurs in October.

The total vote for Presidential electors was 322,473, of which 183,927 were for the ticket of Republican candidates, 105,845 for that of the Democrats, and 32,701 for the Greenback candidate.

The vote for Secretary of State amounted to 323,128, of which Hull, the Republican candidate, received 184,166; Keith, Democrat, 105,760; Walker, Greenbacker, 32,780; Hall, Anti-Secret Society, 282; and 140 were "scattering." The Republican plurality over the Democratic vote was 79,406, while its majority over all was 45,204. The vote on the amendment of the Constitution, striking the words "free white" from the clause defining the qualifications for membership of the Legislature, was 90,237 in its favor, and 51,945 against it, so that it was ratified by a majority of 38,294. The proposition in regard to holding a convention to revise the Constitution was rejected by a majority of 14,022, the vote being 69,762 for and 85,784 against it. Republicans were elected to Congress from all the nine districts, the changes being in the sixth and seventh, where Greenbackers were chosen in 1878.

The population of Iowa by counties, as shown by the Federal census of 1880, in a return sent

by Superintendent Walker to the Secretary of State, is as follows:

Total for State.....			1,624,463

Des Moines, the capital, has risen to the rank of first in population of the cities of the State, the number of its inhabitants being 22,408. The population of Dubuque is 22,254; Davenport, 21,834; Burlington, 19,450; Council Bluffs, 18,059; Keokuk, 12,117; and Cedar Rapids, 10,104.

The total value of property in the State as assessed for taxation is \$392,557,304. The total tax for the year amounted to \$10,238,017, the average rate being twenty-six mills on the dollar. The number of miles of railroad in the State on the 15th of September was 4,977, represented by \$106,719,429 of stock, and \$82,164,510 of debt. The increase in length of track for the year preceding was 581 miles. Of the entire length 1,591 miles are laid with steel rails. The total earnings for the year ending September 15th were \$24,857,545.35, of which \$6,209,386.34 was derived from passenger traffic, and \$18,628,159.01 from freight. Operating expenses for the year amounted to \$13,982,653.77. The increase of earnings over the previous year was \$3,496,835.91, while that of operating expenses was but \$1,078,232.85. The railroads paid \$591,843.08 in taxes, which was nine per cent. of the net income. Six com-

panies control more than four fifths of the railway in Iowa, as follows:

	Miles.
Chicago, Burlington and Quincy.....	756.94
Chicago, Rock Island and Pacific.....	848.90
Chicago and Northwestern.....	574.26
Illinois Central.....	492.06
Chicago, Milwaukee and St. Paul.....	975.99
Burlington, Cedar Rapids and Northern.....	465.71

Total..... 4,026.86

According to the records of the State Auditor's office, there are in Iowa 1,745,149 cattle, valued at \$18,445,957; 691,797 horses, valued at \$20,247,884; 356,846 sheep, valued at \$423,886; and 2,466,935 swine, valued at \$4,652,601. Real estate to the value of \$4,960,224 is exempt from taxation on account of tree-planting.

The school statistics of the year show that there were 10,590 ungraded public schools and 2,209 departments in graded schools in operation an average of 7.4 months. There were 7,254 male and 14,344 female teachers, employed at average compensation per month of \$31.16 for males, and \$26.28 for females. The number of children between the ages of five and twenty-one years was 586,456, of whom 426,937 were enrolled in the public schools. The average attendance was 259,836. The average cost of instruction per month for each pupil was \$1.56. The whole number of school-houses was 11,037, valued at \$9,227,943. The receipts and expenditures balance at \$1,390,-442.79 for the school-house fund, \$1,453,970.14 for the contingent fund, and \$4,841,872.56 for the teachers' fund.

On the 30th of September there were 378 inmates in the State Penitentiary, an increase of twenty-five for the year. The average ages of the convicts was twenty-seven years, seven months, and thirteen days; average sentence, one year, ten months, and seven days.

YEARS.	Births.	Rate to population.	Deaths.	Rate to population.	Marriages.	Rate to population.

1878.....	41,124
1879.....	47,065

Total from 1851-1879..... 2,541,670

The Census Commissioners of 1841 divided the dwellings of the people into four classes. The fourth class comprised all mud-cabins having only one room; the third class consisted of a better description, built from mud, but varying from two to four rooms, and windows; the second were good farm-houses, or, in towns, houses having from five to nine rooms and windows; the first class included all houses of

IRELAND, AND THE IRISH QUESTION. As Ireland is an integral part of the United Kingdom, the former volumes of the "Annual Cyclopædia" have treated of the condition and current history of Ireland under the head of Great Britain. During the year 1880 the affairs of Ireland have attracted the attention of the world to an unusual degree, and the Irish question has become one of the great complications of European politics. We therefore devote this year a special article to Ireland, giving a full account of the proceedings and the progress of the Land League, and such Irish statistics as will aid in understanding the present situation of the country.

The population of Ireland, according to the last official census of 1871, was 5,402,759. In 1861 it was 5,798,624; in 1851, 6,514,473; in 1841, 8,199,853; in 1831, 7,767,401; in 1821, when the first complete census was taken, it amounted to 6,801,827. These numbers show a decrease during the period from 1841 to 1871 of more than 2,700,000, a fact without parallel in the recent history of civilized countries. Between 1841 and 1851, the decrease amounted to 19.79 per cent. of the population; from 1851 to 1861, to 11.79 per cent.; from 1861 to 1871, to 6.67 per cent. Since 1871 the decrease has continued, though at a much less rate. At the middle of the year 1880 the population was estimated at 5,327,000.

The number of large towns in Ireland is much smaller than in England and Scotland. Among the fifty-six towns of the United Kingdom which in 1871 had a population of more than 40,000 inhabitants, only three belonged to Ireland: Dublin with 246,326 inhabitants, Belfast with 174,394, and Cork with 78,642.

The number of births, deaths, and marriages in the years 1877, 1878, 1879, were as follows:

a better description. The following table shows the house-accommodation in 1841, 1851, 1861, and 1871:

	1841.	1851.	1861.	1871.
First class.....	40,050	50,164	55,416	60,919
Second class.....	264,184	318,758	360,693	387,660
Third class.....	533,297	541,712	489,668	357,126
Fourth class.....	491,278	135,589	89,374	155,675
Total.....	1,323,889	1,046,223	995,156	961,380

The total number of persons, five years old and upward, in 1841, who were unable to read and write, was 3,766,066, or 53 per cent.; for 1851 the proportion had fallen to 47 per cent.; in 1861 it was further reduced to 39 per cent.; and in 1871 to 33 per cent., showing a decrease during the period between 1841 and 1871 of 20 per cent. Those who could read only were in the same proportion in 1861 as in 1851—20 per cent., which was an increase of 1 per cent.

only since 1841; in 1871 the percentage was 17·3; those who *write* as well as read advanced from 28 per cent. in 1841 to 33 per cent. in 1851, and 41 per cent. in 1861, being an increase between 1851 and 1861 of 8 per cent., and between 1841 and 1861 of 13 per cent. In 1871 the percentage was 49, being an

increase between 1861 and 1871 of 8 per cent., and between 1841 and 1871 of as much as 21 per cent.

The number of educational establishments, primary and superior, and the number and religious profession of pupils and students, in 1861 and 1871, are shown by the following table:

	ESTABLISHMENTS.		PUPILS.	
	1861.	1871.	1861.	1871.
<i>Primary schools:</i>				
Schools under Board of National Education.....	5,663	6,834	304,162	490,608

The number of the Irish-speaking population is rapidly decreasing, as will be seen from the following table:

	1861.	1871.
Persons who spoke Irish only.....	163,275	103,562
Persons who spoke Irish and English.....	942,261	714,313
Total persons who could speak Irish.....	1,105,536	817,875
Proportion per cent. of the population who could speak Irish.....	19·1	15·1

The country is represented in the Imperial Parliament by 28 imperial peers and 103 commoners. Of the latter class, 64 represent 32 counties; 2 Dublin University; 12 the cities and towns of Dublin, Cork, Limerick, Waterford, Belfast, and Galway; and 25 the boroughs. By an act passed in 1854, occupiers of any tenements, rated in the last poor-rate at a net annual value of £12 and upward, are entitled to vote in elections for counties, also owners of certain estates of the rated net annual value of £5. By the same act, occupiers in boroughs, rated in the last poor-rate at £8 and upward, were entitled to vote, subject to certain limitations. An act passed in 1868 reduced the £8 occupation to a rating of any amount more than £4, and introduced a new franchise, giving the right of voting to any lodger who had occupied, as sole tenant, for the twelve months preceding the 20th of July in any year, the same lodgings (being part of one and the same dwelling-house) of a clear yearly value, if let unfurnished, of £10 and upward. The polling at contested elections in counties, cities, and boroughs, is now for one day only. The number of electors on the register are 170,693 for counties, and 57,290 for cities and boroughs, exclusive of 3,548 for Dublin University.

The large majority of the population belongs

to the Roman Catholic Church. The Roman Catholic population numbered, in 1871, 4,141,933, while the Episcopalians 683,295, the Presbyterians 503,461, the Methodists 41,815, the Independents 4,485, the Baptists 4,643, the Society of Friends 3,834, the Jews 258. The Roman Catholics constituted 96·2 per cent. of the population in Connaught, 93·7 per cent. in Munster, 85·4 per cent. in Leinster, but only 48·9 per cent. in Ulster. In all Ireland they were 76·7 per cent. of the population, against 77·7 per cent. in 1861. Among the 103 Representatives of Ireland in the House of Commons, 55 were Roman Catholics. Among the 185 Irish Peers, there are 12 Roman Catholics. There is no Roman Catholic among the 28 Representative Peers for Ireland.

The Poor law came into operation in 1838, but none of the workhouses were opened for the admission of paupers till 1840. Notwithstanding the constant flow of emigration, the number of paupers relieved, both in the workhouses and out of them, was larger in 1879 than in any previous year. The number of paupers relieved in 1879, continuously or successively, was as follows:

In the workhouses.....	304,826
Out of the workhouses.....	56,426
Total relieved.....	391,252

The total Poor Relief Expenditure amounted to £847,955.

In 1870, the Irish Government obtained returns of the names of proprietors, and area and valuation of all properties in the several counties of Ireland, held in "fee," in "perpetuity," or on "long leases at chief rents," classified according to area, but omitting cities and towns. The total number of agricultural holdings was ascertained to be 608,964, and the rural population 4,286,019. From these returns the following details are given:

AREAS OF PROPERTIES.	No. of proprietors.	Total area in statute acres.	Total valuation.
20,000 acres and upward.	110	4,151,142	£1,512,594
20,000 to 10,000.....	192	2,607,719	1,174,223
10,000 to 5,000.....	440	3,071,471	1,453,697
5,000 to 2,000.....	1,246	3,872,611	1,997,202
2,000 to 1,000.....	1,773	2,474,756	1,985,551
1,000 to 500.....	2,693	1,571,171	1,193,577
500 to 300.....	2,271	854,493	591,104
300 to 200.....	1,916	471,646	345,662
200 to 100.....	2,788	408,639	334,476
100 to 50.....	2,082	152,004	144,441
50 to 25.....	1,460	52,504	62,637
Under 25 acres.....	2,377	29,056	47,187
Total.....	19,288	20,047,572	£10,182,681

The total number of ejectments executed "for non-payment of rent" was in 1878, 1,749; in 1879, 2,077; and from January 1 to June 30, 1880, 1,696. The number of families evicted for non-payment of rent was in 1877, 261; in 1878, 608; in 1879, 903; and from 1st of January to 30th of June, 1880, 995. The number of agrarian outrages was in 1878, 280; in 1879, 870.

The following statement of the number of land-proprietors, who hold in fee-simple or perpetuity, or on long leases at chief rents, is founded on a return presented to the House of Commons on the 23d of April, 1872:

CLASSIFICATION OF THE PROPRIETORS.	No. of proprietors.	Area of property in statute acres.	Annual value of property for rating.
1. Resident on or near the property.....	5,589	8,880,549	£4,718,497
2. Resident usually elsewhere in Ireland, and occasionally on the property.....	377	852,818	371,123
3. Resident elsewhere in Ireland.....	4,465	4,362,446	2,128,220
4. Proprietors resident in Ireland and their properties.....	10,431	14,095,813	£7,217,840
5. Not usually resident in Ireland, but occasionally on the property.....	180	1,363,847	£601,072
6. Barely or never resident in Ireland.....	1,443	8,145,514	1,583,041
7. Proprietors not ascertained (therefore here assumed to be non-resident).....	1,350	615,303	331,743
8. Absentee proprietors and their properties.....	2,973	5,129,169	£2,470,816
9. Proprietary institutions, public or charitable, or public companies.....	161	534,327	£234,678
10. Proprietors, or properties under 100 acres, unclassified.....	5,982	236,873	257,100
General total.....	19,547	20,046,182	£10,150,484

The Irish peerage consists of one peer of the royal blood, the Earl of Armagh, Ernest Augustus, Duke of Cumberland, 2 dukes (Leinster, Abercorn), 11 marquesses (Waterford, Downshire, Donegal, Drogheda, Headfort, Sligo, Ely, Londonderry, Conyngham, Ormonde, Clanricarde), 63 earls, 38 viscounts, 67 barons; total, 185 Irish peers. Besides the peer of the royal blood, there were, in 1880, 78 Irish peers who had also British titles, and, on that account, sat and voted in the House of Lords, and 105 peers who had no seat in the House of Lords; of the latter class, 28 are elected for life as representative peers for Ireland. Among the 185 Irish peers, there are only 12 Roman Catholics, namely, the Earls Westmeath, Desmond (Earl of Denbigh, in England), Fingall, Granard, and Kenmare; the Viscounts of Gormanston, Netterville, Taaffe, and Southwell; the Barons Louth, Ffrench, and Bellew.

The chronic dissatisfaction with English law which has existed in Ireland ever since its annexation to England, and which again begins to assume so large dimensions, is now more than ever concentrating itself in a national uprising against the land laws. The race question, though it may embitter the strife, is no longer the leading feature, for the opposition of the Land League is no less directed against the old Irish families which are landholders than against those which are English. Moreover, Ireland at present has not a more unmixed race than England and Scotland, and on this account an indelible hatred of one race against the other is hardly possible any longer. Of still less

moment is the religious* question. During the last forty years many of the most prominent men of the Irish agitations have been Protestants. Thus William Smith O'Brien, the leader of the "Young Ireland" movement, was a Protestant; so was Sir John Gray, who distinguished himself by his efforts in behalf of the abolition of the State Church; so was Isaac Butt, by whose untimely death the Home Rulers lost in 1878 their most gifted leader (see "Annual Cyclopædia" for 1878, article Butt), and so is Parnell (see PARNELL), the chosen head of the Land-League party. As the present movement is essentially of an agrarian character, a brief review of the land laws* prevailing in Ireland will help us to understand the importance of the whole question.

There is strong reason for believing that, very early in the history of Ireland, land was held as common property, and the commons even at the present time are remnants of that communal tenure. At the time of the Norman invasion land was held under three forms of tenure: commonage land, mensal land or land connected with the land of chief magistracy, and land held by the nobility. Part of this land held by the nobles was held as demesne land, and the remainder was given over to the tenants. The demesne land was cultivated by villeins of three classes, none of which possessed any political rights. First came the

* The relation of the race and religious differences to the present Irish question is fully treated of by Dr. Sener, "Die irische Frage," in the "Augsburg Gazette," 1881, No. 29-33.

† The following outline of the history of Irish land laws is condensed from H. C. Adams, "The Irish Land Question," in the "New Englander," January, 1881.

Bothachs or Cottiers, who held a right of settlement, probably as all that remained to them of their share of communal property; a second class, the Sincleithe, the descendants of mercenaries or prisoners who "had acquired a right of settlement," possibly through the analogy of their condition to that of the Cottiers; a third class, the Fuidirs, foreigners, who might gain a right of settlement by forfeiting their rights as freemen. Service under two successive lords, however, regained for them their forfeited right. The tenants upon the remainder of the landed estates were of two kinds, called Saer Ceili and Daer Ceili—that is, free-tenant and base-tenant. The relation of the former to the noble was analogous to that of knights' service in feudal laws, and of the latter to common socage. These tenants, as well as the laborers upon the demesne land, held rights in their tenements which the common law protected against the encroachments of the nobility. Thus this right of security in tenure has for Ireland the sacredness of antiquity. Though modified by the successive conquests and settlements, the idea of property in his holding has never been entirely uprooted from the mind of the peasant. Yet previous to 1870 this idea had a practical influence only in the province of Ulster; in the three other provinces it had given way to the successive encroachments of landlords. As the legislative or statutory power was in the hands of landlords or landlord sympathizers, these encroachments had been legalized in various ways. Three acts of Parliament may be cited which took away rights from the Irish peasant which he believed himself to possess by the authority of the common law. The first provided that, should a tenant resort to legal procedure to prove unfounded the claim of a landlord, and lose his case, he should be fined twice the costs. By another act, Parliament refused to recognize the right given to the tenant by the common law, according to which a standing or growing crop was considered part of the soil, and the landlord, although holding a judgment against his tenant, could not seize it. Parliament empowered the landlord to send his helper to take possession of the field and bear away the crop when ripe. As another innovation, Parliament granted to the landlord "power of evicting his tenant for non-payment of rent, and of recovering possession of the land in cases in which he was not entitled to this remedy by the forms of his contract or by the rules of common law." Thus the Irish landlords obtained remedies unknown to those of England or Scotland. The third of the above enactments produced the greatest grievance. This, as interpreted and practiced, came to mean the right on the part of the landlord to evict a tenant at will. It was not until the time of George I that anything like eviction, even for non-payment of rent, was recognized, and to the tenant, who was now for the first time deprived of all property right in his holding, it was really con-

fiscation. A different system of land-tenure was adopted by the northern province of Ireland, which is commonly known as the Ulster Right or Ulster Custom. So far as the tenant is concerned it secured to him three rights: 1. Security of tenure as long as the rent was paid and no injurious mode of farming followed. 2. The right to sell his holding at will, together with improvements put upon the farm, to any person approved by the landlord. 3. Rent could not be determined by competition but by valuation. Under this system of tenure Ulster has become by far the most prosperous of the four provinces of Ireland. In the three other provinces "competitive rents" have been paid for generations. By that term is meant that farms were advertised and let out at the rent offered by the highest bidder. This custom placed the culture of the land in the hands of shiftless and dishonest peasants, and forced those who would be thrifty to become as shiftless as their neighbors. For a few years previous to the Gladstone Land Act of 1870, the land-tenure question had been brought prominently into notice, as well by the great economic changes that were taking place as by agitation of agricultural grievances. In 1870, of the entire extent of the island, one half was given to pasture-land, nearly one fourth was bog or waste land, and a little more than one quarter under cultivation. According to Cliffe Leslie, between 1861 and 1869, 1,398,000 acres of land have gone out of cultivation, the crop-land being converted into pasture, but there had been no increase of pastoral products corresponding to the increase of pasture-land. For while in 1859 the number of horses had been 629,075, of cattle 3,815,598, and of pigs 1,265,751, there were in 1869 only 527,248 horses, 3,727,097 cattle, and 1,079,793 pigs. In about three fourths of the island, says Mr. Leslie, we find "hardly a town or village whose trade and population have not decreased in the last twenty years"; indeed, "but few which are not in a state of complete decay, in spite of the auxiliaries to town industry, mechanical, chemical, and intellectual, which those twenty years have created." This system of tenure Mr. Gladstone, in 1870, tried to reform by his Land Act. It contained two principles: 1. The recognition of the Ulster Custom as embracing the sanctity of law in Ulster, and as desirable for the whole island. 2. The recognition of the superiority of peasant proprietorship over any form of tenantry whatever, and the right of the Government to aid peasants to become holders in fee-simple. The act did not carefully define the Ulster Custom legalized by Parliament, "but the framing of an accurate definition appeared so difficult," as Mr. Gladstone afterward declared, "that it was considered best to confide that duty to the courts of law." A decision in the case of *Graham vs. Earl of Erne*, declared that custom to embody the following points: 1. "The right or custom in general of yearly tenants, or those deriving through them, to

continue in undisturbed possession so long as they act properly and pay their rents." This gave the yearly tenant a perpetual lease for good behavior, and rendered him independent of the landlord. 2. "The correlative right of the landlord periodically to raise the rent, so as to give a just, fair, and full participation in the increased value of the land, but not so as to extinguish the tenants' interest by imposing a rack-rent." As far as the sections of the Gladstone Land Act referred to Ulster, they gave to the landlords and tenants of that province entire satisfaction. Three sections of the Land Act affected particularly the provinces other than Ulster. By the third section, any tenant who is "disturbed" in his holding, may receive compensation upon quitting it; in other words, a pecuniary fine is placed on eviction. By "disturbance" any eviction caused by no fault of the tenant is understood. The non-payment of rent, as cause of eviction, would not be included under this head; eviction for the purpose of putting cultivated land into pasture-land would be judged a disturbance. By the fourth section, the tenant is secured compensation for improvements which he or his predecessors in title may have made. Previously the landlord had, at the close of any tenancy, considered himself entitled to all improvements made on the land except recognized fixtures. This is one of the most important sections of the Land Act of 1870. By the seventh section it was declared that, if a tenant had paid money on account of coming into his holding, on quitting it, he should receive some compensation for such payment. The tenant right created by these three sections for the peasants of southern Ireland, though not exactly the Ulster right, is something like it, but the hope of the Gladstone Government that it would place the three provinces on a level with Ulster in regard to prosperity were not fulfilled. It became apparent to the landlords that an estate in the hands of a few large farmers was more manageable, and in every way more desirable, than an estate divided among a large number of peasant tenants; and it was also discovered that, on account of the new kind of property which could be created under the act, the process of change was not altogether unprofitable to them. Accordingly, evictions have not ceased since 1870, and farmers have found it necessary to form clubs to "protect tenants' rights under the act, and to have the act amended."

The second great principle embodied in the Gladstone Land Act of 1870 is a recognition of the superiority of peasant proprietorship over any form of tenure whatever, and the right of the Government to assist peasants to become proprietors in full of their holdings. The act permitted the Government, through a Board of Works, to advance two thirds of the purchase money in any case where the landlord was willing to sell. If the supporters of this claim expected any rapid change in the tenure of

land, they were doomed to disappointment. The landlord, not being forced to sell, would only part with his estate for pecuniary considerations, and it has ever been found to be more advantageous to him to sell his estate as a whole to an incoming landlord than to sell in small farms to the tenants.

Previous to the reaccession of the Liberal party to power, in 1880, Sir Stafford Northcote, a member of the Disraeli Government, introduced a bill, which afterward became a law, proposing that the Government be empowered to loan money to Irish landlords at the rate of one per cent. for the improvement of their estates. On the Liberal side Mr. Bright proposed that the Government buy all estates offered for sale, and resell in small farms on thirty-six years' time, and further, that the Government buy by forced sales, for this purpose, all lands held by corporations. Irish dissatisfaction with English law greatly increased in 1877 and 1878, when the harvests were bad, and still more in 1879, when the harvest was a total failure. In October, 1879, Mr. Parnell organized the National Irish Land League, of which he was chosen president. The League declared its objects to be—a reduction of rents, and refusal to pay if such a reduction were refused; and, finally, an entire change in the land laws, peasant proprietors to be substituted for the landlord. (See "Annual Cyclopædia" for 1879.)

The violent agitation, of which Ireland had been the scene in 1879, continued unabated throughout the year 1880. Severe distress prevailed in Ireland during a part of January, 1880, and the attempts of the agents of landlords to collect rent were frequently attended by disorders. The Roman Catholic Bishop of Elphin said, in a letter to the Dublin Mansion House Relief Fund, that the failure of the crops and the loss and depreciation of live stock had pressed with exceptional severity in Sligo and Roscommon. In the towns the tenants were unable to pay rents, landlords were straitened and embarrassed, and the distress was universal, while in the cottier and small tenant class thousands of families were suffering from hunger. The conviction was general that relief should come from the treasury. Mr. Davitt reported to a meeting of the National Land League that, in Connemara, all expressed the belief that private charity would not be able to cope with the distress between March and June, and that Government aid alone would prevent starvation.

The Government determined, in order to help to relieve the distress, to extend the facilities for loans that had lately been offered under the Board of Public Works by taking £250,000 from the Church Surplus Fund, to be advanced so far as might be required, with the expectation of obtaining from Parliament an act of indemnity for the step. It was proposed that each of the loans should be paid back at the end of thirty-five years, making the annual charge for repayment of principal and interest

only four per cent. Subscriptions opened by the Duchess of Marlborough, at the Dublin Mansion House and in London, were liberally responded to, and the funds derived from these sources, with the measures of relief offered by the Government, were sufficient greatly to mitigate the distress before the close of January. Mr. Parnell having asserted that the administration of the Mansion House Fund was influenced by a political bias, several archbishops and bishops came forward to give the statement an emphatic denial and condemnation. The Duchess of Marlborough's fund amounted in March, including the subscriptions forwarded from London, to £80,000, while the Mansion House Fund had, at the same time, received £100,000. The sum of £100,000, which had been collected through the agency of the "New York Herald," was also contributed from the United States and placed in the hands of Archbishop McCabe for distribution. The United States frigate *Constitution* reached the country on the 2d of April, bringing supplies of provisions which had been contributed by citizens of the United States. A sum was also raised for the relief of the distress through the agency of the Land League. Less extensive measures of relief continued to be necessary through all the growing season till the harvest afforded new supplies of food.

Political issues were not clearly defined during the canvass for the Parliamentary elections, and the question of Home Rule did not enter as prominently into the discussions as it was anticipated it would do. The Home Rule League issued an address March 17th, which, after asserting that the movement had been attended with considerable success in drawing the attention of England to the claims of the Irish people, reviewed the letter which Lord Beaconsfield had addressed to the Duke of Marlborough. It described the words of the Premier on the Irish question as a "cry" which was an unscrupulous and audacious fabrication, designed to snatch a further lease of place and power by exciting English passions against Ireland. The insult upon Ireland implied in the matter and tone of his statements, it said, must be signally avenged; and the authors of the address counseled Irishmen to let every Tory candidate feel the utmost force of their hostility, to strain every nerve to inflict defeat on the followers of Lord Beaconsfield, and thus to punish the worst enemy they ever had. The Land League issued a manifesto, calling upon the electors to withhold their votes from all landlords; for to vote for them would be to vote for rack-rents, evictions, workhouses, and extermination. Mr. Parnell arrived at Cork from America March 21st. A dinner was given to him in the evening, when Mr. Biggar said in a speech: "They had seen what Hartmann had done in Russia, and if the constitutional course they were pursuing in Parliament at present failed in its object, he thought Ireland might be able to produce another Hartmann,

and probably with better results." In several instances Mr. Parnell set up candidates of his own selection in opposition to those who were already in the field, and thereby excited the hostility of members of his own party, which was manifested by a violent outcry and attack upon him at a meeting in Rexford before which he was about to speak. A conference of forty-four Home Rule members-elect was held at Dublin, May 16th, when Mr. Parnell was elected sessional leader of the party over Mr. Shaw, and a resolution was passed favoring the introduction into Parliament of a bill forbidding ejectments from holdings in Ireland valued at twenty pounds sterling or under, until a satisfactory solution of the land question had been arrived at. Mr. Shaw insisted that the appointment of Mr. Parnell as head of the party must be accepted on his side upon the understanding that it did not involve a sanction of the principles which he had advocated in America and throughout Ireland during the last few months. The excitement on account of agrarian outrages rose to a great height after the murder of Lord Mountnorres, who was shot dead on the 25th of September near his home at Ebor Hall, Clonbur, County Galway, as he was returning from a meeting of magistrates. He had not been connected with any proceedings for eviction, nor was he about to evict any tenant. He had, however, been engaged in a dispute with one of his tenants with regard to the character of his holding, and had till a short time previously had the protection of an escort of police.

Much interest was excited in November by the case of Captain Boycott, agent of the Earl of Erne, under whom he also rented a farm at Lough Mask, County Mayo. The Earl had, unsolicited, made reductions in his rents within the last two years, which brought them below Griffith's valuation, and had, in addition, provided his tenants with seed and artificial manure to the extent of one fifth of the rental. The tenants now demanded a further reduction of twenty-five per cent. in their rents, and, their request being refused, declined to pay anything. Ejectment processes were taken out, but the process-server was badly beaten, and it was found possible only to serve three of the papers. Captain Boycott was afterward subjected to a continuous persecution. Laborers declined to work for him, and his crops were left ungathered. Shopkeepers would not sell him goods, the people refused to speak to him, car-owners did not dare to convey goods for him, and his estate had to be protected by military patrols, notwithstanding which outrages were of frequent occurrence upon it. A movement was organized among the opponents of the Land League in the North to relieve Captain Boycott, by gathering his crops for him. A party of fifty Orangemen went down, protected by detachments of soldiers stationed at different points along the road, and accomplished their object of taking care of the crops and setting the farm in order, successfully and

without disturbance. This incident gave origin to the new verb "to boycott," which became extensively current in the newspapers to denote that kind of persecution which is carried on through a conspiracy to deprive the object of it of the privileges of intercourse and trade with his fellow men.

The Royal Commission of Inquiry into the working of the Irish Land Act held its first sitting at Dublin on the 1st of September. Its purpose was to seek information through the *viva voce* examination of witnesses, and by procuring replies from competent persons, to whom carefully prepared written questions were addressed, as to whether rents had increased since the Land Act of 1870 went into operation; whether the compensations given under that act had been fair and sufficient; whether the effect of the act had been to lead to the making of improvements by the landlord or by the tenant; and whether the tenants had sought to borrow upon or mortgage the conditional property in their farms obtained under the act. Inquiries were also made concerning the workings of the Ulster Custom, and its adaptability to different parts of Ireland; and with respect to the possibility of reclaiming waste lands, and the best means of furthering the creation of small owners in fee, and, at the same time, preventing alienation or subdividing. The leaders of the Land League regarded the work of the Commission unfavorably, and resolved not to recognize it. Their action was not, however, acquiesced in by all their followers.

Mr. Parnell, addressing a meeting at Ennis, September 19th, said that he believed that the Commission was appointed in order to find out for the English Government what was the least measure of reform that had a chance of being accepted in Ireland, and to divert the minds of tenant-farmers from agitating and organizing. He could not see what useful effect evidence before the Committee could have, for its report, if it made a report, must be of a one-sided character, and against the interests of the people of the country. The character of the Land bill, to be secured at the next session of Parliament, would depend largely on the attitude the tenantry should maintain. The speaker exhorted his hearers to band themselves together into Land Leagues; and, having suggested the question what should be done with a tenant who should bid for a farm from which another had been evicted, he said that a more Christian and charitable way than to shoot him would be to shun him in every way, both in public and private, "by putting him into a moral Coventry, by isolating him from the rest of the country, as if he were the leper of old." No settlement of the land question, he said, could be satisfactory or permanent which did not insure the uprooting of the landlord system.

At the meeting of the League, of December 12th, Mr. Michael Davitt spoke in reference to

the charges which had been brought against the organization of causing law-breaking and disorder, which he repelled. As to the real facts, he said, four hundred and fifty demonstrations had been held in Ireland since the commencement of the movement, representing, on the supposition that each meeting was attended by an average of five thousand persons, an aggregate assemblage of more than two million people. If the passions of that number of people had been directly and systematically inflamed during the last two years, there would have been a far heavier calendar of crime and outrage than even the enemies of the League could bring against it. Yet, notwithstanding the famine and the serious crisis through which the country had just passed, it was found that during the last two years only five homicides and a small number of attacks upon individuals had occurred. A document was adopted setting forth the objects of the League, and the duties of branches. It urged that no compromise be made with "landlordism," and that the proposals known as the "three F's" (fixed tenure, fair rents, and free sales) should be rejected, and deprecated acts of violence, threatening letters, and the mutilation of cattle.

The State prosecution of Mr. Parnell, and thirteen of his leading associates in the Land League, commenced in the Queen's Bench Division, Dublin, on December 28th. Lord Chief Justice May, at the opening of the proceedings, intimated that he had resolved not to preside at the trial. He stated that his remarks on the occasion of the application for a postponement of the trial had been misconstrued, and that observations which he had made hypothetically, were erroneously supposed to express his deliberate opinions on the charges against the defendants. His connection with the trial would be caviled at by those who were unable or unwilling to comprehend any explanation. He therefore left it to Mr. Justice Fitzgerald and Mr. Justice Barry to conduct the trial at bar. The jury, as ultimately chosen to try the case, consisted of eight Catholics, three Protestants, and one Quaker. On January 5, 1881, Mr. Parnell, and the other members of Parliament included in the indictments, left Dublin for London to attend the opening of Parliament. The trial terminated on January 25th. The jury, after six and a half hours' deliberation, were unable to agree upon a verdict, and they were discharged. One of the jurymen stated that ten were of one way of thinking, and two of another.

Additional troops were sent to the country in December; and circulars were issued by the Government to the constabulary, directing them to take immediate steps against persons taking or being put in possession of premises from which they had been evicted, informing them that they would be held responsible for outrages committed against persons lawfully occupying such premises, and warn-

ing them to be on their guard against outrages by night-patrols.

ITALY,* a kingdom of Southern Europe. King in 1878, Humbert I, born March 14, 1844. He succeeded his father, Victor Emanuel II, January 9, 1878, and married, April 22, 1868, Margaretha, daughter of Prince Ferdinand of Savoy, Duke of Genoa. Heir apparent, Victor Emanuel, Prince of Naples, born November 11, 1869.

The area of Italy is 296,322·91 square kilometres, or 114,415 square miles. The following table gives the area of the larger territorial divisions (*compartimenti*), with the population at the close of 1878, according to an official calculation:

TERRITORIAL DIVISIONS.	Square kilometres, †	Inhabitants at the close of 1878.
Piedmont.....	29,286·20	3,077,200
Liguria.....	5,324·20	856,855
Lombardy.....	23,328·51	3,658,941
Venetia.....	23,463·73	2,512,022
Emilia.....	20,515·09	2,198,415
Umbria.....	9,683·46	573,405
The Marches.....	9,708·70	948,284
Tuscany.....	24,052·99	2,219,422
Rome.....	11,917·13	549,125
The Abruzzi and Molise.....	17,290·11	1,383,056
Campania.....	17,978·00	2,579,717
Apulia.....	22,115·07	1,522,782
Basilicata.....	10,675·97	582,927
Calabria.....	17,257·13	1,261,310
Sicily.....	29,241·27	2,798,672
Sardinia.....	24,342·05	667,427
Total.....	296,322·91	23,209,620

Of the total population, 8,777,131 lived in towns, and 19,432,489 in the country.

According to the census of 1871, Italy had 26,628,679 Roman Catholics, 58,651 Protestants, 35,356 Israelites, and 48,468 others (not belonging to any of these three denominations).

The number of emigrants in 1878 was 96,268; in 1879, 119,831. Of the latter, the largest number, 39,713, went to France, 18,617 to Austro-Hungary, 10,401 to Switzerland, 12,989 to Brazil, Venezuela, Mexico, and Central America, 3,208 to the United States and Canada, and the remainder to other countries. Considering that emigration has assumed extraordinary proportions, the Government early in 1880 issued a special circular to the prefects, recommending stronger measures against emigration than they have hitherto had recourse to.

The number of Italians living in foreign countries was estimated in 1871 at about 477,000, of whom 118,496 lived in France, 26,889 in Austro-Hungary, 17,980 in Switzerland, 50,031 in other states of Europe, 44,360 in the Levant and Northern Africa, 147,547 in South and Central America (Argentine Republic about 88,000, Uruguay 32,000), 70,000 in the United States, about 1,100 in Asia and Australia.

The following cities had, according to the latest information, more than 90,000 inhabitants in 1880:

CITIES.	Year.	Population.
Naples.....	1878.....	450,504
Rome.....	1880.....	303,358
Milan.....	1878.....	262,283
Palermo.....	1878.....	231,536
Turin.....	1879.....	231,636
Florence.....	1878.....	168,423
Genoa.....	1878.....	168,294
Venice.....	1878.....	125,276
Messina.....	1878.....	120,917
Bologna.....	1878.....	111,969
Leghorn.....	1878.....	97,908
Catania.....	1878.....	90,886

The Italian Ministry consisted, at the close of 1880, of the following members: B. Cairoli, President of the Council and Minister of Foreign Affairs; A. Depretis, Minister of the Interior; E. de Sanctis, Minister of Public Instruction; A. Magliani, Minister of Finance and of the Treasury; Major-General B. Milan, Minister of War; F. Acton, Minister of the Navy; T. Villa, Minister of Grace, Justice, and Worship; A. Baccarini, Minister of Public Works; L. Micelli, Minister of Agriculture and Commerce. The only new member of the Ministry is General Milan, who succeeded General Bonelli as Minister of War in July. General Milan is a Neapolitan, and commenced his career in the army of the Two Sicilies. On its fusion with the Italian army after 1860, being then a colonel, he distinguished himself greatly in the suppression of brigandage in Calabria. After his promotion to the rank of major-general, he became second in command of the Staff Corps. He has hitherto taken no part in political or parliamentary life.

The official statistics of Italian education for the academical year 1878-'9 show that there were 278 institutions for secondary education in the peninsula. Of these, 105 were lyceums and 173 gymnasiums. Of the lyceums, 83 belonging to the state had 5,775 scholars, while there were 775 in 22 private lyceums; 109 state gymnasiums had 11,603 pupils, and 64 private gymnasiums had 5,251 pupils. The entire number of pupils receiving secondary instruction was, therefore, 23,404. There were also in Italy 164 technical schools and 63 technical institutes, having altogether 21,403 pupils.

The actual receipts and disbursements of the kingdom from 1875 to 1878 were as follows (in lire—1 lira=19·3 cents):

YEAR.	Receipts.	Disbursements.	Deficit (D.), or Surplus (S.).
1875.....	1,387,353,292	1,415,447,752	D. 28,094,460
1876.....	1,429,423,758	1,436,887,413	D. 7,413,655
1877.....	1,491,778,495	1,480,750,305	S. 11,028,190
1878.....	1,443,085,277	1,480,822,500	S. 12,212,777

In the budget for 1880, the revenue and the expenditures were estimated as follows:

	REVENUE.	Lire.
Ordinary.....	1,278,457,162	
Extraordinary.....	185,584,385	
Total.....	1,413,991,547	

* See "Annual Cyclopædia" for 1879, for latest statistics on movement of population, commercial value of imports and exports.

† One square kilometre = 0·386 square mile.

EXPENDITURES.

Expected surplus.....	21,042,308			

According to the Provisional Budget for 1881, there would be a diminution of fourteen millions of lire in income on account of the abolition of the grist-tax, and, on the other hand, an increase from various sources of thirty-five millions. This would give a surplus of twenty-one millions, but it was expected that this would be reduced to seven by increased expenditure.

The public debt of Italy, which stood at 2,439,000,000 of lire (= \$471,000,000) in 1860, the year before the establishment of the kingdom, had, in consequence of the ever-recurring deficits of recent years, increased to 9,750,000,000 (= \$1,872,000,000) at the end of 1878. The following table shows the steady and rapid increase of the public debt (value in lire):

YEAR.	Amount of capital.	Amount at interest.
1860.....	2,437,000,000	116,000,000
1865.....	5,454,000,000	270,000,000
1870.....	8,287,000,000	357,000,000
1872.....	8,470,000,000	382,000,000
1874.....	8,542,000,000	383,000,000
1876.....	8,197,000,000	419,000,000
1878.....	9,750,000,000	495,000,000
1880.....		495,000,000

The strength of the Italian army on September 30, 1878, was as follows:

Infantry of the line.....	271,873
Military districts.....	251,155
Companies of the Alps.....	13,583
Bersaglieri.....	41,738
Cavalry.....	32,066
Artillery.....	63,989
Engineers.....	13,513
Gendarmes (carabinieri).....	18,313
Military schools.....	8,955
Sanitary companies.....	4,203
Veterans.....	977
Stud depots.....	217
Disciplinary companies.....	1,800
Penal institutions.....	2,112
Officers in service.....	11,597
Other officers.....	2,284

1. Standing army.....	737,565
2. Provincial militia.....	240,064
3. Officers of reserve.....	2,736
4. Territorial militia.....	564,900

Total..... 1,544,665

The navy was composed as follows in 1879:

VESSELS.	Number.	Guns.	Tons.	Horse-power.
<i>Men-of-war:</i>				
Ironclads.....	20	242	105,460	13,890
Screw-steamers.....	18	143	24,280	4,610
Paddle-steamers.....	6	41	7,960	2,050
Total men-of-war.....	44	426	137,700	20,550
<i>Transports:</i>				
Screw-steamers.....	20	40	17,703	2,914
Paddle-steamers.....	9	12	2,244	725
Total transports.....	29	52	19,947	3,639
Total navy.....	73	478	157,647	24,189

The navy was manned, in 1879, by 11,200 sailors and 660 engineers and workingmen, with 1,271 officers, the chief of them one admiral, one vice-admiral, 10 rear-admirals, and 83 captains.

A new ironclad, the Italia, which is the biggest ironclad afloat, was launched on September 29th. Her dimensions are 122 metres in length, 23 metres in breadth, and nearly 10 in depth. In December, the Chamber agreed to the construction of two men-of-war of 10,000 tons displacement, at a cost of 15,000,000 lire.

The movement of shipping in 1878 is exhibited by the following table:

VOYAGES.	TOTAL.		LADEN.		STEAMERS.	
	Vessels.	Tons.	Vessels.	Tons.	Vessels.	Tons.
ENTERED.						
1. Long voyage:

The movement of special foreign trade from 1874 to 1879 was as follows:

YEARS.	OFFICIAL VALUE.		COMMERCIAL VALUE.	
	Imports.	Exports.	Imports.	Exports.
1874.....	1,251,700,000	1,088,400,000	1,305,000,000	955,500,000
1875.....	1,280,000,000	1,158,300,000	1,215,400,000	1,084,000,000
1876.....	1,364,300,000	1,228,000,000	1,327,200,000	1,216,800,000
1877.....	1,280,700,000	1,044,900,000	1,156,300,000	967,400,000
1878.....	1,070,300,000	1,045,800,000
1879.....	1,262,000,000	101,000,000

The aggregate length of railroads in operation was on December 31, 1878, 8,159 kilometres; of railroads in the course of construction, 566; of railroads projected, 480. The Mount Vesuvius Railroad was formally opened in June, 1880.

The number of postal stations at the close of 1878 was 3,200; of letters and postal cards, 152,145,110; the revenue, 26,117,374 lire; the expenditure, 22,980,766 lire.

The aggregate length of telegraph lines at the close of 1879 was 25,533 kilometres; of wires, 84,101 kilometres, exclusive of 175 kilometres of submarine cable. The number of offices was 1,462, exclusive of those belonging to railroads and other companies. The total of dispatches was 5,905,900 in 1878, and 5,502,581 in 1879. The receipts and expenditures were as follows, in 1878 and 1879:

YEAR.	Receipts.	Expenditures.
1878.....	9,664,431	6,964,100
1879.....	10,593,797	7,164,000

The condition of the finances of the kingdom, and particularly the abolition of the grist-tax,* continued to engross the attention of the Parliament until its dissolution in May. On January 19th, Signor Saracco presented in the Senate the following motion on behalf of the Central Committee: "Awaiting the time when effectual measures shall have been taken which will permit of the gradual abolition of the grist-tax, without imperiling the finances of the country, the Senate suspends all discussion on the subject and passes to the order of the day." The debate concluded on January 31st, when a resolution, recommending the postponement of the discussion of the bill until the tax can be abolished without prejudice to the finances, was adopted by 125 against 83 votes. The Ministry considered this as equivalent to the rejection of the measure. On February 2d, the "Official Gazette" published the royal decree closing the Senate and Chamber of Deputies, and fixing the reopening of the session for the 17th of February. On that day the Parliament was opened by the King in person. In the speech from the throne the King announced that two bills would be presented, one for the gradual abolition of the grist-tax, and the other for extending the suffrage. Referring to the friendly relations of the Government with foreign powers, he said that the preservation of peace was warmly desired by Italy, and was a matter of great moment to her. It was but

natural, therefore, that she should scrupulously observe the Treaty of Berlin. It was also easy for her to fulfill the promise she had made, that when once her unity had been secured, she would become an element of concord and progress. His Majesty, in conclusion, expressed a hope that the present session would not be less active, but would be more fruitful in results, than the last. On the day before, February 16th, the "Official Gazette" published a list of twenty-six newly appointed senators. Signor Farini was reelected President by 213 votes in a House numbering 280. The Vice-Presidents, the two Questors, and six of the eight Secretaries were also reelected by large majorities. On the 20th the Chamber voted the budget of the Ministry of Justice for 1880. The Chamber, on February 21st, passed the naval estimates without amendment. During the discussion Signor Brin said that the Duilio was absolutely superior to any other ironclad as regards the power of her machinery and armament. Only the British ironclad Alexandra possessed a slight superiority over her in speed. Admiral Acton, the Minister of Marine, confirmed Signor Brin's statement. The Chamber passed a resolution expressing satisfaction at the results of the Duilio's trial and the thanks of the House to the persons connected with her. The discussion of the foreign affairs estimates led on March 11th to a debate on the foreign policy of the Government which lasted until March 20th. Signor Visconti Venosta fiercely attacked the Government on March 12th. Italy, he said, was isolated in the councils of Europe. She was not sufficiently conservative to reassure Turkey, nor sufficiently liberal to satisfy Greece. Signor Visconti Venosta also asked what the intentions of the Government were with respect to the "Italia Irredenta" movement, and said he was grieved to see that the relations with Austria, formerly so satisfactory, were now less friendly. He added: "We have lost the confidence of Europe, and it is necessary to regain it by means of a policy having for its object the promotion of the general interest, and not the furtherance of small and party views." Signor Visconti Venosta concluded by saying he would still hope that Italy might be able to regain her old position, but he deplored the ground which he feared had been lost to her for ever. On March 15th, Signor Crispi, in a long speech, attacked the policy of the Government on account of its want of energy. He added that the "Italia Irredenta" movement was a legacy of the badly arranged peace concluded in 1866, that it had no

* See "Annual Cyclopædia" for 1879, article ITALY.

real importance, and that to try and put it down by force would be an error of statesmanship. Signor Crispi blamed Signor Depretis for having thwarted the legitimate desires of Greece for the annexation of Albanian territory, and concluded by saying that what Italy required was a firm and powerful Government. Such a one alone would possess influence abroad. The Prime Minister, Signor Cairoli, made a speech in the Chamber, in which he declared that peace was a necessity for Italy, and that the Government was firmly resolved to respect its international obligations. The vote, which closed the debate on March 20th, gave to the Government a large majority. From among the eight orders of the day before the Chamber, Signor Cairoli elected to stand or fall on that presented by Signor Mancini, which read: "The Chamber takes note of the Ministerial declarations, and, confident that Italy in her foreign relations will represent among the nations a policy of peace, of respect for treaties, and of progress in international civilization, passes to the order of the day." This motion was adopted by 220 to 93 votes.

On April 29th the Ministry were defeated in the Chamber, by 176 to 153, on a vote of confidence in connection with the provisional exercise of the budget. Signor Cairoli at once went to the Quirinal to have an audience of the King, who returned to Rome from Turin in the afternoon. A Cabinet Council was subsequently held, and, after a prolonged sitting, Ministers decided upon placing their resignations in the hands of the King. King Humbert sent for Signori Cairoli and Depretis, and, declining to receive the resignation of the Ministers, accepted instead their proposal to dissolve the Chamber and appeal to the country. New elections took place in May, which gave to the Ministry a majority of about 24 over the combined Right and the Dissidents of the Left. The Right numbered about 150, and the Dissidents of the Left 90 supporters. The new Parliament, which is the fourteenth Italian Parliament, and the first elected since the accession of King Humbert to the throne, was opened by the King on May 26th. The speech from the throne, which treated almost exclusively of internal questions, recommended the abolition of the grist-tax, and a reform of the electoral law, and announced the presentation of several bills. Respecting foreign affairs, the speech said: "The initiative taken by a friendly power, and approved by other powers, including Italy, justifies the hope that the remaining difficulties attending the execution of the Berlin Treaty will be removed. It is also to be hoped that it will be possible to prevent the outbreak of war in the territory bordering on Montenegro. The Italian Government will lend its assistance to the endeavors which are being made for bringing about a solution of the Greek question, in accordance with the engagements existing between Italy and other powers, and with the traditions of Italian policy." The proceedings

of the Parliament were generally not of great interest. On July 10th the Chamber for a third time voted for a gradual abolition of the grist-tax. The first article, abolishing one fourth of the tax from the 1st of September next, was voted by 262 against 108, and the second, to the effect that the tax should entirely cease on the 1st of January, 1884, by 244 against 116. This time the Senate also yielded to the wish of the Government, and on July 19th the King signed the decree by which the abolition of the tax became law. On receiving intelligence of the vote of the Senate, the King, who had the abolition of that impost especially at heart, congratulated the Prime Minister on having held fast to his programme and successfully carried it in the face of no ordinary difficulties.

The foreign relations of Italy also became frequently the subject of animated debates. The opponents of the Ministry eagerly seized every opportunity for charging the Government with following a foreign policy ever uncertain, hesitating, and risky. It was especially the Tunisian question which gave rise to many bitter attacks upon the Government. "When Italy became a nation," said Signor Salvini, in the sitting of November 12th, "she looked around upon her seas and beheld England and France holding such positions on the Mediterranean as rendered them almost masters of that sea. Carthage should be allowed to rise again, but not to the injury of Rome." When he saw the French flag covering Tunis, which was not a suburb of Algeria, he could not keep silence. Signor Damiani said the Government, afraid of war with France and of being abandoned by the other powers, had shrunk back. The Ministers had no faith in the strength of the Italian people. The advantages obtained by France must not be allowed to destroy Italy's rights nor her means of asserting them. France, by the annexation of Tunis to Algeria, would tend toward creating a French Africa; but Italy would have the means of frustrating France's designs of conquest. These means were the strength of Italy's rights and the importance which she maintained in those regions—an importance which others vainly pretended not to recognize. This importance was derived from tradition, from commerce, from the close vicinity of the two coasts, from Italy's colony there, and from that just influence which was the result of the good policy observed in the past by Italians toward less civilized States. He referred with satisfaction to the treaty of 1868, due to General Menabrea, who had been the first to recognize the importance of Italy's interests in those regions. In the mean time France sought to find her advantage in the augmentation of the Tunisian debts, which would enable the creditors, for the most part Frenchmen, to impose their will when Tunis was no longer in a position to fulfill her engagements.

Besides the Tunisian question, the relations to Austria gave considerable trouble to Italian statesmen. The party of the "Italia Irreden-

ta," which clamors for the annexation of large portions of Austrian territory to Italy, for the sole reason that the Italian language prevails in those districts, is growing in power. The Republicans are a unit in the support of this principle. Garibaldi frequently takes occasion to express his sympathy with it. All the other parties more or less favor it. Minghetti, the leader of the Right, expressed the opinion that, if nothing was said about the plans of the party, they would soon be forgotten; but on many sides this was construed as a mere pretext for escaping interpellations on the subject. The leading statesmen of the Left, as Depretis, Crispi, and Cairoli, were obviously, and in some cases avowedly, unwilling to oppose in any way the progress of the annexationist party. Accordingly, the Austrian statesmen who had regarded the annexation of Venetia to Italy as final, became alarmed, and attempted in their turn to scare the Italian statesmen by circulating reports that Austria, if unable to secure the total suppression of the "Italia Irredenta" party by the Italian Government, might regard it necessary for strengthening its southern frontier to reclaim Venetia. In November, Signor Calvaletto urged the Government to push forward vigorously the works for the defense of Venice and the arrangements for fortifying the western frontier, considering it the duty of Italy to be prepared for all eventualities.

After the attacks upon the foreign policy of the Government had continued for several more days, a vote was taken, on November 30th, on the order of the day proposed by Signor Mancini, ex-Minister of Grace and Justice, to the effect that "the Chamber, having heard the declarations of the Ministry, and being desirous of deciding upon the important reforms demanded by the necessities and the wishes of the country, passes to the order of the day," and gave a majority of 33 in favor of the Government, 221 voting for the motion, 188 against it, and five deputies abstaining. The Ministry, in accepting Signor Mancini's motion, stated that they understood it as signifying an explicit vote of confidence. The members of the legitimate Opposition present were 120, that being almost their full number; the remaining 68 of the adverse votes were given by Dissidents of the Left, led by Signori Crispi and Nicotera. Among those who abstained or voted against

the Ministers were many who declared that they would have voted in favor of Signor Cairoli's foreign policy, but they objected to the direction given to internal affairs.

On June 17th, Signor Crispi addressed a letter to the President of the Chamber of Deputies, resigning his seat in the House. Signor Nicotera moved that Signor Crispi should be asked to withdraw his resignation; and several deputies, including the Minister, Signor Cairoli, spoke in favor of the motion, and dwelt upon the services rendered by the honorable member to the country. Signor Nicotera's motion was unanimously approved.

On November 15th, the resignations of Garibaldi and his son Menotti were formally announced. The House refused to accept them, and granted the two deputies three months' leave of absence. Menotti Garibaldi, however, informed the President of the Chamber, in his own and in his father's name, that they persisted in the resignation of their seats. General Garibaldi alleged as reason for his resignation that Italy is misgoverned, and he advocated the clamor for universal suffrage.

The first Congress of Italian shipowners was opened on October 31st, at Camogli, a town near Genoa. All the maritime provinces were largely represented. Many of the delegates made speeches describing the decadence of the Italian merchant navy, which they contrasted with that of other nations, especially that of France. They urged that the present state of things ought no longer to be endured, and contended that the matter should be brought before the Government without delay, in order that some remedy might be found.

The Republican party in Italy is very active. General Garibaldi, in 1880, expressed himself on several occasions very strongly in favor of republican principles. In reply to an address from a large deputation of French residents of Genoa, he said that Italian democracy was united body and soul to republican France. In November he unveiled the Mentana monument in the presence of an immense crowd and amid the utmost enthusiasm. He appeared very feeble, having a worn and weary look, and was propped up with cushions in his carriage. His address was read by his son-in-law, General Canzio. M. Rochefort made a speech which was much applauded.

J

JACKSON, Dr. CHARLES T., scientist, was born at Plymouth, Massachusetts, June 21, 1805. Abraham Jackson, one of the early colonists of Plymouth, who married the daughter of Nathaniel Morton, Secretary of Plymouth Colony, and its well-known historian, was his ancestor. On the maternal side, Dr. Jackson was descended from the eminent Puritan divine, John Cotton. He was prepared to enter Har-

vard College, when the failure of his health induced him to join a party of naturalists on a pedestrian tour through New York and New Jersey. This accidental association, probably, gave a scientific bent to his mind. He took his degree of M. D. at Harvard, in 1829. He aided in a geological and mineralogical survey of Nova Scotia, and prepared the map and record in 1827-29. In 1829 he went to Europe,

when he made geological journeys through the Alpine and Apennine regions and in Sicily. Being in Vienna during the cholera epidemic, he dissected over two hundred bodies, and made minute reports of his observations, which were published in the "Boston Medical Magazine" of 1832. While pursuing his studies in Paris, his attention was roused by the recent discoveries in electricity and magnetism. He procured the best attainable apparatus, and was absorbed in experiments to utilize this power for telegraphy, when he took passage for New York on the packet-ship *Sully*, in October, 1832. On the voyage his frequent theme was the possibility of an electric telegraph, and he detailed the means by which it could be constructed. Among his fellow-passengers was Samuel F. B. Morse, a portrait-painter from New York, who was afterward President of the American Academy of Design. Dr. Jackson maintained, and supported his allegation by the testimony of other passengers of the *Sully*, that Mr. Morse had no previous acquaintance with the subject of electricity, and that the model constructed by Morse in 1835, and afterward patented by him, was in reality invented by Dr. Jackson. In the mean time he had settled in Boston as a practicing physician, though his attention was chiefly bestowed on the sciences of chemistry, mineralogy, and geology. In 1834 he did construct and work a telegraph, but it was applied to no practical use, nor was this possible until after the discovery of Daniell's sustaining battery in 1837. Mr. Morse asserts only that his machine was perfected in 1840. In 1844 the electric telegraph between Baltimore and Washington, the first in the United States, was put in operation. But in 1833 Sir William Cooke and Sir Charles Wheatstone had successfully constructed a telegraph line between Paddington and West Drayton, in England. The debate as to the date of their inventions between Dr. Jackson and Mr. Morse was unnecessary, as the merit of priority clearly rests with their English rivals. What Mr. Morse can claim with justice is an improvement in the method of telegraphing, while Dr. Jackson seems to have been the author of the theory. Dr. Jackson organized the geological survey of New York, on a plan which was authorized by the Legislature of that State in 1844. He made two expeditions to Lake Superior, and was the first to announce the mineral wealth of that region. In 1847 he was appointed to survey the mineral lands of the United States in Upper Michigan. In 1850 he published a valuable report. Dr. Jackson began his experiments in anæsthetics as early as 1834. In 1837 he succeeded in reducing himself to unconsciousness, followed by no injurious consequences, by inhaling pure sulphuric ether mixed with atmospheric air. He gave no special publicity to his discoveries, and, some years later, two physicians who had studied with him laid claim to the discovery of anæsthesia—Dr. Mor-

ton through the use of ether, and Dr. Wells by means of nitrous-oxide gas. The first practical use of anæsthesia produced by ether was in 1846, when it was successfully administered to a patient from whose jaw a vascular tumor was removed. This operation was performed in the Massachusetts General Hospital at the instance of Dr. J. C. Warren. Dr. Jackson and Dr. Morton both assisted. The beneficent agency of anæsthetics was at once acknowledged from end to end of the land. Dr. Jackson did not desire to withhold their use from the faculty. Dr. Morton patented his process. Dr. Wells, after several failures, not finding himself a prophet in his own country, sailed for Europe, where he convinced the Medical Society of France that he had made a notable discovery. Dr. Jackson appealed to the French Academy of Sciences. After a patient hearing of the rival scientists, that body decreed that two Monthyon prizes, of the value of twenty-five hundred francs, should be awarded, one to Dr. Jackson for the general discovery of etherization, and the other to Dr. Morton for the practical application of it to surgery. In this way they fully recognized the value of the agent thus newly discovered and applied. Another claimant has appeared, Dr. Crawford W. Long, of Athens, Georgia. Congress has been appealed to to decide the point, and do honor to the benefactor of suffering humanity. In New England, New York, and Pennsylvania, a petition was numerously signed by the medical fraternity, urging a recognition of Dr. Jackson. This brought out a counter-petition, showing that his opponents had divided the opinions of the profession. Dr. Jackson was the recipient of various foreign orders. He published, in 1863, a "Manual of Etherization, with a History of its Discovery." These controversies embittered him, and irritated his mind, or it may be that "great wits to madness sure are near allied." Dr. Jackson became insane. In 1873 it was necessary to commit him to the asylum, where he lingered until his death, August 29th, at Somerville, Massachusetts.

JAPAN, an empire in Eastern Asia. The sovereign bears the title of "Tenno" or "Mikado." The reigning Mikado, Muts-Hitu, was born at Tokio, September 22, 1852, and succeeded his father, Komei-Tenno, in 1867. He was married on December 28, 1868, to Princess Haruko, born April 17, 1850, daughter of Prince Idchidgo. There is no regular law of succession, and, in case of the death or abdication of the Mikado, the crown does not generally devolve upon his son, but upon either the eldest or most distinguished member of the Shi Shinnô, the four imperial families of Japan. These families are the Katsuma, Arisugawa, Fushimi, and Kani. The power of the Mikado is unlimited in temporal as well as spiritual affairs. He acts through an executive ministry divided into nine departments, viz., of the Imperial House, Foreign Affairs, War, Navy,

Finances, Interior, Public Instruction, and Ecclesiastical Affairs. At the side of the Ministry stands the "Sain" or Senate, composed of thirty members, and the "Shoin" or Council of State, of an unlimited number of members, both nominated by the Mikado, and consulted by him at his pleasure.

The area, according to an official publication in 1877, is 146,613 square miles, or 379,711 square kilometres. The population on January 1, 1876, was 34,338,404, of whom 17,419,785 were males and 16,918,619 females. The following is a complete list of all the cities having, according to the latest dates, more than 50,000 inhabitants:

CITIES.	Years.	Population.
Tokio Proper.....	1879	511,510
Tokio with suburbs.....	1873	1,064,331
Osaka.....	1877	234,105
Kioto.....	1877	229,810
Kagoshima.....	1877	(about) 200,000
Nagoya.....	1877	135,715
Hakodate.....	1874	112,494
Kanasawa.....	1877	103,263
Hiroshima.....	1877	75,760
Yokohama.....	1879	67,499
Yakayama.....	1877	62,197
Tokushima.....	1877	57,003
Sendai.....	1877	52,074

The actual receipts and disbursements of the government from 1875 to 1879 were as follows (value in yens; 1 yen equal 99·3 cents):

YEAR.	Receipts.	Expenditures.
1875-76.....	68,482,677	69,203,242
1876-77.....	62,995,643	62,993,347
1877-78.....	51,256,439	51,256,439
1878-79.....	52,575,926	53,275,926

The revenue and expenditures* in the budget for 1879-80 were estimated at 55,651,379 yens each. The public debt amounted in 1879 to 363,327,974 yens.

Professor Max Müller, in a letter addressed to the London "Times," states that, from what he has been able to ascertain, 100,000 or 200,000 only of the total population of Japan are claimed as professed Shintoists or nothing; the rest are Buddhists or nothing. In 1879 two young Buddhist priests of the Shin-Shu sect were sent to Oxford to learn Sanskrit; not only the ordinary language, but that peculiar dialect in which the sacred books of the Northern Buddhists are written, and of which we have as yet neither grammar nor dictionary.

Christianity continues to make steady progress. The Russian missionaries report a membership of more than 6,000 in the congregations. (See GREEK CHURCH.)

Education in Japan continues to make steady and rapid progress. The latest statistics show that in 1877 the number of elementary schools in all of the seven grand school districts was 25,459, of which 24,281 were public and 1,178 were private schools. The number of teachers was 59,525. The number of scholars was 2,-

162,962. Of middle schools there are 389, with 910 instructors. In addition to these educational establishments there is the university at Tokio, with four departments of law, science, literature, and medicine; and an English language school is annexed to the preparatory department. The total number of students admitted in this department was 1,040. There are besides two normal colleges for training teachers, with 25 instructors and 177 pupils, and 28 foreign language schools, in which French, German, Russian, and Chinese are taught. The total amount of the expenditure on the public schools is given at \$5,364,870.

The Japanese army in 1878 was composed as follows:

ARMS.	Peace footing.	War footing.
Infantry (46 battalions).....	29,568	43,008
Cavalry (3 squadrons).....	890	450
Artillery (10 divisions or 20 batteries).....	2,420	2,960
Engineers and train (17 companies).....	1,670	2,060
Coast artillery (9 companies).....	720	900
Officers.....	2,009	2,343
Total.....	36,777	51,721

The navy in 1879 comprised 10 steam-vessels, of an aggregate of 2,930 horse-power, and with 49 guns. Three of the vessels are ironclads. The fleet is manned by 3,500 men, inclusive of 200 officers.

The foreign commerce in the years 1868 to 1879 was as follows (in yens):

YEARS.	Imports.	Exports.	EXCESS OF	
			Imports.	Exports.
1879...	32,631,000	28,364,000	4,267,000
1878...	33,384,892	26,259,419	7,014,973
1877...	25,900,541	22,866,708	3,033,833
1876...	23,969,004	27,378,851	3,609,847
1875...	28,174,194	17,917,845	10,256,349
1868...	14,076,988	18,491,430	4,414,492

The movement of shipping in the ports open to foreign commerce was as follows in 1879:

NATIONALITY.	Vessels.	Tons.
British.....	408	464,346
American.....	153	199,488
German.....	69	37,034
French.....	29	44,286
Japanese.....	256	351,144
Others.....	27	13,184
Total.....	992	1,101,592

The aggregate length of railroads in operation is 121 kilometres. Eight lines of telegraph have an aggregate length of 2,934 kilometres. There are telegraph stations in 112 towns. The number of dispatches in 1877 was 410,150.

The postal administration of Japan has been rapidly improving since the country, on June 1, 1877, joined the World's Postal Union. According to the annual report of the Postmaster-General, the total number of postal stations on June 30, 1879, was 3,927. The number of letters sent was 29,000,000. The number of

* The details of this budget, and of the public debt, are given in the "Annual Cyclopædia" for 1879.

postal cards was 13,500,000; of newspapers, 11,300,000; of samples and books, 560,812. The aggregate value of the money orders was 3,704,384 yens. The revenue amounted to 949,357 yens, the expenditures to 826,379 yens.

The question between China and Japan respecting their rights in the Loochoo Islands had entered upon a more pacific phase at the end of 1879, and it was agreed between the two countries to appoint commissioners to discuss the points in dispute. As the negotiations proceeded, the prospect of a peaceful solution was increased through the interposition of the friendly offices of the German Government.

A change of ministry took place in April. Of the new ministers, three were known abroad. Matsukata-Massayoshi, Minister of the Interior, was Commissioner-General for Japan at the Exposition of Paris in 1878. Sano Tronétami, another minister, was commissioner-General at the Exhibition in Vienna of 1873, has been Minister Plenipotentiary at Rome and Vienna, and was one of the first members of the Japanese senate. Admiral Yenonoto, Minister of Marine, is considered a very able man, but has never been in favor, and was barely prevented by the Colonial Minister, General Kouroda, from committing the "happy dispatch" several years ago. Each ministerial department is composed of the titular minister, the Kio, an officer of the second rank, the Tayou, and an officer of the third rank, the Shoyou, the officers of the two latter grades corresponding nearly with the European under-secretaries of state. The out-going ministers were appointed Sanghis, or privy counselors, to the Mikado; and the Supreme Council to which they belong, consisting of thirteen members, is, in the absence of any representative body, more powerful than the Ministry, as it has the right of veto on all measures proposed by the latter.

The development of industrial enterprises, which has been actively prosecuted for several years, continues to be marked. A native paper, the "Mainichi Shinbun," recently mentioned many enterprises of various kinds, such as factories of matches, cotton, tea, and sugar, and ship-building yards, as in actual operation, and added that the most striking feature of this development was the extension of the silk trade. In twenty-seven different prefectures, 702 filatures were organized, employing more than 11,000 workpeople, while nearly all the looms were engaged; the great majority of the undertakings had been begun within the last four years. A new cotton factory has been established at Hinieji, the building of which, and the putting in of the machinery (German), were undertaken by Japanese workmen without foreign help. A cloth factory has been set up at Tokio, the manager of which is a Japanese gentleman, who has undergone a thorough technical training in Saxony. An association of twenty-one silk-growing villages in the prov-

ince of Joshiu, dissatisfied with the present arrangement of selling their "cards" to Italian agents, has determined to start a branch establishment in Italy, and perform its own exporting and commercial transactions direct. A method has been invented for using dog's hair in making coverlets and similar articles, and a considerable trade has been already carried on both in the raw material and in the manufactured goods. Agricultural enterprises have also excited a considerable degree of attention. Among them is a company for horse and cattle breeding at Shizoku, which has found much favor with investors.

The Japanese settlement of Fusan, which was founded on the southern point of the peninsula of Corea in 1877, has become a town of two thousand inhabitants. A consul resides there for the protection of Japanese interests; and a consular residence, a school, and a hospital have been built. The formation of a chamber of commerce has followed the rapid increase of trade. Numerous restaurants furnish food prepared in the Japanese and European styles. Building is actively going on. The goods imported into the place are for the most part from Europe and America, and are only to a small extent the produce of Japan, ninety per cent. of the imports of 1879 having been from Europe. Another settlement has been founded at Gensan, on the west coast of Corea, 447 miles from Fusan. This place is situated on a vast plain, and in a very favorable position, and has a large and handsome harbor, which is said to be greatly superior to that of Fusan. The Japanese settlement, which has an area of about eighty-three acres, is already partly occupied, and the building of a consulate is nearly completed. The principal productions of the neighborhood are gold, silver, leather, bones of horses and bulls, grain, fish, and seaweed. The subject of forcing Corea to grant a more liberal treaty has been much discussed in the Japanese journals; and a combination of the European, American, and Japanese fleets in a naval demonstration for this purpose has been suggested. The Chinese Government has been exerting an influence to the same purpose by sending a letter to the King urging him to open immediately some ports to foreigners as a precautionary measure against the constant menace of an invasion by Russia. The Russian Government took some steps during the summer, with its fleet, in the direction of an effort to open negotiations for a commercial treaty, and invited the assistance of the American fleet, which was then stationed in Chinese waters.

JETER, J. B., was born in Bedford County, Virginia, and died in Richmond, February 23, 1880, at the age of seventy-eight years. He was, perhaps, more widely known than any other minister of the Baptist Church throughout the United States. For five years he traveled over Virginia, preaching as an evangelist; was pastor of several churches in different

parts of the State, including the First Baptist Church of Richmond; and was pastor of the Second Baptist Church of St. Louis, Missouri, from 1849 to 1852, when he was recalled to Richmond to take charge of the Grace Street Baptist Church, which position he resigned to become senior editor of the "Religious Herald." He held positions of prominence in connection with various institutions of learning, including the Southern Baptist Seminary at Louisville, Kentucky. He was present at the organization of the Baptist General Association of Virginia, in 1823; and several times a delegate to the Baptist Triennial Convention, embracing all the Baptists in the United States. After the division of the denomination he presided over the Southern Baptist Convention at several sessions. At the instance of the Foreign Mission Board of the Southern Baptist Convention, Dr. Jeter visited Italy to supervise the mission work of the Board in that land, and especially to provide a chapel for missionaries in Rome. As a writer he possessed rare excellence, and was the author of various memoirs and religious works.

JOHNSON, Ex-Governor HERSCHEL V., was born in Burke County, Georgia, September, 1812. He graduated from the University of Georgia, at Athens, in 1832, studied law and began to practice in Augusta, Georgia, but removed to Milledgeville, then the capital of the State, in 1844, and soon attained a leading position at the bar. In 1848 he was appointed by the Governor to fill the vacancy in the United States Senate caused by the resigna-

tion of Walter S. Colquitt. He served as Senator until March, 1849. From 1849 to 1853 he was Judge of the Superior Court of Georgia. In 1853 he was elected Governor. In 1860 he was nominated for the Vice-Presidency on the ticket with Stephen A. Douglas, which represented the principle of non-intervention, which was understood to mean that Congress should not interfere with the question of slavery or no slavery in a territory, but that it should be left to the inhabitants to determine, when they assembled to form a State. He was a member of the Union party, and opposed the secession of Georgia to the last; but when the fact was accomplished, he cast his lot with his State, and represented her as Senator in the Confederate Congress. In 1864 he inaugurated the "peace movement" on the basis of State sovereignty. In 1865 his disabilities were removed, at the request of the widow of Stephen A. Douglas. Governor Johnson's property was completely destroyed during Sherman's march to the sea. He visited Alexander Stephens during his imprisonment in Fort Warren. In September, 1865, he held a conference with Andrew Johnson in regard to reconstruction. He presided over the Constitutional Convention held in October of that year. He received thirty-eight votes for United States Senator in the election held in January, 1866. He resumed the practice of the law. In 1873 he became circuit judge, which position he held until his death, which occurred at his home in Jefferson County, Georgia, on August 16th.

K

KANSAS. The State Treasury statement, including the receipts and investments for the school-fund, and all financial transactions for the two years ending June 30, 1880, is as follows:

RECEIPTS.	Amount.
Direct taxes.....	\$1,574,568 24
Sales of school land, principal.....	355,279 92
Sales of school land, interest.....	241,751 49
School-fund securities, principal.....	147,988 81
School-fund securities, interest.....	289,929 19
Five per cent. on sales of Government land.....	4,155 80
On judgment in favor of the State.....	8,364 39
Penitentiary earnings.....	115,890 77
Insane asylums.....	8,27 55
Institutions for the blind.....	79 08
Sinking-fund securities, interest.....	17,417 65
Sales of university land, principal.....	14,202 70
Sales of university land and invested fund, interest.....	2,576 80
Sales of normal-school land, principal.....	16,528 80
Sales of normal-school land and invested fund, interest.....	12,161 29
Lyon County and city of Emporia, for normal school.....	20,800 00
Agricultural College, to refund taxes.....	80 95
Sales of railroad lands.....	8,023 42
Insurance department.....	80,977 84
Sales of Supreme Court Reports.....	9,765 75
Miscellaneous items.....	289 50
Total.....	\$2,817,964 65

DISBURSEMENTS.	Amount.
For public buildings, legislative, executive, judicial, and miscellaneous expenses.....	\$1,815,192 29
Permanent school fund, invested.....	445,624 05
Annual school fund, disbursed.....	670,650 08
University permanent fund, invested.....	8,211 40
University interest fund, disbursed.....	2,658 80
Normal-school permanent fund, invested.....	16,775 83
Normal-school interest fund, disbursed.....	10,970 43
Normal-school permanent fund, disbursed.....	1,000 00
Sinking fund, invested.....	49,924 27
Interest on State debt.....	163,416 00
Railroad fund, disbursed.....	500 00
Agricultural College tax refunded.....	254 87
Counterfeit money destroyed.....	670 00
Total.....	\$2,655,247 07

There was a balance in the Treasury on the 30th of June of \$444,697, of which \$100,405 belonged to the general revenue fund, \$78,119 to the interest fund, \$21,538 to the sinking fund, \$98,828 to the permanent school fund, and \$116,100 to the annual school fund. For the six months ending December 31st, the receipts of the Treasury were \$662,039, and the disbursements \$746,706; leaving a balance in the Treasury of \$360,030.

The total bonded debt of the State at the close of the year was \$1,181,975, of which

amount \$607,925 was held by the permanent school fund, \$192,075 by the sinking fund, \$9,800 by the State University, and \$1,600 by the State Normal School, leaving \$370,575 held by private individuals and corporations.

The State debt is all bonded, and bears interest at the rates of 6 and 7 per cent. No additions are being made to the debt, which remains at about the same amount as in 1878. These bonds are to be paid, according to present arrangements, as they mature. Since 1870 the debt has been reduced \$160,100.

The municipal debts amount in the aggregate to \$13,998,504, against \$13,473,197 in 1878; an increase of \$425,407. Of the total amount, county bonds and warrants make \$7,679,894, township bonds and warrants \$2,260,055, city bonds and warrants \$2,016,797, and school district bonds and warrants \$2,041,858.

The total amount of taxes required to pay State, county, and municipal expenses is stated by Auditor Bonebrake to be \$5,699,409 per annum—about \$5.72½ per head of the population, or 1½ per cent. of the estimated property in the State. These taxes are divided as follows:

For State purposes.....	\$887,636
For county purposes.....	2,061,073
For city purposes.....	365,600
For township purposes.....	564,829
For school purposes.....	1,822,216
Total for all purposes.....	\$5,699,409

While the assessed value of the taxable property of the State was reported by the Auditor, July 1, 1880, as \$160,570,761, or per capita of the population \$161.11, the true value is reckoned at about double this amount, or \$321,141,513, being \$322.23 per capita, taking the population to be 996,616. The area of taxable land is 22,386,435 acres; the number of acres of taxable land under cultivation, 6,697,861; leaving 15,688,574 acres not under cultivation; this makes the amount of cultivated land per capita, 6.72 acres; of uncultivated, 15.74 acres. The amount of State debt per capita of the population is \$1.18. The municipal debts vary in the different counties from 82 cents in Hodgeman, \$1.08 in Nemaha, and \$1.51 in Stafford, to \$28.79 in Doniphan, \$29.39 in Atchison, \$39.35 in Leavenworth, and \$50.55 in Douglas Counties, the average burden being \$14.04 per capita throughout the State. The State and municipal debts together form 4½ per cent. of the estimated actual value of all the property in the State. The counties assessed for the greatest amounts of property are Shawnee, \$6,497,997; Leavenworth, \$6,375,878; Atchison, \$4,986,853; Lyon, \$4,326,855; Miami, \$4,162,945; and Douglas, \$4,138,290.

The population of Kansas, as reported in the enumerators' returns, was on March 1, 1878, 708,497; the returns of 1880 make the population 996,616, an increase of over 40 per cent. The unofficial report of the decennial census gives the total population as 995,335,

divided as follows: male, 536,077; female, 459,258; native, 885,707; foreign, 199,628; white, 951,546; colored, 43,789, including 693 Indians, 104 half-breeds, 19 Chinese, and 3 Siamese.

The assessed value of taxable property has increased from about \$92,000,000 in 1870 and from \$138,968,810 in 1878 to \$160,570,761 in 1880, the increase in the last two years being over 15½ per cent. The assessed value of railroads makes about one eighth of the total valuation. There were on March 1, 1878, 2,302.07 miles of railroad operated in the State, and on the same date in 1880 there were 3,104.21 miles, an increase in the mileage of 35 per cent. The assessed value of this species of property increased in the two years 33 per cent.

The insurance report of Superintendent Welch for 1879 states the amount of fire-risks written as \$34,022,868; the premiums paid, \$509,324—about \$1.50 on \$100 of risk, or nearly double the average rate for the United States; the losses paid, \$158,211, or 31.06 per cent. of the premium receipts. The premium rate charged was less than the average for the preceding eight years; the losses are only one-half the general average, and two thirds of the average for the country in 1878. The receipts of the department for the calendar year 1879 were \$15,354; expenses, \$6,349; receipts for 1880, \$19,000; expenses, \$6,522.

The number of convicts in the Penitentiary on July 1, 1878, was 500. There were 310 received and 1 recaptured in 1878-'79, 296 received and 1 recaptured in 1879-'80, and 141 received in the six months closing December 31, 1880. During the entire period 400 have been discharged on expiration of sentence, 62 by pardon, 25 by commutation of sentence, 8 by the United States authorities, 11 on order for new trials, 10 transferred to Insane Asylum, 17 lost by death, and 3 escaped, leaving in confinement 713—652 under sentence of State courts, and 61 sentenced by United States courts. Of this number 597 were white and 109 colored males, and 3 white and 4 colored females. Of the 1,249 received since June 30, 1878, 374 were boys between the ages of fourteen and twenty-one. The establishment of a separate institution for young criminals is recommended by the Governor. The current expenses, including ordinary repairs, were \$83,125 in 1879, and \$99,100 in 1880. The earnings for the two years amounted to \$116,916. The estimated expenses for 1881-'82 are \$150,802, and for 1882-'83 \$143,342. A coal-shaft has been sunk by the convicts 695 feet, and has nearly reached the bed. For this work \$25,000 was appropriated by the Legislature, and \$62,500 more is required during the next two years, which it is believed will be more than repaid within that time by the product of the mine.

The Insane Asylum at Ossawatimie contained 230 inmates on July 1, 1878; received 163, and discharged 71 restored, 37 improved, 27

unimproved, 1 not insane, transferred 4, lost by death 29, by elopement 3; leaving in July, 1880, 221 in the asylum. One of the buildings was destroyed by fire March 8th. The Insane Asylum at Topeka was opened June 1, 1879. During the year 197 have been admitted, 39 discharged recovered, 15 improved, 10 unimproved, 12 lost by death; leaving, June 30, 1880, 121 in the asylum. Many insane are excluded from the State asylums for want of room, and additional accommodations are asked for. An institute for the education of the feeble-minded, such as have proved successful in other States, is called for by the Governor. There are, according to the census, 134 persons of defective intellect in the State, of whom 66 are under the age of twenty-one years. The Institution for the Deaf and Dumb, established in 1865, had 109 pupils in 1879-'80.

The number of school districts in Kansas in 1880 was 6,134, being an increase during the year of 512. The number of schoolhouses built was 388; their estimated cost, \$359,269. The whole number of schoolhouses erected in the last four years was 1,402, at the cost of \$1,048,974, showing a greater activity in extending the system of public education than at any previous period. The total number of schoolhouses in the State is 5,242. The total value of school property, exclusive of school lands, is estimated to be \$4,633,044. The total school population, comprising all between the ages of five and twenty-one, is reported as 340,647. The number of pupils on the school rolls was 231,434. The average daily attendance is stated as 137,667. The large percentage of children not attending school at all, and the proportion not regularly attending, are the subject of comment in the biennial report of the retiring Superintendent Lemmon. The average daily attendance is only 40 per cent. of the school population. The increase in the number of inhabitants of school age within the biennial period was 64,032. The number of teachers employed was 7,780—3,506 males, and 4,274 female teachers. The school revenue for the two years ending June 30, 1880, including balance on hand June 30, 1878, of \$261,467.72, and \$248,837.04 at the close of June 30, 1879, amounted to \$4,039,069.75, while the expenses during the same period aggregated \$3,403,181.20; \$445,624 have been invested for the school fund in bonded securities within the two years. The permanent school fund invested in interest-bearing securities at the close of the fiscal year ending June 30, 1880, amounted to \$1,683,229.59, to which may be added \$98,828.35 cash in the treasury, making in all \$1,782,057.94; in addition to which lands have been sold for future payments to the amount of about \$1,000,000. This is the largest school fund possessed by any State in the Union, in proportion to age and population; to which will be added from time to time the receipts from the sales of the very large body of school lands yet undisposed of. The

permanent school fund, which has already grown to an extraordinary amount, and is still accumulating, began to be made up in 1865. While \$2,783,229 have been realized thus far, the greater part of the school lands remain still unsold. The sales authorized during the biennial period, of sections 16 and 36, yielded \$355,279. A State land commissioner and a commissioner of appraisement are recommended to be appointed, in order to obtain better prices and save expense in the sales of the public lands.

The State University has grown in 14 years from an institution employing four teachers and containing 55 students to one in which 488 students are taught by 14 instructors. It has a library of 5,500 volumes and a large cabinet of natural history. The appropriations for the two years amounted to \$61,550. Most of the school lands allotted to the University have been sold. Including the amount of the sales for future payment, the permanent fund amounts to about \$120,000.

The Normal School was attended at the close of the year by 247 students. The building which was destroyed by fire two years before was replaced by another equally commodious, which was finished in 1880 at a cost of \$45,579, of which nearly half was borne by the city of Emporia and Lyon County, in which it is situated. The school has a productive permanent fund of the amount of \$121,593, in addition to the invested fund which yields some \$6,000 a year.

The second biennial report of the State Agricultural College shows this institution to be in a very satisfactory condition. In 1878-'79, the whole number of students in attendance was 207—151 males and 56 females. In 1879-'80, the number is increased to 203 males and 73 females, making a total of 276.

During the two years of the last administration eight new counties have been organized, making the total number eighty-one. It devolves upon the Legislature to make a new apportionment in 1881, and ten more counties are expected to be organized and given representation in the Legislature. The unorganized counties of Hodgeman, Pratt, Stafford, Trego, Decatur, Ness, Graham, and Sheridan have never been attached to any judicial districts, and no court has jurisdiction of crimes committed within their limits. The Legislature is therefore expected to pass a law attaching this territory to organized counties for judicial purposes. The county of Wallace, also, though organized in 1875, has no county government and holds no court, so that crime goes unpunished and citizens are without the protection of the law. It is therefore desired that the law of 1875 be repealed, and the county attached to the jurisdiction of some regular county court.

In pursuance of an act of the Legislature of 1879 appropriating \$20,000 for the protection of frontier settlements against Indian depreda-

tions, the Governor raised and equipped a guard of forty men to patrol the southwestern border from Barbour County west about a hundred miles, and furnished independent companies of cavalry and infantry, which he caused to be organized along the western frontier, and provided them with arms, and also organized two regiments of infantry in the interior of the State, and kept scouts in the Indian territory to give warning of hostile movements. During the two years no instance has occurred of any of the exposed settlements being molested, but, on the contrary, the settlers have reposed in perfect security and had no reason to apprehend such danger. The Governor suggests that the State should strengthen its military organization in order to suppress internal disorders, mobs, and uprisings, which may be expected to result from the growth of large manufacturing interests, the extension of railways, and the development of coal-fields and mining interests.

The exodus of colored people into Kansas from Mississippi, Texas, and other parts of the South continued unabated through the early part of the year. After the national elections there were some signs of a renewal of the migration; but this was only a slight movement. In March from 250 to 300 poured into Topeka every week, and there had already immigrated into the State, it was stated by the Freedmen's Relief Association, between 20,000 and 25,000. Toward the end of the year there were 40,000. Many of these hung about Topeka and other towns, and showed themselves incapable and unwilling to try to provide for themselves. Mrs. Elizabeth L. Comstock, Mrs. Laura S. Haviland and other white people, and John M. Brown and other intelligent colored persons, labored energetically to obtain the means of relieving their privations and to aid and stimulate them to become self-supporting. The Freedmen's Relief Association was founded with the coöperation of the Governor soon after the landing of the first band of immigrants at Wyandotte in the spring of 1879. About \$22,000 were distributed among them in clothing, provisions, medicine, freight, and transportation, etc. During the following winter and spring about \$25,000 more were expended by the association in relieving the colored people and aiding them to find employment. Altogether about \$150,000 were contributed to the support of the colored immigrants during the first year of their residence in Kansas. They were sent to different parts of the State, and many were given employment. Still, there was much suffering and want, and without benevolent assistance a large proportion of those who had come in 1879 were in 1880 not yet in possession of the means of subsistence. Henry King calculated that their total surplus earnings at the end of the first year of the exodus amounted to about \$40,000, or \$2.25 per capita. They bought and entered about 20,000 acres. Of the first 20,000, about 30 per cent. came

from Mississippi, 20 per cent. from Texas, 15 per cent. from Tennessee, 10 per cent. from Louisiana, and 5 per cent. each from Georgia and Alabama. They were nearly all field-hands, and exceedingly ignorant. The influx during the winter and the early part of 1880 was mainly from Texas. About 4,000 had been forwarded on request into Nebraska, Colorado, Illinois, and other States. The moneys contributed for the benefit of the freedmen came from all parts of the Union, and a small sum from England.

There were distress and destitution in western Kansas, owing to the drought. About 20,000 people were stated to be in a suffering condition, and considerable amounts were contributed in the East for their relief.

In February President Hayes issued a proclamation warning intended raiders from entering the Indian Territory. (See ARMY OF THE UNITED STATES.) A meeting in favor of opening the Territory to colonization took place in Kansas City, Missouri, on the 4th of May, on which occasion the President's proclamation was read by a United States Marshal. An organization was formed, and a memorial to Congress drawn up, which advocated the allotment of land to Indians in severalty, the bestowal of citizenship upon them, the opening of the Indian Territory to settlers, and protested against moving any more wild, hunting Indians to the Territory. Bands of raiders moved upon the Territory in the latter part of the year. The principal body was called the Oklahoma Colony, and had a military organization. They encamped near Caldwell, on the border of the Territory, when winter set in, while a detachment of United States troops watched them. Many crossed the frontier secretly and entered claims. Numbers of these were expelled by the Indian scouts and police. The settlers came from different parts of the Union. A large proportion of them were old frontiersmen. The citizens along the border became more and more friendly to the movement, and aided the settlers with considerable contributions of provisions. The colonists claim that the territory to which they are moving is not legally a portion of the Indian reservation, and that they have the right to occupy it under the homestead laws. They expect that Congress will, in recognition of their spirited action, be more prompt to amend the laws relating to the Indians, and throw open the whole of the reservations, except claims which shall be allotted to Indians in severalty, to free settlement.

A contest between the American Union Telegraph Company and the Western Union took place in the beginning of the year, regarding the right to the telegraph communications along some of the principal Western railroads controlled by Jay Gould, the principal promoter of the American Union Company. Telegraphic connections were considerably disturbed during the progress of the quarrel, es-

pecially in Kansas. The Kansas Pacific Railroad Company took forcible possession of the telegraph wires along the line in February. Injunctions and counter-injunctions were taken out, and in July the matter came up for adjudication before the United States Circuit Court for the Kansas district, at Topeka, in the case of the Western Union Telegraph Company *vs.* the Union Pacific Railway Company, in equity, the Kansas Pacific Railway Company, and the American Union Telegraph Company. The legal contest had been going on for six months or so before the act of seizing the wires in Kansas. The Western Union Company had first attempted to enjoin the other company from carrying wires along railroads east of the Mississippi with which it had contracted for the exclusive privilege. It claimed also the exclusive right of way on the Kansas Pacific under a contract. The lines along the Kansas Pacific and Union Pacific railroads, it was claimed, were built by the railroad companies, and operated by employees of the roads for the Western Union Company, which had contracted with the first road for the monopoly of the commercial business for twenty-five years, and with the second was the assignee of a perpetual lease of the telegraph rights. The American Union made first a formal demand upon the railroads to accept its business on the same terms on which it performed that of the other company, as required by its charter, to comply with which demand the railroads took possession of the wires. In the case of the Kansas Pacific it was shown that the wires were erected by the telegraph company, and that two of them were still its property. The Supreme Court ordered the restoration of the lines to the Western Union in a mandamus and injunction issued by Chief Justice Waite in April. The Kansas Pacific Railroad Company then proceeded to string separate wires for the use of the American Union Company. When the matter came before the Court upon its merits, the contract upon which the Western Union Company claimed the exclusive right of way, was decided to be void on account of the immorality of one of the considerations, to wit, that private messages of the officers of the railroad should be transmitted by the telegraph company free of charge. An amended bill was brought, in which the Western Union Company claimed the right of way by virtue of an act of Congress, notwithstanding the vicious clause in the contract. The act confers the right to build and operate a line of telegraph along the railroad route to the United States Telegraph Company. The Court held that this act gave the telegraph company the equitable right claimed, which held good for its assignee and was exclusive of the contract. On this ground the injunction against the Pacific Railroad Company was continued in force.

Four drive-well defense associations have been formed to contest the validity of the Green drive-well patent, issued in 1868, and

reissued in 1871. These wells are in general use in southern and southwestern Kansas, as also in some other parts of the country; and the owners of the patent have been endeavoring to collect five and ten dollar royalties on them, having brought many hundred suits in Kansas alone for this object. Congressman Ryan presented to Congress a petition requesting that the Attorney-General be instructed to bring a suit against the patentees, on the grounds that the invention is not a patentable novelty, and that if it were, the patent could be voided because the patentee had waived his rights by allowing more than two years to elapse between the date of the invention and the application for a patent. The defense associations expect to prove that the principle of the drive well was known and described in public prints seventy-five years ago, and that these wells have been extensively used all over the United States since 1840.

The Attorney-General, Willard Davis, delivered an opinion that the registry law passed in 1879, requiring registration as an indispensable condition of the right to vote, was in conflict with the Constitution, since the constitutional qualifications for voting can not be abridged by law, which would be the case if a voter possessing the constitutional requirements were deprived of his vote through failure to register, when prevented from so doing through sickness, absence, nonage, or other cause. The law, he thinks, would hold if an amendatory clause were inserted, excepting electors who were prevented involuntarily from voting; and a qualified elector would then work his own disfranchisement if through negligence he failed to comply with the statutory requirement. The question has been brought before the Supreme Court for adjudication.

The County Commissioners, acting as a board of canvassers, refused to declare the result of the county election held in Harper County, in November, 1879, on the ground that it was fraudulent, 2,957 votes having been cast, when there are not over 800 voters in the county. The question of removing the county-seat from Anthony to Harper was voted upon in this election. An action was brought by the State, at the instance of the county attorney, in the interests of persons claiming to have been elected officers, and of the town of Harper to have the Commissioners canvass the returns and declare the result. The Court refused the application for a mandamus on the ground that the election was manifestly fraudulent. Another litigated county-seat dispute was the case of Pratt County, where some of the township clerks failed to sign the returns, and the Commissioners refused to count them, leaving Iuka the county-seat instead of Saratoga, and a mandamus was applied for to compel the canvassing of the vote.

An important constitutional point is to be tested in the Supreme Court in a case brought to determine the validity of the appropriation

act for the Fish Commissioner. This was the only bill found on the journals of the Legislature involving the question at issue, which was brought before the Supreme Court in 1877, but was not decided for want of jurisdiction. The Attorney-General then brought an action of *quo warranto* against a member representing Rush County, in accordance with a joint resolution of the Legislature requesting him to have the Supreme Court pass judgment upon the question whether this district, numbered 127, can be represented, when the Constitution limits the number of members in the House to 125. The Court ruled that each House of the Legislature alone has jurisdiction of election returns and the qualifications of its members, and can not by any legislative act vest it in another tribunal, deciding at the same time the question of the constitutionality of a law enacted by the aid of the votes of persons admitted beyond the constitutional limit, and which would not otherwise have passed. Such an act was found the one above mentioned, which would have fallen short of a majority one vote without the votes of four members sitting for new counties. The Attorney-General has therefore applied for an injunction to restrain the Treasurer from paying a warrant issued for a small balance of the fishery appropriation, in order to test this important question.

The case of Senator Ingalls, elected to the United States Senate, January 30, 1879, against whom charges of bribery and corruption in procuring the election had been considered and dismissed by the Kansas Legislature, was investigated by the committee of the United States Senate on privileges and elections. The committee on February 16th unanimously agreed to a report exonerating Senator Ingalls himself from the charge of bribery preferred by Kansas memorialists who asked for the investigation; but the Democratic majority of the committee offered an accompanying report reflecting severely upon the methods employed in the Kansas Legislature to secure the election of a Senatorial candidate. The memorial to the Senate had been signed by a number of the Democratic, Greenback, and Republican members of the Legislature, who had coalesced to defeat Ingalls in the heated Senatorial contest, in accordance with a minority report of the only Democratic member of the Legislative committee of investigation.

The Republican State Convention, for the election of delegates to the National Convention and candidates for electors, met at Topeka, March 31st. Delegates favorable to the nomination of Blaine were chosen by resolution, all together, against the protest of a minority. It was announced by supporters of Grant that two of the districts would send contesting delegations to Chicago. The four contesting delegates were subsequently admitted to seats at Chicago, but the whole ten delegates were granted but six votes. The platform adopted by the Convention contained planks charging

the Democratic party with causing the civil war, and declaring all who have wavered from fealty to the Union unfit counselors in the affairs of the nation, and one instructing the delegates to vote for Blaine, together with the following:

That we are a nation, and that the mission of the Republican party will not be completed until under one flag every citizen, however humble, is secure in the honest expression of his opinions in all parts of our dominion, and is fully protected in his life and liberty and in the full enjoyment of all the political rights of an American citizen.

That the unhappy cause of the migration of the colored people from the South to the North, is the apprehension, persecution, and robbery of them by the white people, their former masters, and present owners of the soil, and it is the duty of the Government of the United States to extend to the colored people of the South such protection that their removal from their native land shall cease to be a necessity.

The Democratic State Convention met at Topeka, May 26th, to elect delegates to the National Convention. Instead of the majority report of the Committee on Resolutions of a platform instructing the delegates to vote for Seymour and Hendricks, a resolution to the effect that they should act without instructions was adopted.

The Greenback-Labor party met in convention at Topeka, August 4th. The following candidates were put in nomination for the State offices: for Governor, H. B. Vrooman; for Lieutenant-Governor, H. L. Phillips; for Secretary of State, A. B. Cornell; for Treasurer, Dr. S. A. Marshall; for Auditor, D. J. Cole; for Attorney-General, D. B. Hadley; for Superintendent of Public Instruction, Charles Smith. In the platform were the following resolutions:

That we favor an equitable appreciation of all lands sold under mortgage or legal process, and an equitable stay or redemption law on forced sales of real estate by process of law.

That we oppose any modification of the present constitutional tax-exemption law, and that we are unable to perceive any good and sufficient reasons for holding a State Constitutional Convention at this time.

That the act of the last Legislature in abolishing the one mill State-school tax, which has been levied from the beginning of our State's existence, merits our unqualified condemnation from the fact that it was a blow struck at the people's colleges—the common schools of our State—in the interest of corporations.

That we are in favor of the regulation of common carriers so as to prevent extortion and discrimination in rates of freight.

That we condemn the extravagance of our last Legislature in the expenditures of public money, adding about \$150,000 to the annual expense of the State, and raising our State tax one mill on the dollar, and we demand in future the most rigid economy in all State, county, and municipal affairs.

That we are in favor of taxing the mortgages of non-residents recorded in this State the same as residents, and the strict enforcement of our State tax laws so as to include all property subject to taxation.

That the rate per cent. just fixed by law in Kansas is ruinously high, and is fast swallowing up the wealth of this State, and that we demand of the next Legislature a law fixing a low rate of interest and a penalty, forfeiture of all interest and principal for its violation.

That we are opposed to the employment of convict labor in competition with the free labor of the State, and we demand appropriate legislation to protect the

lives of employees in the mines of Kansas and to secure miners their wages.

The Democratic Convention for the nomination of State officers met at Topeka, August 31st. The following candidates were chosen: for Governor, ex-Senator E. G. Ross; for Lieutenant-Governor, Thomas George; for Secretary of State, John M. Giffin; for Auditor, J. G. Neumueller; for Treasurer, Theodore Wickselbaum; for Attorney-General, A. L. Hereford; for Superintendent of Public Instruction, Miss Sarah A. Brown. A resolution was adopted which approved the Presidential nominations at Cincinnati, also the following on State matters:

Resolved, That the proposition made and submitted by the last Republican Legislature to the people to amend the Constitution of the State, affecting the repeal of the constitutional exemption of \$200, is not in the best interests of the State, and is an outrage upon the poor people of the Commonwealth, and we pledge every honorable effort to defeat said proposition.

In the Republican State Convention, which met at Topeka, September 1st, Governor John P. St. John was renominated; D. W. Finney was nominated for Lieutenant-Governor, after several ballots; James Smith was nominated for Secretary of State; P. J. Bonebrake for Auditor; John Francis for Treasurer; William A. Johnston for Attorney-General; H. C. Speer for Superintendent of Public Instruction. With the exception of the Attorney-General and the Superintendent of Instruction, the nominees were all of them the incumbents of the offices for which they were nominated. The following platform was adopted:

The Republicans of Kansas, in Delegate Convention assembled, heartily endorse the declaration of principles embodied in the National Republican platform, and pledge their united and zealous support to the nominees of the Chicago Convention, General James A. Garfield and General Chester A. Arthur.

We point with satisfaction to the rapid and substantial growth of Kansas under the unbroken Republican Administration, extending through two decades. We congratulate the people of the State that general education has gone hand in hand with material development. We take especial pride in the fact that the revenues of the State have been honestly collected and wisely and securely invested. We affirm that the United States is a nation, and that it is alike the right and duty of the General Government to secure to all of its citizens full and complete liberty and exact equality in the exercise of their civil and political rights. A free ballot, uninfluenced by force or intimidation, and fair count of such ballots are necessary for the preservation of free institutions. The Republic can not endure if shot-guns or tissue ballots, intimidation or false counting, control the choice of officers and the policy of legislation or administration. The change most needed in this country is one which will abolish the system by which a vast section of the country has been made and is kept solid for the Democratic party.

We congratulate the people upon the fact that the resumption of specie payments has brought in its train general prosperity and universal confidence, and that our currency, coin, and paper has a fixed value, and is convertible, secure, and equivalent.

We declare that, inasmuch as the Republican party of this State is justly held responsible for the officers whom it or its representatives elect, and inasmuch as experience has shown the grave evils resulting from

purely personal canvasses, it is the duty of the Republican members of the Legislature, in the election of the various officers within their choice, to act in concert, and in accordance with the determination of a fairly expressed majority of the Republican members in caucus or convention assembled.

The important question of the adoption of the prohibitory temperance amendment to the Constitution was to be decided at the November State election. A heated controversy between the friends and opponents of the proposed amendment went on throughout the summer. The main strength of the Republican gubernatorial candidate, in the Convention and before the people, consisted in his ardent prohibition sympathies and his decided approval of the plan embodied in the amendment. The proposed amendment was to incorporate the following additional section into the Constitution:

The manufacture and sale of intoxicating liquors shall be for ever prohibited in this State, except for medical, scientific, and mechanical purposes.

After the election there was still a question as to whether the amendment had been adopted, and it remained for the Supreme Court to decide whether a plurality vote was sufficient to carry the amendment. (This question has been decided in the negative in the matter of the Indiana amendments by the Supreme Court of that State. See INDIANA.)

The returns of the vote for Governor gave St. John 115,204 votes; Ross, 63,557; Vrooman, 19,477; scattering votes, 692; making the Republican plurality 51,647, and majority 50,955. The other Republican candidates for State officers were elected by pluralities some 10,000 or more greater. John A. Anderson was elected member of Congress from the First District by 48,599 votes, and a majority of 18,534; J. C. Haskell, from the Second District, by 30,758 votes, and 7,001 majority; Thomas Ryan, from the Third, by 41,094 votes, and 14,721 majority.

The vote for the Legislature returned 36 Republican, 1 Independent Republican, 1 Fusionist, and 2 Democratic Senators; and 118 Republican, 3 Independent Republican, 5 Fusion, and 11 Democratic Representatives.

There were 92,302 votes cast for the proposition to amend the Constitution by adding the clause prohibiting the manufacture and sale of liquors, and 84,304 votes against the proposition.

For the proposition to amend the Constitution by striking out the clause "exempting \$200 personal property from taxation," there were 38,442 votes cast, and 140,020 against the proposed amendment.

The vote upon holding a Constitutional Convention was 22,870 for and 146,279 against.

The vote for the Presidential electors averaged 121,529 for the Garfield electors, 59,729 for the Hancock electors, 19,715 for the Weaver electors, and 35 votes for other tickets; making Garfield's plurality 61,800, the largest gained in any State.

KENTUCKY. The session of the Legislature was a notable one on account of the measures which were taken to extricate the State from financial difficulties, and to arrest and remedy numerous administrative abuses. The Legislature acted upon every one of the recommendations contained in the Governor's message. The most important measures were the addition of five cents on the one hundred dollars in the tax levy, making the general revenue tax four and a half mills, as formerly; stringent laws for the assessment and collection of the taxes, and for the detection of fraudulent witness claims and others, and the reduction of fees; the substitution of the warden system for the lessee system in the Penitentiary, and provisions for enlarging the accommodations and reforming the management; the submission of the proposition of calling a Constitutional Convention to the vote of the people; the creation of a commission for the regulation of railroads; the reduction of appropriations, and provisions for the better management of the State charitable institutions; the endowment of the Agricultural and Mechanical College; the transfer of the State's improvements in the Kentucky River to the General Government, and provisions for the acquisition of property by the Government for river improvement and for the protection of the Government works; certain amendments in the civil code, and the redistricting of the State into judicial circuits, and the abolition of a number of lesser courts.

The Legislature began its session on December 31st, and adjourned on the 6th of May, sitting 127 days, a longer session than that of any previous Legislature. Lieutenant-Governor James E. Cantrill presided over the Senate, and J. M. Bigger was elected Speaker of the House. In addition to the important general laws which were enacted, a large number of local and private acts were also passed. Many of the members sat in the Legislature for the first time in the lower house, and the regularity of the proceedings was broken several times by stormy scenes, and excited, unparliamentary language. The session of the Senate was not marked by any similar unpleasantness, and the debates of this body were uniformly good-natured and courteous.

The act to take the sense of the people upon calling a convention to revise the Constitution of the State, provides that the vote on this question shall be polled at the next ensuing election of representatives; that the proposition shall be duly advertised, and polls opened by the sheriffs and other election officers, who shall propound the question, "Do you vote for calling a convention or not?" to every elector entitled to vote for Representatives, and record the answers and make returns of those voting in favor of a convention to the Secretary of State.

Among the revenue and taxation acts was one permitting the owners of property sold

for taxes due in or before 1878, and bought in by the State, to redeem it by paying the purchase money and interest at thirty per cent. per annum. This act was afterward amended by making the rate of interest six per cent. per annum, and subsequently to the effect that the lands are redeemable upon payment of back taxes and interest. An act to prevent the payment of fraudulent claims against the Commonwealth, provided that the order of a court allowing a bill or credit against the State should be regarded as *prima facie* evidence of the correctness of the claim, but should not be treated as a judgment. In case the Auditor suspects the fraudulence or illegality of such claims, he may, with the advice of the Attorney-General, contest their payment in the Circuit Court of Franklin County, which is given jurisdiction of all suits against the Treasury. The Attorney-General was authorized to sue for the recovery of moneys suspected to have been paid out of the Treasury heretofore upon fraudulent or irregular claims. Another act authorized the Attorney-General to investigate the condition and value of judgments obtained by the State upon which executions have been issued, and the return of no property found made by the officers. An act to prevent the payment of fraudulent claims out of the Treasury makes it a felony for a justice of the peace, sheriff, constable, or other peace officer, to present a false claim for services connected with the arrest, trial, or transportation of prisoners. The Auditor was authorized to appoint agents to attend to revenue matters in the counties, who shall see that persons who have failed to return their taxable property shall be summoned into court to give in their lists, that sheriffs and collectors who have collected delinquent taxes and not accounted for them shall be prosecuted, and to investigate the accounts of officers, and see if there have been any overcharges or defalcations. Another act makes it punishable for a magistrate to issue warrants for arrest in felony cases without filing in his office an affidavit specifying the charge and showing reasonable grounds for suspecting the person arrested. These acts were the result of the discovery of extensive and systematic frauds practiced by county officials upon the Treasury, especially in the eastern part of the State.

The sheriffs or collectors of the State or county taxes are required to return the tax receipts of insolvent and delinquent taxpayers, and are barred from collecting the taxes returned as delinquent unless they are relisted. The time for the collection of fees and taxes, except such as were already outlawed, was extended two years. The law regarding the service of tax-notices was amended so as to require the sheriff to tender a receipt specifying the assessment and tax due from any person upon demand, and to notify personally or leave a written notice at the house of every tax-payer, resi-

dent in the county, before distraining. Lands held by the State on tax titles, on which the equity of redemption had expired, were directed to be sold at public auction and conveyed in fee-simple to purchasers, until enough of each parcel is sold to pay all arrears. The right of redemption runs five years after the first tax sale. Lands conveyed by the Auditor's deed are subject to a lien for valuable improvements made by the former owner.

The Commissioners of the Sinking Fund were authorized by act of the Legislature to transfer the balance of the fund to general revenue. The total outstanding bonded indebtedness amounted to \$180,394, of which \$6,394 were overdue, and had not been presented, being probably lost or destroyed, leaving \$174,000 to be provided for by the sinking fund. The sinking fund amounted to \$235,671, or \$61,671 more than the debt to be met, which surplus was ordered to be applied to current expenses, as well as any like surplus which should be found on hand in the future. A temporary loan of \$500,000 was authorized to relieve the embarrassment of the Treasury, and the State officers were empowered to issue bonds at 6 per cent. up to that amount.

Many fees and salaries were cut down. Jailers are allowed 50 cents a day for the keeping of a prisoner. Only one guard is allowed in the transportation of a prisoner. For keeping a pauper or idiot, \$75 a year is allowed; for a lunatic, \$165.

The Commonwealth was divided into eighteen circuit court judicial districts. These circuit courts are to sit two terms in each county, except certain specified counties, in which a greater number of terms are to be held. They are courts of record. The criminal, chancery, and common pleas courts were abolished, except in certain counties. The circuit judges and Commonwealth's attorneys for the several circuits were elected in August.

An act allows plaintiffs to prosecute non-resident owners of real estate for amounts under \$50 in the circuit and equity and criminal courts of the county where the land is situated. Concurrent jurisdiction with circuit courts was extended to quarterly courts in cases involving sums not exceeding \$200. A penalty was prescribed for soliciting service as juror. The practice in appealed cases was changed so as to restrict the appellant to the errors specified in his assignment of errors, and to allow judgment to be passed only on such of these as prejudice substantial rights, amendments to the bill of errors being allowable on ten days' notice. Appeals can be taken to the appellate court for amounts of \$100 and upward; to the Circuit Court for \$25 and upward; from a magistrate to the quarterly court for from \$10 to \$25; and over \$25 to either the quarterly or the circuit courts.

An act fixed jurors' pay at \$1.50 for each day of attendance to petit and \$1.25 to grand jurors. The fees of justices for holding levy

courts, etc., were fixed at \$2 per diem. Commissioners and receivers appointed by the circuit judges are required to report the moneys they collect under oath. The number of jurors in justices', police, and quarterly courts was reduced to six, and their pay was reduced to 50 cents for each case, or \$1 a day when several cases are disposed of. The county courts were empowered to fix the time for holding the quarterly courts in each county. Retail druggists were exempted from jury service. Public executions were abolished in an act providing that the death penalty shall be inflicted in an inclosure, in the presence of not over fifty persons. Witness fees in felony cases were fixed at \$1 per diem, with four cents mileage for witnesses from outside the county limits. Officers speculating in witnesses' claims are finable \$50.

The volumes of reports of decisions of the Court of Appeals are hereafter to be named "Kentucky Reports," instead of bearing the name of the reporter.

The act establishing a board of railroad commissioners provides that the Governor shall, with the consent of the Senate, choose the board, consisting of three commissioners, to serve for a term of two years. They are to be selected, one from the agricultural, one from mercantile, manufacturing, or mining class, and one representing the railroad interest. An oath is required that they will discharge their duties without fear or favor. They are to prosecute all violations of the railroad laws, and have power to examine accounts and papers, take testimony, and subpoena witnesses. They are to make annual reports to the Governor, and make suggestions as to classifying and rating fare and freight charges. The duties of the railroad board of equalization and taxation were devolved upon the railroad commissioners, and the old board abolished.

An act was passed forbidding persons other than passengers or employees to get on or off trains in motion.

It was made a misdemeanor to throw missiles or to shoot at railroad trains, and murder if death ensue.

The act to incorporate the Agricultural and Mechanical College of Kentucky vests the management in a board of trustees, presided over by the Governor, and composed of twelve members, nominated by him and elected by the Senate for the term of six years. The professors are only removable for cause, and by a majority vote of the whole board. The students are admitted on competitive examination, one in each year between the ages of twelve and twenty-five, from each representative district, being entitled to free scholarships. The teachers and trustees of each common school are to select one pupil as a candidate for the scholarship, giving the preference to energetic young men of limited means. The faculty have the power to issue teachers' certificates.

The amendments to the act removed the limitation of the power of the trustees to remove

teachers. It makes the collegiate period four years; but a normal department for the education of teachers shall be maintained in conjunction with the college, which has no stated curriculum. Teachers and persons preparing to teach are admitted tuition free, not exceeding four in number from each representative district, for one year. Students are admitted, without regard to their places of residence, upon payment of the tuition fees. A special fund for the endowment and maintenance of the Agricultural and Mechanical College was created, to be derived from a special supplemental tax of one-half cent on the one hundred dollars on the property of all the white citizens of the State.

The overcrowded condition of the State Penitentiary impelled Governor Blackburn to declare, during the gubernatorial canvass, that, if elected, he would release enough convicts by the exercise of the pardoning prerogative to insure the health of the remaining ones. Many petitions on behalf of convicts came to him after he entered upon his duties, and more prisoners were set at liberty by his orders than had been customarily pardoned. There were 969 prisoners in the Penitentiary, with only 780 cells for their accommodation. A large number of the convicts had died of malarial disease, and many were sick. He began by pardoning the sick and the dying, regardless of the murmurs of the press and the public. Upon the meeting of the Legislature a committee was appointed to visit the prison with the Governor, and, upon its recommendation, over 100 more pardons were issued. The Legislature passed an act authorizing the appointment of commissioners to select a site and plans for a branch prison, and to visit the prisons of the East to study the best system of prison construction and discipline.

The new penitentiary law provides for the election of a warden by the joint ballot of the Legislature. His term of office is four years. He is removable by the Commissioners of the Sinking Fund. His duties are to direct the prison and look after the diet, health, comfort, and discipline of the convicts. He is expected to keep such as are not contracted for at labor within the prison. The Commissioners of the Sinking Fund and *ex-officio* Prison Commissioners are intrusted with the appointment of a deputy warden, clerk, physician, and chaplain to the prison. The Commissioners are to hire out on contract the labor of the whole 600 convicts, more or less, to be employed within the prison walls, to the highest and best bidder, the contracts to run from one to four years. The contractors are to defray the expense of keeping the prisoners, and to furnish the discharged with clothing and a passage to their own counties.

Many acts were passed prohibiting the retail traffic in liquor in particular towns and counties. A general act prohibits any druggist, without license, from selling liquor or medi-

cines containing alcohol in such places, and allows licensed druggists to dispense such liquors only on the prescriptions of physicians.

A public grain warehouse act requires a bond from the proprietor of a public elevator or warehouse, and compels him to store the grain according to the grading of the inspector, to give numbered receipts which represent actual quantities received in store, to deliver promptly upon demand, to use due diligence in guarding against overheating, and upon discovering that any grain is likely to be injured by heating to publish the numbers of the receipts outstanding upon which it is deliverable, and the names of the persons from whom it was received, and forbids him to mix different grades together. An amendment to the Board of Health Act authorizes local boards of health to inspect houses and enforce regulations for the prevention and checking of disease; and the boards on the borders of the State are authorized to declare quarantine, which shall be continued with the approval of the State Board of Health, which is empowered to establish quarantine, or to take any measures deemed necessary to prevent the introduction or spread of contagious disease. The penalties of the Civil Damage Act were extended to "any person who procures or furnishes" liquor to a known inebriate. An act was passed forbidding any person or corporation to employ convicts of other States within the limits of the State. An act was passed requiring persons engaged in manufacturing or selling commercial fertilizers to send samples to the Commissioner of Agriculture for inspection, with a statement of the composition and the proportion of the ingredients, and receive from him a certificate that the manure is composed as represented, and shall label all his goods with a statement of the percentage of the different ingredients, or failing to affix such certificate shall forfeit \$100, or affixing a false certificate shall forfeit \$200 to the purchaser.

The divorce law was changed so as to allow a divorce to the husband for habitual drunkenness on the part of the wife. A lottery bill prohibits the sale of lottery tickets without express authority of law, the act to be conspicuously posted at the place of sale. A Sunday liquor law was passed forbidding tavern and saloon-keepers to have their places open, or to sell or give away liquor on Sundays. The penalty for the third offense is forfeiture of the licenses. The provisions of the Sunday laws were remitted as far as they apply to street-railroad companies. An act was passed making it a misdemeanor for a person to use abusive or insulting language in the presence of another or others, intending to provoke an assault, punishable by a fine not exceeding \$20, or if the offender be a male and the injured person a female \$50. A law was enacted for the benefit of certain counties, prescribing that voters at primary elections shall be legal voters, shall possess the qualifications demanded by

the political organization in which they vote, etc., and that otherwise they are guilty of a misdemeanor, and can be fined. An amendment to the law exempting property from execution exempts the tools, materials, and productions of mechanics with families to the value of \$200. The articles to be exempted shall be appraised by three disinterested housekeepers. Another law requires a horse worth more than \$150, or a cow and calf worth more than \$60, claimed to be exempt under the general law of executions, to be appraised in like manner and sold, the excess going to the creditor. Liens on foundries and manufactories for labor or supplies were abolished except for wages due within sixty days of an assignment. A bill was passed allowing salvage to the taker-up of timber, etc., adrift on rivers.

The act of 1873 authorizing a reward for the killing of wolves, foxes, and wildcats was repealed. A poison bill, which was passed, requires every person who sells a poison to label it with the name of the article, the word "poison," and his name and address; to satisfy himself that the purchaser is of age and desires the article for a lawful purpose, and to keep a register in which each sale and the address of the buyer is entered.

The act to enable the United States to acquire lands for the purpose of constructing canals, locks, dams, etc., for the establishment of slack-water navigation on the rivers of the State, provides that the Government can purchase land for such purposes whenever appropriations are made by Congress for locks, permanent or movable dams, dams with adjustable chutes, or canals for the improvement of any navigable river; and that, in case the Government can not come to an agreement with the owners, it can apply to a court of record in or nearest to the county for the condemnation of the land. The same act imposes a penalty for injuring the property acquired under its provisions. It also transfers to the United States the five locks and dams constructed by the State in the Kentucky River. For the improvement of this river the last Congress appropriated \$100,000, and a further appropriation of about \$130,000 was made by Congress in 1880. Other special acts were passed to cede the right to acquire and condemn land, giving concurrent jurisdiction over the same, to the United States, for the improvement of Big Sandy and Licking Rivers, for the construction of a canal around the falls of Cumberland River, and for other similar improvements.

A large number of railroad charters were granted to companies engaging to carry through lines between the Atlantic and the Western States, through the State, and to others promising to develop the valuable, but backward, eastern section of the State.

Among the appropriations made were \$30,000 for additional buildings for the Institution for the Deaf and Dumb; \$38,650 for an extension of the Lunatic Asylum at Anchorage;

\$500 per annum for the Agricultural Bureau. The Geological Survey was continued, for which \$10,600 was appropriated—\$4,000 for the geological survey, \$2,000 for topographical labors and the State map, and the rest for photography, office expenses, examination of water-power and forest resources and of building-stones, and for chemical analysis. The State Geologist, who is also the Commissioner of Emigration, is to hold his office two years, one being appointed by the Governor and approved by the Senate at each meeting of the Legislature. He is to keep in his office a record of lands for sale, lease, or colonization, the owners paying a fee of \$2 for each entry, and to collect and disseminate information regarding the utilization of the raw products of the State. The Fish Commission was continued, and \$5,000 appropriated for its objects.

A bill to strike out the word "white" from the jury law was passed by the Senate on the last day of the session, but was not acted upon by the House. The question of the constitutionality of the law came up in the courts during the year on writs of *habeas corpus* sued out by negroes indicted and sentenced under the existing law. The subject first arose in the United States Circuit Court at Covington. Judge Barr granted a writ of *habeas corpus* to two colored men, William Gillis and John Davies, indicted in the Bourbon County Circuit Court for malicious shooting, on the ground that they could not be legally indicted and tried in that Court. The Governor was requested by many to call an extra session of the Legislature for the particular purpose of amending the law to make it conform to the fourteenth amendment of the United States Constitution, as it was feared that no negro malefactors could be tried or convicted before that was done. But the difficulty was obviated by the decision rendered by the Kentucky Court of Appeals. In this Court the constitutionality of the statutes providing that grand and petit jurors must be white citizens was tested in the case, on appeal, of *Commonwealth vs. James Johnson*. Following the decision of the United States Supreme Court in the case of *Strander vs. the State of West Virginia*, the Court decided that portion of the jury law excluding colored persons from jury service unconstitutional; the other qualifications—that jurors shall be "housekeepers, at least twenty-one years of age, sober, temperate, and of good demeanor"—remaining in force. In the opinion, Judge Cofer explained the import of the decision as follows:

This question has not been heretofore passed on by this Court, and as the duty of selecting and summoning jurors is devolved upon merely ministerial officers, we ought to assume that, in performing their duties, they obeyed the statute as enacted by the Legislature, and that they excluded colored persons from the jury because the statute declared them to be incompetent, and consequently that the appellee was deprived by the statute of a right which the Supreme Court holds is secured to him by the Constitution.

But the word white, as found in our jury laws, being now declared to be no part of that law, it will be incumbent on all officers charged with the duty of selecting or summoning jurors to make their selections without regard to race or color; and when jurors are hereafter selected and summoned, it ought to be presumed that the officers did their duty and ignored the statute so far as it is herein held to be unconstitutional, and that they have not excluded any person from the jury on account of his race or color.

We do not mean, however, to be understood to say that a negro can not be lawfully indicted and tried unless the jury is composed in part of persons of his own race. All we decide is, that such persons must not be excluded because of their race.

In the case of the Commonwealth, appellant, *vs. Isaac Wright*, it was decided that unconstitutionality of the law excluding negroes from juries could not be put in plea by a white person, as it does not deprive the members of the favored race of the equal protection of the law, following the decision in *Marshal vs. Donovan*, in which a white person undertook to raise the question whether the exclusion of negroes from the common schools was not unconstitutional.

A suit brought in the Court of Common Pleas by William Browne against Watt Young, for services rendered in securing the pardon by President Hayes of the son of the latter, confined in the Penitentiary at Joliet, was dismissed by Judge Smith, on the ground that it was contrary to public policy to allow a recovery at law for services of that character.

Judge William L. Delaunay, in a supplemental charge, called the attention of the grand jury at Bowling Green, November 9th, to the publication of the Willard Hotel lottery advertisements, and so instructed them that they brought in indictments against the proprietors of five of the leading newspapers of the State. The Legislature, in 1879, passed a special act authorizing the owner of the hotel to dispose of it by lottery. In the advertisements money-prizes were added, contrary to the act. By a general statute lotteries of all kinds are prohibited, and by another their advertisement is forbidden under the same penalties. The case never came to trial, as the Governor interposed his pardoning power, and relieved the newspaper owners of the penalties.

An act passed in April, to repeal the charter of the Green and Barren River Navigation Company, was decided by the Court of Appeals, October 29th, to be unconstitutional, on the ground that the charter granted in 1868 was in the nature of a contract, requiring the company to keep the navigation in repair for thirty years, for which they gave bonds; and the judgment of the lower court was affirmed, to the effect that the possession of the dams and locks leased to the company, and the privilege of collecting tolls granted in the charter, could not be taken away by the action of the Legislature without compensation.

In the case of the Newport and Cincinnati Bridge Company, appellant, *vs. R. W. Woolley*, the claim of the latter for payment for legal

services was resisted, on the ground that the company, which was chartered by two States to construct the bridge to the limits of their several territories, had no legal existence, and that the Ohio corporation, which was sued, had not employed appellee. The Court ruled that the two companies were in partnership, and each bound by the acts of the other.

In the case of *W. G. Strubbee vs. Trustee Cincinnati Southern Railway*, in the Court of Appeals, the judgment rendered in the lower court, allowing plaintiff, who sued for specific recovery of wood taken by trespassers from his land, and sold to the company in the form of railroad-ties, only the value of the timber in the trees, was reversed, and judgment for specific recovery awarded.

An organization called Regulators committed many excesses and violations of law in the counties of Boyd, Lawrence, and Carter, killing people, breaking open jails, etc., in the name of popular justice. It was remarkable among vigilance associations for the extent of its membership, and the power which was exercised by it over a large extent of country. It finally broke up of its own accord, 200 men giving themselves up to the civil authorities in the town of Louisa, and furnishing the names of 800 others of the same country.

The coal product of Kentucky mines, not including "neighborhood diggings," or small mines worked by farmers and others for local consumption, was reported to the census officers as 1,060,095 tons, valued at \$737,966 in 1880, an increase in ten years of over 600 per cent. in quantity and of 165 per cent. in value. The wages paid aggregated \$766,236, against \$278,411 in 1870; the number of hands employed 2,977—666 men and 53 boys above ground, and 2,078 men and 180 boys below ground, against a total laboring force of 714 in 1870. The capital invested was \$1,833,347, against \$717,950 at the time of the last census. The coal-measures of the State have been made the subject of recent researches of Superintendent John R. Procter, of the Geological Survey. The district in the southeastern corner of the State, between Cumberland Mountain and the Virginia line, is said to be a mining region of unsurpassed richness. The coal-measures are over 2,000 feet deep above drainage, and contain all varieties of coal. Some of bituminous coal, which is sometimes found in beds eight feet in thickness, gave 62.69 per cent. of coke on analysis. Cannel coal occurs in places in beds four feet thick. Railroads are being built into this rich district. Iron is found in great quantities in immediate proximity to the coal-beds. It might be smelted with the high-grade North Carolina ores, which now go to Pittsburgh. The timber supply is unequaled, particularly of black walnut and poplar.

The bulletins of the Census Bureau give the total population of Kentucky as 1,648,599, divided into 832,616 males and 815,983 females;

1,589,131 native and 59,468 foreign born; 1,377,077 whites and 271,522 colored, the latter number including 50 Indians and half-breeds, and 10 Chinese. The population of the principal cities of the State is reported as follows: Louisville, 123,645; Covington, 29,720; Newport, 20,433; Lexington, 16,656; Paducah, 8,376.

The preliminary report of the census on the cereal acreage and product of the State shows the areas given up to the different crops, and the aggregate yield of each, as follows:

CROP.	Acres.	Bushels.
Indian-corn.....	8,017,043	73,856,629
Wheat.....	1,158,514	11,341,264
Oats.....	402,359	4,576,435
Rye.....	89,563	676,154
Barley.....	20,124	457,031
Buckwheat.....	1,806	14,940

The Democratic State Convention, meeting at Lexington on the 17th of June, elected delegates to the National Convention, and adopted the following platform:

The Democracy of the Commonwealth of Kentucky, in convention assembled, do declare:

1. For freedom of the ballot.
2. For home rule.
3. For the supremacy of the civil over the military authority.
4. For no tariff that has protection for its effect.
5. For reform in the administration of the Federal Government.
6. We declare that the action of the Republican party, whereby the verdict of the people as rendered in 1876 was reversed and their will thwarted, was a crime against the Constitution; a crime against the people; a crime against established precedents, and a crime against civil liberty itself; and the people of the United States owe it to themselves and to their institutions to see that this wrong shall not go unrebuked. We do further declare our unfaltering trust in the ability of Samuel J. Tilden as a leader, his patriotism as a citizen, and his fitness for the position to which he

was indubitably elected, but, having confidence in the wisdom and judgment of our delegates to the Cincinnati Convention, we leave them free to exercise their best discretion with reference to all matters that come before them.

7. To the extent of the powers of this body we instruct our delegates to vote as a unit on all questions and in all matters before the Cincinnati Convention.

8. We favor the retention of the two-thirds rule, and direct our delegates to give it their support.

In the Presidential election the Hancock and English electors received an average of 148,715 votes; the Garfield and Arthur electors, 105,961; the Weaver and Chambers electors, 11,423; and the Dow and Thompson electors, 257.

KIMBERLEY, JOHN WODEHOUSE, Earl of, Secretary of State for the Colonies, was born January 7, 1826, and educated at Eton and Christ Church, Oxford, where he graduated B. A., in 1847, taking a first class in classical honors. He succeeded his grandfather as third Baron Wodehouse in 1866, and was raised to the earldom for political reasons in 1866. He held the post of under-Secretary of State for Foreign Affairs, under Lords Aberdeen and Palmerston, from 1852 to 1856, when he was appointed Ambassador at St. Petersburg. He returned from Russia in 1858, and resumed his former position as under-Secretary of State for foreign affairs in Lord Palmerston's second ministry. Retiring in 1861, he was sent on a special mission to obtain a settlement of the Schleswig-Holstein question. He was appointed, in October, 1864, Lord-Lieutenant of Ireland, in place of the late Earl of Carlisle, and retained that position until the resignation of Earl Russell's second administration, two years later. In Mr. Gladstone's former administration he held office from December, 1868, to July, 1870, as Lord Privy Seal, and from 1870 until 1874 as Colonial Secretary.

L

LENOX, JAMES, the founder of the Lenox Library, died in New York on February 18th. He was the son of Robert Lenox, of Philadelphia, who moved to New York at the close of the Revolutionary War. He married a daughter of Nicholas Carmer, and purchased from the corporation of New York a farm at the Five Mile Stone. It covered about thirty acres in Fourth and Fifth Avenues, near Seventy-second Street. He purchased twelve acres on one side at a cost of five hundred dollars, and repented his bad bargain in buying the same number of acres on the other side, from the estate of his friend, Archibald Gracie, at \$10,700. He was far-seeing enough to bequeath it, from "a firm persuasion that it may at no distant day be the site of a village," to his son on conditions that prevented its sale for many years. At the time of his death, in 1830, he was considered one of the five wealthiest

men in New York. James Lenox, his only son, was born in August, 1800, at his father's residence, No. 59 Broadway. He was educated at Princeton College, and while there developed a taste for literature and art, which became the absorbing passion of his life. He studied law, but never practiced it. He went abroad shortly after his admission to the bar, and immediately began the collection of works of art and rare books, the foundation of his famous library. In 1863 the Commissioner of Streets began to cut streets through the Lenox farm, in pursuance of the plan of creating Central Park. In 1868 Mr. Lenox's property had so enhanced in value that he began to carry out his long-cherished plans. The Presbyterian Hospital was founded, and endowed with the land between Madison and Fourth Avenues, and Seventieth and Seventy-first Streets. He made further donations to it, amounting to

over a million of dollars. The following year he gave lots on Seventy-third Street, assessed at \$84,000, to the Presbyterian Home for Aged Women. In 1874 he gave the site of the Presbyterian Church on Seventy-third Street, estimated at \$100,000. On March 17, 1870, he conveyed the ten lots on the crest of the hill between Seventieth and Seventy-fifth Street, overlooking Central Park, for the erection of Lenox Library. The ground was valued at \$100,000. The building cost him \$450,000. The collection of books and works of art which it contains, the accumulation of a half century of assiduous labor, are beyond value. Mr. Lenox was almost a recluse in his habits. He was a member of the Chamber of Commerce, having been elected in 1830. He served as president of the Presbyterian Home, and was a member and regular attendant of the Presbyterian Church. But he was singularly reserved and retired in his habits. He was never seen in that older society of New York to which, by birth and connection, he belonged. He was never married. Of his seven sisters, two only survive him. His special request to his family and attendants was that no details of his life should be given for publication. But he was of that class of men who "do good by stealth, and blush to find it fame." His charity was unostentatious, but the magnificence of his gifts brought them before the world. They must preserve the memory of a public benefactor.

LESLIE, FRANK. This well-known publisher of numerous periodicals, illustrated ones especially, died at his residence in New York City on January 10, 1830, he being then fifty-nine years old. He had been for some time sick of a cancer, as the attending physicians pronounced it; but its deadly character was so little apprehended that, as late as one hour before he expired, the members of his family believed he was growing better, approaching convalescence. His real name was Henry Carter, born at Ipswich, England, in 1821, the son of Joseph Carter, a glove manufacturer of that place. *Frank Leslie* was assumed; a *nom d'art* it might perhaps be termed, as we call that a *nom de plume* under which many a writer gives his or her literary productions to the world. He passed his boyhood in his father's factory to learn the glove-making business; and, that he might perfect himself in it, he was sent to London at seventeen years of age, recommended to his uncle, who had an extensive dry-goods establishment in the capital, and who employed him as clerk in the glove department. Both at Ipswich, however, and more in London, he indulged his naturally predominant passion for drawing, sketching, and engraving, particularly on wood, devoting to knowledge and proficiency in art all of his free hours, and much also of the time which he should have given to duty as a trader's apprentice. His father and uncle, who destined him for trade, reproved him for his wander-

ing after art; and it was chiefly to escape detection and reproach from those to whom he naturally owed respect and deference that he sought to hide himself under the name of Frank Leslie. In his twentieth year he chose, and actually began to practice, art as his only pursuit in life. At that age he also married, and three sons have been born to him—Henry, Alfred, and Scipio, all of whom grew up to man's estate, the last named one having died in 1879. As to happiness in domestic life, however, his marriage proved an unfortunate one from the beginning; and, after nearly twenty years' continuance, ended in separation in 1860. In his career as an artist he started from the establishment of the "Illustrated London News," whose engraving department he took in charge. It was during his connection with that journal that he mastered the details and *minutiae* relating to an illustrated paper, which knowledge he turned to good account in after-life. In 1848 he emigrated from his native country and settled himself in New York City, and shortly after arrival had his family name, Henry Carter, formally changed into Frank Leslie by a special act of the Legislature. His first business connection in America was with the New York "Gleason's Pictorial." Some time later, when Phineas T. Barnum, with the Messrs. Beach, started their illustrated paper, Mr. Leslie was treated with to superintending the engravings. Mr. Barnum had so favorable an opinion of the young engraver's abilities that in a consultation with his associates he offered to double the twenty thousand dollars which he had already invested in the concern, on condition that its management should be placed in Frank Leslie's hands, which proposal was not accepted. Journalistic records attest that paper to have been short-lived. In 1854 Mr. Leslie embarked in the publishing business on his own account. He began with the "Gazette of Fashion," which was soon after followed by the "New York Journal." He purchased the "Journal" cheaply, as its gradually decreasing circulation in the hands of its former owner had been at that time run down to the lowest figure. Under Mr. Leslie's skillful management it very speedily became profitable. On December 14, 1855, he issued the first number of "Frank Leslie's Illustrated Newspaper," the most noteworthy of his periodicals. The events regarded most stirring and important by the people of this country are found chronicled and illustrated in this paper as they successively occurred during the interval intervening between that date and Mr. Leslie's death—a quarter of a century; among others, the Burdell murder in Bond Street; the inauguration of President Buchanan, the first event of that kind ever illustrated in North America; the swill-milk horrors, for his action in exposing which Mr. Leslie received public recognition, and a public testimonial; the execution of John Brown; the great Lynn strike; the Japanese Commission; the first laying of the At-

lantic cable; the assassination of President Lincoln and other salient points of the late civil war; the Chicago and Boston conflagrations; and the Centennial Exhibition at Philadelphia.

In 1865 Mr. Leslie started the "Chimney Corner," the editing of which he intrusted to his second wife. He married her after his separation from the first had been legally effected; she also having previously been divorced from her husband, E. G. Squier, the archæologist. To her he assigned likewise the editing of the "Lady's Magazine," a continuation and enlargement of the "Gazette of Fashion," the first of his publications in order of time.

To these he then added in rapid succession the "Boys and Girls' Weekly"; "Pleasant Hours"; the "Lady's Journal," edited also by Mrs. Leslie; the "Popular Monthly"; the "Sunday Magazine"; the "Budget of Wit and Chatter-box"; and "Die illustirte Zeitung," in German.

Such novels as from time to time appeared in the columns of his periodicals he published in book form at their conclusion.

From these various publications, which proved generally profitable, Mr. Leslie gathered a great deal of money. From the "Chimney Corner" alone he is said to have cleared fifty thousand dollars in one year. The late civil war between North and South was to him a field of most abundant harvest, the circulation of his papers, chiefly the illustrated ones, having during that time exceedingly increased. A large portion of the money thus amassed he converted into houses and other immovable property, within the city and outside.

Occasionally, however, he sustained considerable losses, and more than once his financial condition was not a little embarrassed. He may, indeed, be said to have died in that condition.

In 1857, three years after he had commenced as a publisher, the state of his affairs was such that he should have stopped business but that his creditors granted him an extension of time for payment, during which respite he managed matters so well as to set himself on a firm footing again.

More seriously embarrassed were his affairs in 1877, when he was forced to surrender his property into the hands of a receiver, judicially appointed in the interest of his creditors. By an agreement which the parties concerned entered into at this time, the creditors retained Mr. Leslie as general manager of his publishing business, allowing him twenty per cent. of the profits for his use, which arrangement proved beneficial in its results, as, partly by a material reduction made in the running expenses of the establishment, and partly by the savings obtained from other details in conducting it, above a million dollars of Mr. Leslie's liabilities were, in a short time, cleared away. In April, 1879, he also judicially recovered a large proportion of his business.

One of his heaviest losses was of very recent

date—the publication of the "Historical Register of the Centennial Exhibition," in one volume, and it was caused by his eagerness in doing well what he had undertaken. This magnificent volume embodies a statement and discriminating record of the industrial competition of almost all the peoples on earth friendly assembled together, and represented, each by its own native deputies, at Philadelphia in 1876, the most noteworthy details of the exhibition being also illustrated through the entire volume in the best style of art Frank Leslie could command. The work was finished and published at an immense outlay of money; but, while, on account of contents and manner of execution, it is both valuable in itself and most creditable to the publisher, it proved a complete loss to him. It also involved him in a number of unpleasant lawsuits with his Philadelphia agents.

The public's appreciation of Frank Leslie in his chosen field of action was apparently such, besides the generally widespread reputation of his name, as must have gratified his sensibilities. In 1848, the year of his first arrival in this country, the American Institute of New York awarded to him the medal for wood engraving. In 1867, the State of New York appointed him her Commissioner for the Fine Arts Department to the Universal Exhibition held that year in the French capital; and at the close of it the Emperor Napoleon III personally presented him with the prize gold medal. Again, in 1876, the State of New York selected him as her Commissioner to the Centennial Exhibition at Philadelphia, and his brother commissioners from the other States elected him president.

His standing in life's social relations with his fellow-citizens may appear from the fact that he had his family residence on Fifth Avenue, the most fashionable and costly location for private dwellings in the city, and was a member of the Manhattan and Jockey Clubs, neither of which admits persons into membership but such as hold a certain height of respectability in the public's eye. He was also a mason, and belonged to the so-called aristocratic Holland Lodge.

His hospitality was accounted boundless for the manner in which he entertained his friends and visitors at home, and the *fêtes* he gave at his rural residence, situate about midway between Saratoga and Lonely Lake, acquired for him a world-wide celebrity. Mr. Leslie passed much of his time at this residence, called from its location "Interlaken," and surrounded by an estate of six hundred acres of land.

A very commendable trait of Frank Leslie's character appears in the relations he held with his employees, who numbered for some time more than three hundred, the amount of money paid them for their work exceeding six thousand dollars weekly. He was beloved by them all, and deservedly, as the manner in which

he treated them was always remarkably kind, and, whenever occasion offered, more remarkably generous. To some among them, confined to a bed of sickness, or otherwise disabled for work, he continued the salary's full payment for months. One, being in a delicate state of health, he sent to Europe as a better means to recruit, taking upon himself the charge of all traveling expenses, besides continuing to pay the traveler's salary in full. He provided for the widow and children of another; and, generally, whenever any of his employees happened to die, leaving their families destitute, Frank Leslie made it his especial care to supply their wants.

LEWIS, Mrs. ESTELLA ANNA, best known to the world of letters by her *nom de plume* of "Stella," was the widow of Sydney B. Lewis, the intimate friend of Edgar Allan Poe. She was born in Maryland, the daughter of Mr. del Monti, a wealthy planter. While yet a schoolgirl, she translated the "Æneid" into English verse. She wrote a ballad, "The Forsaken," which Poe lauded extravagantly. Still very young, she published "Records of the Heart," a volume which had a wide circulation. Lamartine, who probably admired the woman better than he understood her poetry, called her the "Female Petrarch," as Poe had spoken of her as the rival of the poetess of Lesbos. She was well received in the literary circles of Paris, and by Napoleon III at the Tuileries. While in Italy she wrote her tragedy of "Helemar," which was published after her return to America in 1864. She was encouraged to begin "Sappho," her best dramatic work. It has reached a seventh edition, and has been translated into Romance, and played at Athens. Mrs. Lewis was a writer of society letters for the papers, and love-stories for the magazines. Her latest work was a series of sonnets, defending Poe from his slanderers. She died on November 24th in London.

LIBERIA, a negro republic in Western Africa. President, Anthony W. Gardner, assumed office January 7, 1878, reelected in 1880. Vice-President, D. B. Warner. The Cabinet consisted, in 1880, of the following members: Secretary of State, G. W. Gibson; Secretary of State and of War, W. H. Roe; Secretary of Interior, E. W. Blyden; Attorney-General, W. M. Davis.

The Senate consists of eight members, each of the four states or counties, Montserrado, Grand Bassa, Sincoe, and Maryland, sending two members to the Senate. The House of Representatives is composed of thirteen members. It is provided that, on the increase of population, each ten thousand persons will be entitled to an additional representative.

The Liberian Consul-General in England announced, in February, 1880, that he had been officially informed of the peaceable annexation to Liberia of a large and important tract of land known as the kingdom of Medina. The Consul-General says of the new land that it has an

abundance of the richest African products. Thousands and thousands of acres of gold and iron fields are found there; the forests are full of ebony wood, palms, gum, and gutta-percha trees, while the well-known Liberian coffee-tree grows wild in its native beauty up to thirty and forty feet of height. With this new acquisition, Liberia has opened still more widely the gate to Central Africa. The Medina Bofora-Land, with its 700,000 inhabitants, will constitute, with the exception of the rich coffee plantation on the St. Paul River, the richest and most densely peopled part of the republic.

The area of Liberia, exclusive of the new territory of Medina, is given by Boehm and Wagner ("Bevölkerung der Erde," vol. vi, 1880) at 49,077* square kilometres. The extent of Medina is not yet known. The population of Liberia within its former boundaries was estimated at 718,000, and that of Medina at 700,000. The capital, Monrovia, has about 3,000 inhabitants.

The republic has concluded treaties with Great Britain, Germany, France, Belgium, Denmark, Italy, America, the Netherlands, Sweden and Norway, Portugal, Austro-Hungary, and Hayti.

The public revenue is estimated to amount annually to \$85,000 in paper currency, and the expenditures to \$120,000. In August, 1871, the foundation of a public debt was laid by contracting a loan of \$500,000, at 7 per cent. interest, to be redeemed in fifteen years.

The number of civilized negroes was estimated in 1873 at 20,000, and in 1878 at 19,000. In 1880 the Government itself officially claimed only 18,000. This shows a slight decrease during the last seven years, a remarkable fact, if it is taken into consideration that the American Colonization Society continues to encourage and to support emigration from the United States.

Ex-President Warner, in a letter dated December 6, 1878, gave the following account of the educational institutions of the country:

A fresh impulse to the educational department has been given by the reopening of the Methodist Episcopal seminary in Monrovia, which admits between its walls children of parents of the several denominations of Christians. At Bassa, a graduate of Liberia College has charge of a school in which the higher branches of studies are pursued. This is giving marked satisfaction in that country. The Alexander High School, now located in Clay Ashland, under the supervision and instruction of another graduate of Liberia College, is also doing good work; and the preparatory school in the college is being carried on with commendable energy and profit. The two schools at Arthington, aggregating seventy-eight scholars, and the school at Brewerville, numbering thirty, supported by the American Colonization Society, are in lively operation. The Government schools are adding their quota of instruction to as many as will attend them. Many circumstances combine to render a compulsory system of education here impracticable, but as the country rises to a higher sphere of civilization, and awakens to a keener sense of the great importance of an advanced standard of education, and of having an educated pop-

* The "Gotha Almanac" for 1881 gives 37,200 square kilometres, 18,000 civilized, and 1,050,000 uncivilized negroes.

ulation as a means of safety, it will establish this system and invest it with obligations that will insure it complete success.

LIGHTHOUSE ESTABLISHMENT, THE UNITED STATES. The lighthouse system of this country commenced with its commerce. There is little doubt but that the early colonists recognized the necessity for beacons with which to guide their home-returning shallops to a safe anchorage, and that they took effective means to show the English and Dutch ships, which should make their landfall at night, the safe way to their harbor. But the first authentic evidence of this being done at the public charge is the record of the proceedings of the General Court of the Province of Massachusetts Bay, from which it appears that on March 9, 1673, a petition came from the citizens of Nantasket, Massachusetts (now Hull), for the lessening of their taxes, because of the material and labor they had expended, over and above their proportion, in building the beacon on Point Allerton, the most prominent headland near the entrance to Boston Harbor. At that session also it appears that bills from Nantasket were paid for making and furnishing "fier-bales of pitch and ocum for the beacon at Allerton Point," which "fier-bales" were burned in an iron grate or basket on the top of a beacon, for the building of which Nantasket had furnished 400 boat-loads of stone.

The first lighthouse on this continent was built at the entrance to Boston Harbor, on Little Brewster Island, in 1715-'16, at a cost of £2,385 17s. 8½d. It was erected by the order and at the expense of the General Court of the Province of Massachusetts Bay, and it was supported by light-dues of 1d. per ton on all incoming and outgoing vessels, except coasters, levied by the Collector of Imports at Boston. The maritime colonies followed the example of Massachusetts, and when the United States, by the act of August 7, 1789, accepted the cession of the title to, and joint jurisdiction over, the lighthouses on the coasts, and agreed to maintain them thereafter, they were eight in number, and comprised the following lights, all of which are still in existence, though so greatly improved that they are the same only in purpose and in site:

Portsmouth, New Hampshire, Harbor Light; Boston Light, on Little Brewster Island; the Gurnet Light, near Plymouth, Massachusetts; Brant Point Light, on Nantucket, Massachusetts; Beaver Tail Light, on Conanicut Island, Rhode Island, in Long Island Sound; Sandy Hook Light, New Jersey, entrance to New York Harbor; Cape Henlopen, Delaware, at the entrance to Delaware Bay; Charleston Main Light, on Morris Island, entrance to the harbor of Charleston, South Carolina.

When the lights came into the possession of the General Government, they were placed under the direction of the Secretary of the Treasury, who seems to have given them his personal attention, but to have taken no im-

portant action without the direct approbation of the President.*

On May 8, 1792, the office of Commissioner of the Revenue was established, and the superintendence and control of the lights were devolved upon him. On April 6, 1802, this office was abolished, when the then Secretary of the Treasury, Mr. Gallatin, resumed the control of the lights. Their management remained in the Secretary himself, who gave it much of his personal attention, until July 24, 1813, when, on the reestablishment of the office of Commissioner of the Revenue, the control of the lights became again a part of his work. That office was a second time abolished by the act of December 23, 1817, which went into operation on July 1, 1820, when all its duties, including those of superintending the lights, were devolved on the Fifth Auditor of the Treasury. During these thirty years that had elapsed since the lights had come under the control of the General Government, the number had been increased, under Congressional enactment, from 8 to 55; and each seems to have been built to meet immediate and pressing local want, and without reference to any general system.

The Fifth Auditor, Mr. Stephen Pleasanton, who was popularly known as the General Superintendent of Lights, accepted that duty in 1820, and continued in charge until 1852. During this time the establishment was increased from 55 lighthouses and a few buoys to 325 lighthouses, 35 light-ships, with numerous buoys, monuments, and other aids to navigation.

The General Superintendent of Lights was the officer who executed the orders of Congress, but to whom was delegated a certain discretionary power. Congress, in appropriating the funds for a light, usually fixed its location, its kind, and its order. He formulated the orders of Congress by advertising for proposals to build the kind of lighthouses desired, and signed the contract on the part of the Government. The collector of customs nearest to the location of the proposed light was usually made the local superintendent, and after he had selected the exact site, was furnished with a plan of the building, and was authorized to employ a suitable mechanic as overseer, who was to make sure of the quality of the material and labor used. Payments were made only on the certificate of this overseer. The local superintendent was expected to visit each lighthouse in his district yearly, in June, if possible, and to report to the General Superintendent in Washington the condition of each, and this was often done.

* As an instance of this, the following letter, the original of which hangs in the office of the Lighthouse Board, is here given:

MOUNT VERNON, October 12, 1790.

SIR: I have received your letter of the 5th instant. The public service requiring the arrangement which you have made relative to the lighthouses of Newport and Portland, they are perfectly agreeable to me, and receive my approbation. I am, sir, your most obedient servant,

GEORGE WASHINGTON.

To ALEXANDER HAMILTON, Esq., Secretary of the Treasury of the United States.

The lighthouses were kept in repair by contract; and it appears from the reports of the General Superintendent, that the repairs were, in his opinion, promptly and effectually made. The methods of supplying the lights varied, apparently with their increase in number. When Mr. Gallatin was Secretary of the Treasury, oil and money to purchase other supplies were furnished to a contractor, who made a yearly visit to each light, to keep the illuminating apparatus in repair, and, at the same time, supplied the illuminant, wicks, chimneys, and cleaning-stores. This was not difficult when there were but some fifty lights; but Mr. Pleasanton found, as their number increased, a new method of supply was necessary. He accordingly advertised for proposals to furnish all the supplies needed for the whole lighthouse establishment, and to keep all the illuminating apparatus in complete repair for a given sum per lamp per year, and made a contract with the lowest bidder, to continue for five years, paying him \$35.87 per lamp per year to supply everything necessary for keeping up the lights. The contractors were, also, to visit each lighthouse annually, and report on its condition, specifying the repairs needed to each structure, as well as to its illuminating apparatus; and they were also to report on the conduct and ability of the keepers. And the keepers were to report on the quality of the supplies furnished, and on the condition of the illuminating apparatus and buildings. This plan Mr. Pleasanton reported as working satisfactorily to the Government.

Meantime, complaints were made in various quarters as to the efficiency of the lighthouse establishment. The Messrs. E. & G. W. Blunt, of New York City, the publishers of Blunt's "Coast Pilot," were among the more prominent complainants, or, rather, they forwarded to Washington the complaints made to them by shipmasters, and thus they were brought into antagonism with the General Superintendent of Lights, who felt called upon to defend his administration. An account of this was laid before the Senate, by the Secretary of the Treasury, on January 26, 1838, in response to its resolution of inquiry made the day previous.

Mr. Pleasanton had referred to the charge of the Messrs. Blunt, "that the lighthouse establishment was badly managed." The Blunts, on November 30, 1837, in a letter to the Secretary of the Treasury, undertook to show that the annual sums appropriated by Congress were not judiciously or energetically used. Among other things, they said that "the establishment has increased beyond the ability of any single individual at Washington to superintend it in its more important details, and the efficiency of the whole has become greatly lessened. The intelligent gentleman who, for so many years, has had the general superintendence of the lights, has had but little assistance of the proper kind; he has been compelled to rely too much on contractors;

and the representations of contractors will always be favorable. The duties of the office of Superintendent of Lights at Washington coming immediately under the direction of the present incumbent have been conducted, to the best of our knowledge, with skill and promptitude; but those duties have been, for many years, almost necessarily confined to the payment of salaries and contractors and other financial matters; and there can be no doubt this least important part of the whole system has been exceedingly well managed."

Meantime, Congress had been so profuse in its appropriations for lighthouses that the propriety of erecting those for which funds had been more recently appropriated was questioned. So, on March 3, 1837, it was provided, in the act making appropriation for building a large number of lighthouses, light-boats, buoys, etc., that, before any of these improvements should be commenced, the Board of Naval Commissioners should cause an examination to ascertain whether the safety of navigation required any additional facilities, and, if so, what was most suitable for each place, and to report their opinion in regard to all such places to the Secretary of the Treasury, who should proceed with the work so recommended; and that, if the board should advise that the improvements were not needed, they should not be made, and the commissioners' opinions, with the facts, should be reported to Congress.

The Navy Department detailed twenty-two officers on this duty, and, as the Treasury Department placed at their disposal its revenue-cutters, they were enabled to carry out their orders, which were quite precise, and to make their report to the Commissioners, in time for them to report to Congress, by the end of the year, their recommendations, which in effect arrested the erection of thirty-one of the proposed lighthouses, for which \$168,700 had been appropriated. In concluding their report, the Navy Commissioners said:

When the great importance of the lighthouse system is considered, in relation to the safety of human life and of the vast amounts of property, to the facilities and rapidity of communication which it gives between different parts of our extensive Atlantic and Lake coasts, and to the cost of establishing and supporting it, the board would respectfully suggest whether some additional measures may not be desirable for obtaining the necessary information to secure the greatest public advantage for the expenditures which may hereafter be authorized for these purposes.

On March 22, 1838, the Senate

Resolved, That the Committee on Commerce be instructed to inquire into the expediency of importing one or more sets of the most approved apparatus, now employed on the coast of Europe in the lighthouses; and

That the same committee be instructed to inquire whether a more efficient, safe, and useful system of locating, constructing, lighting, and managing the lighthouses necessary for our coasts may not be adopted.

On May 10, 1838, the Committee on Com-

merce made report. Among other things, it said:

The committee fully concur with the Navy Board that legislation should proceed on more safe and satisfactory information. Hitherto, Congress had before it, when proceeding to authorize the erection of new houses, little information beyond the loose, irresponsible statements of petitioners, most of whom were in many instances unknown, and there is too much reason for believing that those most active in getting up these petitions have been persons interested in their success, that some importance might be given to an unfrequented harbor where they had lands; that they might be made superintendents of lights, or make sale of the sites, or get a contract, or be benefited in some other way which had no connection with the public interest, beyond making it subserve their own. Legislation should proceed upon a more safe and satisfactory basis.

The result of the discussion which followed this report was the insertion in the current appropriation act for building lighthouses, etc., approved July 7, 1838, clauses providing, among other things, that the Secretary of the Treasury import two sets of lenticular apparatus, and one set of the reflector apparatus—all of the most improved kinds—to have them set up, and their merits, as compared with the apparatus in use, tested by satisfactory experiments; and \$15,000 were appropriated for that purpose; that Congress may be furnished with more exact information in regard to the lighthouse system, the President divide the Lake and Atlantic coasts into districts, and appoint a naval officer to examine each district whose duty it shall be to inspect all the lighthouses, etc., and to report upon their present condition and usefulness; also to report whether the public emergencies require any, and, if any, what further additional lighthouse works, and of what kind; and also to report whether any modification of the system of erecting, superintending, and managing the lighthouses, etc., is required, and, if so, in what particulars; also that these officers were to examine and determine whether it was expedient to construct the specified lighthouses.

Under this act the President divided the Atlantic coast into six and the Lake coast into two districts, and in August, 1838, an officer of the navy was detailed to each; a revenue-cutter or a hired vessel was assigned to him, and he was instructed by General Superintendent Pleasanton, on August 4, 1838, to make his examinations and reports as soon as possible, that their result might be communicated to Congress.

These officers presented a detail of facts that deserved grave attention. Their reports showed much of poor management, and something of a lack of energy, while certain minor deficiencies were pointed out with fullness of statement. But, while details were severely criticised, more fault was found with the system itself than with its administration. Lieutenant Bache's report is noticeable for its presentation of a plan for a new system, somewhat like that which is now actually in operation.

Mr. Pleasanton met the criticisms in these reports by confession and avoidance. If too many lights had been established, and if some were in wrong places, as charged, it was the fault of Congress. If they were not well built, it was the fault of contractors or collectors. But, in the light of the facts given in the reports, it would be possible to remedy the errors of detail, and he should do so as rapidly as the funds at his disposal would permit. He did not, however, admit that the system could be improved except in its administration.

On February 18, 1842, the House of Representatives

Resolved, That the Committee on Commerce inquire into the expenditures of the lighthouse establishment since the year 1816, including expenditures for building and repairing lighthouses, light-ships, beacons, and every work embraced under this general head, and make their report of the result of their inquiries; and also to examine into the propriety of reorganizing this establishment; of changing the mode of its superintendency, and equalizing the compensation given to them and to the light-house keepers, and the keepers of other lights, buoys, etc., and the propriety of suppressing some of the posts of this establishment, and of so modifying the laws and practices under them in reference to this establishment as to secure strict observation of the duties of superintendents and keepers of lights; and to report the result of their examinations to this House, with such plans as they may agree upon, tending to reduce the annual expenditures of this establishment, and to improve the facilities and safety to navigation.

Resolved, That the Committee on Commerce be instructed to inquire into the expediency of providing by law for a retrenchment of the expenditure and better regulation of the lighthouse department; and, also, whether the same ought not to be placed under the charge of the Topographical Bureau.

On May 25, 1842, the committee made a careful, and apparently an exhaustive report, tabulating the expenses of the establishment year by year, and taking a kindly view of its administration, as the following extracts will show:

From July, 1820, when the number of lighthouses was fifty-five, to the present year, when the number of lighthouses is two hundred and fifty-six, of light-boats thirty, of beacons about thirty-five, and of buoys nearly one thousand, the establishment has been under the charge of the present general superintendent, the Fifth Auditor of the Treasury. It might well be expected that a twenty-two years' service would have given to the incumbent an experience and a practical knowledge of his business, which should not, for slight causes, be lost to the public. A transfer of his duties to other and inexperienced hands could not but be attended with derangements, and, probably, with an increased expenditure. It has now a good degree of method, system, and economy; and with some improvements, particularly in regard to inspection, it is believed that our establishment may, with no disadvantage, compare with that of any other nation. Every innovation is not an improvement. When an old and well-tried system works tolerably well, change and experiments should be avoided. More time and further experience will furnish correctives far better than any which may be anticipated from a change of system, and a displacement of those who have thus far given that system a claim upon the confidence of the country. That complaints, to some extent, have been made, is true; and that complaints would be made occasionally, under any mode of administration, is equally true; but, taking into account the magnitude of the estab-

ishment, the multiplicity of its details, and the large number of agents necessarily in its service, it seems to the committee that it merits no little commendation. In the opinion of the committee, a transfer of the duties of the Treasury Department, imposed by law in regard to our lighthouse establishment, is not called for by the public good.

The appointment of inspectors, whose duty it should be to devote their entire time, under the direction of the general superintendent, to frequent examinations of the lighthouses, light-boats, buoys, etc., would be attended with no great increase of expense. The amount now paid to the collectors acting as superintendents is about eleven thousand dollars. There is already attached to the establishment a small vessel. That, with the addition of another, and the salaries of two inspectors for the two districts on the Atlantic coast, bays, etc., if two should be deemed necessary, the increase of expense will be inconsiderable. The frequent reports of these inspectors to the general superintendent would enable him at all times to know the precise condition and order of the establishment, and to increase its efficiency, usefulness, and economy.

As Congress coincided with its committee, no further legislative action was then taken on the subject.

On the day that the Committee on Commerce reported to the House of Representatives, Mr. Forward, then Secretary of the Treasury, appointed Mr. I. W. P. Lewis, a civil engineer of high repute, as agent to visit certain lighthouses, and to make an examination of their positions, and of the floating lights, beacons, and buoys, and to report generally, and in particular on specified points which covered a large range, including mooted points, as to the management of the lights.

On January 31, 1843, Mr. Lewis made his report, which was soon submitted to Congress by Secretary Forward, with recommendations. The agent had inspected seventy lighthouses in Maine, New Hampshire, and Massachusetts, or one third of all in the establishment. He reported as to the condition of each with such a reckless vigor that Mr. Pleasanton, in his reply, made after Mr. Spencer had succeeded Mr. Forward as Secretary of the Treasury, characterized Mr. Lewis's report as "these calumnies," and spoke of himself as "having been grossly misrepresented by him."

Relative to this controversy, a prominent Boston journal said:

The report that resulted from this partial survey was a severe blow to the defenders of the old system; and, if the Government had possessed the proper energy and vigilance, such an array of facts could not have been passed over unnoticed. A most important benefit, however, resulted to the public from the detail of the defective condition of the lighthouses, and particularly as to the illuminating apparatus contained in this report of Mr. I. W. P. Lewis; for it compelled the General Superintendent of lighthouses to bestir himself, and get things a little more to rights. All the prominent coast lights received new lanterns and apparatus, as fast as the contractor could supply them, and many of the minor lights were similarly renovated. The public mind was also directed to the subject, in consequence of the attacks brought upon Mr. Lewis by his temerity in exposing the actual condition of things; and the subject has by slow degrees begun to assume that importance which so properly belongs to it.

VOL. XX.—28 A

But Secretary Forward, on February 24, 1843, in transmitting Mr. Lewis's report to Congress, accompanied it with recommendations, indicating on his part, at least, a comprehension of the fact that the system in vogue was not equal to the requirements made upon it by the country's commerce. Among other things, he suggested "that no appropriation be made thereafter for the erection of a new lighthouse until the necessity for such a light shall have been ascertained by a competent engineer, who shall report on its necessity, on the site to be selected, and shall submit a suitable plan, estimate, and specification, for the required buildings; also detailing the magnitude of the light required, and its distinctive character, with a view to render it intelligible to seamen, if established—all of which shall be submitted to Congress for such action as may be then deemed proper; that, whenever the repairs of lighthouse buildings or floating lights called for exceed five hundred dollars, the nature and extent of such repairs, and their probable cost, shall be carefully estimated and reported before they shall be authorized; and that contracts shall be made where the expenditure for the construction or repairs of land and floating lights exceed five hundred dollars, which contracts shall be filed in the Treasury; that the system of illumination, and whatever is connected with the lighting apparatus, shall be placed under the supervision of the engineer, who shall report the alterations or improvements, if any, which may be required, such report to be approved before the work is authorized; that, for the attainment of these purposes, the Secretary of the Treasury be empowered to appoint a competent scientific and practical engineer, with a salary of three thousand dollars, whose whole time shall be devoted to the regulation of the details of the lighthouse system, and who shall annually report the condition of the lighthouse establishment, and its wants for the coming year, with detailed estimates, and such other information as comes within the scope of his duties, for the information of the Treasury and of Congress."

Congress adjourned before action was had, and the matter went over with many others to the next session.

On June 19, 1845, the then Secretary of the Treasury, Hon. R. J. Walker, had Lieutenants Thornton A. Jenkins and Richard Bache detailed for that purpose from the navy, and sent abroad "to procure information which may tend to the improvement of the lighthouse system of the United States; and, as it is alleged that important improvements have been made in the lighthouses of Europe, especially in those of France and Great Britain, the Department wishes to understand fully what those improvements are, and if they are adapted to introduction into our country." They were especially directed to procure information as to the organization of lighthouse systems; the construction of lighthouses; the lighting ap-

paratus used abroad; attendance on lights and its expense and efficiency; and as to buoys and their appendages. They were also required to make full descriptive reports, with recommendations; and they were to visit some of our own lighthouses, to compare them with those they had seen while abroad. Lieutenants Jenkins and Bache spent the greater part of the next year in Great Britain and on the Continent, and, after a tour among the principal lighthouses of this country, on June 22, 1846, made a report with recommendations for the "reorganization of the lighthouse establishment by the appointment of an engineer and optician, and a number of district superintendents to assist the general superintendent, under the direction of the Secretary of the Treasury."

Under this organization the duties of the general superintendent were to be slightly changed; the engineer was to make the plans, drawings, and specifications of works, assist in the selection of sites, superintend the construction and repairs of all towers and buildings, and inspect, at least once a year, the principal light stations; the optician was to superintend the construction of and to test all illuminating apparatus, make experiments upon apparatus and illuminants, and visit all the lights once a year, to direct repairs and adjustments of illuminating apparatus, which would take all the time of the engineer and optician.

The coasts were to be divided into ten districts, and each was to be placed in charge of an officer of the navy as district superintendent, who was to inspect monthly the lighthouses, at least, who was to establish positions of the aids to navigation by angles, bearings, etc., attend to the buoys, etc., and make regular reports to the central office. They also earnestly recommended the substitution of the French lenticular apparatus for the reflectors then in use. They argued in favor of the economy of the change, and detailed the manner in which it might be effected.

The Secretary of the Treasury, Mr. Walker, in transmitting the report to Congress, after stating that the suggestions for the improvement of the system met his hearty concurrence, said: "The report of the inspecting officers detailed from the navy to examine the lights on our coasts showed their absolute defects; the present report shows their deficiencies as compared with other countries. The trial made of one of the French lights at Sandy Hook, entrance to New York Harbor, has been very successful, but the use of this apparatus has not been extended." The Secretary then discussed the propriety of the changes, and stated that the existing laws still required the use of the old-fashioned reflectors in lighthouses. He concluded with the following suggestions in the interest of reorganization:

"It is obvious that a very considerable range of practical and theoretical knowledge is required for the improvement of the system;

more than can be looked for from one individual, however eminent in science. The proper organization of the system and planning of its details require the efficient head of a bureau familiar with the working of a general organization—a person capable of furnishing information in regard to the coasts and harbors from actual surveys; persons minutely acquainted with the wants of navigation, with the details of location and construction of the lighthouses, and with the chemical and mechanical principles involved in lighting. While this knowledge can not be obtained from one person, a board may be organized, without expense to the Government, by which the system may be considered in all its particulars, and an efficient plan of action recommended. Such a board might consist of the Fifth Auditor, the Superintendent of the Coast Survey, two naval officers, two engineer officers (one military, the other a topographical engineer), and a secretary, who might be a junior officer of the navy. By their action a plan might be prepared which would secure approval, and provide for the necessary progress of our system of lighthouses, and our other aids to navigation. I would, in conclusion, respectfully request from Congress the authority to organize such a board, and to execute the plans which they may suggest, as far as practicable, under existing laws regulating this branch of the public service."

Congress received this report and these recommendations, as it had those previously presented, and, as before, without immediate action. But on March 3, 1851, an act of Congress was approved, in which the Secretary of the Treasury was authorized to put the Fresnel illuminating apparatus into lighthouses as rapidly as he thought best; to appoint a board of proper persons to inquire into the condition of the establishment, and make a detailed report and programme to guide legislation in extending and improving the system of construction, illumination, inspection, and superintendence; and to detail engineer officers from the army to superintend the construction and renovation of future lighthouses. On May 21, 1851, Mr. Corwin, the Secretary of the Treasury, constituted and instructed this board. It consisted of Commodore W. B. Shubrick, U. S. Navy, as President, Commander S. F. Du Pont, U. S. Navy, General Jos. G. Totten, U. S. Engineers, Colonel James Kearney, U. S. Topographical Engineers, Professor A. D. Bache, Superintendent U. S. Coast Survey, and Lieutenant T. A. Jenkins, U. S. Navy, Secretary.

On January 30, 1852, the board made an elaborate report of seven hundred and sixty pages, illustrated by forty plates, and with numerous wood-cuts, embodying the scientific and practical information necessary to a clear understanding of the lighthouse system. The examinations extended into the construction of towers, dwellings, and illuminating apparatus, included a careful investigation of the manner in which keepers performed their du-

ties; of the ability and fidelity of the inspectors; of the mode of supplying the establishment with oil and other stores, and of the method of making contracts and testing supplies. It contrasted our methods with the lighthouse administration of Great Britain and France. Every source of reliable information seems to have been explored to reach a true estimate of the merits and defects of our system. The board recommended that the lights be classified, after the French method, into orders, to be followed by a system of designation. The orders running from one to six would indicate the magnitude or intensity of the light—the first order being the largest. The designation would define its characteristic, as fixed, flashing, revolving, red, white, or a combination of these qualities. Then it recommended the general adoption of the Fresnel lenticular system of illuminating apparatus, in place of the old system of illumination by the Argand lamp and parabolic reflector. And it also recommended a more vigorous administration of the establishment, and to that end the erection of a board much after the French plan, which should combine in it all the scientific experience necessary to the highest success in illumination, construction, hydrography, engineering, knowledge of the needs of commerce, and especially of administration. It recognized the services of Mr. Pleasanton, who had administered the lighthouse service for over thirty years, bringing it up from twenty-five lights to three hundred, saying that "great credit is due to the zeal and faithfulness of the General Superintendent and to the spirit of economy which he has shown," which spirit, perhaps, accounted for the "lack of zeal exhibited for the adoption of modern improvements"; but they asserted the impossibility that any one man should be able then to handle the system, and the necessity of organization and subdivision, and for a system comprehending the great and varied requirements necessary to a successful administration of the many separate and distinct interests constituting the establishment, and bringing all under the consideration and final direction of a central head, which they proposed should be, instead of one man, a board of experts, having, or capable of obtaining, the knowledge necessary to every detail of each branch of the great and still growing establishment. This report was referred by the Senate to its Committee on Commerce on February 5, 1852, but was taken up for action in the House of Representatives, which embodied the plans it suggested in an appropriation bill, which passed both houses, and was approved August 31, 1852, by the President. This organic act, constituting the Lighthouse Board as it now exists, is contained in the last nine sections of the act providing for the civil and diplomatic expenses of the Government for the year ending June 30, 1853. This act required the President, immediately after its passage, to appoint two officers

of the navy of high rank, two engineer officers of the army, and two civilians of high scientific attainments, whose services might be at the disposal of the President, an officer of the navy and an officer of the engineers of the army as secretaries who should constitute the United States Lighthouse Board; the board to be attached to the office of the Secretary of the Treasury, and under his superintendence to discharge all the administrative duties relating to the construction, illumination, inspection, and superintendence of lighthouses, light-vessels, beacons, buoys, sea-marks, and their appendages, and embracing the security of foundations of existing works, procuring illuminating and other apparatus, supplies, and materials of all kinds for building and rebuilding, and keeping in good repair buildings, vessels, and buoys of the United States. The Secretary of the Treasury was to be president, but the board was to elect from its own number a member to act as chairman in the president's absence. The board was to meet quarterly, and as much oftener as might be found necessary; and to it was to be transferred all the archives, books, documents, models, drawings, apparatus, returns, etc., belonging to the lighthouse establishment of the United States, together with the clerical force employed on lighthouse work.

The board was required to arrange the Atlantic, Gulf, and Pacific coasts of the United States into twelve lighthouse districts, and an officer of the army or navy was to be assigned to each as lighthouse inspector under its orders.

The board was to make and promulgate, with the approbation of the Secretary of the Treasury, rules and regulations necessary for securing an efficient, uniform, and economical system of administration. It was to have prepared, by its engineer-secretary, or other engineer officers of the army under its orders, the plans, drawings, specifications, and estimates of cost of all illuminating and other apparatus, of construction and repair of towers and buildings. It was to procure by public contract all material for the construction and repair of lighthouses, light-vessels, beacons, buoys, etc., and all construction and repairs were to be made under the superintendence of its engineer-secretary. It was to furnish estimates of all the expenses which the several branches of the lighthouse establishment might require, and to make a full annual report. Its members were to receive no pay for their services other than that they received in the army, navy, or civil service, and they were prohibited from having any interest in any lighthouse contracts, as were all others in the lighthouse service. Each of those who had served on the provisional board was appointed on the permanent board, and its organization was completed by adding to it Professor Joseph Henry, Secretary of the Smithsonian Institution, and Captain E. L. F. Hardcastle, U. S. Engineers,

the latter as its engineer-secretary. The board met on October 9, 1852, and elected Commodore Shubrick as its chairman; and then it arranged to receive from the General Superintendent the property of the lighthouse establishment, and to make the necessary rules and regulations for its governance. Those who had made the programme which had guided legislation to the creation of this board, and who had in mind all the details necessary for carrying out the plan, and who had the necessary industry, perseverance, and patience to put them into operation; those who knew all the defects of the service and all the excellencies of the French service on which the new establishment was to be modeled; those who had so much at heart the interests of the plan, and who had staked their reputation on its success, were appointed on the board. And their zeal was tempered by the addition to it of the calm wisdom of Professor Henry, whose habits of patient investigation, and impartial decision on the weight of ascertained authority, and whose already great reputation as a physicist, would go far to prevent any unnecessary changes or any hasty action.

The plans proposed by the provisional board to Congress, and formulated in the organic act, were put into operation by the permanent board as rapidly as existing law and the funds at the control of the board would permit.

An inspector, who was either an army or a navy officer, and, as soon as needed, an engineer officer from the army were assigned to each lighthouse district. The inspectors, under the charge of the naval secretary, who also had charge, in the absence of the chairman, of the office of the board, were charged with the maintenance of the lights and lighthouses and with the discipline of the light-keepers. The district engineers, under the direction of the engineer-secretary, were charged with building the lighthouses, with keeping them in repair, and with the purchase, the setting up, and the repairs of the illuminating apparatus. Both inspectors and engineers made regular and special reports to the board, acting always under its direction, and the board made a full annual report to the Secretary of the Treasury, who, in turn, made a full annual report to Congress. The board assigned its members first to an executive committee, and then divided them into committees on finance, engineering, light-vessels, lighting and experiments, and placed that one of its members most expert on each particular branch at the head of the committee having charge of that branch. The committee on light-vessels was afterward charged with the care of buoys also, when it was called the "committee on floating aids to navigation." In after-years, the committee on the location of all aids to navigation was added. The executive committee, consisting of the chairman and the two secretaries, were in perpetual session, carrying on the routine business of the establishment, while the other committees met

frequently, and the full board met monthly, or oftener, though required by law to meet but once a quarter.

The board, finding, from the experience of the keepers of the lights at Navesink, that the lenticular apparatus could be managed by the average light-keeper after instruction by an expert, and that its use was more economical in oil than was the reflector apparatus, pushed its substitution with vigor, and, as they had anticipated, with a diminution of the annual expenditure for oil.

It perfected the classification of lights, and so differentiated them by proper distinctions that mariners were enabled to identify and recognize each light. It substituted lighthouses for light-ships, wherever practicable, as rapidly as desirable, thereby making large saving in expense for maintenance without diminution of the light produced. When sperm-oil became too expensive for economical use, the board cast about for a substitute for it as a lighthouse illuminant, and after trying and discarding colza, a vegetable oil, it finally, after much experimentation, adopted lard-oil, at a large saving in cost, and without diminution of light. And again, twenty years after, when it was evident that a further economy could be made, it substituted mineral oil for lard-oil, after much tentative action, resulting in the invention and manufacture of lamps for its proper combustion. It has tested gas as a lighthouse illuminant without finding it adapted to the purpose, although it still has several stations lighted with gas from the neighboring cities, and one series of stations lighted with compressed gas made by its employees.

It has carefully watched the results of the experiments made in other countries with the electric light, and has given much attention to the various methods of producing it, without result, however, as Congress has thus far failed to act on the board's suggestion to provide means for its practical test in a lighthouse. By a long series of investigations into the laws of sound, it ascertained the principles on which fog-signals, as aids to navigation, were to be constructed, and giving them to the public, accelerated the invention of proper machines, stimulated their manufacture, and then put them into operation without other expense to the Government than their purchase.

When the commerce on the Mississippi had induced Congress to authorize aids for river navigation, the board devised and put into operation a system of lights which has revolutionized steamboat navigation, making it so safe that the boats which tied up at night now run as by day, and that at a small cost, as compared with the expense of the lights on the ocean and even on the lake coasts.

The board has organized and built up by degrees a corps of intelligent light-keepers, who, entering the service in its lowest rank, after examination are eligible to promotion in grade and pay according to merit, as vacancies occur,

whose tenure of office is practically during good behavior, where transfers in location are made when the wishes of the keepers and the wants of the service coincide, and whose physical and mental welfare are carefully looked after, that they may be contented in their responsible and isolated situations.

The board has had the services of some of the brightest and most active minds in the American navy. The lighthouse service has, like the Coast Survey, come to be regarded as a training-school for young officers and as a field for the best efforts of those higher in rank. The roll of lighthouse inspectors contains the names of the flower of the navy; hence it is no source of wonder that a tour of lighthouse duty is sought by the more ambitious and studious of our naval officers, and that the service has its choice from among the best of them in times of peace.

The army has also been well represented in the lighthouse service. On the list of the lighthouse engineers will be found many of the names which have given our military establishment reputation if not fame, and such have been their victories in solving the problems of sub-aqueous structures, and in opposing successful resistance to the violent attacks of the elements under the most discouraging circumstances, that it is a question whether those names connected with the erection of certain lighthouses will not live when history has let die the memory of their brilliant military achievements.

The civil service has been well represented on the board itself, in connection with the army and the navy, by such men as Professors Bache, Peirce, Henry, and Morton, who have acted as the scientific advisers of the service, and whose names are identified with the solution of problems in physics which have been worked out under their direction in methods for guiding mariners by light at night, and by sound when light was unavailable. Something of the operations of the Lighthouse Board will be detailed in its proper place.

The lighthouses on the New England coast were constructed previous to 1840 in two forms, namely: conical towers of rubble-stone masonry and wooden frame towers erected upon the roofs of the keepers' dwellings. The stone towers were built on the natural rock, from stone split from the adjacent ledges or from pieces collected on the beach, sometimes even from fragments of the cliffs rounded by attrition in the surf. The walls were usually three feet thick at the base, tapering to two feet at the top, and the towers varied in height from twenty to fifty feet. At the top of the tower and within the walling of rubble, a dome of brick was turned, with a square opening near the springing-line on one side, forming a scuttle entrance to the lantern. On this brick dome, a flat roof composed of slabs of stone four inches thick was laid, projecting over the walls of the tower from six to

twelve inches. The lanterns were attached to the towers by imbedding the lower ends of their iron angle-posts into the masonry of the walls some three or four feet, and the entire construction of the towers was rude in kind.

The wooden towers erected on the keepers' dwellings were framed into the roof of the house. The angle-posts rested on the attic floor-beams unsupported by studding; consequently the framing of the house-roof was distorted by the swaying lateral motion of the tower in storms, and there was necessarily some leakage.

In 1847 the construction of six difficult lighthouse structures was devolved by Congress on the topographical engineers of the army. They used the iron pile system, when applicable, and made numerous improvements in the combination of the framework, in making appropriate arrangement of elevated apartments for the keepers, in making disk pile foundations for coral or incrustated bottoms, and in improved devices for the foundations. Captain W. H. Swift, of this corps, rebuilt the Black Rock beacon in Long Island Sound, some four and a half miles from Bridgeport, Connecticut. Three successive stone beacons, costing together some \$21,000, had, in the course of twelve years, been demolished. Captain Swift, at a cost of but \$4,600, erected a pile beacon thirty-four feet above low water, three feet higher than any of its predecessors, which is still standing. An artificial foundation was made by placing six twelve-ton stones partly in an excavation, and by bedding them in concrete, making a solid platform, and setting into it five wrought-iron periphery piles and one center pile, measuring from three to five and a half inches in diameter. They were sunk through holes drilled to receive them, rose in the form of a conic frustum, and were solidly joined together, and properly capped at the top.

A pile structure was also erected on Minot's Ledge, in the open sea, near Boston Bay, in 1847-'8, by Captain Swift, but it was destroyed by the storm of 1851, and the keepers lost their lives. It was based on the solid rock by drilling holes five feet deep, in which one center and eight periphery eight-inch wrought-iron foundation piles were wedged, and so placed as to form an octagon twenty-five feet in diameter at the bottom and fourteen feet at the top, which had an elevation of sixty feet. On this was placed the lantern, making the height of the whole edifice about seventy feet. The structure was stiffened by a complex system of diagonal bracing connecting the piles. Whatever may have caused the overthrow of the lighthouse—and that is still a mooted question—it does not appear to have been owing to any fault of the rock fastenings, as the piles were broken or twisted off, leaving stumps from four to six feet long in their original places.

Brandywine Shoal, in Delaware Bay, about eight miles from the ocean, was begun in 1848

and lighted in 1850, costing \$53,317 for the lighthouse, and \$11,485 for the surrounding ice-breaker. This was the first lighthouse built in the United States on the Mitchell screw-pile, which takes its name from the inventor of its broad helicoidal flange, like an augur pod, which, by merely turning, is bored into a sand, mud, or other penetrable bottom, so as to form a foundation with a broad bearing, on which the weight of a columnar structure may be safely diffused, and to which it is firmly fastened. This structure has a light forty-six feet above sea-level, and is independent of the ice-breaker, which is a pier of thirty screw-piles, each twenty-three feet long and five inches through, connected at their heads, near low water, by spider-web braces, by which a shock on one pile is communicated to all. The lighthouse is in good condition, as is its ice pier, which has been reinforced. It was designed and built by Major Hartman Bache, then of the corps of Topographical Engineers of the army.

An iron-pile lighthouse was begun for Carysfort Reef, Florida, in 1848, and finished in 1852. It stands on a coral reef in the Gulf Stream in four and one half feet water, and is one hundred and twelve feet high. It is founded on a hard exterior coral crust, above a softer mass of calcareous sand; hence, screw-piles bored through the crust would have an insufficient bearing. On this account, large iron foot-plates were used to diffuse the pressure over the one hundred and thirty square feet of surface crust, and the piles, passing through center-eyes in the plates, were driven ten feet into the sand, or until their under shoulders were lodged on the bed-plates. Nine eight-inch piles constitute the center and angles of an octagon, and the aggregate column gets rigidity from a peculiar system of cross-ties and braces. The keepers live on the structure in an elevated house. The whole was made, framed, tied together, and set up for trial in Philadelphia, so as to obviate the necessity of fitting parts at its isolated site. Its cost is stated at \$105,069 for the entire structure.

Sand Key lighthouse is built on a plan somewhat like that of Carysfort, but it stands in deeper water, on screw-piles; its focal plane is one hundred and twenty-one feet above the foundation; it cost \$101,520, was completed in 1853, and it has proved its complete stability. It was built by the late Major-General George G. Meade, then a lieutenant of Topographical Engineers, who also built an iron screw-pile lighthouse on the flats in Key West Harbor, and the important pile beacon on Rebecca Shoals, since destroyed and rebuilt, and several other lighthouses.

But the most important lighthouse built by General Meade was that on Coffin's Patches, or Sombbrero Key, on the Florida Reef, about fifty miles east of Key West. It stands in eight feet of water, and shows a light about one hundred and forty feet above the sea, illuminating

a range of over twenty statute miles. The twelve-inch wrought-iron foundation-piles rest centrally on cast-iron disks eight feet in diameter, and go ten feet into the rock. They stand at the angles and center of an octagon fifty-six feet across, and are braced by horizontal radial and periphery ties of five-inch round iron. The frame rises from this foundation pyramidal in shape, in six sections, with a diameter of fifty-six feet at the bottom, tapering to fifteen feet at the top. All the shafts, except those of the lower series, are of hollow cast iron. The keeper's dwelling, in the second section, is thirty feet square, and of boiler-iron lined with wood. A circular stairway ascends to the lantern, in a cylinder of boiler-iron lined with wood. The entire structure, illuminating apparatus included, cost about \$120,000, is still standing, and is in excellent condition.

There are now, principally in the Southern waters, more than fifty iron-pile lighthouses; some with and some without screws, and of a variety of detail and size. The following cut shows a specimen of the screw-pile river or harbor lighthouse. It is a representation

HARBOR SCREW-PILE LIGHTHOUSE ON CEDAR POINT, POTOMAC RIVER, VIRGINIA.

of the lighthouse on Cedar Point, Potomac River, Virginia.

Fowey Rocks lighthouse was commenced in 1875, and finished and lighted on June 15, 1878. It is on the extreme northern point of the Florida reefs. It is of iron, and rests on nine piles driven about ten feet into the live coral rock. The different parts were made by three different contractors, but they were fitted together and set up before the structure was shipped to its site.

The lower series of piles was put in place in the summer of 1876. A working platform, about eighty feet square, was erected on the site, twelve feet above low water, on iron-shod mangrove piles driven into the coral. The disk for the central iron foundation-pile was then

lowered to its place, and through this disk the first iron pile was driven. A perimeter disk was then located by a gauge, and then the first perimeter pile was driven through the center of this disk. After every blow of the pile-driver, the pile was tested with a plummet, and the slightest deviation from the vertical was rectified. In locating the disk for the next perimeter pile, two gauges were used to get the proper distance from the center pile, and to maintain it from the perimeter pile just driven. The disks were dragged along the bottom until their outer edges just touched the free edges of the gauges. Each pile was then driven through the center of its disk. When all were driven, their tops were leveled by cutting off each to the line of the lowest. The piles were then capped with their respective sockets; the horizontal girders were inserted, the diagonal tension-rods were placed and screwed up, and the foundation series were completed. Two months were occupied in placing the wooden platform and this series. During this time they had a smooth sea, but after this time the main difficulty was the bad weather. Finally, that problem was solved

month. The material was stored at Soldier Key, four miles distant, and it was delivered by lighters towed by a steam-launch, which waited with steam up day and night to tow them out when the weather would permit. On March 16th the derrick and shears were set up, and a cargo of iron delivered; and in the course of the next sixteen days five more cargoes were landed on the platform, and the first series of columns, girders, sockets, and tension-rods was placed in position. On April 7th the skeleton of the second series and the cylinder to the top of the series was up; and in another week all the iron up to and including the service-room floor was on the platform. On April 30th the dwelling was finished; on May 25th the illuminating apparatus was in position, and on June 15th the work was completed and the light was exhibited. The whole structure was completed in good time, despite the trying circumstances accompanying its construction. The preceding is a representation of the lighthouse in question.

The use of iron plates for building lighthouses on dry foundations, though not uncommon abroad, met early with little favor in this country. But, in later years, when a greater knowledge of iron as a material for construction was obtained, it came into larger use. Among the more prominent of the iron towers are those at Cape Canaveral, Florida, designed in 1860 and built in 1868, 150 feet high; that at Bolivar Point, Texas, built in 1872, 120 feet high; that at Hunting Island, South Carolina, built in 1875, 130 feet high; and the tower now being erected at Cape Henry, Virginia, which is to be 165 feet high.

The following description of the tower at Hunting Island will show how these iron towers are put up, and this is a good specimen, as the necessity of taking it down to remove it further back, if the encroachments of the sea make it necessary, was considered at the time of its erection. The shell of the tower is composed of cast-iron panels of about twelve hundred pounds weight each, of exactly the same size, in each section, that they may each occupy any position in the ring which they form when put together. These panels vary in thickness in the different sections, those of the lower section being an inch and a half thick and of the highest three quarters of an inch. They are provided with flanges so as to connect the several tiers of plates, and the plates of each tier with each other by bolts through them, and the flanges are made smooth, with true planed surfaces. The base of the first tier of panels consists of a flange three feet wide. This flange extends one foot four inches beyond the outside of the tower. It is strengthened by bosses and vertical knees extending upward to the top of the castings, which contain the holes for the foundation-bolts. The top flange is six inches by one and three quarter inches. The lower flange of the second section is one foot two inches wide. The

FOWEY ROCKS LIGHTHOUSE, FLORIDA REEF.

by pitching tents on the working platform, leaving a force of workmen there above the running sea, supplied with material, and with a small hoisting-engine to work their derrick and their shears which had been erected in the single day of good weather they had out of a

top flange of this tier and the flanges of the third section are six inches by one and three-quarter inches. The flanges of succeeding sections are similar. The side flanges correspond in size with the top flange of each panel. The horizontal flanges have strengthening knees. A nine-inch interior lining of brick is built between the lower flanges. The whole structure rests on an eight-inch concrete foundation, to which the lower iron section is secured by thirty-six anchor-bolts built into the concrete.

Iron skeleton-towers are used on land where the soil affords an inadequate support for a masonry foundation, and where great cheapness is required. That at the Southwest Pass of the Mississippi may be regarded as typical. Its foundation consists of a grillage of timber resting on piles and covered with concrete, on which are secured the iron socket disks from which start eight external and one central shaft of the skeleton. A two-story dwelling for the keepers was placed within the shafts, and a staircase was carried up to the lantern through a tube as in case of the similar lights on sub-aqueous foundations. These towers are found to meet the purpose for which they were intended, and are practicable where heavier structures would not answer, affording less resistance to the wind, and being much cheaper to build.

An interesting specimen of these skeleton iron structures has recently been erected on Paris Island, Port Royal Sound, South Carolina, and is to exhibit the rear light of the Paris Island ranges. Altogether, it is the most economical

structure of its kind in the history of lighthouse construction. The plan was born of necessity, as it was found that the appropriation made by Congress was insufficient to put up the kind of structure usual in such a position. The light exhibited is simply a locomotive head-light, which is a powerful parabolic reflector. It is claimed, however, that it is possible to use on it a lenticular apparatus. The tower is composed of columns, sockets, struts, and tension-rods, framed in the form of a triangular pyramid. It rests on six circular iron disks, anchored to a concrete foundation. The top sections of the side facing the channel, for which the tower is the guide, are provided with horizontal slats, to increase the visibility of the beacon by day. The light, which runs up and down in rails in the plane of the structure, is housed by day, and at night is hoisted to its place at the apex of the triangle by machinery worked in the oil-house. The large foundation-plates are about forty feet four inches apart. The focal plane of the light is one hundred and twenty feet above the sea level, but the top of the structure is one hundred and thirty-two feet from the ground. The cost of the iron work set up is \$9,400, and that of the structure complete and lighted about \$12,000.

Saint Augustine lighthouse was built of brick and iron, on Anastasia Island, on the

PARIS ISLAND LIGHT, SOUTH CAROLINA. REAR RANGE.

ST. AUGUSTINE LIGHTHOUSE, FLORIDA.

eastern coast of Florida. Its base is a frustum of an octagonal pyramid, on which rests the frustum of a cone. The interior of the tower

is lighted by five windows. Eight flights of spiral stairways furnish access to the watch-room, the first seven of which make half a revolution of a spiral, but the eighth a whole revolution. This arrangement does away with the incumbrance of a central shaft to support a winding stairway, and allows of a better lighted interior and of more room. The structure is 150 feet high from base to focal plane, and 165 feet above the level of the sea; shows a first-order light, and cost about \$100,000. The spiral stripes shown in the cut are added to distinguish it, as a day-mark, from adjacent sea-lights.

Many brick lighthouses of this type have been built, among which are those at Cape Hatteras, Currituck Beach, and Body's Island, North Carolina; Morris Island, South Carolina; Sand Island, Alabama; Cape Foulweather, Point Arena, and Pigeon Point, on the Pacific coast.

Minot's Ledge lighthouse was almost the first, if not the first, important structure erected by the Lighthouse Board. According to General Barnard, himself an engineer of wide fame, "it ranks, by the engineering difficulties surrounding its erection, and by the skill and science shown in the details of its construction, among the chief of the great sea-rock lighthouses of the world." [For an account of its erection, see Appletons' "Cyclopædia," article LIGHTHOUSE.] The board gave to the plan and its execution its freshest and best powers, and the combined energies of all its members. A careful survey of the rock was made by Major Ogden, of the Topographical Engineers, and then, after a full consideration of all the difficulties by the full board, the preparation of the plan was devolved on the chairman of its committee on engineering, General Totten, then Chief of the Engineers of the army, who planned the masonry tower for this difficult position, and so successfully that, with the exception of the lower stones of the foundation, which had to be studied out of the rock itself, and some details of the construction, the tower was built throughout by B. S. Alexander, then Lieutenant of Engineers, according to the plans of General Totten. The brief memoir left by Colonel Alexander, the only authentic record of the construction of the tower, brief and modest as it is, shows that the skill and ability of the builder equaled that of the designer, and the great tower stands as a monument to both and to the board that availed itself of their powers. The last stone was laid June 29, 1860, five years from the commencement, and the cost, including the keepers' houses on shore, was about \$300,000.

Spectacle Reef lighthouse, a similar structure, stands on a limestone reef at the northern end of Lake Huron, near the Straits of Mackinaw, which join it to Lake Michigan. The nearest land is ten and one half miles distant, but it is sixteen miles from Scammon's Harbor, where the work for it was prepared. The waves have

a fetch of one hundred and seventy miles to the southeastward, but the ice-fields, which are here moved by a current, and which are thousands of acres in area, and are often two feet thick, had to be specially provided against, as, when moving in mass, they have a force which is almost irresistible. But this is overcome by interposing a structure against which the ice is crushed, and then its motion is so impeded that it grounds on the shoal, on which there is but seven feet of water, and forms a barrier against other ice-fields. The tower (see cut) is in shape the frustum of a cone, thirty-two feet in diameter at the base, and eighteen feet at the spring of the cornice, eighty feet above the base. The cornice is six and the parapet seven feet high. The focal plane is four feet three inches above the top of the parapet. The entire height of the masonry above the base is ninety-three feet, and of the focal plane ninety-seven feet three inches; the base is eleven feet below, and the focal plane eighty-six feet three inches above the water. For the first thirty-four feet, the tower is solid; from thence it is hollow, and in it are five rooms one above the other, each fourteen feet in diameter, with different heights, from nine feet two inches to seven feet eight inches. The walls of the hollow portion are five feet six inches at the bottom, and taper to eighteen inches at the spring of the cornice. The interior is lined with a four-inch brick wall, between which and the masonry is a two-inch air space.

The blocks of stone below the cornice are all two feet thick; those of the solid portion of the tower were cut to form a lock on each other in each course, and the courses are fastened together with wrought-iron bolts two and a half inches thick and two feet long, while the lower course is bolted to the foundation-rock with bolts three feet long, which enter the bed-rock twenty-one inches, the other courses receiving the bolts for nine inches. Each bolt is wedged at both ends, and the bolt-holes, which were made with the diamond drill after the stones were in place, are plugged with pure Portland cement which is now as hard as the stone itself. Hence the tower is in effect a monolith. The stones were cut, as were those of Minot's Ledge, at the depot, and fitted, course by course, on a platform of masonry, and the work was so well done there that a course could be, under favorable circumstances, set, drilled, and bolted in three days. The main difficulty, however, lay, as in Minot's Ledge tower, in the preparation of the foundation. This was overcome by a pier of protection inclosing a coffer dam. The pier was a crib-work of twelve-inch timbers built upon ways at the depot, as a ship might have been, when it was launched, and towed by a number of steamers to the reef and grounded on its site. It was of wood, ninety-two feet square and twenty-four feet high, having an inside space forty-eight feet square, and was divided into compart-

ments, which were ballasted to make it firm. Thus a protected pond was formed for the coffer-dam, designed by General W. F. Raynolds, of the United States Engineers, and a landing wharf was afforded for material, as well as for the reception of quarters for the men, all twelve feet above water, and out of reach of ordinary waves. The coffer-dam was thirty-six feet across, and cylindrical in form. It was made of jointed staves fourteen feet long, four inches thick, and six inches wide, held in place by three iron hoops, like a tub, and braced and stayed inside against a center post, the axis of which coincided with the axis

SPECTACLE REEF LIGHTHOUSE, LAKE HURON.

of the cylindrical coffer. It was built at the surface of the water, and suspended exactly over the site of the tower. A loosely twisted inch and a half rope of oakum was tacked to the lower end of the staves, and then the cylinder was lowered to the bed-rock, which had such irregularities on its surface that some of them were three feet high. All these were compensated by driving the jointed staves home with a heavy top-maul, the oakum rope serving as calking; and this was made approximately water-tight by an ingenious arrangement of a loosely twisted four-inch hay-rope and a canvas flap, which was attached in part to the outside of the lower edge of the cylinder, that lay in part flat on the rock, and which was forced into the angle by the outside pressure when the pumps commenced lowering the water in the dam. The work was commenced

in May, 1870, and the light was first exhibited from the finished structure in June, 1874; but the available working time spent on this lighthouse was but about twenty months. This tower, which cost, including the steamer and appliances of all kinds, about \$375,000, is our best specimen of monolithic stone masonry. It was built by General O. M. Poe, of the United States Engineers, who was General Sherman's chief engineer in his march to the sea. Its strength has been thoroughly tested by the ice push already. When the keepers returned to the tower on May 15, 1874, they found the ice piled against it to a height of thirty feet, which is seven feet higher than the doorway, and they could not effect an entrance to the tower until they had cut through the iceberg, of which this lighthouse formed the core. The cut shows this lighthouse surrounded by an ice-floe.

The board is now building a stone tower in Lake Superior, on Stannard's Rock, twenty-eight miles from shore, for which the steamer and the plant used in erecting the light on Spectacle Reef are being used. It will be, when finished, 101½ feet in height, will cost about \$300,000, and will show a light of the second order.

Tillamook (Oregon) lighthouse is placed on an isolated basalt rock high out of water, about one mile from the mainland, in fifteen fathoms of water, and about twenty miles south of the mouth of Columbia River. It is divided above low water into two unequal parts by a wide fissure, with vertical sides running east and west, standing one hundred feet above the sea, with a crest capable of such reduction as to accommodate a structure not larger than fifty feet square. A landing could with difficulty be made on the side next the shore during a smooth sea. The rugged character of the headland, the tendency of the sea face to landslides, and the great distance from Astoria, the nearest supply-point, made the execution of the work a task of labor, difficulty, danger, and expense. The drowning of the foreman on the landing of the first working-party tended to confirm the prejudices of the local public against the enterprise, and to increase the difficulty of obtaining the services of skilled workmen. On October 21, 1879, however, four workmen, with hammers, drills, bolts, provisions, fuel, a stove, and some canvas to protect them and their supplies from the weather, were landed, and, a few days later, five more men and a small derrick were got to the rock, from which time the commencement of the work may be dated. For the first nine days after reaching the rock, the nine workmen had no shelter from the rain and spray, except that of the canvas lashed to ringbolts. But during this time they cut a shallow niche in the north and east sides, in which they set up a strong timber shanty, which they bolted to the rock, covered with canvas, and secured to ringbolts. From this they secured safety, but got little comfort. After setting up the

main derrick and cutting a pathway up the face of the rock, they opened a bench around it by suspending the workmen on staging supported by bolts let into the rock's crest. The bench once formed, the reduction was pushed to the center. The outer surface of the rock was easily removed with moderate charges of black powder, but the nucleus was hard and firm, and giant-powder was necessary to open the mass, when large charges of black powder acted satisfactorily. The working party, in spite of their rude, uncomfortable quarters, worked diligently through the winter with good results. But the work was much delayed by spells of weather so bad that little could be done. The coast was visited by a tornado in January, which caused the waves, reflected from the rock, to be carried by the wind over its crest, so that for many days continuously the receding floods poured over the eastern slope, making work impossible. On one such day this cataract carried away the supply-house, and even endangered the quarters of the working-party. For more than two weeks at this time it was impossible for the steam-tender which supplied their wants to cross the

bar at the mouth of the Columbia River to go to their assistance; when, after sixteen days, communication was reopened, the party was found to be safe, but much in want of fresh provisions. These were supplied by an endless line running between the mast of the supply-vessel and a ringbolt driven into the top of the rock, in water-tight casks suspended by slings from a traveler, which was made to move along the line.

In May the top of the rock was leveled, and a foundation made about eighty-eight feet above the sea, and, on the 31st, three masons, four derricks, a small engine, and the appliances for laying the masonry, were landed. The stone, a fine-grained, compact basalt, quarried near Portland, and cut to dimensions by contract, was delivered at Astoria and shipped to the rock on the tender. The first cargo was landed on June 17th; on the 22d the corner-stone was laid, and then the rest of the material was shipped to the rock as the weather permitted.

The building is a square, one-story keeper's dwelling, with a rectangular extension for the duplicate siren fog-signal apparatus. From the

TILLAMOOK LIGHTHOUSE, OREGON.

center of the keeper's dwelling rises the tower, which is crowned by a gallery and a lantern containing a first-order lens apparatus. The material used is stone, cut to dimensions on the shore, for the outer walls, and brick, iron, and wood for the interior. The light is forty-eight feet above the base of the tower and one hundred and thirty-six feet above mean sea-level, and it was shown for the first time on February 1, 1881. If it had been finished a month

earlier, it probably would have saved the English iron bark *Lupata*, of 1,039 tons burden, which was dashed to pieces on the main shore, not a mile from the lighthouse, with a loss of the vessel, its freight, and every one of the twenty persons on board. The bark came so near the rock that the creaking of the blocks and the voices of the officers giving orders were distinctly heard, but the night was so dark that nothing could be seen except her lights. The

local foreman had a bonfire built on the rock as soon as possible, but the vessel was lost probably before the signal could be seen. It was on this night that the working-party lost their supply-house, and came so near losing their quarters, if not their lives.

The illuminating apparatus used by the lighthouse establishment varied with the dates of its use. The beacon on Point Allerton, Massachusetts, was illumined in 1673 by "fier balls of pitch and ocum," burned in open braziers. The lighthouse on Little Brewster Island, Boston Harbor, erected in 1715-'16, was first lighted by tallow candles. Then followed the spider lamp, burned in the lantern as it might have been in a window. In 1812 the Government bought of Mr. Winslow Lewis, for \$20,000, the patent for his "magnifying and reflecting lantern." This is described as consisting of a lamp, a reflector, and what was called the magnifier. The reflector was of a thin sheet of copper, commonly segments of a sphere, plated over with a slight film of silver, though the copper was so thin that its compression between the arms of its iron supports materially altered its form, and its silvered concave surface had much the grain and luster of tin ware, and would reflect no distinct image. The patentee, in 1812, made no pretension to a knowledge of optics as now understood, and his reflectors came about as near to a true paraboloid as did a barber's basin. The lamp, roughly constructed on the principle of Argand's fountain-lamp, burning from thirty to forty gallons of oil per year, had a three-quarter inch burner, and was attached to a circular iron frame in front of the reflector. Before the lamp was a so-called lens, of bottle-green glass, shaped like the bull's-eye let into a ship's deck, from two and a half to four inches thick through the axis and nine inches in diameter, which was supposed to have some magnifying power. This apparatus was inclosed in a massive wrought-iron lantern, glazed with panes ten by twelve inches in size. The effect of the whole was characterized by one of the reporting inspectors as making a bad light worse. But its main merit seems to have been that of economy, as the patentee, who had fitted thirty-four lighthouses with his apparatus, contracted in 1816 to maintain the lights on receiving one half the oil previously consumed, and again, in 1821, for one third of the old allowance.

This apparatus is spoken of more respectfully in a report to the House of Representatives in 1842, made by its committee on commerce, from which it appears that "the improvement in the character of the light and the economy in saving oil were subjects of high commendation by the Government." It also appears that the use of the magnifying bull's-eye was gradually abandoned, so that but few remained in 1838, and the last one was removed in 1840. The administration of the system was largely improved. The reflectors were made on true optical principles, approximating,

if not reaching, the paraboloid in form, and were heavily silvered and properly placed. The heavy lantern frames were replaced by lighter ones, the small panes of glass by larger ones, and the ventilation of the towers was so largely improved that obscuration by smoke was no longer unpreventable. The system, largely improved, was retained, but its administration was good only where it had faithful, intelligent, and honest administrators. Finally, the reflectors were so well made and so well placed that, in certain instances, it is now a question whether a better light was possible than was then furnished. Some of the old reflectors then used appear from recent examination to have an enormous candle power. But a poor light was the rule, and a good light the exception. War was made on the system of reflectors, and, when the lighthouse establishment was turned over to the Lighthouse Board in 1852, the reflectors were replaced by the Fresnel lenticular apparatus, found so successful in France, and more or less throughout the world. The adoption in this country of the lenticular apparatus made it possible for a light-keeper of average capacity to keep a good light, and impossible for him to keep a bad one, except by violation of plain rules and avoidance of routine duties. Besides this, the saving in oil effected by use of the lenses over reflectors was so great that the expense of exchanging the one for the other was saved in a few years, although the first cost of the lenses was quite large.

It was shown, in a report made to Congress in 1858, that the mean average cost of each lighthouse, for the five and a quarter years preceding the organization of the Lighthouse Board, was \$1,302, with oil at an average of \$1.13 per gallon, while, for the same period after the board took charge, it was but \$1,286, with oil at \$1.62 per gallon. Thus it appeared that under the board the average cost of maintaining each light was about \$16 per year less than under the previous management, although oil was about fifty cents per gallon more; and it was broadly claimed by the board, and the claim does not appear to have been disputed, that by the change it furnished under the new system, "at least four times as much light for the benefit of the navigator as the best system of reflector lights which has been devised, and at the same time at a consumption of not more than one fourth of the quantity of oil, required for the best system of reflector lights."

A full description is given in Appletons' "Cyclopædia" of the reflectors, under the head LIGHTHOUSES, and of the lenticular apparatus under the name of AUGUSTIN FRESNEL, its inventor.

The illuminant of the lighthouse establishment has been changed whenever a better one has been found. The "fier-balls of pitch and ocum," used in the open brazier at Point Allerton in 1673, were succeeded by tallow candles at Little Brewster Island in 1716, which gave

way to fish-oil, burned in spider-lamps, with solid wicks, suspended by iron chains from the dome of Sandy Hook lighthouse as late as 1760; and this was in turn succeeded in 1812 by sperm-oil, burned in a sort of argand lamp in Winslow's "patent magnifying and reflecting lanterns"; and this illuminant was continued until the beginning of the latter half of the present century, when the reflector system, much as it was improved, was itself superseded by the Fresnel lenticular apparatus, now in use.

When the Lighthouse Board came into power, one of the first subjects which received its best attention was that of obtaining a new illuminant of less cost than sperm-oil. The yearly diminution of the whale catch and the increased use of sperm-oil as a lubricant made it more and more expensive. The board, therefore, called in the aid of such scientists as Professors Morfit and Alexander, of the University of Maryland. Their analyses, quantitative and qualitative, chemical, photometric, etc., of spermin, whale, shark, fish, seal, colza, olive, lard, and mineral oils, of various grades and combinations, were published by the board in 1855, and these are still regarded by the trades as high authority on those subjects.

It was found from these examinations that colza, the oil expressed from the seed of several plants, but especially from that of the wild cabbage (*brassica oleracea*) was largely used in France, and would comply with all the required conditions except that of being of home production. This difficulty the board overcame by stimulating the cultivation of the plant and the manufacture of the oil from its seed as a private industry.

In 1861 the board purchased and used over 5,000 gallons of colza-oil at \$1.10 per gallon; in 1862, 2,000 gallons at \$1 per gallon, and 10,000 more at \$1.10 per gallon, and that, too, while sperm-oil was selling at \$1.64½ per gallon; and it speedily became evident that the country would soon supply all the colza-oil wanted for lighthouse consumption at \$1 per gallon as a maximum price.

Meantime the board had experimented with lard-oil, and with such success that it appeared that this oil of a certain grade was a more desirable illuminant than colza, and it gave equally good results, was more certain in quantity and production, and was economical in price.

The principal manufacturer, who, after several attempts, had succeeded in making colza-oil, and who to do so had put up expensive machinery at the board's instance, finally informed it that the result of its experiments had convinced him that the Government could not afford to use colza-oil in preference to lard-oil, and that he would abandon its further manufacture for lighthouse purposes, though he had demonstrated its success in all respects except competition with lard-oil, if the board would purchase from him the colza he then had on hand. This was done, and lard-oil became the established illuminant.

Oil for the year is usually purchased by contract in the autumn, after advertisements for proposals, and is made deliverable in large lots at different times and places, to suit the convenience of the establishment. When delivered, it is subjected to careful and exact test, to ascertain its purity; and its light-giving power, in lighthouse lamps, is ascertained by photometric measurement. The best oil of commerce is not always the best for lighthouse lamps, and the dealers have much difficulty in meeting the precise wants of the establishment; hence it is not unusual that some oil is rejected. Taking the oil purchased in open market, to meet sudden demands, which it is cheaper to meet by purchase than by transportation, together with that purchased by contract, the establishment bought on an average about 100,000 gallons of oil yearly. The highest price it has paid for sperm-oil was \$2.43½ per gallon, the lowest \$1.09; the highest that it has paid for lard-oil was \$2.27, and lowest 48½ cents per gallon.

The lard-oil used by the lighthouse establishment from 1867 to 1880, both inclusive.

YEAR.	Gallons.	Average cost per gallon.	Total cost.
1867.....	75,000	\$1.29½	\$96,950 00
1868.....	53,000	1.25½	66,350 00
1869.....	60,000	1.45½	86,425 00
1870.....	80,000	1.57½	124,140 00
1871.....	91,000	1.2635	115,197 50
1872.....	91,000	.9325	85,845 00
1873.....	95,000	.7826	74,020 00
1874.....	99,000	.57½	58,060 00
1875.....	118,000	1.21½	167,575 00
1876.....	85,000	1.1755	99,930 00
1877.....	110,000	.96½	106,282 50
1878.....	107,000	.7052	71,459 90
1879.....	106,000	.52616 +	55,805 20
1880.....	67,000	.69937 +	46,875 50
1881.....	44,000	.7447	32,849 00

The lighthouse establishment from its inception had a tendency to the use of petroleum. As early as 1807 there was a correspondence between Mr. Gallatin, then Secretary of the Treasury, and the owners of the good ship *Corlomande*, from Rangoon, in the kingdom of Ava, relative to five thousand gallons of earth-oil, which is commended as the "best article known for burning in lighthouses, making a very strong, clear, and bright flame, emitting at the same time a great volume of smoak." It may be that then, as often since, the "great volume of smoak" prevented the use of the earth-oil. In 1855 the board made some unsuccessful experiments with the various forms of petroleum. Meantime the price of lard-oil had so far increased that a cheaper illuminant became a necessity. It was only necessary, however, as a matter of economy, since lard-oil had proved itself acceptable in every other respect. The matter was approached with much caution, as the volatile, inflammable, explosive nature of mineral-oil was well known. The keeper of one of the lights on Lake Michigan had, in 1864, on his own motion, substituted for the usual lard-oil lamp one burning kerosene. Soon after commence-

ing its use, he attempted to extinguish the lamp by blowing down its chimney, when it exploded. He had scarcely reached the foot of the staircase, with his clothes on fire, when another explosion took place, which blew the whole lantern from the tower, and effectually destroyed the lenticular apparatus. But, as mineral-oil was, in one form or another, in successful use in European lighthouses, the board set about solving the problems connected with its uniform and economical combustion, its purchase in the large quantities needed, the tests as to purity, and the degrees of heat at which it should burn and flash, the degrees of cold at which it should remain limpid, methods for its transportation and storage, and the other questions connected with its safe and economical use.

The first difficulty was that of the lamp in which it should be burned. At the outset a claim was set up that mineral oil could not be burned in a lighthouse without infringing on a certain patent. The board, always ready to encourage inventive genius when applied to lighthouse matters, asked the necessary authority to deal with the patentee, when the Secretary of the Treasury, as the custom is, referred the legal questions involved to the Attorney-General. Thus a legal controversy arose which continued some three years, running through the Patent Office, and was finally adjudicated in the courts, where it was decided that mineral-oil could be burned in any lighthouse lamp except one without infringing any patent. Meantime, the board had, after much experimentation in its own laboratory and workshops, succeeded in producing a mineral-oil lamp capable of consuming all the carbon it set free, and introduced it into its lighthouses.

The chairman of the board, the venerable Professor Henry, had been during this time dealing with other difficulties practically and personally in laboratory and workshop, and in them had more than once endangered his person, if not his life, and thus the board reached in advance certain determinate results. It fixed the flashing test of the mineral-oil that would be accepted for lighthouse use at 140° Fahr., the fire test at 154° , and the freezing test at which it should remain limpid at zero. Litmus paper immersed in it for five hours must, by remaining unchanged in color, show its freedom from acid; its specific gravity must not be less than 802° ; and it is to be paid for by weight, at the rate of $6\frac{7}{8}$ pounds net weight to the gallon. The board has contracted for several lots deliverable at different periods at New York, Detroit, and San Francisco, amounting to 75,000 gallons in all, at an average price of $14\frac{2}{3}$ cents per gallon. The difficulty of storing and transporting such quantities in bulk was conceded, but its danger was evaded by having the oil placed at once in five-gallon cans, where it was to remain until transferred to the lighthouse burners for combustion. Mineral-oil is now used

throughout the lighthouse establishment, except in the seventy-three lights of the highest powers, in which this illuminant fails yet to burn to as good advantage as does lard-oil. It is claimed that five gallons of mineral-oil will give as much light as four gallons of lard-oil, while mineral-oil at the present writing costs about fourteen cents and lard oil about seventy-five cents per gallon. Thus it may be stated roughly that mineral-oil, as compared with lard-oil, gives one fifth more light and costs four fifths less money.

The propriety of using gas as a lighthouse illuminant has several times been considered. An effort was made in 1844 to use a rosin gas at the Christiana light station, near Wilmington, Delaware, but, after something less than a year of trial, it was abandoned as impracticable. Another unsuccessful attempt was afterward made at the light station on Reedy Island, mouth of Delaware River.

From time to time, lighthouses near cities have been illumined with gas from the city gas-works; it is now used in but three stations, namely, Cleveland, Ohio, Alexandria, Virginia, and Newburyport, Massachusetts; and even at these three it has been found necessary to guard against the accident to gas-pipes, most likely to happen in the coldest weather, by keeping a set of oil-lamps ready to take the place of the gas-burners at a moment's notice. But, while the board has not found the use of gas practicable thus far, it keeps itself informed as to the progress made in its manufacture and its combustion.

The board is using compressed gas to light the ten lights at the northern entrance to Currituck Sound, North Carolina. This gas is made and compressed at its own gas-works, and it is carried to each of the beacons in tanks, built into a scow, which is towed by a steam-launch, manned by the keepers of these ten small lights, who reside on board. The gas in each will burn for ten days and nights, if need be. Though the action of this illuminant is not unsatisfactory, it can hardly be said that it has yet passed beyond the experimental stage.

The board has watched the experiments made in other countries with the electric light as a lighthouse illuminant, and, while it does not consider that this light can be seen farther than its own best lights—which are seen, located, and identified as far as the curvature of the earth will allow—and while it is not convinced that the electric light can be located or identified better, or even seen in fog farther, than its oil lights, still, for purposes of practical experimentation, it has—unsuccessfully, however—for several successive years, asked Congress for such an appropriation as would enable it to erect and put in operation an electric light by the side of and in competition with an oil light. Meantime it has tested every prominent American-built machine for making the electric light, that it might be ready to use the best when Congress had pro-

vided the funds for that purpose. The results of these tests are given in its Annual Reports for 1879 and for 1880.

None of the various lighthouse establishments have as yet succeeded in producing a light that can be identified as to kind, or located as to site, at any considerable distance, through a fog, or even through a snow-storm. But earnest effort is made to guide the mariner by sound when sight will not avail, and fog-signals of various kinds have been applied to this purpose.

In the course of his researches as head of the board's committee on experiments, Professor Henry developed two theories, stating them to be good working hypotheses: one relative to the effect of the wind on the direction of sound, and the other on the failure of sound to make itself heard at irregular intervals. The effect of the publication on the first has been to cause seamen, wishing to hear a fog-signal against which the wind is blowing, to go aloft as they would to see a distant light, and to go as near to the surface of the water as possible to catch the sound, if the wind is wafting the sound toward them.

As to the interval in the audibility of a continuous sound, it is now accepted that a fog-signal may be in full blast and audible for a long distance, and inaudible at varying points within that distance, and that the sound may shade off from audibility to inaudibility, and back to audibility, several times in passing from the fog-signal to that point farthest distant from it where it is clearly heard. Hence mariners understand that, though they may not hear it, still they may be within earshot of a fog-signal in operation. They also fully realize the fact that they may, while sailing toward the sound already caught, lose it, and that by continuing their course they may pick it up again. They also understand that, while sailing away from the fog-signal, they may lose its sound and hear it again several times before passing entirely beyond its range of audibility. Therefore, they now make allowances for the variations of the sound of the fog-signal as they do for the variations of the mariner's compass, although the law of the variations of its sound has not yet been fully deduced or completely formulated. The board's annual reports show something of its gradual but effective labors to wrest from Nature her carefully guarded secrets, and to utilize the results of this work as rapidly as they are obtained.

It was within its plans to have continued its researches into the laws of sound by a grand attack with all its available forces. Professor Henry was to have been assisted by several scientists, in addition to those officially connected with the board, who were to be stationed in steamers and in captive balloons above, at various heights, all to note simultaneously the degree of audibility in numerical scale of the sound of a powerful fog-signal in full

blast on a light-ship more than twenty miles from land, so that they would not be puzzled by shore echoes, on which all the various phenomena that could be registered by the thermometer, the hygrometer, and the anemometer, were also to be noted, on charts previously prepared, and it was expected, when all this field work had been plotted, to deduce something of the law of these variations of audibility, and to show what allowance may be made for them. The death of Professor Henry caused the postponement rather than the abandonment of these experiments. Professor Morton, his successor as the scientific adviser of the board, in doing that duty which laid nearest his hand, has brought out the photophone, an instrument by which the mariner, when puzzled as to the location of the fog-signal, which, when heard in snow-storm or in fog, seems to come from anywhere, may determine its direction to within a point of the compass.

And at this time, although the board has not brought its fog-signal service up to its own standard, it is of large service to commerce, and has been made the subject of study by commissions sent hither by other countries, especially by Brazil and Great Britain; and it is not too much to say that it is in advance of that of any other lighthouse establishment.

The principal fog-signals now used by the board are the trumpet, the siren, the steam-whistle, the whistling-buoy, the bell-boat, the bell-buoy, and bells rung by machinery impelled by clock-work.

The board, in 1854, employed Professor J. H. Alexander, of the University of Maryland, to make a series of researches as to the audibility of sound in fog and as to the action of fog-signals, and it published the Professor's report and circulated it among scientific mechanics. During this time, Mr. C. L. Daboll, of New London, Connecticut, had been experimenting on his own account. Under the encouragement of the board, he brought out his trumpet fog-signal. His plan was to employ a reed trumpet, made somewhat like a clarinet, and sounded by air condensed in a reservoir by machinery driven first by horse-power, and, later, by a hot-air engine. In it the trumpet is the resounding cavity, and the necessary agitation of the air is produced by the vibration of the tongue-like reed. The trumpet is vertical, curved at the upper part. A first-class trumpet is 17 feet long, including the curvature, has a flaring mouth 38 inches across, while its throat is 3½ inches in diameter. The reed is of steel, 10 inches long, 2½ inches wide, 1 inch thick at the fixed, and half that at the free end. It is driven by an Ericsson hot-air engine, having a 32-inch cylinder with an air chamber 4½ feet across and 6 feet long, which, at a pressure of from 15 to 20 pounds, could make a five-second blast every minute. While the trumpet is not as far-reaching as some other fog-signals, it has been preferred for

rock stations where there was a scarcity of fresh water, and where fuel was difficult of access. But it is now losing favor because of its liability to accident and the difficulty of its repair.

The siren, originally invented by Cagniard de La Tour, and used by physicists in comparing sounds and in measuring the number of vibrations in different musical notes, was largely changed by A. & F. Brown, of the New York City Progress Works, under the direction of the Lighthouse Board, and adopted for use as a fog-signal. It can be sounded with either steam or compressed air driven through a fixed flat disk, placed in the throat of a trumpet, to which is attached the pipe conveying the motive power. The disk has from eight to twelve radial slits. Back of the fixed disk is a revolving plate with a like number of similar openings, which is rotated by power specially ar-

ranged for that purpose. When the slits in the revolving plate coincide with those in the fixed disk, as they must, say twelve times in each revolution, a jet of steam or air is forced through each opening under great pressure into the trumpet, and the interruption of these jets causes the song of the siren. The rotating plate is directly connected with and supported by the shaft, which is so geared to a steam or hot-air engine as to make 2,400 revolutions per minute, and as each revolution allows the escape and interruption of twelve jets through the coinciding openings, there are 28,800 shrieks given, creating, as the vibrations are taken up by the trumpet, a condensed beam of sound of great intensity and of surpassing power.

The siren is used on shore, as shown in the following cut, and on light-ships, as shown in the cut of Pollock Rip Light-Ship, on page 450.

The first-class steam siren, when working

SIREN FOG-SIGNAL.

with a pressure of seventy-two pounds of steam, consumes about one hundred and eighty pounds of coal and one hundred and twenty-six gallons of water per hour, and can be heard under usual circumstances at a distance of twenty miles, and in still air thirty miles, even in a dense fog. Its range of sound, however, is not deemed of so much importance as its quality and its power of domination over local noises, such as that of the surf, the whistling of the wind through a ship's rigging, that of paddle-wheels, or the working of an engine. This it has to such extent that it has been well said that "its density, quality, pitch, and penetration render it dominant over such noises after all other signal sounds have succumbed." The committee sent in 1872 by the British lighthouse establishment, Trinity

House, to this country, headed by Sir Frederick Arrow and Captain Webb, of H. M. Navy, reported so favorably upon it that, since then, "twenty-two sirens have been placed at the most salient lighthouses on the British coasts, and sixteen on lightships moored in positions where a guiding signal is of the greatest service to passing navigation." While the siren is the best fog-signal yet invented, it is also the most expensive to build and to run, is the most complicated in its parts, and requires more attention and skill in its management than any other signal, and is adapted only to such stations as are amply supplied with water and have machine-shops in the vicinity where necessary repairs can be promptly made.

The steam-whistle is largely used as a fog-signal, and with satisfactory results, in places

not requiring the greatest intensity and power of sound. It is the ordinary locomotive whistle, of a varying diameter, from six to eighteen inches, operated by steam from an ordinary and often an upright boiler, with a pressure of from fifty to one hundred pounds to the square inch. It can be made to produce any combination of shrieks, in a given time, so that it can be identified by its published characteristic. These are produced and regulated automatically by an engine taking its steam from the same boiler, which, at arranged intervals, opens and closes the valves, thus shutting off or letting on the steam. The machinery is simple and the piston-pressure quite light; and, while it is not liable to get out of order, it requires no more attention than an ordinary stationary engine.

A great number of experiments have been made with these three signals. From their average it appears that the power of the first-class siren, the twelve-inch whistle, and the first-class Daboll trumpet may be thus expressed: siren, nine; whistle, seven; trumpet, four; and their relative expenditure of fuel is recorded as, siren, nine; whistle, three; trumpet, one.

The board had in operation on July 1, 1880, fifty-seven fog-signals operated by steam or hot air.

Bells are also largely used as fog-signals. When the board assumed charge of the establishment, they were rung by clock-work, rude in kind and wasteful of power, its weight constantly descending even during the silent intervals. This defect was remedied, under the suggestion of the board, by Mr. Stevens, of Boston, who introduced an escapement arrangement, somewhat like that of a clock, and moved by a small weight, the larger one operating only to strike the bell itself.

The large, unwieldy bell-boats of the early days of the establishment have mostly gone out of use.

The Brown bell-buoy, recently invented by the master of one of the lighthouse tenders, is a simple arrangement by which the bottom section of a first-class iron nun-buoy is decked over and fitted with a framework of three-inch angle iron, nine feet high, to which a bell is rigidly fixed. Under the bell, which, if of the first-class, weighs 300 pounds, a concentric grooved iron disk of chilled cast iron is fastened to the frame around the disk; opposite each groove a spring is fastened, and on the disk a heavy iron ball is allowed to roll. The swaying of the buoy, by the undulations of the sea, causes the ball to roll from side to side and to strike the bell with each roll. The

springs throw the ball from the bell after each blow, permitting vibration, and causing the bell to give out the largest volume of sound possible under the circumstances. This signal is never silent, but the heavier the sea the louder is the sound.

The automatic signal- or whistling-buoy invented by Mr. J. M. Courtenay, of New York, consisted originally of an iron, pear-shaped bulb, say twelve feet in diameter, with a tube, twenty inches across and forty feet long, descending through its bottom. The water in this tube acts by its own inertia as a piston to draw in air through an orifice supplied with a retaining valve, and to expel it through a ten-inch whistle. The sound produced is only comparable to itself in kind, and it is of a quality which asserts itself over all others, and of a power audible several miles even against the wind. Its dimensions have been recently largely but proportionately reduced without detracting from its usefulness. As its action depends on the undulation of the surface, and, as from its great draught it must be moored in deep water, it is only used in roadsteads or in the open sea. But it has proved so successful that it is used at some points where a light station would otherwise be required, and, in one instance, has, satisfactorily to mariners, replaced a light-ship. At the date of its last report,

COURTENAY AUTOMATIC WHISTLING BUOY.

July 1, 1880, the board had twenty-five of the whistling-buoys in position.

The purpose of a light-ship is to do the work of a lighthouse in a place where one is necessary, but where it has not been erected because of the great difficulty, not to say expense, of plac-

ing such a structure. But the light-ship should have the permanency and efficiency of a lighthouse, and should give as good a light in clear weather and sound as far-reaching a fog-signal in thick. To insure permanency of position is a matter of great difficulty. When moorings have been made too heavy to drag, chains have broken; when they have held, mooring-bitts have been torn out; when they have held, the ship has foundered at her anchors, or the cable has been slipped, and the ship has sought a harbor or gone to sea for safety. But under the present rules of the board rigid inspection is frequently made of their riding-gear, and the absence of a light-ship from her moorings is now quite unusual.

The board has thirty light-ships of various sizes on duty in the service. The smaller, slighter built, and older vessels are moored in sounds and bays. The larger, stronger, and later built are anchored in the open ocean. Among the latter is that on New South Shoals, some twenty-seven miles at sea, the nearest land being Nantucket; Pollock Rip light-ship, moored at the eastern entrance to Nantucket Sound; another is moored at the western entrance to Vineyard Sound; two off Sandy Hook entrance to New York Bay; another off the mouth of Delaware Bay; another on Winter Quarter Shoal, off the coast of Virginia; another on Frying Pan Shoal,

off the mouth of Cape Fear River, North Carolina; another on Rattlesnake Shoal, off the entrance to Charleston, South Carolina; another off Martin's Industry Shoal at the entrance to Port Royal, South Carolina; and the last light-ship built (1880) is on Trinity Shoal, off the coast of Louisiana. This last is fitted with a twelve-inch steam-whistle fog-signal, and is perhaps the strongest and best-equipped light-ship afloat. The light-ships on Pollock Rip and at the mouth of Vineyard Sound have fog-signal sirens operated by hot-air engines, which are to be replaced by steam-engines, as it is found that hot air endangers the health of the crew and shortens the life of the ship.

Each light-ship shows either one or two lights. Each light has eight reflectors, each twelve inches in diameter, set upon a ring which encircles the mast, and can be lighted and hoisted to the masthead by night and lowered and housed by day. These reflectors are illumined by a kind of Argand lamp, in which the sperm-oil formerly burned was succeeded by lard-oil, and that is now superseded by mineral-oil, burned in a lamp specially adapted to the purpose. The lighting apparatus is inclosed in a lantern, with large panes of glass which protect the light from the wind.

The light-ship shown in the accompanying

POLLOCK RIP LIGHT-SHIP.

cut is that upon Pollock Rip Shoal, in the broken water at the eastern entrance to Nantucket and Vineyard Sounds, Massachusetts. It was built in 1877, is about one hundred and twenty feet long, nearly twenty-seven feet

beam, twelve feet five inches hold, and is of four hundred and ten tons burden. She is schooner-rigged, with a lighting apparatus upon each mast supplied with eight burners and reflectors. It has been found so difficult to keep

this vessel from dragging her anchors that she is now fitted with moorings as heavy as those of a frigate. In spite of her brilliant lights and her powerful fog-signal, she has been repeatedly run into by passing vessels and more or less damaged, as have most of the other light-ships in the service. She has a master, a mate, two engineers, and a force of six men. Her cost was \$50,000, and it requires about \$5,000 a year to maintain her exclusive of repairs—a larger sum than is needed for smaller ships, or for those without fog-signals. It is estimated, however, that it costs \$10,000 per year to maintain and keep in repair each of the first-class light-ships in the service, and this is urged as a reason for replacing them as fast as possible with lighthouses.

The buoy is to the seaman by day what the light is at night, and what the fog-signal is in thick weather. It tells him by its size, form, color, and number how to avoid the rocks and shoals, and shows the way in and out of harbor.

The growth of the buoy service may be measured by its cost, which was for the five years preceding the organization of the board, in 1852, about \$75,000 per year, and for the five years after about \$82,000 per year.

In 1842 there were nearly 1,000 buoys in position; in 1855 the board had 1,034; in 1860 it had 1,738; during the war it lost those on the southern coasts, but in 1867 it had so far replaced and added to them that it had 2,044; in 1875 it had 3,002; and on June 30, 1880, it had 3,140 buoys in the waters of the several districts. An appropriation of \$325,000 was made for maintaining the buoyage of the United States coasts during the year ending June 30, 1882.

The buoy service has its own code of laws, state and national, a fleet of small tenders for its maintenance, besides a corps of contractors to attend to the buoyage of coves and inlets impracticable to the lighthouse tenders. It has its depots for the storage of iron buoys, where they are painted and numbered, or repaired, and also where wooden buoys are made ready for service. It has its own directory printed yearly, in twelve volumes, distributed gratuitously for the benefit of commerce, in which each one of the more than 3,000 buoys is mentioned by name, located by station, and is described by size, shape, color, number, and vicinity. The problems connected with its improvement, as well as its maintenance, are considered as of grave importance, and are made the subject of deep consideration by the best scientific aid at the disposition of the board.

Buoys are of wood or iron. The wooden buoys now in use are sticks from twelve to sixty feet long, of pine or spruce, but preferably of cedar. The board frequently contracts for the delivery at one of its depots of a cargo of logs, in the rough, at from \$10 to \$15 each, where they are freed of their bark, smoothed of their protruding knots, painted to the pat-

tern required to tell their allotted story, fitted at the larger end with an iron sleeve, to which the stone or iron anchor can be attached by a mooring chain, when they are packed in classes or sizes on skids to season, and finally to take their tour of duty in the water to replace others which are to rest a while on shore, be freed from acquired barnacles, take on a fresh suit of paint, and, by drying, recover their buoyancy. Spar-buoys are classified first by length and thickness, and then by acquired color; but they are interchangeable within these conditions. The cuts represent spar-buoys and their appendages, much as they appear in the water.

tern buoys are hollow, with air-tight compartments, and are made of three shapes, called nun, can, and ice buoys. The nun-buoy is al-

most conical in form; the can-buoy is in shape the frustum of a cone nearly approaching a

cylinder; and the ice-buoy is much like a spar-buoy, of great length, slight thickness, and of largest diameter near its middle. Each shape is classified by size, and diversified by color and number. They were once made of wooden staves, like barrels, but their rapid destruction by the *Teredo navalis* caused the substitution of boiler-iron. The cost of these buoys varies with the price of iron and cost of labor. The board's last contract for buoys, with all their attachments, except mooring-chains, was made at the following rates:

For first-class can-buoys, six feet across, and nine feet six inches high.....	\$262
For second-class can-buoys, four feet four inches across, and seven feet high.....	143
For third-class can-buoys, three feet two inches across, and four feet ten inches high.....	96

Congress prescribed by act of September 28, 1850, that red buoys, with even numbers, be placed on the right-hand side, and black buoys, with odd numbers, on the left-hand side of channels approached from seaward; that buoys placed on wrecks or other obstructions, having a channel on each side, be painted with red and black horizontal stripes; that those buoys placed in mid-channel, and which indicate that they must be passed close-to to avoid danger, be painted with white and black perpendicular stripes; and finally, that perches, with balls, cages, etc., when placed on buoys, will indicate a turning-point, the color and number of the buoy showing the side on which they are to be passed.

Buoys are exposed to many dangers, not the least of which is that of being run down and ripped open by passing steamers. As the iron buoys are made with compartments, they are rarely sunk, but their line of flotation is often lowered, and their usefulness accordingly decreased. Spar-buoys frequently lose a portion of their length, which is cut off by strokes of colliding propeller-blades. Despite state and national statutes forbidding it, vessels will sometimes make fast to buoys, thus gradually dragging them off their bearings. A buoy has sometimes been set adrift, that a reward may be obtained for its recovery; but this is not a profitable operation, as the reward paid is varied with the circumstances of each case.

The buoys' worst enemy, however, is ice, when moving in mass, and with a tide or current. A well-made, well-moored buoy, at the mouth of a narrow river, can create an ice-gorge; but usually, when the ice moves in force, the buoys net have their mooring-loops torn out, their mooring-chains broken, or their

mooring-anchor weighed; and in each case the buoy is carried out to sea, when the buoy-tenders give chase, and, if successful in its capture, return it to position. The sea-going qualities of the large iron buoys are shown by their volunteer voyages. One is now anchored off the coast of Ireland, where it was picked up, about six weeks after it had been wrenched from its place in New York Harbor, and turned over to the Irish lighthouse establishment, by which it was reported to the United States Lighthouse board, when it was presented to the Irish board, who simply added to its former marks their own, and moored it near the point where it came ashore, in commemoration of its peculiar voyage.

The importance of keeping New York Harbor and Bay well marked has moved the board to keep its iron buoys in position, notwithstanding their danger during the winter, but with a spar-buoy beside each iron buoy, as the ice that carries away the one passes over the other, and allows it to resume its position, and indicate to passing vessels where the iron buoy should be, and also to show the buoy-tenders exactly where it is to be replaced. New York Harbor was twice swept clean of iron buoys during the winter of 1880-'81, and, though some of them have been recovered, the board has been put to large expense to replace those which were lost. Still, it recognizes the fact that the loss of one steamer might cause a destruction of property many times greater than the cost of the buoys, to say nothing of the loss of life that the absence of buoys might occasion. The ice-buoy invented by Mr. J. Parsons Smith, clerk to the Lighthouse Inspector at Philadelphia, is made of boiler-iron, and is divided into compartments, so that any one may be pierced without sinking the buoy. That of the first class costs \$300, is fifty feet long, and stands twenty-two feet out of water. That of the second class costs \$250, is forty feet long, and stands seventeen feet out of water. As with wooden spar-buoys, the ice passes over them without carrying them away; but, unlike the wooden buoys, they break the propeller-blades which strike them instead of being broken, and thus, defending themselves, last many times longer than spar-buoys, and, though costing more at first, are more economical in the end.

The board has a fleet of twenty-three steamers and three schooners, ranging from fifty to five hundred and fifty tons burden. It is the business of some of these steamers to attend to the buoyage of the coast, replacing the buoys which have gone adrift, exchanging every buoy for a fresh one once a year, and placing new buoys. They are also used to supply the light-houses with provisions, fuel, and minor supplies, and on them the inspectors visit the light-stations to make their regular quarterly inspections and to pay the keepers. Certain of the tenders are used for construction purposes, freighting building material to light-

house sites, and conveying building and repairing parties from station to station. The *Fern*, the largest of all, is used as a supply steamer, and yearly visits the light-stations on the Atlantic and Gulf coasts. Nineteen of these vessels are employed on the Atlantic and Gulf coasts, three on the lakes, two on the western rivers, and two on the Pacific coast. Thirteen of these vessels have been built for lighthouse purposes since 1870, and are in tolerable condition. Ten of the steamers and two of the schooners are poorly adapted for the service, quite old, and are only kept on duty until they can be replaced by others. The board has just built two iron side-wheel steamers, which cost about \$40,000 each, when finished and equipped, and which are one hundred and forty-six feet three inches long, twenty-three feet eight inches beam, nine feet six inches hold, and of about 300 tons burden. Of those now in use, one is under 100 tons burden, seven are between 100 and 200, seven between

200 and 300, six between 300 and 400, one between 400 and 500, and one between 500 and 600.

The steam-tender *Manzanita*, which is represented in the cut, was built in Baltimore in 1878-79, and was sent through the Straits of Magellan to the Pacific coast, where, by reason of her size and power, she is used for inspection, supply, and construction purposes. Her length is one hundred and fifty-two feet, beam twenty-six feet, and hold nearly twelve feet. She is a screw steamer, schooner-rigged, built of wood, and cost, when equipped, about \$60,000. She has a derrick attached to her foremast, operated by a hoisting-engine, which takes its steam from her boiler. She is manned by a captain, mate, two engineers, and twenty-one others. The *Manzanita* may be considered as typical of the tenders of the future, rather than of the past or present, as she is the best in the service.

The first light-keeper, of whose regular ap-

LIGHTHOUSE STEAM-TENDER MANZANITA.

pointment there is authentic information, was George Worthylake, husbandman, aged forty-three years, who was made keeper of the lighthouse on Little Brewster Island, Boston Harbor, in 1716, at fifty pounds per year, by the order of the General Court of the Province of Massachusetts Bay; and it seems that the keepers of the other seven lighthouses of colonial times were appointed in like manner.

When the General Government had assumed charge of the lighthouse establishment, the appointment of keepers was made by the President, and quite a number of the commissions bear the signature of George Washington, who took great interest in lighthouse affairs. One of the first official acts Washington, as President, performed, was to write to the keeper of Sandy Hook light, directing him to keep it

burning until Congress had opportunity to provide for its continuance. Jefferson also took personal interest in lighthouse affairs, and in its personnel. There are hanging in the office of the Lighthouse Board, at Washington, several letters from Washington and Jefferson on lighthouse matters. Among them is a letter on which is the following endorsement:

"The above is accompanied by two other letters dated respectively May 30, and June 1, 1808, which strongly recommend Jared Hand's appointment [as keeper of Montauk Point Light] to succeed his father, which were duly submitted to the President for his approval or rejection." On the letter the following endorsement appears:

I have constantly refused to give in to this method of making offices hereditary. Whenever this one be-

comes actually vacant, the claims of Jared Hand may be considered with those of other competitors.

THOMAS JEFFERSON.

As their number increased, the nominations of keepers were made by collectors of customs who were the local superintendents of lights; but the appointments were made by the Secretary of the Treasury. That usage crystallized into law, and still obtains; but the nomination of the collector is forwarded to the Lighthouse Board, where it receives an endorsement which procures for it favorable or adverse action. The appointment, however, is but temporary, and continues only until the candidate has been examined, after which, if he passes, a full appointment is given him; otherwise he is dropped from the service.

The appointment of light-keepers is restricted to persons between the ages of eighteen and fifty, who can read, write, and keep accounts, are able to do the requisite manual labor, to pull and sail a boat, and have enough mechanical ability to make the necessary minor repairs about the premises and keep them painted, white-washed, and in order.

Although but one grade of keeper is recognized by law, usage has divided keepers into several, with different pay as well as different duties, and with promotion running through the various grades. At one lighthouse there may be but one keeper; at another, a principal keeper and an assistant; and there is a station where there is a principal keeper with four assistants, the fourth having the lowest grade and the lowest pay, and the others having been appointed at that grade, and promoted as merit was shown and vacancies occurred; or they may have been transferred and promoted from another station. Although persons are appointed to the service and assigned to a given station, they are frequently transferred from one station to another, as the interests of the service may demand, and, while it is usual to consult a keeper's wishes in his assignment, there is nothing in the regulations to prevent the transfer of a man appointed in Maine to a station in Georgia; and occasionally keepers are with their own consent transferred from one district to another at a great distance. Young men who have seen some sea-service are preferred as assistants at the larger stations; and at stations requiring but one keeper, retired sea-captains or mates who have families are frequently selected. At those stations where there are fog-signals, it is customary, however, to have one assistant who is able to operate its machinery and keep it in repair; and he is usually one who is something of a machinist. Such persons are graded and paid at a higher rate on their original entry into the service than others.

While there are numerous light-stations located on submarine sites, the greater number of lights have connected with them a little land which the keepers are encouraged to cultivate. Hence small farms or gardens are often

connected with stations which are cultivated by the keepers' families.

Keepers are forbidden to engage in any business which can interfere with their presence at their stations, or with the proper and timely performance of their lighthouse duties; but it is no unusual thing to find a keeper working at his station as a shoemaker, tailor, or in some similar capacity, and there are light-keepers who fill neighboring pulpits, who hold commissions as justices of the peace, and there are still others who do duty as school-teachers, without neglecting their lighthouses. As the dwellings of the light-keepers are often tastefully planned, well built, and located on picturesque sites, people in search of summer quarters have so besought keepers for accommodation that the board has been compelled to prohibit them from taking boarders under any circumstances.

The board has done much to make keepers comfortable. They are furnished with quarters for themselves, and in certain cases for their families, and, when so far distant from market as to make its carriage equal or exceed its cost, with fuel and rations; suitable boats are furnished stations inaccessible by land; and at those stations on shore, distant from markets, barns are built for their cattle and horses. Something also has been done for the intellectual needs of the keepers and their families by supplying them with libraries. These are arranged in cases so constructed that they make rather a neat appearance when set upright on a table, and they only need be closed and locked to be ready for transportation. They contain on an average about fifty volumes each, of a proper admixture of history, science, poetry, and romance, together with a Bible and a prayer-book. One of these libraries is left at a station for some three months, when it is exchanged, and the first is passed on to another station. This is usually done when the inspector makes his quarterly inspection; so each of the stations to which libraries are furnished sees some two hundred different books each year. There are now nearly three hundred of these libraries in circulation through this establishment, and more are being prepared. In their distribution preference is given to those stations most distant from towns or villages.

The board does not, as yet, uniform its employees, or pension those who become maimed or worn out in its service. Keepers are under the law paid an average sum of \$600 a year; but the rates range in individual cases from \$100 to \$1,000 a year. In March, 1881, Congress appropriated \$585,000 for the payment of its 1,015 keepers.

The discipline of the service is somewhat rigid and severe, and has been from the beginning. On December 31, 1806, Mr. Gallatin, then Secretary of the Treasury, placed the following endorsement on a letter:

The part which relates to the conduct of the keeper of Cape Henry lighthouse is submitted to the President for his decision.

It was returned endorsed :

I think the keepers of lighthouses should be dismissed for small degrees of remissness, because of the calamities which even these produce, and that the opinion of the collector in this case is of sufficient authority for the removal of the present keeper.

TH. JEFFERSON.

Now the class of men from whom keepers are selected is so good that the punishment of dismissal is infrequently inflicted. But it follows swiftly in two cases. A keeper found intoxicated is not only summarily dismissed the service, but he is instantly ejected from the station; and a keeper who allows his light to go out is dismissed without regard to his excuse or his previous good conduct. The views of the board on this subject appear in the following extract from one of its letters :

The board considers it the duty of every light-keeper to stand by his light as long as the lighthouse stands; and that for him to desert it when in danger is as cowardly as for a soldier to leave his guns on the advance of an enemy.

His failure to keep his light burning, especially in time of danger, may cause the wreck of vessels looking for it, and result in the loss of much property and many lives.

Keepers are trained to consider the care of the light and the lighthouse property their paramount duty, beyond any personal consideration; and the *esprit de corps* is such that instances have happened where the keepers on duty have, as in the case of the first light on Minot's Ledge, gone down with their lighthouse and died at their post; others where the keeper has saved his lens, letting his family shift for themselves; and there are repeated instances where the keeper has saved his lighthouse property and lost his own. A recent instance of heroism is that of the keepers of Sharp's Island lighthouse, in Chesapeake Bay. It was lifted from its foundation, thrown over, and carried away by ice early in February, 1881. The keeper and his assistant clung to the fallen house, and, although one of their boats remained uninjured, they were adrift in the bay sixteen and a half hours without fire or food, always in imminent danger, as the heavy floating ice often piled up against and threatened to swamp the house. It grounded, however, on an island shortly after midnight, at high tide, and was full of water. Being satisfied that it would not float off again, the two keepers went ashore in their boat, and when the tide had fallen, they returned, saved and took to the shore the lens, its pedestal, the oil, the library, much damaged by water, and even the empty oil-cans, and then reported the facts through their inspector to the board. Meantime the keepers of another lighthouse, fearing the ice, had deserted their post, and gone on shore. The fact that no vessels could have needed their light while the ice was unbroken, and that they returned to their post when the danger had passed, did not avail them. So soon as the fact of their desertion was determined, they were dismissed the service, and

the two keepers who had spent those terrible hours afloat in Sharp's Island lighthouse, and then had saved its apparatus, were highly complimented by a letter direct from the board itself, and then were appointed to the deserters' places. Light-keepers have been conspicuously successful in their exertions to save endangered life. It is recorded of Mrs. Ida Lewis-Wilson, the keeper of Lime Rock lighthouse, in the harbor of Newport, Rhode Island, that she has saved the lives of thirteen different persons, in each instance at the risk of her own. Medals and other testimonials to her heroism have been conferred on her by individuals, by humane societies, and by State authorities. The latest recognition of her services has been made by the General Government, which, in May, 1881, conferred on her the first-class gold medal awarded by Congress to those who save life at the imminent risk of their own.

The commerce of the Western rivers was mainly restricted to motion by daylight, because of the difficulty in keeping steamboats in the tortuous channels, and in avoiding the obstructions with which the channels abound. There were in 1873-'4, on the Mississippi, Missouri, and Ohio Rivers, 1,100 steamboats, of 258,000 tons, 832 licensed barges, of 179,000 tons, and coal barges and other craft of 750,000 tons, making a total of about 1,200,000 tons. The total value of the cargoes carried by them was estimated at \$400,000,000 per year. The coal sent to market yearly, by the Ohio River alone, amounted to 4,090,000 of tons. Hence, when those interested in river commerce took vigorous measures, they had little difficulty in procuring Congressional action. In 1874, an appropriation of \$50,000 was made for a survey of the Mississippi, Ohio, and Missouri Rivers, and to establish on them temporary lights and buoys. The survey was made, a favorable report followed, and two lighthouse districts were duly established, one, the fourteenth, extending from Pittsburgh to Cairo, and the other, the fifteenth, comprising the Mississippi and the Missouri Rivers. An inspector and an engineer were appointed for each district; a steamer hastily fitted for the work was furnished to each inspector, and they proceeded to light up the rivers.

The navigation of these waters was of the most intricate character. The crossings were numerous; and, at some, technically called "blind crossings," where the banks show no diversity of outline, and where the channel is narrow, pilots were frequently delayed, and could not always avoid disaster. At many points, previous to the establishment of the lights, passage was never attempted on a dark night, but by means of the lights, the passages are made practicable at all times. The hidden obstructions are numberless, and in many places barely leave room for the passage of large steamers. There are many consecutive miles on these rivers where the wrecks average more than one

to the mile. Keepers for the river lights are selected from among the people living on and owning property along the river, and they have generally been found trustworthy, and awake to the demands of the service.

The fixed lights used, as shown in the cut, are substantially made lens lanterns, which are

A LIGHT ON THE MISSISSIPPI RIVER.

suspended from an arm projecting from a post, at an elevation of from eight to ten feet from the ground. They are of most service during low water, though they afford important aid at other times. At points where the channel is made very narrow by permanent obstructions, and the passage dangerous, buoys have been placed as day marks, to which floating lights are attached at night. From the testimonials received from officers and managers of different steamboat lines, boards of trade, and others interested in the navigation of those waters, these lights and buoys appear to be a great benefit to river commerce.

In 1875, \$100,000 were appropriated to maintain the lights on the Western rivers; \$150,000 in 1876; \$140,000 in 1877, the same in 1878, but \$130,000 in 1879, \$140,000 again in 1880, and \$150,000 were appropriated in 1881. There were on June 30, 1880, on the Ohio, Mississippi, and Missouri Rivers, eight hundred and nineteen of these lights, each having an average cost for its maintenance of \$156.28 per year, and all of them costing in the aggregate \$128,000 for that year. The board by the act of

March 3, 1881, was also required to light the mouth of the Red River.

The lighthouse inspector is an officer of the army or navy, the detail being changed at proper times. It is now considered that the time an officer spends on lighthouse duty aids to make up his education and to contribute to his efficiency. Hence this duty is sought in times of peace by ambitious young officers of judgment, tact, and habits of study, who can do the lighthouse establishment good service. The fourteen inspectors now on duty are all officers of the navy; one is a rear-admiral, one a captain, ten are commanders, and two are lieutenant-commanders. They serve without other than their shore-duty pay. It is the duty of each inspector to attend, under the directions of the board, to supplying the lights of his respective district; to maintain its buoyage; to keep up the discipline of the light-keepers; to inspect the light-stations, light-ships, and light-tenders, and all the lighthouse people and property in his district each quarter; to attend to the examination, promotion, and transfer of the keepers, to answer the calls made on him by the board, for special information as to the needs of commerce at specified points; to make the numerous reports to the board, on blanks provided for that purpose; to act as purchasing and disbursing officer; and he has recently been ordered to pay each keeper his salary each quarter. Commander C. J. McDougal, U. S. N., the Inspector of the Twelfth Lighthouse District, was drowned on March 28, 1881, when attempting to reach Cape Mendocino, light-station, California, from the lighthouse steam-tender. The surf-boat was upset, and the inspector, though an expert swimmer, together with three other persons, was lost. He is supposed to have been carried down by the weight of the coin on his person that he was taking on shore, to use in paying to the light-keepers their quarterly salary.

There is no specified time for which an officer of the corps of engineers shall serve as a lighthouse engineer, as he often has at the same time charge of fortification or harbor engineering works. His lighthouse duties are to prepare plans and specifications for lighthouse structures, and submit them to the board; to purchase the material, arrange for the labor, and take charge of their erection or repair; to set up and keep in repair the illuminating apparatus of each light-station in his district, and to purchase and care for the real estate, lighthouse sites, etc., of the establishment in his district. He reports to the board, when requested, as to the necessity and cost of establishing new aids to navigation. The coasts of the country show with what success the engineers have grappled with the problems of light-house engineering, not only on land but on subaqueous foundations.

Enough has been said of the routine duties of the board. But two points should be here mentioned. It is not only its duty to build

lighthouses when authorized by Congress, but it is customary to furnish Congress reasons for refusing appropriations for building unnecessary lighthouses. Each lighthouse is established by Congressional enactment. A petition from those interested, usually ship-owners and ship-masters, is presented by a Senator or the Representatives in whose district it is proposed that the lighthouse shall be located. The petition is referred to the Committee on Commerce, which asks the opinion of the Secretary of the Treasury, who refers the question to the Lighthouse Board, which in turn calls on the inspector and engineer of the proper lighthouse district to examine and report on the necessity, practicability, and cost of the proposed structure. Their reports, with such other information on the subject as the board may have at hand, are referred to its own committee on location, when a formal report and recommendation is made to the board, which report is transmitted to the Secretary of the Treasury, who in turn sends both his own opinion and the board's recommendation to the committee of the Senate or House asking the information, and on the report of that committee, if it is favorable, is based the report of the Committee on Appropriations and the action of Congress. But frequently the reports are unfavorable, and it has happened that the board has been interpellated on the same matter by several successive Congresses, and has been required to build the lighthouse it has reported was not needed.

The board often receives from those interested statements bearing on a case intended to affect favorably its report as to the need for a proposed lighthouse. Thus it often weighs rather than finds evidence, and supplements rather than institutes investigation.

The board has been called on several times to show cause why it should not be transferred from the Treasury to some other department. It has already made report against its transfer to the Navy Department and to the War Department; a bill recently was before Congress providing for its transfer to the Interior Department, and the Forty-third Congress rejected a bill providing for abolishing the board, placing the establishment again under the charge of a superintendent.

The heavy tax laid on American commerce by Great Britain as light-dues has provoked American merchants into taking steps for retaliation. Hence the Lighthouse Board has several times been called on to show cause why light-dues should not be charged upon British shipping coming into American ports, and also why the lighthouse establishment should not be made self-supporting by charging light-dues against our own commerce. It has uniformly responded that light should be as free as air, that its work was done not only in the interests of commerce, but for the sake of science and humanity, and that it should be supported from the national treasury as are the

army, the navy, or as is the Coast Survey or Life-Saving Service.

The board has its own drafting room, where it prepares the plans and specifications of many of its more important lighthouses and light-ships, and where it examines and revises, if need be, the plans submitted by its engineers.

In the home office at Washington, the board has preserved, bound in some five hundred volumes of from five hundred to one thousand pages each, the letters it has received, and in as many more volumes the copies of letters it has written. In those received are recorded the results of the experience of the lighthouse establishment. The board has made that available by a unique subject card index. It is contained in six cases, each of which has thirty-two drawers, in each of which is an average of 1,750 cards, all containing something over 300,000 cards. In addition to this subject index, which of course has many cross entries, and therefore many duplicates, it has a chronological personal index of the same matter running through some thirty volumes, in which there are, say, 130,000 entries.

There were on July 1, 1880, in use the following aids to navigation operated by the lighthouse establishment:

First-order lights.....	47
Second-order lights.....	26
Third-order lights.....	65
Fourth-order lights.....	204
Fifth-order lights.....	128
Sixth-order lights.....	160
Range lenses.....	10
Lens lanterns.....	14
Reflectors on lighthouses.....	10
Stake-lights on rivers.....	819
Light-ships.....	31
Whistling-buoys in position.....	25
Other buoys in position.....	3,115
Fog-signals, steam or hot air.....	57

The average sum paid for maintaining an average light-station of each class was during the year ending June 30, 1880:

For a first-order light-station.....	\$2,584 67
For a second-order light-station.....	2,205 91
For a third-order light-station.....	1,851 92
For a fourth-order light-station.....	1,258 38
For a fifth-order light-station.....	870 66
For a sixth-order light-station.....	502 27
For an outside lightship of recent build.....	8,140 42
For an inside lightship of old build.....	3,955 54
For an average fog-signal operated by steam or hot air, not counting the salary of its operator, who was paid as lightkeeper.....	484 00
For a steam-tender of recent build.....	15,722 20

There are 9,959 nautical miles of lighted coast on the ocean, gulf, bay, sound, lake, and river shores, not counting the Ohio, Mississippi, and Missouri Rivers, which are lighted on a different and cheaper plan. The sums actually expended in lighting and buoying these 9,959 miles of coast during the year ending June 30, 1879, amounted to \$1,708,700. And in this sum the \$97,000 expended in maintaining the fifty-four fog-signals operated that year is not included. Hence the cost of lighting and buoying the United States coast was for that year \$171.57 per nautical mile.

The appropriations made by act of March 8, 1881, for the maintenance of the United States Lighthouse Establishment for the year ending June 30, 1882, amounted to \$2,525,400, of which \$476,400 were appropriated for new works, or for finishing those previously commenced and not then finished.*

ARNOLD B. JOHNSON,
Chief Clerk Lighthouse Board.

LITERATURE, AMERICAN, IN 1880. The cheap republications of English books have so diminished the trade of the respectable houses which reprint by arrangements with the authors or allow royalties, that as a consequence American publishers have depended much more upon American authors for their supply of new works than heretofore. Of ninety books published lately by the Harpers, exclusive of the Franklin Square Library, fifty-four were by American authors, and many of these have been republished in England. Of forty-nine of the publications of Charles Scribner's Sons, approximately covering the year 1880, forty were written by Americans, of which twenty-eight were new works, and half of this number were reproduced on the other side. Of thirty books issued by G. P. Putnam's Sons, comprising their more important publications in 1880, eighteen were of American authorship. And in the reproductions of foreign books by American publishers not one half are reprints of English books, a large proportion being special translations made for the publishers from the Continental literatures by native writers.

The entries in the "Publishers' Weekly" for the year, comprising the lists of the more prominent publishers of the country and the more notable books published by others, added together and classified, give the following approximate computation of the more respectable publications of 1880:

CLASS.	No. of works.
Fiction.....	292
Juvenile books.....	270
Theology and religion.....	289
Biography, memoirs, etc.....	151
Education—language.....	131
Description, travel, etc.....	115
Medical science.....	114
Poetry and the drama.....	111
Literary history and miscellany.....	106
Political and social.....	99
History.....	73
Useful arts.....	63
Law.....	62
Natural sciences.....	56
Fine arts and illustrated works.....	44
Domestic and rural.....	43
Amusements, sports, etc.....	32
Humor and satire.....	30
Music (chiefly church and school).....	24
Mental and moral philosophy.....	22

Total books reported..... 2,076

In *Theology* the publications of 1880 are remarkable for their value and originality, though not surpassing in number those of former years. Matthew Pool's "Annotations upon the Holy Bible" (New York, Carters) is a model commentary for familiar use, being at the same time faithful and learned in substance, and popular and lucid in style. "The Life and Writings of St. John," by the late Rev. Dr. James M. Macdonald, is a fine example of the studies of the religious nature and personality of personages of the Scriptures which have multiplied of recent years (Scribners). Francis H. Underwood's "The True Story of the Exodus of Israel" gives the conclusions of Brugsch-Bey, reached after his prolonged investigations of the monuments of Egypt, corroborating the Scriptural account of the sojourn in Egypt and escape of the Israelites (Boston, Lee & Shepard). "Fifteen Sermons," by William Rollinson Whittingham, are characteristic discourses of the lately deceased vigorous and earnest Bishop of Maryland. "Sabbath Essays" are argumentative papers read at the Sabbath Conventions in Massachusetts (Boston). "The Christian Preacher" (New York, Randolph) is a reproduction of lectures in the Yale Divinity School on the character and attainments which befit a clergyman, by Rev. Dr. Howard Crosby. "Faith and Character" (New York, Scribners) is a collection of sermons on the true type of healthy religious life, by Rev. Dr. Marvin R. Vincent. "The Limitations of Life, and other Sermons," is a volume of eloquent discourses on personal religion, by Rev. Dr. William Taylor (New York, Armstrong). "The Influence of Jesus" is a series of elegantly written and effective lectures of similar purpose, by Rev. Phillips Brooks. The "Sermons Preached on Various Occasions by James de Koven, D. D.," containing a memoir, by Rev. Dr. Morgan Dix, is a collection of characteristic discourses by one of the most ardent and devoted of Christian teachers, who clung tenaciously to the old traditions and beliefs (published by D. Appleton & Co., of New York, for the benefit of Racine College). The translation of Dr. Gieseler's learned "Text-Book of Church History" has been completed, since the death of Professor Henry B. Smith, who translated the first four volumes and a portion of the last, by Miss Mary A. Robinson (New York, Harpers). "The Congregationalism of the Last Three Hundred Years," is a valuable contribution to the history of Protestantism, by Henry Martyn Dexter (New York, Harpers). The "Oriental and Biblical Journal" is a new quarterly, de-

\$222.11 to the mile, while it cost the United States \$171.57 per mile.

* M. Allard, Inspecteur-Général des Ponts et Chaussées [the managing head of the French lighthouse establishment] gives, in the "Annales des Ponts et Chaussées" for October, 1880, some statements from which it appears that there are 1,550 nautical miles of coast lighted and buoyed by the French Bureau des Phares, at a cost during 1879 for maintenance, of 7,730,000 francs, or of 1,155 francs per nautical mile. Taking the franc at 5-20 to the dollar, it seems that it cost France

But, then, France had that year twenty-five lighthouses and fifty-three buoys to the hundred miles of coast, while the United States had in that year but nine lighthouses and forty-two buoys per hundred miles of coast. Then, again, France had but four fog-signals, while the United States had fifty-four; and France had no river lights worth mentioning, according to M. Allard, while the United States maintained 737 during that year.

voted to research in the Bible lands, edited by Rev. Stephen D. Peet (Chicago, Jameson & Morse). The Rev. E. C. Bissell, D. D., is the editor of an edition of the "Apocrypha of the Old Testament," which forms a supplementary volume to Lange's "Commentary," of which the publication has been completed (New York, Scribners). The "Longer Epistles of Paul" is a valuable exegetical work by the Rev. Henry Cowles, D. D. (New York, Appletons). "Studies in the Mountain Instruction" is one of the Rev. George Dana Boardman's books of devout and lofty religious contemplation (New York, Appletons). Professor T. C. Murray's "Origin and Growth of the Psalms" (New York, Scribners) is one of the most thoughtful and original religious works of the year. The "Studies in the New Testament," by the Rev. Dr. Charles Robinson, D. D., is another of the numerous aids to the understanding of the Scriptures; as are also Calderwood's "Parables of our Lord," and Taylor's "Gospel Miracles." "The Age-Temptation of American Christians" is a popular book of religious reflections (New York, Randolph). "The Foundations of Christianity," by the Rev. Dr. J. Monro Gibson (Chicago, Jansen, McClurg & Co.), is a vigorous and clear example of modern religious thought. The "Sacraments of the New Testament," by the Rev. G. D. Armstrong (New York, Armstrong), is an elaborate account of the sacraments of the Protestant and also those of the Catholic Church. "Christ bearing Witness to Himself" (New York, Randolph) is a volume of thoughtful lectures by the Rev. George A. Chadwick, D. D. A "Compendium of Christian Theology" (New York, Phillips & Hunt) is a systematic course of Biblical, dogmatic, and historical theology in outline, by William Burt Wilder, D. D.

The number of works on subjects connected with *Philosophy* is small, but includes some of considerable originality and depth. Some valuable translations have also been published. The development theory, as applied to ethics, receives an able contribution in "The Morals of Evolution," by M. J. Savage (Boston). In "The Emotions," Dr. McCosh draws a line of demarkation between the psychological excitement and the physiological phenomena attending the expression of the emotions. "Natural Science and Religion" (New York, Scribners) is a reprint of lectures by Professor Asa Gray, expressing the concurrent acceptance of the theory of the evolution of species and the revelations of the Bible. "Life: its True Genesis," by R. W. Wright (New York, Putnams), is a sharp polemic against the evolutionist school. The "Theory of Thought" is a treatise on deductive logic, which follows the old Aristotelian principles, but in analysis and systematic treatment contains much which is original, by Noah K. Davis (New York, Harpers). "The Perception of Space and Matter," by Rev. Johnston Estep Walter, propounds an original and philosophical theory of perception (Bos-

ton, Estes & Lauriat). The translation of Professor Eucken's "Fundamental Concepts of Modern Philosophic Thought" (New York, Appletons) is a lucid exposition of the position of the introspective philosophers with regard to the fundamental problems of being, which, for want of a popular interpretation, have of late been neglected for less abstract studies. Lange's great work on the "History of Materialism" has been published in a translation (Boston, Houghton).

Of publications on the *Natural Sciences* there have appeared but few original treatises in book form during the year. For the popular presentation of the theoretical conclusions and important discoveries of the scientific world the public depend in a great measure upon British authors. Several translations of extensive works in other languages have been made and published in this country, and all the important English books of popular interest have been reproduced. The original scientific workers in the United States, who are becoming more numerous and their labors more productive, find admirable vehicles for the publication of their results in the scientific periodicals, the reports and transactions of scientific societies, and, lately, in the publications which are issued at the expense of some of the larger universities. The aid and encouragement which is extended to science by the Government is not generally appreciated. Though the principle is deprecated by many, the extent of this encouragement and the value of the subsidized labors to science and to the country are disproportionately greater than the costs incurred. The important publications of the scientific bureaus connected with the Government, and those of the States, deserve notice from their increase and improvement. Among the Government publications may be mentioned "Henry's Contribution to the Electro-Magnetic Telegraph," by William B. Taylor; "Report on the Lands of the Arid Regions of the United States," by J. W. Powell; Colonel Garrick Mallory's "Introduction to the Sign Languages among the North American Indians," a Smithsonian publication; Lieutenant Sigsbee's "Deep Sea Soundings," the magnificently illustrated account of hydrographic work on the American coast; the "Monographs on the Cotton Worm," by Charles V. Riley, and the "Chinch-Bug," by Cyrus Thomas; G. K. Gilbert's "Report on the Geology of the Henry Mountains," an important original work upon volcanic action; Hayden's "Reports on the Geological Survey of the Territories"; "The Narrative of the Second Arctic Expedition made by Charles F. Hall," edited by Professor J. E. Nourse; and Dr. Baird's "Fishery Reports."

The "North American Entomologist," A. R. Grote, editor, is a new scientific monthly, published in Buffalo; Nicol's chapters from the "Physical History of the Earth" is a well-planned book on the changes of the planet

(New York, Harpers). A "Refutation of Darwinism" has been written by T. W. O'Neill (Philadelphia, Lippincott). Dr. Prantl's "Text-Book of Botany," translated from the German, and edited by S. H. Vines, is an excellent compendium of the modern structural and physiological botany, presenting the discoveries and generalizations which have only recently elevated this branch into the position of a genuine natural science. Niaudet's "Galvanic Batteries" (New York, Wiley) is a thorough treatise on the subject. The "Science of Life," by J. H. Wythe, M. D. (New York, Phillips & Hunt), is a treatise on biology from the orthodox standpoint. Du Bois's "Thermo-Dynamics" (New York, Wiley) is a most elaborate and exhaustive treatise. The more important reprints of foreign publications are: Huxley's "Crayfish"; "Darwin's "Power of Movement in Plants"; Lindsey's "Mind in the Lower Animals"; Roscoe and Schorlemmer's "Chemistry"; Ball's "Astronomy"; Bastian's "Brain as an Organ of Mind"; and Maudsley's "Pathology of Mind." The "American Journal of Philology" is a quarterly, edited by Professor Basil Gildersleeve, of Johns Hopkins University, in Baltimore.

Professor Alexander Winchell, in "Pre-Adamites," while expounding his own thoughtful views on the first appearance of man, conveys a great deal of anthropological knowledge in a readable and systematic form (Chicago, Griggs). "The Mound-Builders," by J. P. McLean (Cincinnati, Clarke), is a general compendium on the subject, and an account of the author's own researches in Ohio. The first annual report of the Archaeological Institute of America, established in Boston in 1879, contains several learned papers by Lewis H. Morgan, Joseph T. Clarke, and other members (Cambridge.)

Among numerous excellent *educational treatises* on scientific subjects may be mentioned, Edward S. Dana's Text-Book of Mechanics (New York, Wiley); "The Orthoëpist," the best and most convenient guide to the correct pronunciation of English words, by Alfred Ayres (New York, Appletons); and "Chemical Exercises in Qualitative Analysis," by George W. Rains, M. D. (New York, Appletons), introducing younger students to laboratory practice and experimental study. Professor T. R. Lounsbury's "History of the English Language" (New York, Holt) is a manual for the accurate student. William Swinton's "Masterpieces of English Literature" is a book which will help materially to impart that knowledge of our literature and its development, which has lately become so prominent a study in schools (New York, Harpers). "Ballads and Lyrics" (Boston, Houghton) is a book of similar purpose and excellence, being a well-selected anthology for school use, made by Henry Cabot Lodge. "The Science of English Verse" is a scholarly and scientific treatise on prosody, by Sidney Lanier (New

York, Scribners). "Words and their Uses" and "Every-Day English" (Boston, Houghton) are by Richard Grant White, the popular grammatical critic. Mayo W. Hazeltine, in "British and American Education" (New York, Harpers), makes a just and thorough comparison of the two systems of higher education.

Technical works on the most various branches of practical knowledge have for many years been produced in considerable numbers in the United States. Many of these are elaborate treatises which rank high in their special departments for completeness, accurate learning, and logical and perspicuous exposition. The number issued of such works of the highest class is increasing from year to year. Colonel William Pratt Wainwright's "Radical Mechanics of Animal Locomotion" (New York, Van Nostrand) is a military treatise, but has a general practical and scientific interest. "The Field Engineer," by William Findley Shunk (New York, Van Nostrand), is a manual for railroad engineers. Appletons' "Cyclopædia of Applied Mechanics" is a very complete and extensive illustrated dictionary of mechanics and engineering, edited by Park Benjamin. Corthell's "History of the Mississippi Jetties" is a thorough technical account of those works (New York, Wiley). Among the many other practical and theoretical works on mechanical and industrial subjects may be noted Leaning's volume on "Quantity Surveying"; Dunbar's new book on "Paper-Making" (New York, Spon); Searle on "Field Engineering" (New York, Wiley); Burr's "Stresses on Bridges"; and Rickett's "Assaying" (New York, Wiley). "Strategos" (New York, Appletons) explains an adaptation of the German war-game, elaborated by the author, Lieutenant Charles A. L. Totten, for the use of American students of tactics, which has been taken up with much favor by American military men.

Armstrong's "Cattle-Feeding" is an elaborate practical treatise on this important subject (New York, Wiley). "Scientific Agriculture" is a valuable compendium, in clear and popular language, by N. T. Lupton, LL. D. (New York, Appletons). Edward P. Roe's "Success with Small Fruits" (New York, Dodd & Mead) is as pleasant to read as it is useful and sensible.

The publications of the year on subjects connected with *Medicine* from their number and excellence show that in this as well as in other branches, and perhaps more than in other branches, the cultivation of solid and thorough learning, particularly of the sort which has an immediate practical bearing, is becoming more general. The numerous popular books on medical and hygienic subjects by competent authors is a gratifying phenomenon which is not confined to the United States, although this country leads in this important line of progress. Dr. George M. Beard gives the results of his exhaustive study of the nervous infirmity of Americans in "A Practical Treatise on Ner-

vous Exhaustion" (New York, Wood). Dr. John Wilson has written a suggestive volume on "Health and Health Resorts" (Philadelphia, Porter & Coates). A valuable work on European medicinal springs is Dr. Edward Gutmann's "Watering-places of Germany, etc." (New York, Appletons). Dr. Beard's "Sea-Sickness" propounds an entirely new theory of the cause and treatment of that malady (New York, Treat). "The Summer and its Diseases," by James C. Wilson, M. D.; "Winter and its Dangers," by Hamilton Osgood, M. D.; "The Throat and the Voice," by J. Solis Cohen, M. D.; and "Brain-Work and Overwork," by Dr. H. C. Wood, are some of a series of American "Health Primers" edited by Dr. W. W. Keen (Philadelphia, Blakiston). Dr. J. M. Anders's "Hygienic and Therapeutic Relations of House-Plants" (Philadelphia, Lippincott) treats of a subject of practical concern, and gives the results of interesting observations. Other treatises on hygiene and medicine for popular use are, "The Throat and its Functions," by Louis Elsberg (New York, Putnams), and "A Doctor's Suggestions to the Community," by Dr. D. B. St. John Roosa (New York, Putnams). Contributions to sanitary science are "Our Homes," by Dr. Henry Hartshorne (Philadelphia, Blakiston); and "Water Analysis for Sanitary Purposes" (Philadelphia, Blakiston), a reliable manual by the noted chemist, Dr. Frankland. Special treatises of interest and value are Roosa and Ely's "Ophthalmic and Otic Contributions" (New York, Putnams); Alt on "The Human Eye" (Putnams); the translation of Wecker's large work on "Ocular Therapeutics" (New York, Wood); Jacobi on "Diphtheria"; Bosworth's "Diseases of the Throat and Nose," and Robinson on "Catarrh"; the translation of Frey on the "Microscope"; Rosenthal's revised work on nervous diseases (New York, Wood); and Gross on "Tumors of the Mammary Gland" (New York, Appletons). A pharmaceutical journal in German, of scientific scope, is edited by Dr. George W. Rachel, and published in New York.

The excellent methodical treatises on the *Law*, of which the juristic literature of America possesses a great number, are receiving new accessions; and, concurrently, some of the legal writers are turning their attention to the preparation of popular expositions of the theory and operation of the laws for the instruction of lay-readers, a commendable practice, pregnant with beneficial consequences. B. V. Abbott's "Judge and Jury" (New York, Harpers) is a pleasantly instructive outline of the more important laws now in force in the United States, the changes which the law has undergone, the system of the judiciary, etc. "The General Principles of Constitutional Law in the United States," by Thomas M. Cooley (Boston, Little, Brown & Co.), is an able analytical and historical treatise in concise form of the American Constitution and its present interpretation and workings. Bige-

low's "History of Procedure in England" is a learned work upon a subject connected with the history of our jurisprudence (Boston, Little, Brown & Co.). Special treatises issued by the same publishers are Bigelow's "Bills, Notes, and Checks"; Benjamin Robbins Curtis's "Jurisdiction and Peculiar Jurisprudence of the Courts of the United States"; F. F. Heard's "Principles of Pleading in Civil Actions"; Professor C. C. Langdell's "Summary of the Law of Contracts"; "Schouler on Bailments, including Carriers, Innkeepers, and Pledge"; and "The Trial by Jury," a text-book prepared for the Harvard School, by Thomas Starkie. The "Brief Synopsis of the Collection Laws of the United States and Canada" (New York, Appletons) supplies information which was greatly needed by business men in an accurate and handy book. The "American Manual of Parliamentary Law," by George T. Fish (New York, Harpers), is an excellent new hand-book of the recognized customs of deliberative assemblies (New York, Harpers).

Among the American books on *Art* and the history of the arts, the following are worthy of notice: Three excellent manuals for students and amateurs are "Pottery Decoration under the Glaze," by M. Louise McLaughlin, "Instructions in the Art of Modeling in Clay," by A. L. Vago, and "Charcoal Drawing without a Master," by Karl Robert, all published by Robert Clarke & Co., of Cincinnati. "Some Practical Hints on Wood Engraving," by W. J. Linton (Boston, Lee & Shepard), is a harsh diatribe against the experiments and innovations of the new school of artistic wood-engraving, by one of the early leaders in the movement which he deplures. "Great Lights in Sculpture and Painting" (New York, Appletons) is a manual for young students of art history, by S. D. Doremus. The elaborate "History of Painting" by Woltmann and Woermann is produced in New York by Dodd, Mead & Co. "The American Art Review" is an æsthetic journal of rather high standing and purpose, published in Boston by Estes & Lauriat.

The handy volume on "Great Singers," by George T. Ferris (New York, Appletons), is a very agreeable, gossipy account of the famous lady opera-singers of bygone times. Louis Nohl's "Life of Mozart," translation by John J. Lalor, is a model musical biography (Chicago, Jansen, McClurg & Co.). Schumann's volume of essays and criticisms, entitled "Music and Musicians," has been translated and published with annotations by Fanny Raymond Ritter (New York, Schuberth & Co.).

No comprehensive work of *History*, of American authorship, has appeared during the year, but a few books of research on special subjects have come out. Of outline sketches and digests for popular reading and instruction there is an abundant supply. Dr. Schliemann was assisted in his "Researches and Discoveries on the Site of Troy," a magnificent volume, published in this country by Harpers, by the la-

bors of several of the most eminent European archaeologists. "The Origin of the Homeric Poems" (New York, Harpers) is a translation by Professor Lewis J. Packard of a remarkable lecture by Dr. H. Bonitz, which is much read in Germany, summing up the great controversy and the investigations concerning the authorship of Homer which have been going on for nearly a century. Professor Herbermann's "Business Life in Ancient Rome" (New York, Harpers) is a fine monograph on antique commerce and industrial methods. "Caliph Haroun Alraschid and Saracen Civilization," by E. H. Palmer (New York, Putnams), is the authentic history of the famous Saracen monarch by E. H. Palmer, the Orientalist.

Professor Henry M. Baird has written a good historical monograph, evincing earnest labor in a congenial field of research, on the "Rise of the Huguenots in France" (New York, Scribners). Henry P. Johnston's "Observations on Judge Jones's Loyalist History of the American Revolution" (New York, Appletons) is intended to refute the misstatements of the spirited and witty but slanderous and vituperative diary, first published in 1879, lest these errors should creep into other works. "New England Bygones" and "Old-Time Child-Life" are pleasant descriptions of American life in early times, by E. H. Arr (Philadelphia, Lippincott).

Books upon *Politics and Economy* are becoming more numerous. Although American writers on these subjects are not divided into well-defined schools of thought as in other countries, and although they do not derive the assistance which they might from the enormous new European literature on these subjects, many desultory and occasional disquisitions are published upon special matters which have become prominent questions for speculation and opinion. The "Miscellaneous Writings," by Francis Lieber, have been published by Lippincott & Co. "A True Republic," by Albert Stickney (New York, Harpers), arraigns party government, and advocates civil-service reform. New numbers of Putnams' "Economic Monographs" are "Free Ships," by Captain John Codman; "Labor-making Machinery," by Frederick Perry Powers. "Labor" and "Socialism" are series of lectures on topics connected with these subjects, by Joseph Cook. "The Interoceanic Canal and the Monroe Doctrine" is an anonymous vindication of the exclusive policy regarding the canal. "The Action of the United States Tariff," by Alfred Tylor, an English thinker, suggests an unsuspected effect of protection (New York, Putnams). "Free Land and Free Trade" is a plea for unrestricted commerce and a warning against land monopoly, by Samuel S. Cox (New York, Putnams). H. W. Richardson's short account of "The National Banks" is not only a correct description but an able defense of the system (New York, Harpers). "The Elective Franchise in the United States," by D. C. Mc-

Millan (New York, Putnams), gives a searching examination of the working and defects of the present American elective methods, and proposes as a remedy for the caucus the elevation of the primaries into a condition for spontaneous and authoritative action, qualifications for voters at primary meetings, and direct nominations of party candidates. Henry George's "Progress and Poverty," published in library form by Appletons, is one of the most original and profound works in political economy which has appeared lately in any country, and which is so recognized, being translated and studied in various European languages; the author has, independently and without aid from their writings, taken the advanced position of the later school of German writers on theoretical jurisprudence and national economy. Blanqui's famous "History of Political Economy" has been translated into English for the first time, by Emily J. Leonard (New York, Putnams). "Certain Dangerous Tendencies in American Life" [by Harrison] is a book containing much shrewd thought, and is a strong presentation of the author's peculiar views (Boston, Houghton). Bolles's "Financial History of the United States" (New York, Appletons) is a learned and valuable work. The "Political and Legal Remedies for War," by Sheldon Amos (New York, Harpers), gives a thoughtful examination of the subject. Atkinson's "Railroads of the United States" ably discusses the political aspects of transportation. Mrs. Julia Ward Howe's "Modern Society" (Boston, Roberts) gives the reflections of a bold and acute female thinker on social subjects. "Homicide North and South" is an interesting statistical study of the relative frequency of personal violence in the different sections of the Union, by H. V. Redfield (Philadelphia, Lippincott). Dr. E. C. Wines, the energetic laborer for prison reform, has published a volume entitled "The State of Prisons and of Child-saving Institutions in the Civilized World," a description of the penal and reformatory institutions and methods of every country, comprising even those of Oriental nations. "The State and the Liquor Traffic" is a paper by the Secretary of the Board of Health of New Jersey, Ezra M. Hunt, intended to show that the license system was originally adopted for restrictive, and not for revenue purposes (New York). "A Century of Dishonor" (New York, Harpers) contains a disclosure of the injustice to the Indians resulting from the policy and practice of the United States Government in its relations with the tribes [by Mrs. Helen Hunt Jackson]. The Indian question is discussed more fully, and more calmly and objectively, in "Our Indian Wards," by George W. Moneypenny, ex-Commissioner of Indian Affairs (Cincinnati, Robert Clarke & Co.).

A large number of excellent works of *Travel* and geographical description have been published. Nathaniel H. Bishop's "Four Months

in a Sneak-Box" (Boston, Lee & Shepard) is a narrative of a voyage down the Mississippi in a small boat. John Mortimer Murphy's "Sporting Adventures in the Far West" (New York, Harpers) contains the suggestions of an experienced sportsman. A. Judd Northrup's "Camps and Tramps, etc." (Syracuse), is an account of hunting and fishing adventures in the Adirondacks and Michigan. "Canoe and Camera" is a description of a fishing excursion in the Maine lakes, by Thomas Sedgwick Steele (New York, Orange Judd & Co.). Marion Harland's [Mrs. Terhune's] account of European travel, "Loiterings in Pleasant Paths" (New York, Scribners), contains useful suggestions for invalid travelers. Howard Payson Arnold has written an agreeable narrative of travel in a seldom trodden corner of Europe in "Gleanings from Petrosina and the Upper Engadine" (Boston, Houghton). Samuel S. Cox's "Search for Winter Sunbeams" (New York, Appletons) is a second edition of the entertaining and comical observations of that witty author on the shores of the Mediterranean. Frederick A. Ober's "Camps in the Caribbees" (Boston, Lee & Shepard) is an entertaining account of a naturalist's adventures in the little known Lesser Antilles. "New Colorado and the Santa Fé Trail" is a lively, graphic account of scenes in the far West and adventures of travel by A. A. Hayes (New York, Harpers). "Brazil: the Amazons and the Coast" (New York, Scribners) is an entertaining narrative of travel in an interesting region, by Herbert H. Smith.

"The Russian Army and its Campaigns in Turkey" is by Lieutenant F. V. Greene, military *attaché* to the United States Legation in St. Petersburg. The new edition of Lippincott's "Gazetteer" is the completest geographical dictionary published.

Biographical works and volumes of personal reminiscences form an unusually large proportion of the year's publications. In religious biography several notable works have appeared. "Heroes of Christian History" (New York, Armstrong) is a series of sketches of eminent religious men by English and American authors: lives of William Wilberforce, by John Stoughton, D. D.; Henry Martin, by Canon Charles D. Bell; and Philip Doddridge, by Charles Stanford, D. D., have been published. A memoir of the Rev. Dr. Charles Hodge has been written by the Rev. A. A. Hodge, D. D. (New York, Scribners). The "Life and Work of William Augustus Muhlenberg," by Anne Ayres (New York, Harpers) is a biography of one of the most eminent of American divines. On the still more celebrated and influential Dr. Channing the "Life" by his nephew has been reissued on the occasion of the centennial of his birth, and a volume of "Reminiscences," by Elizabeth Palmer Peabody, and a memorial essay by Charles T. Brooks (Boston, Roberts), have been published. The life of another eminent clerical thinker is recounted in the "Life and Letters of Horace Bushnell" (New York,

Harpers). "Memorials of Frances Ridley Havergal," author of tender religious poetry, have been prepared by her sister, M. V. G. H. (New York, Randolph), and several volumes of her writings have also been published during the year. "Sister Augustine, an Old Catholic" (New York, Holt), is a translation from the German memoir of Amalie von Lassaulx, the story of a remarkable life of devotion to religious convictions and to benevolent works. "A Model Superintendent" is a sketch of the life and labors of Henry P. Haven, by H. Clay Trumbull (New York, Harpers). Professor Henry Boynton Smith's memoir, edited by his wife (New York, Armstrong), is an interesting biography of an amiable and accomplished scholar.

An edition of Madame d'Arblay's memoirs of English court life, revised and edited by Sarah Chauncey Woolsey, is called "The Diary and Letters of Frances Burney" (Boston, Roberts). Henri de Lacretelle's "Lamartine and his Friends," translated by Maria E. Odell (New York, Putnams), gives the reader a familiar acquaintance with the brilliant poet-statesman and other great Frenchmen of the nineteenth century. C. H. Jones has written sketches of the lives of Macaulay and Gladstone (New York, Appletons). "Certain Men of Mark" (Boston, Roberts) contains sketches of living historical characters, by George Makepeace Towle. The long-delayed publication of the "Memoirs of Madame de Rémusat," now completed (New York, Appletons), has accomplished an important mission in substituting the image of a real man, though in many respects an ignoble one, for the floating vision of ideal virtues and vices, and superhuman powers, which political panegyrists and detractors have left of Napoleon.

"Abraham Lincoln and the Abolition of Slavery in the United States" (New York, Putnams) is a life of Lincoln, written by Charles Godfrey Leland, with enthusiastic admiration and intelligent appreciation for the war President's true virtues and achievements. "Anecdotes of Public Men" is a volume of intensely interesting reminiscences by Colonel John W. Forney (New York, Harpers). The "Memoir of Governor Andrew" contains personal reminiscences of the late Governor of Massachusetts, by Peleg W. Chandler (Boston, Roberts). The "Memoir of Henry Armit Brown," edited by Professor J. M. Hoppin (Philadelphia, Lippincott), preserves the memory of a gifted orator and high-minded politician whose early death was a national loss.

Mrs. John T. Sargent's "Sketches and Reminiscences of the Radical Club of Chestnut Street, Boston," and Charles T. Congdon's "Reminiscences of a Journalist" (Boston, Osgood), present interesting pictures of literary and intellectual society in America. "My College Days," by Dr. Robert Tomes, is a frank and garrulous narration of personal reminiscences of school and college life in New York,

Hartford, and Edinburgh. Henry Wikoff's "Reminiscences of an Idler" is a sprightly, entertaining narrative of a careless life of social pleasure and adventure (New York, Fords). Jane Grey Swisshelm has published a volume of personal recollections under the title of "Half a Century" (Chicago). "Elihu Burritt," edited by Charles Northend (New York, Appletons), is an account of a man who deserves to be remembered as a philanthropic agitator, though more famous in his day as a self-taught linguist. The "Recollections and Opinions of an Old Pioneer" is an interesting account of early California life, by P. H. Burnett, the first Governor of the State (New York, Appletons).

Literary History and Criticism have received many excellent contributions. Hermann Grimm's "Life and Times of Goethe" has been translated by Miss S. H. Adams (Boston, Little, Brown & Co.). The translation of the correspondence of Catherine Elizabeth Goethe, mother of the poet, with her son and others, made by Alfred S. Gibbs (New York, Dodd, Mead & Co.), has proved a popular book. Dr. Scherr's critical and historical biography of Schiller has been translated by Elizabeth McClellan (Philadelphia, Kohler). "Studies in German Literature" is a series of lectures by Bayard Taylor, which, although written for delivery before students, reveal throughout his unlimited knowledge of literature and his rare critical insight (New York, Putnams). "Madame de Staël," by Abel Stevens (New York, Harpers), is a thorough and well-sifted collection of all facts which are connected with the life of this famous woman, and is an exceedingly interesting work. "Aspects of German Culture," by Granville Stanley Hall (Boston, Osgood), is an analysis of contemporary life and thought in Germany by the keen observer who has written on German subjects for the New York "Nation."

"Shakespeare: A Biographic and Æsthetic Study," is a gracefully written essay, speculating on the life and character of the great poet (Boston, Lee & Shepard). "Shakespeare's Morals" is another reflective essay, in which the moral convictions of Shakespeare are deduced from his writings, by Arthur Gilman (New York, Dodd, Mead & Co.). The "New Variorum Edition of Shakespeare," which is being prepared by Dr. Horace Howard Furness (Philadelphia, Lippincott), is the work of an accomplished scholar possessing fine critical discernment, and, what is equally important, an accurate appreciation of the taste and demands of the public in an edition of Shakespeare. Henry James's study of Hawthorne, which has provoked many strictures and various comments, is very conscientiously thought out and characteristic of the author. Eugene Lawrence's series of "Literature Primers" (New York, Harpers) closes with the "Primer of American Literature." "Great Authors of All Ages" is an imperfect and careless com-

pilation, but contains selections from a large number of writers, especially in English literature, by S. Austin Allibone (Philadelphia, Lippincott). Rev. E. Cobham Brewer's "Reader's Hand-Book" (Philadelphia, Lippincott) is a handy reference volume containing the names, fictitious, historical, and legendary, which are common subjects of allusions and parallels in fine literature, and giving epitomes of the plots of dramas and fictions, and other such literary information.

A posthumous volume of "Essays and Critical Notes" by Bayard Taylor, published by Putnams, contains confidential revelations of the professional life of an author following high ideals of art, but forced to descend to more remunerative work. Among the other books of essays and literary criticism the following are noticeable: "Self-Culture," by James Freeman Clarke (Boston, Osgood); Frederick Metcalfe's "The Englishman and the Scandinavian" (Boston, Lothrop), a study of the ancient Norse literature; Bartol's "Principles and Portraits" (Boston, Roberts); and Professor Francis Bowen's "Gleanings from a Literary Life" (New York, Scribners).

Two volumes of social essays may be selected for notice: "Penciled Fly-Leaves," consisting of essays on familiar, every-day American subjects conceived in a poetic spirit, by John James Piatt (Cincinnati, Clarke); and "Causerie" [by William A. Hovey], in which are preserved some excellent specimens of the kind of bright newspaper-writing which is too good to serve for a moment's entertainment and then be cast aside, as is usually the fate of such literature, however elegant and fine (Boston, Roberts).

In poetry there have been but few noteworthy publications, and none of extraordinary excellence. "Ultima Thule," by Henry Wadsworth Longfellow, and "The Iron Gates, and other Poems," by Oliver Wendell Holmes (Boston, Houghton), contain recent and before uncollected poems. A collection of the poems of Richard Henry Stoddard has been issued by Scribners. "Hesperus and other Poems" is a collection from one of the junior poets, Charles De Kay (New York, Scribners). Susan Coolidge has a collection of "Verses" (Boston, Roberts). The "Poems" of George Arnold are published by Osgood & Co. A collection of Lucy Larcom's poetry is entitled "Wild Roses of Cape Ann and other Poems" (Boston, Houghton). Mrs. Anne Field's poems on classical themes are given in a collection named "Under the Olive" (Boston, Houghton). "Echoes of Half a Century" is a collection of the poems of William Pitt Palmer (New York, Putnams). "All Round the Year" is the title of a budget of new poems by Elaine and Dora Goodale (New York, Putnams). "The Microcosm and other Poems" is an elegantly printed volume of poetry, by Dr. Abraham Coles (New York, Appletons). The collection of the poems of Frank O. Tick-

nor, M. D., a lately deceased Southern writer of verse, includes the pathetic ballad of "Little Giffen" (Philadelphia, Lippincott). Another volume of Southern verse is Father Ryan's "Poems" (Mobile). "The Maid of Northumberland," a drama by Daniel Bedinger Lucas (New York, Putnams), is also a Southern production. "Three Friends' Fancies" is a collection of simple and sincere verses by three Southern ladies. The fine short poems of T. B. Aldrich have been published in a collection entitled "XXXVI Lyrics and XII Sonnets" (Boston, Houghton). The first complete translation of Schiller's works has been published in Philadelphia by J. Kohle and edited by Charles J. Hempel.

The *Novels* of the year are numerous, and many of them of high character. The "Undiscovered Country," by W. D. Howells, is a gracefully handled delineation of an intellectual type not uncommon in America, that of a devotee to a speculative hypothesis; his crotchets were also a typical one, being connected with the theories of modern spiritualism. "Dr. Heidenhoff's Process," by Edward Bellamy (New York, Appletons), is a remarkably artistic and effective story, containing many life-like details strung upon an ingenious and fanciful thread. "A Fool's Errand," by One of the Fools [Albion W. Tourgee], is a political novel in which the author, who had filled a judgeship in North Carolina during reconstruction, attacked the South so trenchantly and bitterly, and presented tales of Southern barbarity and persecution with so skillful a simulation of historical candor and reality, that the intended political effect was very successfully accomplished, a more momentous effect than has been produced by any other pamphlet of late years. This partisan novel was followed by a second of like import—"Bricks without Straw." Mr. Tourgee had previously published a tale of Western life, called "Figs and Thistles," in which the untrained but somewhat graphic power of his episodes and the lack of every quality of a coherent plot are seen undisturbed by the political interest of his other novels (New York, Fords). A "Reply to the Fool's Errand" (New York, Hale) was written by Mr. Royall, of Virginia. "Democracy" (New York, Holt) is a political satire of broader purpose, in which the roguery of practical politics is painted with a moderate degree of skill and truth. "The Virginia Bohemians" is a tale in which the characteristics of Southern life before the war are exhibited with an instinctive and delicate touch, though the scenes and incidents are placed in the present day, and nothing in the story itself bears the stamp of dramatic realism, by John Esten Cooke (New York, Harpers). "The Stillwater Tragedy" is a romance of crime combined with a love-story, both parts as well done as might be expected from the accomplished author, T. B. Aldrich, but hardly well blended (Boston, Houghton). George W. Cable's "The Grandissimes" is an

historical novel of the highest order, whose scene is laid in Louisiana at the time of the annexation (New York, Scribners); Cable's pictures of life are artistic and real, showing qualities in which American novelists have before proved themselves wanting, and in his portrayal of feminine character he ranks with the highest artists of any land. In "The Confessions of a Frivolous Girl," Robert Grant has produced one of the best satirical sketches of fashionable society which has appeared (Boston, A. Williams & Co.). "The Worst Boy in Town" is by the author of "Helen's Babies" (Jack Habberton), and in a similar vein. "Salvage" (Boston, Roberts) is a well-conceived though imperfectly sustained story. "A Foreign Marriage" (New York, Harpers) describes the fortunes of a selfish and ambitious beauty and an aspiring artist. "Tales of the Chesapeake" is a collection of good dialect sketches, by George Alfred Townsend (New York, American News Co.); as is also "Camp and Cabin," tales of Western life, by Rossiter W. Raymond (New York, Ford). One of the best works of the kind ever executed in the only field for such a work which our country presents is "Uncle Remus's Folk-Lore," by Joel Chandler Harris (New York, Appletons), a genuine collection of the legendary tales, which have animals for their actors, current among the Southern negroes, the embellishments of characteristic negro humor and fancy adding to their value as a collection of myths, while imparting a quality of irresistible fascination; the only perfect reproduction of the negro dialect which is embodied in this collection gives it, even in a higher degree than the myths which it preserves, a lasting philological importance. "Cape Cod and All Along Shore" (Franklin Square Library) is a collection of amusing stories illustrating characteristics of New England people, by Charles Nordhoff. Julian Hawthorne's "Sebastian Strome" is a work of considerable power, and contains many striking and original features, though lacking artistic unity; it accomplishes the difficult task of drawing base and wicked characters without making them unreal beings incapable of awakening a human interest and a degree of sympathy (New York, Appletons). "Golden-Rod" is a pleasing and refined society story (New York, Harpers). "A Strange Disappearance," by Anna Katherine Green (New York, Putnams), is a well-wrought-out story with a mystery, like her former one of "The Leavenworth Case." "His Majesty Myself" (Roberts's "No-Name Series") is a fine example of character-drawing and graphic depiction of social life. "The Heart of It," by W. O. Stoddard (New York, Putnams), is a realistic study by a new author. "Uncle Jack's Executors" is a pleasant story of three professional young women, by Annette Lucille Noble (New York, Putnams). "Rodman the Keeper" is the title of a series of sketches of Southern life, remarkably poetical and dra-

matic in conception, and rich in descriptive beauties and fine delineations of character, by Constance Fenimore Woolson (New York, Appletons). "Odd or Even?" is a story of New England, by Mrs. A. D. T. Whitney (Boston, Houghton). "Confidence" (Boston, Houghton) is one of Henry James, Jr.'s, analytical studies of Americans abroad. Sylvester Judd's "Richard Edney and the Governor's Family" is a tale of the New England of the last generation, truthful in incident but speculatively psychological (Boston, Roberts). "Louisiana," by the popular Mrs. Frances Hodgson-Burnett, has for its theme a subject which she has before treated of, the transition of a girl from homely surroundings to metropolitan elegance (New York, Scribners). "A Hopeless Case," by Edgar Fawcett (Boston, Houghton), is a delineation of the artificialities of Knickerbocker society. "Mrs. Beauchamp Brown" (Boston, Roberts) is a less refined and less truthful picture of the fashionable life of Boston. "Radder Grange," by Frank R. Stockton (New York, Scribners), is a delightful extravaganza written in a rich and original vein of humor. "Unto the Third and Fourth Generation," by Helen Campbell, is a fatalistic romance, containing some strong life-like traits of a crime and its results (New York, Putnams). "From Madge to Margaret" depicts the growth of a woman's character, by Carrol Winchester (Boston, Lee & Shepard). Henry James, Jr., lays the scene of "Washington Square" in New York a generation back; it is published with Du Maurier's illustrations by Harpers. "The Diary of a Man of Fifty, and A Bundle of Letters" are two short stories by this keen analyst of character (New York, Harpers). "A Fair Barbarian" is one of the most powerfully written of the stories of Mrs. Frances Hodgson-Burnett; it is a novelette dealing with the life of Americans in Europe, and can be compared with the best of Henry James's for excellent characterization (Boston, Osgood). "Hope Mills" (Boston, Lee & Shepard) is a story of American factory-life, by Amanda M. Douglass, resembling in plot and treatment the English story, "Probation," by Miss Jessie Fothergill. Colonel Forney's novel, entitled "The New Nobility: A Story of Europe and America" (New York, Appletons), is stamped with the enthusiasm of a democratic thinker. "A Day of Fate" is another successful novel by the popular Rev. E. P. Roe (New York, Dodd & Mead). "Mashallah!" is a pleasant story, describing incidents of Egyptian travel, by Charles Warren Stoddard (New York, Appletons). "Poverina" is a delicious story of Italian life (New York, Appletons). The most popular of the other novels of the year are Miss S. Warner's "End of a Coil" (New York, Carters); the "Head of Medusa," a striking story, by Miss Fleming (Boston, Roberts); Wallace's religious historical romance of "Ben Hur," in which the action is placed in the age of Christ, and in which all the knowledge bear-

ing on the life of the founder of Christianity that can be collected from pagan sources is made use of (New York, Harpers); Miss F. W. Peard's entertaining and wholesome story of "Mother Molly" (New York, Putnams); the anonymous novel entitled "Beauty's Daughters" (Philadelphia, Lippincott); and "Roy and Viola," a successful novel by Mrs. Forrester (Philadelphia, Lippincott). The "Twins of Table Mountain, and other Stories" is a collection of tales by Bret Harte (Boston, Houghton). "Manch" is an entertaining story of the South by a Southern lady, Mary E. Bryan (New York, Appletons). Among the most interesting foreign novels which have been translated for the English-reading public are the following from French authors: Théophile Gautier's "Capitaine Fracasse," one of the masterpieces of historical romance-writing, as vivid and natural as it is artistic and picturesque, which is given to English readers for the first time, in two translations, with the indelicate scenes of the original left out, that of M. M. Ripley (New York, Holt), and Ellen Murray Beam's (New York, Putnams). René de Pont Jost's "No. 13 Rue Marlot," translated by Virginia Champ- lin, is an exceedingly well-constructed detective story (Boston, Lee & Shepard). Edmond About's "Story of an Honest Man," which conveys moral lessons in an agreeable manner (New York, Appletons); as a presentation of the intrinsic worth and honor of the simple obedience to the dictates of civil duty and benevolence in humble station it has never been surpassed; "Angèle's Fortune" is one of Theuriet's smooth and refined stories, translated by Mary Neal Sherwood (Philadelphia, Peterson); another of Theuriet's productions is published in Appletons' "Handy Volume Series," under the name of "Young Maugars." "Nana" (Philadelphia, Peterson), translated by John Stirling, is one of the most vivid and successful of Zola's portraiture of vice. "The Sisters" and "Homo Sum" are translations of the fine historical romances of the Egyptologist, Georg Ebers (New York, Gottsberger). Auerbach's simple and charming tale of "Brigitta" has been translated and published by Holt & Co. in their "Leisure-Hour Series"; his "Foresters" has also been translated (New York, Appletons). "The Spellbound Fiddler" (Chicago, Griggs) is a Scandinavian romance by Kristofer Janson, translated by Auber Forrester.

LITERATURE, BRITISH, IN 1880. In Great Britain, as on the Continent, there is an abatement of power and originality in works of imagination and invention, without any diminution in quantity. In fiction a greater number of productions attain a fair and tolerable degree of excellence than ever before, but none have the impress of great genius. In poetry a good number of finished products appear, but the general want of vigor and spontaneity, the cultivation of difficult versification, and the search for new models in other literatures, be-

tray a critical rather than a creative epoch. Science engenders the most vigorous and original thought. Philology and criticism, æsthetic and literary, are cultivated assiduously. The philological study of the Bible is pursued by English theologians with great zeal, incited by the example of Ewald and other German Hebraists, from whose bold and speculative conclusions, however, the British Biblical scholars are beginning to recoil.

As the result of these new, critical researches in the Hebrew and Greek Scriptures, an entirely new theological literature is springing up. The controversy with the scientific men about the evolutionary theories is dying out, and many theologians have become reconciled to these hypotheses. Rev. T. K. Cheyne, one of the most accomplished of English Hebraists, has in progress a translation and exegesis of the prophecies of Isaiah. The Rev. Dr. Cunningham Geikie's "Hours with the Bible" (New York, Pott) is a work containing the knowledge which modern research and orthodox criticism afford for the elucidation of the earlier books of the Bible. "The Speaker's Commentary," edited by Canon F. C. Cook (New York, Scribners), gives in convenient shape the results of orthodox philological criticism of the Bible. Canon Farrar's "Life and Works of St. Paul" (New York, Dutton) is the completest and most real presentment which has yet been given of the personal character and religious mission of the great apostle, and of all that is known of his life and the scenes in which it was passed. "Christian Institutions" is a series of connected essays by Dean Stanley upon the sacraments, rites, creeds, clergy, and other ecclesiastical subjects, being a kind of antiquarian and historical inquiry into the origin of the leading features of the English Church (New York, Scribners). P. Le Page Renouf, in "The Origin and Growth of Religion, as illustrated by the Religion of Ancient Egypt" (New York, Scribners), follows the new synthetic and comparative method of tracing the development of civilization. "The Metaphysics of the School" is an elucidation and defense of the scholastic philosophy, by Thomas Harper, S. J., of which the first volume has appeared (London, Macmillans). The "Manliness of Christ" is a series of lectures by Thomas Hughes, intended to convey his ideas of a stalwart Christian character (Boston, Houghton). Dr. Caird's temperate and liberal "Introduction to the Philosophy of Religion" is a welcome contribution to the controversy between scientists and theologians (New York, Macmillan). "The Manifold Witness for Christ," Boyle Lectures, by Alfred Barry, D. D., is a dignified and able defense of Christianity. "The Foundations of Faith" contains the Bampton Lectures of Henry Wace on the same subject. The "Dictionary of Christian Antiquities," edited by Dr. William Smith and Samuel Cheetnam (London, Murray), is made up of interesting and erudite articles on all subjects in

ecclesiastical archæology, by eminent scholars. Paul Isaac Hershon has placed before English readers a great number of sample extracts from the Talmud, in a "Talmudic Miscellany," selecting especially those passages which throw light upon the Bible.

"Unconscious Memory," by Samuel Butler, is an able critical examination of some of the mooted philosophical questions, marred, however, by bitter attacks upon other thinkers (London, Bogue). "Studies in Deductive Logic" is a manual by Professor W. Stanley Jevons.

The first clear and comprehensive account of Spinoza and his system of philosophy which has been given in English, is presented in Frederick Pollock's "Spinoza, his Life and Philosophy" (London, Kegan Paul). "Wish and Will" is a thoughtful and original work on psychology by George Lyon Turner (London, Longmans). "The Story of Philosophy," by Aston Leigh (London, Trübner), is intended to awaken a popular interest in philosophy, and is a most entertaining account of the Greek philosophers.

Among a large number of learned treatises on Oriental philology and religion, those enumerated below are the most important. "Chinese Buddhism" is a volume of critical and historical papers by the Rev. Dr. Joseph Edkins, who has made use of Chinese sources. "The Religions of China" contains a critical examination of Confucianism and Taoism compared with Christianity, by James Legge, Professor of Chinese at Oxford. The continuation of the translation of "The Sacred Books of the East," under the editorship of Max Müller, includes the first part of the "Zend-Avesta" (the Vendidad), translated by James Darmesteter in Vol. IV; the "Pahlavi Texts," translated by E. W. West, Vol. V; and the "Institutes of Vishnu," translated by Julius Jolly, Vol. VII (Oxford, Clarendon Press). "Cradle Land of Arts and Creeds," by Charles J. Stone, attempts to trace the Christian religious doctrines to Indian originals. Robert Needham Cust, the author of "Linguistic and Oriental Essays," is filled with a strong affection and respect for the Indian race, and discusses with great intellectual grasp and courage the religious and political questions and the historical problems which relate to the Indians and the future of India (London, Trübner). "India, Past and Present," by Shoshee Chunder Dutt (London, Chatto & Windus), consists of a number of ably and lucidly written essays on Indian subjects by a Hindoo who is versed in the thought and literature of his own race, but is more thoroughly imbued with European culture.

The extraordinary development of natural science which received its first impetus in England, is still going on without any sign of cessation. An unusual number of important original works have appeared in 1880, the chief of which have been reprinted in the United States. Professor Huxley's "Crayfish" (New

York, Appletons) is the most successful argumentative and explanatory work on the Darwinian theory which has yet been addressed to the general public, as well as an excellent and original scientific monograph upon the family of crustaceans which is selected to illustrate the author's doctrine. Huxley's "Introductory Science Primer" (New York, Appletons) is an important essay upon the aims and methods of modern science. Professor E. Ray Lankester's "Degeneration" (London, Macmillan) is an original contribution to the Darwinian doctrine, giving to the degeneration of species an important part in organic evolution. Alfred Russel Wallace's "Island Life" is an elaborate and important treatise upon the conditions and character of insular faunas and floras, complementary to his "Geographical Distribution of Animals" (London, Macmillan). "Mind in the Lower Animals in Health and Disease," by Dr. W. Lauder Lindsay (New York, Appletons), is a cogent and original treatise, written from the materialistic standpoint, presenting a mass of evidence to prove that animals possess a psychical nature differing only in degree from that of man. "Man and Beast Here and Hereafter" is a genial defense of the belief that animals have immortal souls, and a good-humored recital of the remonstrances the author provoked by announcing his belief, by Rev. J. G. Wood. Dr. Bastian's new book, "The Brain as an Organ of Mind" (New York, Appletons), is a work of great importance on psychology and the physiological aspects of mind. Charles and Francis Darwin's work on the "Power of Movement in Plants" (New York, Appletons) records some of the most important discoveries in vegetable physiology ever made (see CIRCUMNUTATION).

There has been issued the first part of a great work on the infusoria, by W. Saville Kent (London, David Bogue). The first volume of the final report, prepared under the superintendence of Sir Wyville Thomson, of the "Results of the Voyage of H. M. S. Challenger" has been printed, and contains the report on "Zoölogy." "Ideal Chemistry" suggests problems in chemical science, and contains conjectures on the fundamental conditions of matter, by Professor Brodie, of Oxford (London, Macmillan). W. Mattieu Williams, one of the best popular writers on science, has written "A Simple Treatise on Heat" (London, Chatto & Windus). "Ponds and Ditches" is a pleasing popular exposition of scientific knowledge, by M. C. Cooke. Professor Wurtz has contributed to the "International Scientific Series" an admirable history and explanation of "The Atomic Theory," translated by E. Cleminshaw (London, C. Kegan Paul & Co.). Karl Semper's excellent book on "The Natural Conditions of Existence as they affect Animal Life" has been translated. "Fossil Men and their Modern Representatives" (London, Hodder & Stoughton) gives an able argument in refutation of the doctrine of evolution based

upon anthropological research, by Professor J. W. Dawson, of Montreal. Professor W. Boyd Dawkins has written an exhaustive work on "Early Man in Britain and his Place in the Tertiary Period" (New York, Macmillan). Macmillan has published a translation of Pasteur's "Studies in Fermentation." "Electric Induction," by J. E. H. Gordon (London, Low), is a republication of lectures before the Royal Institution, explaining in popular language the accepted theory of electricity and the facts which support it. "Geodesy," by Colonel A. R. Clarke (Oxford, Clarendon Press), is the first treatise on the subject in the English language. Professor M. Foster's "Text-Book of Physiology" is an admirable treatise embodying the latest advances of the science (London, Macmillan). "The Poetry of Astronomy" contains Richard A. Proctor's latest popular scientific essays; another of his recent productions is "The Stars and the Earth" (St. Louis, Jones). "The Power of Sound," by Edmund Gurney, is an elaborate scientific treatise on music.

"Therapeutics and Materia Medica," by C. E. Armand Semple; "Forensic Medicine and Toxicology," by W. Douglass Heming, and "Aids to Anatomy," by George Brown, are students' manuals (New York, Putnams). "Eye-sight, Good and Bad" (London, Macmillan) is a practical treatise on the care of the eye by Robert B. Carter. On sanitary subjects there have appeared "Health and Healthy Homes," by George Wilson (Philadelphia, Blakiston), adapted to American conditions; Professor Corfield's "Dwelling-Houses" (New York, Van Nostrand); and "Health," a popular treatise on personal hygiene (New York, Appletons), by the same author.

The passion for travel preceded the development of scientific tastes in England. Since the acquirement of scientific knowledge has become a part of the higher education, the descriptions of travels have a better fund of interesting material to draw upon than the scraps of classical learning and antiquarian speculations which used to flavor such works. The widely extended imperial interests of Great Britain cause the English to feel more directly concerned with many remote lands than the people of other countries, and actuate the preparation of profound studies of those lands by trained political administrators or by other investigators who have given their subjects prolonged attention. "Portugal, Old and New," is a volume of intelligent observations and researches by Oswald Crawford, for a long time British consul at Oporto (New York, Putnams). "Siberia in Europe" gives an account of an ornithological tour to Northeast Russia, by H. Seebohm. "The Gardens of the Sun" is an account of a naturalist's visit to Borneo, by F. W. Burbidge (London, Murray). "Africa, Past and Present," by an Old Resident [Mr. Moister], is a brief summary of the history of African exploration (New York, American Tract Society). "Recollections of South Africa at the Time of

the Annexation of the Transvaal" is an exceedingly interesting account of the Boers by Theodore M. Tromp, a Hollander, who lived among them as the secretary of President Burgers (Leyden). "My Journey round the World," by Captain S. H. Jones-Farry, is a lively account of travels in America, the Australian colonies, and the Orient. A similar recountal of travels is entitled "Far-Out," by Lieutenant-Colonel W. F. Butler. Mrs. Brassey's "Sunshine and Storm in the East" is a description of a voyage in the Mediterranean, by a lady who has already won the esteem of the public by the refined and intelligent qualities of her narration of travels (New York, Holt). Henry Havard's new book, "The Heart of Holland" (Franklin Square Library), is of the same excellence as his others on the subject. "Holland and its People" is a translation by Caroline Tilton from the Italian of Edmondo de Amicis, a brilliant describer of lands and customs (New York, Putnams). "Columbia and Canada," by W. Fraser Rae (New York, Putnams), is a sketchy criticism of American things from hasty observations. Miss Isabella L. Bird has produced two very interesting books, "A Lady's Life in the Rocky Mountains," recounting the experiences of a fearless and observant lady explorer in unfrequented ways, and "Unbeaten Tracks in Japan," one of the best descriptive works on that country which has appeared (New York, Putnams). Oppert's "A Forbidden Land" is an important work of geographical and historical research in and concerning Corea (New York, Putnams), translated from the German. Sir Edward J. Reed's "Japan" is an admirable historical account and analysis of the social conditions of Japan, with a narrative of a visit to that country, which forms the second volume (London, Murray). "Turkey, Old and New," is a more labored and exhaustive account of the Ottoman Empire than the previous books which have appeared on the subject, by Sutherland Menzies. Robert Spence Watson's "Visit to Wazan" is an interesting narrative of travels in Morocco (London, Macmillan). Ball's "Jungle Life in India" is a diary kept by the author while working on the geological survey, and contains a vast amount of scientific information (London, De la Rue). "The Great African Island" is a popular description of Madagascar, by James Sibree (London, Trübner). Captain Gill's "The River of Golden Sand" (London, Murray) is a full account of his interesting travels in China. "Our Future Highway," by V. L. Cameron (London, Macmillan), relates to the possible railway connection with India by the Tigris route. Major H. G. Raverty's "Notes on Afghanistan and Part of Baluchistan" (London, Eyre & Spottiswoode) is an important treatise containing historical and geographical data derived from Oriental authors. A series of descriptive works upon the principal countries of the world is being issued by Sampson Low & Co., of which there have appeared "The West Indies,"

by C. H. Eden, and "Peru," by Clements R. Markham (New York, Scribner & Welford). Laurence Oliphant's "Land of Gilead" is an account of a tour of inspection, undertaken with a view to the colonization of Palestine with European Hebrews, a plan which the author conceived would greatly aid in the preservation and reformation of the Turkish Empire (New York, Appletons).

Political economy shows signs of entering upon a new stage of progress. The marks of a fresh advance are more apparent in the periodical literature than in the published treatises. The authority of the great names of the political economists of the past is at last waning, as the generalizations of the theoretical economy have long been disregarded in practical legislation, and the sociological investigations of English scholars are generating as a natural fruit new conceptions of the organization of civilized society. "Popular Sovereignty" is the title of a book which contains a cogent and earnest defense of the principle of popular self-government and the democratic idea, by Charles Anthony, Jr. (London, Longmans). A translation has been made of Dr. Luigi Cossa's admirable "Guide to the Study of Political Economy," a product of the older orthodox school of economy. "Principles of Property in Land" is a theoretical discussion of the land problem on general grounds of right and the common weal, in which liberal but not rash and unpractical views are expressed, by John Boyd Kinnear (London, Smith, Elder & Co.). "Free Land," by Arthur Arnold (London, C. Kegan Paul & Co.), is a clear and interesting treatise on land tenures, advocating free trade in land, and a peasant proprietorship. Among the special books on the land question in Ireland, the chief are "Irish Distress and its Remedies," by James H. Tuke; "The Parliamentary History of the Land Question," by R. Barry O'Brien; "Hibernian Horrors," by Alfred Austin; "The Land Question, Ireland;" "The Life's Work in Ireland of a Landlord who tried to do his Duty," by W. Bence Jones; "A Short Statement concerning the Confiscation of Improvements in Ireland," by a Working Landlord; "Parnellism Unveiled," by Philip H. Bagenal. "Hodge and his Master," by Richard Jeffries, is a very spirited and persuasive presentation of the extremely conservative and aristocratic sentiments regarding the peasantry. "Round about a Great Estate" is a delightful portrayal of the incidents and diversions of English rural life, by the same author.

No important work of history has appeared, but several interesting monographs, carefully digested summaries, and interesting discussions of recent history, have been published. Herbert Spencer's great work of "Descriptive Sociology, or Groups of Sociological Facts," is still in progress; the installment on the "Hebrews and Phœnicians" is the work of Dr. Richard Scheppegg. "The Aryan Village in India and Ceylon" is an interesting contribution to so-

ciological knowledge, by Sir J. Phear (London, Macmillan). Henry Brugsch-Bey's "History of Egypt under the Pharaohs, derived entirely from the Monuments," was translated by the late Henry Danby Seymour, and the work completed and prepared for the press by Philip Smith (London, Murray). "The Criminal Code of the Jews, according to the Talmud," gives the evidence of the wisdom and humanity of the Hebrew criminal jurisprudence (London, Smith, Elder & Co.). Lady Charlotte Jackson's "Old Paris" (New York, Holt) is an entertaining anecdotal history of the French court. James Geddes, in his "History of the Administration of John De Witte," of which the first volume has appeared (New York, Harpers), is working up a period of great importance in the history of political progress with commendable labor and judgment. Thomas Hodgkin, in "Italy and her Invaders" (Oxford, Clarendon Press), has written a history of the fall of the Roman Empire which shows profound study and acumen, containing valuable new matter upon a subject which has previously been handled by some of the ablest historians, and generalizations of great depth and boldness. Reginald Lane Poole's "History of the Huguenots of the Dispersion at the Recall of the Edict of Nantes" (London, Macmillan) recounts the fortunes of the emigrants, the interesting information having been gathered and verified with much labor. Vernon Lee, in "Studies of the Eighteenth Century in Italy," writes of Italian culture and society during a period of which almost nothing has previously been told in English literature. C. F. Johnston has given very interesting, well-arranged, and scholarly summaries of the history of the minor and less-known countries of Europe in his "Historical Abstracts" (London, C. Kegan Paul & Co.). Standish O'Grady has attempted to construct a "History of Ireland" from the ancient legendary lore, presenting the traditions in all their romantic and mythical details with genuine love for his subject (London, Low). "An Anecdotal History of the British Parliament" (New York, Appletons) is a fascinating book by George Henry Jennings, stimulating the study of history, and containing some valuable out-of-the-way information. Kinglake's great work on the "Invasion of the Crimea" ends with the sixth volume. Sir Charles Gavan Duffy's "Young Ireland," though covering the period of the former agitation, throws much light upon the present troubles in Ireland (New York, Appletons). "A Guide to Modern English History," by William Cory (New York, Holt), is an instructive commentary on British political history. C. A. Fyffe's "History of Modern Europe," of which the first volume has been published (London, Cassell), is a compendious, comprehensive, and philosophical review of European politics since the French Revolution. "A History of our own Times," by Justin McCarthy, deals with the history of England during the reign of Victoria, and,

while written with the skill of an accomplished author who possesses the art of enchainning the attention of the popular reader, it presents the views and conclusions of an enlightened and advanced political thinker, so moderately and considerately expressed as to offend the susceptibilities of none (New York, Harpers). Green's "History of the English People" has also been concluded, ending with the overthrow of Napoleon in 1815 (New York, Harpers). "England, her People, Polity, and Pursuits," by T. H. S. Escott (New York, Holt), is an outlined exposition of the data of the English social and political system.

Of memoirs and biographies there have appeared a large number, some of them important from the light they throw upon history, some of them relating to people of interesting personality, and some embodying critical studies of a high character. "Caroline von Linsingen and King William the Fourth," translated from the German, purports to give letters from that lady to the English King, and to reveal the fact that they were secretly married. Theodore Martin has published the fifth and final volume of his "Life of the Prince Consort" (New York, Appletons). "The Life, Times, and Correspondence of the Right Rev. Dr. Doyle, Bishop of Kildare and Leighlin," by W. J. Fitzpatrick, is a new and greatly augmented edition of the memoirs of one of the most illustrious and influential Irishmen of the century. Louis Kossuth's "Memoirs of my Exile," translated by Ferencz Jausz (New York, Appletons), is not so much a narrative of personal experiences as an impassioned protest against the extinction of Hungarian national independence. "Francis Deák" (London, Macmillan) is an account of the life and work of that illustrious Hungarian patriot and statesman. "Four Centuries of English Letters" contains typical and entertaining selections from the correspondence of every remarkable epistolary writer from the Paston letters to those of Prince Albert—W. Baptiste Scoones, editor. The "Life and Letters" of Chief-Justice Campbell has been prepared by his daughter, Mrs. Harcastle. The "Memoirs of Prince Metternich," which appeared in 1879, have been translated into English by Mrs. Alexander Napier (New York, Scribners). Guizot's memoirs by his daughter, Madame de Witt, have been translated by M. C. M. Simpson, "Monsieur Guizot in Private Life" (London, Chapman & Hall). "The Early History of Charles James Fox" is by George Otto Trevelyan, the most brilliant biographer of the time (New York, Harpers). Henry W. Luey's "Gladstone" (Harpers) is a well-written biographical sketch of the Premier. The keen and profound critical perceptions of Georg Brandes are directed to a worthy subject in his study of "Lord Beaconsfield," translated by Mrs. George Sturge (New York, Scribners). A memorial sketch of the remarkable wife of the historian Grote, "Mrs. Grote, a Study," is by Lady Eastlake (London, Murray). Dr. W.

G. Blaikie's "Personal Life of David Livingstone" is compiled mainly from his unpublished journals (New York, Harpers). "The Life of Joseph Barker" (London, Hodder & Stoughton) is the interesting autobiography of that remarkable religious neologist and political visionary. "The Life and Work of Mary Carpenter" is a finely written, ennobling relation of a life passed in the service of humanity, by J. Estlin Carpenter (London, Macmillan). In the series of biographical sketches, which are intended to offer a coherent review of modern German literature, and which are given under the title of "German Life and Literature," the author, Alexander Hay Japp, seeks to depose Goethe from the lofty pedestal upon which his German and English admirers have placed him. "Etienne Dolet, the Martyr of the Renaissance" (London, Macmillan), is an account of one of the most interesting figures of the period of the Reformation, and one of the most intellectual and progressive men of that progressive age, written by Richard Copley Christie. Mrs. Oliphant has written a sympathetic sketch of "Cervantes" for Blackwood's series of "Foreign Classics." An excellent and extensive biographical "Dictionary of Musicians," edited by George Grove, has just been completed (London, Macmillan). "Cowper," in Morley's series of "Men of Letters," is by Goldwin Smith, and ranks with the best of these biographical essays (New York, Harpers). Edward Dowden's "Southey," in the same series, is a careful and judicious memoir of a poet who has undeservedly lapsed further from public thought and attention than most of the subjects of these sketches. Adolphus William Ward's volume on "Chaucer" is well calculated to awaken a popular interest in the father of English poetry. The sketch of "Byron" is by John Nichol. Froude's "John Bunyan" in this series (New York, Harpers) is calculated to attract the attention of the reader, who will be pleased by the perusal of this thoughtful biographical study. "Alexander Pope," by Leslie Stephen, gives a severe estimate of the man, which may be warranted, but hardly an appreciative estimate of his genius. "Reminiscences by Thomas Carlyle" (New York, Scribners) consists of some sketches of an autobiographic character found among the papers of the late author by Mr. Froude; they are full of the frank opinions and candid criticisms of the great Scotchman upon books and people. "Samuel Lover," by A. J. Symington, is an agreeable account of the amiable and light-hearted novelist (New York, Harpers). "Thomas Moore, the Poet," is an equally interesting memoir by the same author (New York, Harpers). He has also prepared a readable, panegyric sketch of the life of William Cullen Bryant. The translation of Dr. Kraus's "Erasmus Darwin" (New York, Appletons), the learned essay of the German scholar in which the poet-naturalist's position in the history of science is vindicated, is prefaced by a

more interesting writing, namely, a delightful biographical account of his grandfather by Charles Darwin. Alfred Henry Huth's "Life and Writings of Henry Thomas Buckle" (New York, Appletons) is an interesting biography of a remarkable thinker.

"Essays on Art and Archæology" is a volume of learned review articles by C. T. Newton upon Greek art (London, Macmillan). Professor Mahaffy's "History of Classical Greek Literature" is an excellent conspectus which will inspire a livelier interest in the study of the Greek classics (New York, Harpers). John Addington Symonds's "Sketches and Studies in Southern Europe" (New York, Harpers) is a book of Italian travel, containing æsthetic and literary studies by the well-known historian of the Renaissance; "Studies of the Greek Poets" is a revision of his two former books on the subject, prepared for publication in America, characterized by the elegant diction and æsthetic perceptibility of the author, though out of his chosen field (New York, Harpers). Anthony Trollope has published a "Life of Cicero" (New York, Harpers), with the object of vindicating the character of the Roman orator from the charges of selfishness and unpatriotic conduct. Among the host of small books which are common nowadays few are as admirable in plan and execution as the sketches of classic authors edited by John Richard Green, in which series have appeared "Euripides," by J. P. Mahaffy; "Virgil," by H. Nettleship; and "Sophocles," by Lewis Campbell (New York, Appletons). The interesting collection of "Popular Romances of the Middle Ages," made by Sir George W. Cox and Eustace Hinton Jones, has been reprinted by Henry Holt & Co. In William J. Rolfe's edition of Shakespeare, each volume contains a single play with notes and various readings (New York, Harpers). Alexander James Duffield has given to English readers, for the first time, "The Ingenious Knight Don Quixote de la Mancha," the masterpiece of Cervantes, in an unadulterated, literal translation. The ribald interpolations of Phillips and Matteaux and the paraphrases and additions of Smollett so altered and corrupted the work that all the English translations of "Don Quixote" have been but loose adaptations, differing essentially in style and in sense from the original.

With the exception of Tennyson, Browning, and Swinburne, the poets who have published during the year claim attention rather from the skill and melody of form than by the power and freshness of their poems. Tennyson's recent poems of miscellaneous character are collected in "Ballads and other Poems" (Boston, Osgood). "Songs of the Springtides" is the title of a volume of noble poems by Algernon Charles Swinburne, among the best that he has produced. "The Heptalogia; or the Seven against Sense: a Cap with Seven Bells," is a volume of exceedingly keen satirical parodies [attributed to A. C. Swinburne]

of the styles of certain famous poets (London, Chatto & Windus). Edwin Arnold's shorter poems have been collected and published by Roberts Brothers. The second series of the "Dramatic Idyls" of Robert Browning contains poems which are, like his other poetry, informed by the subjective moods and feelings of the poet, and equally involved and enigmatic in their expression, and as richly clothed as ever with the picturesque imagery and descriptive touches and the dramatic adornment, which give to his poesy its peculiar, invigorating charm. Ernest Myers, whose "Puritans" and other former poems displayed technical dexterity and freshness of thought, in "The Defense of Rome" handles the theme of the recent development of nationalism among European peoples with poetic eloquence, employing rhymed hexameters with rare skill (London, Macmillan). "New and Old" is a volume of verse by John Addington Symonds, which exhibits all the delicacy of perception, the graceful poetic diction, and mastery of form which would be expected from that elegant prose-writer, but lack, as might also be expected, poetic originality and vigor. "Genevra" and "The Duke of Guise" are two tragedies which evince a fine dramatic instinct as well as an intimate knowledge of history. The "Ode of Life" (Boston, Roberts Brothers) is a poetical discourse on the conditions of life and the nature of man, conceived in the spirit of a fine Christian philosophy, by the author of "The Epic of Hades" [L. Morris].

British fiction is as prolific as ever. The purpose and method of the new novels are often admirable, and in none more so than in those of some of the younger authors; but no successors have yet appeared to replace the great masters of the English school of fiction, who have now all passed away. "Endymion" (New York, Appletons) is precisely such a shrewd, witty, and guarded political novel as the author of "Vivian Grey" might be expected to write after attaining the position and experience of the Earl of Beaconsfield. It is a skillfully confused masquerade of real historical characters and paraphrase of political events and phenomena. Thomas Hardy's powerful and successful story, named "The Trumpet-Major," has been published by Houghton & Co. The new novel by Ouida [Louise de la Rame], entitled "A Village Commune" (Philadelphia, Peterson), is entirely free from the moral eccentricities of her previous writings, being an eloquent disclosure of the political oppression to which the Italian peasantry is subjected under the existing municipal system. One of the most striking and popular of Ouida's novels in her ordinary manner is "Moths," a cynical picture of society (Philadelphia, Lippincott). May Laffan, whose spirited and lifelike pictures of Irish political society, "Hogan, M. P.," "The Honorable Miss Ferrand," etc., were published anonymously, has appended her name to her latest novel,

"Christy Carew," another story of Dublin life (New York, Holt). "Mademoiselle de Mersac," by W. E. Norris, is an excellent novel, its scenery and pictures of society artistic and true to nature, its character-drawing masterly and delicate, sprightly in its development, but leading to an appropriate tragic ending (Harpers' Franklin Square Library). Rhoda Broughton's "Second Thoughts" is a great improvement on the reckless stories which formerly flowed from her pen, higher-toned and more studious, displaying her vivacity and genuine artistic talent to much better advantage (New York, Appletons). "Mary Auerley" is a fine story by R. D. Blackmore, in his earlier manner (Franklin Square Library). "The Duke's Children," by Anthony Trollope, is more like his best novels than his other recent productions (Franklin Square Library). William Black's "White Wings" is a popular story, very similar to his former productions (Franklin Square Library). Mrs. L. B. Walford's "Troublesome Daughters" is a delightfully humorous and faithful picture of English life. Mary Cecil Hay is one of the best of contemporary story-tellers, and her depiction of winning young female characters is unrivaled; "For her Dear Sake" is one of the best of her productions (Franklin Square Library). Other numbers of this series of novels for the million are Georgiana M. Craik's "Two Women" and Frank Frankfort Moore's "Daireen," two graceful love-tales; "Reata," by E. D. Gerard, the work of a promising beginner, prolix, but containing good pictures of Austrian life and a well-constructed plot; "The Pennant Family," by Anne Beale, a thrilling tale of wrecking on the Welsh coast; Mrs. Molesworth's love-story of "Miss Bouverie"; "A Sylvan Queen," a pleasant picture of English rural life; "The Return of the Princess," a graphic contrast of the Mohammedan customs of Egypt and European life, in a fictitious correspondence translated from the French of Jacques Vincent, by Laura E. Kendall; W. W. Synge's lifelike and interesting story of "Tom Singleton"; "Barbara," by Miss M. E. Braddon; "Sir John," by the author of "Anne Dysart," and "Little Miss Primrose," by the author of "St. Olaves," two pleasant and refined novels; "The Queen of the Meadow," a delightful pastoral tale by Charles Gibbon; Mrs. Oliphant's "The Greatest Heiress in England," which quite sustains the high standard of this conscientious artist, and turns upon an eccentric will by which the actions of the amiable heroine are fettered; "Sweet Nelly, my Heart's Delight," by Walter Besant and James Rice, a charming historical novel whose scene is laid in old Virginia and London in colonial times. "Loukis Laras, Reminiscences of a Chiote Merchant during the War of Independence," by D. Bikelas, is a Greek romance which was published in Athens in 1879, and has since been translated into several languages; the present English translation is by J. Gennadius (London, Macmillan). "Matri

mony" is a later novel by W. E. Norris, less original than "Mademoiselle de Mersac," but showing keen observation and a knowledge of society in different countries. "Johnny Ludlow" is a new novel by Mrs. Henry Wood, lifelike, and marked by genuine humor and pathos. "A Life's Atonement," by David Christie Murray, a new author, displays constructive ability and good powers of delineation. "A Confidential Agent," James Payn's latest novel, is one of his best. "Dimplethorpe" is a charming idyllic novel by the author of "St. Olaves." Amelia B. Edwards's "Lord Brackenbury" is a well-worked-out story, whose interest depends upon an act of self-sacrifice on the part of the hero. "Ellice Quentin" is printed with four other stories by Julian Hawthorne, all of them based upon fine dramatic conceptions which are well wrought out and told in a terse and vigorous style. "Mehalah" is a powerful story of tragic interest by a new author. "Passages from the Diary of an Early Methodist," by the late Richard Rowe, is a remarkably vivid and truthful picture of religious and social life in England in the time of Wesley (Strahan).

LITERATURE, CONTINENTAL, IN 1880.
FRANCE.—In this country every original work is followed by a number of others which seem more like imitations written for sale than serious labors. This explains, perhaps, the extraordinary assaults on the Christian theology contained in Dufay's "La Légende du Christ," and Wilfrid de Fonvielle's "Miracles devant la Science." Ernest Rénan has followed up his remarkable Hibbert Lectures with a profound study on Marcus Aurelius. Naville defends the truths of Christianity with ability in "Jésus Christ." Hovelacque's volume on the Avesta is one of the best works which has appeared on the Zoroastrian religion. Sayous discusses the relations between the Jewish and Mohammedan religions in "Jésus Christ d'après Mahomet." Pierret, in his essay on Egyptian mythology, considers it a degraded monotheism instead of a developed paganism. Lenormant's "Des Origines de l'Histoire d'après la Bible" compares the Bible account of the beginnings of history with the Persian, Assyrian, and Babylonian records. Jules Mohl's valuable contributions to Oriental philology have been published in a collection. Barthélemy Saint-Hilaire has published a dissertation on the Aristotelian philosophy.

Important cyclopædic works which are in progress are Victor Gay's dictionary of mediæval and Renaissance art; Saglio's dictionary of Greek and Roman antiquities; Vivien de Saint-Martin's geographical dictionary, and his atlas; and Elisée Réclus's work on "Universal Geography," the latest installment of which treats of Asiatic Russia; the corrected edition of the "Biographie Universelle des Musiciens"; the fifth edition of Vapereau's "Dictionnaire des Contemporains"; Godefroy's colossal dic-

tionary of mediæval French, and several other similar works.

A host of publications relating to various periods of French history has been published. Upon some events and characters of past ages much new light has been cast by records which were before unknown or inaccessible. Besides the memoirs of Metternich and Madame de Rémusat, the biography of Marshal Davoust by his daughter, Madame de Blocqueville, and the researches of Jung into the early life of Napoleon, are interesting books. The correspondence of Coray, which has just been published, contains interesting details concerning the Reign of Terror. Thoughtful studies of Danton have been written by Dubost and Dr. Robinet. Wallon is completing the work of Mortimer-Ternaux on the Revolution. The speeches of Thiers and Gambetta have been collected. Madame de Witt's reminiscences of Guizot are a valuable addition to his memoirs.

Victor Hugo, in his "Feuilles d'Automne," shows no loss of vigor. Sardou's "Daniel Rochat," De Bornier's "Noces d'Attila," and Deroulède's "La Moabite" were the three dramatic events of the year. Zola has followed "Nana" with the "Soirées de Médan." Henry Gréville with "La Cité Ménéard," and Erckmann-Chatrian with "Le Grandpère Lebigre" and "Un Vieux de la Vieille," still hold their own.

BELGIUM.—The chief philosophical publications of the year are Charles Loomans's analytical "Essais de Psychologie," and J. Delbœuf's original investigations on the phenomena of sleep, given in "Le Sommeil et les Rêves." Two extensive histories of Belgium have been called out by the politico-religious conflict which agitates the country, that of Namèche from the Ultramontane, and that of Veicamer from the Liberal standpoint. "Cinquante Ans de Liberté" is a remarkable survey of recent history written by several Liberal politicians. Théodore Juste and many others have produced works on the fifty years of Belgian independence. General Vander Meere and other veterans of the Belgian Revolution have published memoirs. There are as many books of antiquarian and local interest and reprints of old documents as usual. Several excellent works upon the older national history have been published by Gachard, Duverger, Wauters, and other historians. A curious "Histoire de Belgique," by Van Bommel, who has just died, is transcribed from the texts of writers of every age. V. Brants has published an important historical essay on the condition of the rural classes down to the close of the eighteenth century. To this department belongs also the small book of Hermann Pergameni, "Les Guerres des Paysans," of which the range extends from the time of the Roman Empire down to the *jacquerie* of Galicia in 1846, and to the revolts in Ireland. Paul Devaux, the Liberal politician, recently deceased,

wrote a pregnant study on the political history of ancient Rome.

Bibliography has been cultivated by Vanderhaegen, Alphonse Willems, and others. Guillaume de Coster has written a systematic treatise on aesthetics; E. Leclercq, some fine studies of the Flemish painters; and E. Vanderstraeten, an account of music in the Low Countries before the nineteenth century. "Over de Alpen," the account of the art critic Max Rooses of his æsthetic observations in Italy, is the finest literary production of the year, and is to be translated into English. Vanden Brande is at work on a fine history of the Antwerp school, in Flemish.

Among philological works are Scheler's dictionary of the Walloon language; the translation from the Sanskrit of the "Story of Rama" of the poet Bhavabhuti; the manual of the sacred Persian language, or Pehlevi, by C. de Herlez, etc. An important treatise on international law is being written by Professor Laurent. Émile de Laveleye has published in book form his "Lettres d'Italie." Burdo has written an account of his travels in the Niger region; Dr. Dutrieux published a book on the commercial resources of Africa, and in favor of an international league for their development. Baron Lahure has published a relation of his sojourn in Dutch Malasia before 1830. In poetry and fiction in French may be mentioned the poetical writings of J. Demoulin, Bailly, Verdevaine, De Baillet, Gillion, and Nizet, the poems and dramas of Comte Maurice Duchastel, and the historical plays and dramatic sketches of Charles Potvin, the first of living Belgian poets; and in prose fiction the stories of C. Lemounier, and of Émile Leclercq. In Flemish literature, the tender poems of Gentil Antheunis, "Leven, Lieven, en Zingen" ("Life, Love, and Song"), and E. Hiel's "Songs for Great and Small Children," are noticeable for freshness of manner and originality. Hendrik Conscience, the great novelist, has written two sketches based upon his personal reminiscences. "Uit het dagelyksch Leven" ("From Daily Life"), by Vander Ven, is a naturalistic story. "Baas Colder," is a collaborated novel, by Teirlinck and Styns. In dramatic compositions the Flemish literature is as prolific as ever: the best productions are a comedy ("Three Old Friends") and a proverb ("A Cloudlet before Marriage"), by Emiel van Goethem.

HOLLAND.—A number of the prominent Dutch authors have died during the year. Cremer, the writer of didactic fiction, left a fine tale on the evils of gambling, called "Monte Carlo." Dr. van Vloten has published a second volume of old Dutch farces, and the expected edition of Maerlant's "Merlin." A few poems of Honigh and Miss Stratenus are the only noticeable contributions to poetical literature. The principal productions in fiction are Bruning's "Alice"; Mrs. van Westhrene's "Philip's Eerzucht"; "Zyne Zuster," by the lady who uses the pseudonym of "Van Walcheren"; "Konings-

droom," a satirical novel by Jan Holland; and Mrs. Bosboom-Toussaint's "Raimond de Schrynwerker." Vosmaer's "Amazone" is also a notable production.

GERMANY.—The enormous volume of literature of every class which issues from the presses of Germany seems to be still swelling. But this productivity is hardly a sign of greater intellectual activity; for it is the lighter, popular literature which makes up the increment. In philosophy, if extreme diversity in the fundamental positions is a sign of fruitfulness, German speculative thought was never more prolific. "To return to Kant" seems to be the watchword of all the schools; but each sets up a Kant of its own. Dühring, of the materialistic school; Hartmann, the mystic philosopher; and Liebmann, Vaihinger, and other followers of the "critical" school of Lange, have published works during the year. Gustav Biedermann has constructed a scheme of all the knowable in his "Philosophie als Begriffswissenschaft." Lotze, the most distinguished German philosopher of the time, has completed his system, which commenced with the "Logik," with the publication of the "Metaphysik." Eduard von Hartmann presents the evidence of his assertion of the disruption of Christian theology in "Die Selbstersetzung des Christenthums." Zahnsen, in his "Realdialektik," expounds a new paradoxical philosophy.

Popular scientific lectures are a new phenomenon in Germany. Not less than five collections of these have been published during the year. Helmholtz, Zeller, and other distinguished professors give explanations of scientific principles before popular audiences.

A number of interesting historical monographs have been published, among which G. Wolf's tract upon the relations of Prussia and Austria in the time of Joseph II, Adam Wolf's "Culturbilder aus Oestreich," and the history of the city of Berlin, by Adolf Streckfuss, may be noticed. Bruno Bauer, the philosopher, has arraigned in a tone of bitter condemnation the new German Empire and its founder in his tractate "Zur Orientirung über die Bismarck'sche Era."

The autobiography of Louis Schneider is a singularly frank recountal of the life of a man who was first a subordinate actor in a second-rate theatre, then a servant in the Prussian King's household, then a spy of Russia, and finally the confidant and military adviser of the Czar Nicholas. The record of a nobler life is given in the memoir of Gottfried Semper, artist and patriot, by his son. New letters of Goethe and of his mother have been brought to light in Pirazzi's "Aus Offenbach's Vergangenheit," and in the La Roche family correspondence, and others have been published in Geiger's "Goethe Annual," which contains also a life of Bettina von Arnim by her son-in-law.

Scherer is engaged upon a history of German literature. Otto Brahm has published studies

of the German plays of chivalry. Those of Count Toerring Seefeld, a contemporary of Goetz von Berlichingen, have recently been unearthed. Eduard Devrient and August Hartmann, among others, have written upon the Passion Play.

On art, the most important books are Jacob von Falke's history of costumes; Starke's work on the archaeology of art; Ernst Foerster's "Farnesina Studien"; Bruno Bucher's manual of art-history; and the studies of Italian paintings in German galleries, by Lermolieff [Morelli]. Dohme's illustrated biographical history of art is about completed. A new volume of artists' letters has been published by Ernst Guhl. The final report of the Austrian archaeological excavations on the island of Samothrace has been published. Of the German explorations in Olympia and Pergamos only preliminary reports have been issued.

Travels in Persia and Turkey are recounted by a diplomat under the pseudonym of "Charikles." Max Nordau has a graphic account of travel "From the Kremlin to the Alhambra." L. Steub and J. F. Leutner have written two amusing accounts of life and nature in the Tyrol. Wilhelm Rossmann's art letters from southern Italy have been followed by another volume of observations in monasteries of the characteristics of the Roman and Greek Catholic religions. Hermann von Schlagintweit's great work of "Reisen in Indien und Hochasien" is ended with the publication of the fourth volume. Lauth's "Bilder aus Ägyptens Vorzeit" supplements Ebers's great book on Egypt, with which splendid work may be classed Emil Schlagintweit's "Indien in Wort und Bild." Other books of travel are the posthumous volume of Dr. Buchholz's diaries made during his travels in Western Africa; Lux's account of explorations back of the Loando coast; Pogge's diary of travel in the same region; Holub's "Sieben Jahre in Süd-Africa," the English translation of which is published by Sampson Low & Co.; "Die Karawanenstrasse von Ägypten nach Syrien," and other illustrated works by the same author [the Grand-Duke of Tuscany].

The voluminous work on the geography of the United States by Friedrich Ratzel has been completed.

The works of Georg Buechner and Ludwig August Frankl, two of the most notable of the champions of political freedom in the past generation, have been collected for the first time. Buechner died young, and is only known in literature by his famous revolutionary drama of "Dantons Tod." An unfinished work of similar character has been found among his papers. Frankl, the veteran Austrian poet, has done as good work as any contemporary German poet, especially in the poems which celebrate Judaism and depict the sufferings of the Hebrew race; and he would have written still better had he not been fettered by the Austrian censorship. Oscar von Redwitz, another

political poet of a different stamp, gives, in the versified story of the monk Odilo, an allegorical apology for his own conversion from Ultramontane romanticism to nationalism, and to the approval of the Bismarckian achievements.

Arthur Fitger adopts in the collection he has this year published, "Winternächte," an earnest tone, as becomes the author of a work as remarkable as his tragedy. Julius Wolff, the author of the "Wilder Jäger," a piece which attained a great popularity, has followed it up with a "Tannhäuser," of a similarly romantic strain. Rudolf Baumbach has published "Frau Holde," a poem based upon a Thuringian saga. The "Lieder der Freude" of Siegfried Lipiner, and the ambitious "Weihgesänge" of Adolf von Schack, are mystical and obscure lyric productions. Bodenstedt, in his newest collection, gives an admirable reproduction of the spirit and style of his rhymes of "Mirza Schaffy" in the lays and aphorisms of "Omar Chadjah." The year has produced a new German lyric poet of Swiss nationality, Rudolf Niggeler. Ernst Heller's collection of German-Swiss poets includes many, such as the Byronic Ferdinand von Schmidt, August Corrodi, and Alfred Hartmann, who have long been in repute in Germany.

To the drama belongs Arthur Fitger's tragedy "Die Hexe." The author has taken his material, scene, and customs from the same East Frisian race from which Heinrich Kruse has derived the plot and characters of his play "Die Gräfin." Fitger depicts in "Die Hexe" the terrible situation of a heroine whose mind becomes imbued with skepticism in the midst of an age of implicit religious faith and superstitious aversion toward heretics, and with historical tact lays his plot in the neighborhood of the fanatical peasantry of both churches on the lower Rhine, and within the horizon of the influence of Spinoza. A new tragedy by Kruse, "Der Verbannte," is founded upon the story of the Danish Minister, Count Ulfeld, and his wife, Princess Leonora Christina. The material of Kruse's "König Erich" has been subjected to a different but able treatment in a tragedy by Josef Weilen. "Robert Kerr" is another historical tragedy by Adolf Wilbrandt, which lacks consistency. Ferdinand von Saar, the most brilliant of German dramatists, has produced a picture of causeless jealousy in "Tempesta." Other dramatic works of the year of conspicuous merit are "Prinz Eugen," by Martin Greif; "Das Dokument," by Countess Wickenbourg-Almásy; "Rolf Bernd," by Count von Putlitz; "Gräfin Lea," by Paul Lindau; and L'Arronge's popular comedy, called "Haus Lonei."

The leading novelists have each of them published some new work during the year. Freitag's great historical series, "Die Ahnen," has been brought to a close. Auerbach's simple but masterly story of Swabian humble life, "Brigitta," was printed in a translation in America almost simultaneously with its ap-

pearance in Germany. Spielhagen has published a tragic tale of love, entitled "Qui si sana." Ebers's "Die Schwestern," a story of Egypt in the time of the first Ptolemy, has also been published in English. Ferdinand Meyer's "Der Heilige" is an excellent historical novel, based on the life of Thomas à Becket. Alexander Schindler has written a delightful historical romance of the time of the Reformation, entitled "Die Goldschmieds-Kinder." Theodor Storm has published "Die Söhne des Senators," another of his accurate sketches from real life. Rudolf Lindau, a disciple of French naturalism, has contributed "Aus der guten Gesellschaft." Theodor Fontane, in "L'Adultera," has made a psychological study of immorality. "Die Boehminger" is a new novel by Heinrich Laube. Friedrich Uhl's "Die Botschafterin" is a romance drawn from the last period of the Polish monarchy. "Das Goldene Kalb" is a satirical novel on the financial fever. "Meister Amor" is a novel of artist-life by Wilbrandt. "Ein Kampf um's Recht" is the latest novel of Franzos, and is the story of a zealot for justice, like Kleist's famous "Michael Kohlhaas," in a Polish setting. Marie von Abner-Eschenbach has written some clever short stories. Paul Heyse's "Die Eselin" is a powerful pessimistic tale.

DENMARK.—A sharp controversy broke out between the Romanticist and Realist schools of poetry and criticism, in consequence of an attack upon the new tendencies made by C. Ploug, which was replied to by the upholders of the "literary Left," whose foremost representatives are Schandorph and Drachman. The best poems of the year are Drachman's fairy tale, "Eastward from the Sun, and Westward from the Moon," his national epic of "Tordenskjold," and his collection of lyrics, called "Youth." Collections have been published of the poems of Grundtvig, and of other poets. Novels and tales have been published by Etlar, Ewald, Schandorph, and others. Gjellerup, author of "The Idealist" and "Young Denmark," has produced a fine story of ancient times, but tendentia like his other works, called "Antigonus." Of historical writings, the most popular is the "History of Denmark and Norway," begun by Troels Lund. Hansen's "Fifteen Years Abroad" has been translated into English.

SWEDEN.—Ahnfelt has compiled from original sources interesting revelations of "Swedish Court Life." Hildebrand is at work on an extensive history of Swedish culture in the middle ages. Novels and tales of Lea [Mrs. Wettergrund], Nordensvan, Bondesson, and Santesson, and the stories of the Lapps, by "Gubben Noah," show commendable qualities. Nordenskjöld's account of his voyage has been published in several different languages. A remarkable economical treatise by K. Wicksell adopts the Malthusian theories. Professor Rudin's work on Kierkegaard is intended to glorify his religious character, and correct the

effects of the critique of Brandes. C. D. af Wirsén and Emil von Qvanten are the principal poetical writers of the year. Rydberg has published a volume of religious reflections. Hedin has concluded his work on the women of the French Revolution, and has written a remarkable pamphlet in defense of the development of the militia system.

NORWAY.—Lyric poetry has died out; and in prose fiction the simple pastoral tale of a few years ago is no longer cultivated. Ibsen and Björnson have turned their hands to the drama, and, with less success, Jonas Lie. Kjelrand, a young author, has produced a striking novel called "Garman and Worse," and Lie a good sea-novel in his earlier manner. Professor O. Rygh has commenced an important work on Scandinavian archæology, and Professor Dietrichson has published an interesting inquiry into the origin of the typical portrait of Christ. Professor Sophus Bugge has published his work on the connection between the Hebrew and the Greco-Roman religions and the Scandinavian mythology.

RUSSIA.—The Pushkin festival was the signal for a reawakening of interest in literature. The most notable product of that occasion was the "Author's Diary," of Dostoieffsky. This author's novel, called "The Brothers Karamazov," is one of the most powerful literary productions of the age. In "A Literary Evening" Gontcharof discusses realism in literature in an interesting manner. Inferior to Dostoieffsky's great novel, but good of their several kinds, are "Serious People," by K. Orlofsky [C. Golovin]; Potiekhin's "Young Sprouts," a socialistic novel; Polonsky's "Cheap City," drawn from actual experiences; Danilefsky's historical novel, named "Mirovitch"; and the satirical pictures by Stehendrin [Saltykov], called "The Golovlefs" and "Beyond the Frontier." Among a large crop of dramas, "A Heart, not a Stone," by Ostrofsky, is the best. Among the historical writings, Kostomarov's "Ruina," on an interesting period of Russian history, is the best. "Rome et Démétrius," by Father Paul Pierling, throws some new light on the episode of Demetrius. In criticism, literary history, science, philosophy, and in political economy, an unusual number of books have been published, some of which show much thought and study.

POLAND.—Kraszewski continues his historical romances, the last being "Cracow in the Days of King Ladislaus Lokietek," and has written a powerful sketch of contemporary life in "The Troubled Spirits." Sienkiewicz is a new author, whose letters from America, Rome, and Paris have won him celebrity. Lam and Wilczynski have each written a successful humorous novel.

ITALY.—Considerable interest is taken in folk-lore, the popular drama, etc.; and literary history and criticism in general were never more cultivated. An anecdotal history of Venice and its people is an interesting produc-

tion. Professor Brunialti has discussed the Turkish question with intelligence. A statistical study of suicide by Professor Morselli, and economical monographs by Rossi and Errera, are of interest, as well as Gabaglio's "History and Theory of Statistical Science," and Sicilian's "Problems of Modern Education." The new translation of the New Testament, by Carlo M. Curci, Priest of the Company of Jesus, one of the most distinguished thinkers among the Italian clergy, is remarkable, not merely as a critical work containing scholarly new interpretations, but much more so as the signal of a radical reform movement in the Church, with which Pope Leo himself is supposed to be identified.

SPAIN.—Popular scientific writings, translations from the classics, and publications of inedited or rare works, are three gratifying classes of books which come from the Spanish presses with unusual frequency. Oviedo's "Las Quinquagenas de la Nobleza de España" is the most important of the latter class. His "Batallas" is also to be printed. Collado's poems and the "Vision de Fray Martin," by Nuñez de Arce, are works of merit. Romano's "Memorias de un Setenton" is a retrospect of Spanish events for fifty years.

LOGAN, JOHN ALEXANDER, soldier and statesman, was born in Jackson County, Illinois, February 9, 1826. His father, Dr. John Logan, who came from Ireland to Illinois in 1823, served several terms in the State Legislature. His mother was Elizabeth Jenkins, a Tennessean. He was indebted for his early education to his father, and to such schools as were maintained for short periods in the new settlements. When the war with Mexico occurred, he volunteered as a private, but was soon chosen a lieutenant in the First Illinois Infantry. He did good service as a soldier, and for some time was adjutant of his regiment. After his return from Mexico he began the study of law with his uncle, Alexander M. Jenkins. In 1849 he was elected Clerk of Jackson County. In 1852 he graduated at the Louisville University, was admitted to the bar, and commenced the practice of his profession. His popularity and success led to his election to the State Legislature in the fall of that year, and in the year following as prosecuting attorney for the third judicial district—a position he held till 1857. He was elected a member of the Legislature again in 1853, and was reelected in 1856 and 1857. He was a Presidential elector in 1856 on the Buchanan and Breckinridge ticket. In 1858 he was elected a Representative from Illinois in the Thirty-sixth Congress, as a Douglas Democrat, and was reelected to the Thirty-seventh Congress in 1860. In the Presidential campaign of that year he earnestly advocated the election of Stephen A. Douglas, but on the first intimation of coming trouble from the South he did not hesitate to declare that, in the event of the election of Abraham Lincoln, he would "shoulder his musket

to have him inaugurated." In July, 1861, during the extra session of Congress called by President Lincoln, fired by the enthusiasm of the hour, he left his seat, overtook the troops that were marching out of Washington to meet the enemy, and fought with distinguished bravery in the ranks of Colonel Richardson's regiment at the disastrous battle of Bull Run, being among the last to leave the field. Returning home the latter part of August, he resigned his seat in Congress, believing he could serve his country better in the field than in its legislative halls. He organized the Thirty-first Illinois Infantry, and was appointed its colonel September 13th. His first encounter with the foe was at Belmont, in November, where he led a successful bayonet-charge and had a horse shot under him. He led his regiment in the attack on Fort Henry, and at Fort Donelson, while gallantly leading the assault, he was severely wounded, which incapacitated him for active service for some time. Reporting again for duty to General Grant, at Pittsburg Landing, he was, March 5, 1862, made a brigadier-general of volunteers. He took an important part in the movement against Corinth, and subsequently was given the command at Jackson, Tennessee, with instructions to guard the railroad communications. In the summer of 1862 his constituents urged him to become a candidate for reelection to Congress. In a letter declining he says: "I have entered the field to die, if need be, for this Government, and never expect to return to peaceful pursuits until the object of this war of preservation has become a fact established." During General Grant's northern Mississippi campaign General Logan commanded the Third Division of the Seventeenth Army Corps, under General McPherson, exhibiting a skill and bravery which led to his promotion as major-general of volunteers, dating from November 26, 1862. He participated in the battles of Port Gibson, Raymond, Jackson, and Champion Hill. In the siege of Vicksburg he commanded McPherson's center, and on the 25th of June made the assault after the explosion of the mine. His column was the first to enter the captured city, and he was made its military governor. He succeeded General Sherman in the command of the Fifteenth Army Corps in November, 1863. In May, 1864, he joined General Sherman's army, which was preparing for its march into Georgia; led the advance of the Army of the Tennessee in the fight at Resaca, repulsed Hardee's veterans at Dallas, and drove the enemy from his line of works at Kenesaw Mountain. At Atlanta, July 22d, where General McPherson fell in the hottest of the fight, General Sherman says, in his report of that battle: "General Logan succeeded him, and commanded the Army of the Tennessee through this desperate battle with the same success and ability that had characterized him in the command of a corps or division." After the fall of Atlanta, September 1, 1864, he went home and took a promi-

nent part in the Presidential campaign of that year. He rejoined his troops, who had accompanied General Sherman in his famous "march to the sea," at Savannah, and remained in active service with Sherman's army till the surrender of the Confederate forces under General Joseph E. Johnston, April 26, 1865. On May 23d he was appointed to the command of the Army of the Tennessee, but, as soon as active service in the field was over, he resigned his commission, stating that he did not wish to draw pay when not on active duty. He was appointed Minister to Mexico by President Johnson, but declined. In 1866 he was elected a Representative from Illinois to the Fortieth Congress as a Republican, and served as one of the managers in the impeachment trial of President Johnson. He was reelected to the Forty-first Congress, and did good service as chairman of the Committee on Military Affairs in securing the passage of an act for the reduction of the army. He was reelected to the Forty-second Congress, but before that body convened he was chosen by the Illinois Legislature a Senator of the United States for the term beginning March 4, 1871. He succeeded Vice-President Wilson as chairman of the Senate Committee on Military Affairs at the beginning of the third session of the Forty-second Congress, December 2, 1872. After the expiration of his term of service, March 3, 1877, he resumed the practice of law in Chicago. He was again returned to the United States Senate, and took his seat on the convening of that body in extra session, March 18, 1879. Both in the House and Senate he has maintained his reputation for brilliancy and success gained in the field. While a Representative, his most important speeches were: "On Reconstruction," July 12, 1867; "On the Impeachment of President Johnson," February 22, 1868; "Principles of the Democratic Party," July 16, 1868; on a resolution introduced by General B. F. Butler protesting against counting the electoral vote of Georgia, February 12, 1869; "Removing the Capitol," January 22, 1870. In the Senate his most noted speeches have been: "Vindication of President Grant against the Attack of Charles Sumner," June 3, 1872; a reply to Senator Gordon on the "Klux in Louisiana," January 13, 1875; "On the Equalization of Bounties of Soldiers, Sailors, and Marines of the Late War for the Union," March 2, 1875; "On the Power of the Government to enforce United States Laws," June 28, 1879. On the 6th of June of the present year he delivered an able and eloquent speech on the "Fitz John Porter case," which has added greatly to his reputation as a forcible and effective speaker. General Logan is a man of fine presence, rendered striking by his jet-black hair and strongly marked features. He possesses in a high degree those traits of character which win success—a strong personal magnetism, undaunted courage, and untiring industry. November 27, 1855, he was married

to Miss Mary S. Cunningham, a daughter of Captain Cunningham, Register of the Land-Office at Shawneetown, Illinois. She is a lady of superior education and rare social qualities, who has taken a deep interest in her husband's career, and has done much to aid in his advancement by her genial intercourse with his supporters, and the care with which she has attended to his large correspondence.

LOUISIANA. The State of Louisiana began the year 1880 with a new Constitution which the people had adopted in December, 1879. This power of reorganization of the political law of the State, Louisiana has frequently exercised. Her first Constitution was framed in 1812, when she applied for admission to the Union. It required that the Governor, Lieutenant-Governor, and legislators should have had a long residence in the State, with a landed estate and a further qualification as to age. Judges were appointed for life. In 1845 a second Constitution was formed to check the Legislature in granting charters to banking and other corporations, and to restrain those already in existence. In 1852 the State desired an elective judiciary for a short term, and railroads, and power to issue bonds, and so a third Constitution was framed. In 1861 the State made a fourth Constitution, and seceded from the Union. In 1864 and 1868 a fifth and sixth Constitution were made to restore the State to the Union. In 1879 the State adopted its seventh Constitution. There were many limitations upon legislative, executive, and judicial powers, and there is no small confusion in the language. Stability in the constitution of government, experience and skill in the administrative departments, and vigilance on the part of the people, alone prevent disorder. On the 12th of January the Legislature met in New Orleans, and, being the first Assembly under the new Constitution, its labors were chiefly directed to the supplementing of that instrument, and the passage of laws to promote the smooth working of the various departments of the newly organized State government. The executive and legislative officers chosen under this Constitution were inducted into office on the 14th of January. Not long after, there was appointed a judiciary composed for the most part of Judges who appeared on the bench for the first time. The Governor, Louis A. Wiltz, in his first message to the Assembly, reminded that body that, their sessions having been changed from annual to biennial, it became their duty to provide in advance for all financial and other contingencies which might arise during that period. The capital having been changed to Baton Rouge, in preparation for their next meeting, they must repair the former Capitol in that town, and take measures for the sale or conversion of property belonging to the State in New Orleans. Special laws must be passed in reference to the liens and privileges of mechanics and laborers, and the responsibility of corporations and companies for work done for

their benefit, so that labor and capital might receive from the law that equal protection to which they are entitled. A Board of Health must be constituted with undoubted authority, under due restraint. It should keep out foreign diseases without destroying intercourse with the outer world. "In behalf of our industrial and commercial interests, we must find some means of adequate protection that will not paralyze the business and blockade the ports and thoroughfares of the State." They were to appoint a time for holding Congressional elections, and to require that, according to time-honored custom, Presidential electors should be chosen directly by the people. The right of suffrage, however obtained, must be conceded and carried out in good faith. A Bureau of Agriculture must be organized, and one of its duties must be the encouragement of immigration. The Federal Government should maintain the levees, but, until it does, the State must depend on its own resources so far as they go. After recommending that some method of capital punishment more humane than hanging should be substituted in the Code, the Governor proceeds to discuss the support of public education, and to treat the difficult subject of State finance.

The first act passed by the General Assembly at the regular session of 1880 was a concurrent resolution "protesting against the recognition of William Pitt Kellogg as United States Senator from the State of Louisiana, and requesting the admission of Henry M. Spofford, the duly elected Senator from the State of Louisiana." Act No. 13 gives authority to railroad companies to borrow money to construct and repair railroads, etc., and to issue bonds or other obligations secured by mortgage upon their franchises, right of way, etc., with power to sell, pledge, or dispose of said bonds. Act No. 22 authorizes the Governor to employ counsel to represent the State in the Supreme Court of the United States in the case of the State of New Hampshire against the State of Louisiana. This suit is of a nature so novel as to ask further notice. It was brought before the Supreme Court of the United States in January, 1880, by the State of New Hampshire against the State of Louisiana for the amount of two hundred and ten dollars, being the sum of six coupons of interest, on as many consolidated bonds, which were not paid at maturity in January, 1880. The General Court of New Hampshire in July, 1879, passed an act to authorize any citizen of that State to make an assignment of the unpaid obligations of any of the States to that State, and directed the Attorney-General of New Hampshire to institute a suit in the name of the State in the Supreme Court to collect them. The assignor was to provide for all costs, charges, and expenses, and the Attorney-General was to be his "trustee," and to keep the amount of collections for his benefit. The Constitution of the United States confers authority upon the Supreme Court to

determine controversies between two or more States. This power was conferred in order that the States might settle their respective claims for boundary and jurisdiction which existed when the Declaration of Independence separated the colonies from Great Britain. Every one of the original thirteen States has had disputes on these subjects, and a number have been presented to the Supreme Court; others were settled by compact under the sanction of Congress. None have supposed before now that a State could by her own initiative obtain assignments of claims, and make use of the Supreme Court as an instrument to collect them for her assignors.

There was an erroneous impression after the adoption of the Federal Constitution in the Convention, in 1787, that a citizen of one of the States, or an alien, might sue another of the States for debt or for wrong. Hamilton notices and confutes this error in the eighty-first number of "The Federalist." Madison and Marshall repelled the existence of any such faculty during the debates on the Constitution in Virginia. Four Judges of the Supreme Bench maintained their jurisdiction in the cause of Chisholm, a citizen of South Carolina, against Georgia in the Supreme Court of the United States in 1793.

Immediately after, William Vassal, a British subject, brought a suit to set aside confiscations of his property in Massachusetts against that State in the Supreme Court of the United States. The process was served on John Hancock, then the Governor of that State. He convened the General Court in extra session, and in a speech of great excellence denied the authority of the Court, and affirmed that such a suit was contrary to the principles of a federal government, and urged the removal from the Constitution of any words that might seem to warrant such a jurisdiction. The General Court so determined, and in 1794 a Senator from Massachusetts introduced into the Senate and caused to be adopted what is now the eleventh amendment, prohibiting a construction of the Constitution to allow a citizen or subject of any State to sue a State. The cases of Chisholm and Vassal were never prosecuted to judgment. No attempt has since been made to use the powers of that Court at the suit of individuals. The case of New Hampshire against Louisiana is now before the Supreme Court, and the decision either way will form a tide-mark when the story of this transition period in the history of the United States is recorded.

Acts Nos. 41 and 56 created and defined the duties of a Bureau of Agriculture and Immigration, and provided for the registration thereby of lands, public or private property, offered for sale in Louisiana. No. 43 was a joint resolution requesting members of Congress to use their influence to obtain the passage of a bill to secure from loss the depositors in the Freedmen's Savings-Bank and Trust Company. Act

No. 60 instructed members of Congress from the State to procure the passage of an act changing the law in relation to the election of United States Senators to the sessions of the General Assemblies next preceding the time at which such Senators are to take their seats. No. 61 requested the Senators and Representatives of Louisiana in Congress to provide in any act conferring upon any railroad company all the rights, privileges, and franchises of any defaulting railroad company, that any *bona fide* settler upon any tract of public land so forfeited and annulled be entitled to all the rights of preëmption, homestead, and purchase to said tract that are assured to him by the preëmption laws of the United States. Act No. 71 provided for the payment of the officers, schools, and charities of the State, and for the payment of the interest upon its public debt. An appropriation of \$360,000 was made to pay interest coupons on consolidated bonds and interest on the new issue of State bonds in July, 1880, and January, 1881; and a similar amount to extinguish this indebtedness in July, 1881, and January, 1882. That part of the new Constitution which referred to the scaling of the debt was submitted as a separate proposition to the people, and received a large majority of votes. To pay the interest accorded, the tax authorized and required is three mills on the dollar. Bondholders at their option may refund and receive the new bonds, representing three-fourths of the face value of the old bonds, and bearing four per cent. interest from the date of refunding. If all the old bonds were thus refunded, they would amount to about \$9,000,000, requiring \$360,000 per annum to meet the interest at four per cent. As consols at the assembling of the Legislature were selling below fifty cents on the dollar, and refunding would offer a six per cent. investment to purchasers of bonds, it seemed probable that refunding would become general, and the Legislature acted upon the advice in the Governor's message, "The only safe course is to assess the whole three mills."

The finances of Louisiana caused a painful and urgent discussion in the Constitutional Convention. The civil war occasioned a subversion of the conditions of property and labor in the State. For some years there was anarchy in the relations of capital and labor. There were disorder, waste, and profusion in the management of the Treasury. The State was reduced to insolvency. In 1874 the last and not the least guilty of these administrations proposed a settlement. There was a funding of bonded and floating debt, both being reduced forty per cent. The rate of interest is seven per cent. per annum. A specified tax was to be imposed, collected, and paid out for interest. The bonded debt at this period was \$22,439,800. The disputed debt was \$3,901,000. There was also a floating debt of \$1,006,839.

It must be borne in mind that the expenditures which had caused this rapid growth of indebtedness had not been made on public works, which would enrich or embellish the country. Roads, levees, the highways of commerce, even the public parks and gardens, everything, great or small, connected with the public welfare, was neglected, and the public money, on what pretense soever it was wrung from a ruined people, served the sole purpose of enriching strangers.

Besides the actual indebtedness above mentioned, there was authority to issue bonds to corporations of different kinds, exceeding the debt there stated. Nor did this statement embrace the bonds of the State loaned to property banks, nearly half a century ago, amounting now to some seven million dollars, which are a claim upon the State.

The Convention determined that the demands upon the State arising from this debt were beyond its ability to discharge, and it fixed the interest at two per cent. for five years; three per cent. for fifteen years; and four per cent. for fourteen years, till the maturity of the bond. One installment of interest was pretermitted. A tax was imposed to meet this changed condition of the consolidated debt.

At this date the amount of the consolidated bonds is \$11,531,000; the disputed debt remains \$3,901,000, with an addition of about fifty per cent. for interest. The bonds loaned to the property banks will become a burden to the State for some four or five million dollars, it being understood that the banks are able only to redeem a portion of the sum due.

The debt of New Orleans is greater than the State debt, and its government is more costly. Five eighths of the burden of State taxation is borne by the city. The debt of the city mostly concerns its citizens, and any plan for its settlement must be submitted to them for approval. The Convention remitted to the Legislature the whole question of the city debt. The Governor in his message counseled the establishment of a syndicate to acquire the outstanding city bonds at their current market value. The syndicate might by refunding, or in some way, bring the interest within the compass of the two-mills tax. A change in the city charter in the interest of retrenchment was also proposed. Accordingly, Act No. 133 was passed by the Legislature "to liquidate the indebtedness of the city of New Orleans, and to apply its assets to the satisfaction thereof; to create a Board of Liquidation and prescribe their duties; and to provide for a fiscal agent and for the levying of a sufficient tax to pay said interest." It created a syndicate of six citizens to form a permanent "Board of Liquidation," with control of all matters relating to the bonded debt of New Orleans, and having power to issue bonds, signed by the mayor and Administrators of Accounts and of Finances,

payable in fifty years, and bearing interest at four per cent.; the entire issue not to exceed \$10,000,000. The syndicate is empowered to retire and cancel all the valid debt of the city, exchanging it for these bonds, or buying it up with their proceeds. Not more than fifty cents of the new bonds shall be given for one dollar of the face value of the old obligations. In doubtful or fraudulent cases the liquidators are to reject the obligations until the courts have pronounced on their validity. The administrators are to turn over the entire real and personal property of the city to them to be disposed of by the board, and the proceeds are to be added to the "city debt fund." This act is not to be construed as affecting the "Premium Bond Act," but the city authorities are to transfer to the board all moneys collected in accordance with that act. After paying the interest coupons of the bonds issued under this act, the surplus moneys are to be applied by the liquidators to the retiring of any valid obligations of the city of New Orleans, whether bonds or judgments. The City Council is required to levy an annual tax sufficient to pay all interest on bonds issued under this act.

The Board of Liquidators report a bonded debt of \$15,309,938.65. The certified and floating debt of the city of New Orleans, December 31, 1880, was as follows:

Floating debt.....	\$1,267,147 10
Judgments on bonds.....	\$225,000 00
Judgments on consolidated coupons.....	12,000 00
Judgments on other coupons.....	7,727 43
Judgments on claims.....	615,504 86
Total registered judgments.....	863,232 29
Interest coupons on consolidated bonds matured to June 1, 1876.....	\$31,821 75
Less amount converted into judgments.....	12,000 00
	\$19,821 75
Interest coupons on other bonds matured to July 1, 1875, unpaid.....	\$287,036 83
Less amount converted into judgments.....	7,727 43
	279,308 90
Total interest coupons.....	229,130 65
Total bonded debt.....	15,309,938 65
Total bonded and floating debt.....	\$17,736,505 69

There has been some progress in the improvement of Louisiana by the construction of lines of railroad during the year. The city of New Orleans has been connected with Houston, and thence with western Texas and the States north by the completion of the Morgan, Louisiana and Texas Railroad, and the Louisiana Western Railroad to the Texas line. The Vicksburg, Shreveport and Texas Railroad, to connect Vicksburg with Texas along the Ouachita River, will be completed during the coming year. The railroad from New Orleans to connect with the Southern Pacific Railroad at Marshall is progressing, and is to be completed during 1881. The connection with Mobile along the Mississippi Sound by railroad has fallen under

the control of the Louisville and Nashville Railroad, and it brings the city into closer relations with the North through Georgia and Tennessee. The Chicago, St. Louis and New Orleans Railroad Company connects New Orleans with the great cities of the West, and furnishes admirable facilities for commercial intercourse with the Northwest. Its managers have formed connections with Europe and the southern states of this continent, whereby the prosperity of the states and communities related to the company must be improved.

More important than commerce, and essential to its existence, is the public health. In 1880 rains were abundant, and the temperature was moderate during the summer and autumn. Rigid quarantine regulations were enforced upon the seacoast. In the cities care was taken to observe sanitary regulations in respect to cleanliness, and the use of disinfectants and purifying agents. The death-rate in New Orleans during every month of this year is less than in any corresponding month for twelve years. The diseases which spread terror whenever their appearance has been detected, have not affected any portion of the State, and the year closed in Louisiana with a better spirit of hopefulness than has been observed for twenty years.

The most important question before the people of the State is that which concerns the colored population. The introduction of a population which had no traditions of civilization, culture, progress, or of advancement to higher conditions than barbarism, to the possession of the powers, faculties, and rights of the most advanced people of the earth, and to require of them to perform the obligations and duties incident to such a possession, must be admitted to have been a perilous experiment. Every analogous experiment has proved a failure, and it had come to be regarded as an axiom in political philosophy that there should be protection, guidance, and preparative measures and strict precautions to afford any hope of success in subduing the appetites, passions, and inclinations of such a race, and thus to discipline and improve them. The report we have to make is that there is improvement in the condition of the colored population. There is among the white population a disposition to aid in measures of amelioration. There is a spirit of kindness and good-will. There are no antipathies or grudges. Habits of thrift and providence are not the result of any legislation, nor do they become established in a community or among a race in a single generation. The most that can be said is that there is room for encouragement and no cause for despair.

There is no large emigration of this population to note; the vagrant disposition probably exists. They are easily beguiled by alluring offers of an improved condition, and they have a child's love of variety; but there has been no motive for persons to make these offers to

them. They are not a desirable population, either at the North or the West. No change in the habitation of this race is probable. The prevalent opinion in Louisiana is that the loss of a very large number of the blacks, and the introduction of colonists from the Northern States and the south of Europe, would be advantageous to the Southern States. No such hegira has taken place in 1880. A diffusion of the colored population over a wider extent of territory, where there are diversities in works of industry, could not but be beneficial to the country. There were strikes in some parts of this State, but they were similar to the labor troubles elsewhere, and were devoid of race antagonism. It was not a rising of blacks against whites, but of employees against employers. In the parishes of St. James, St. John the Baptist, and St. Charles, during the month of March, negroes went from plantation to plantation, requiring others who had not joined in their movement to desist from work, and even to leave these parishes. They rode about in armed bands, broke into cabins, frightened the inmates, took quiet laborers from their work in the fields, and whipped them. No outrages were committed except on colored persons. The Governor's proclamation produced no effect upon the rioters, and the militia was called out and sent to the two or three points of disturbance. The ringleaders were arrested without bloodshed or difficulty, and were brought to New Orleans, tried, and imprisoned. The other strikers appointed a conference committee to arrange their difficulties with the planters. A colored Senator, Demas, wrote out the following petition in behalf of the St. Charles strikers, which shows the misconception of their rights under which they acted:

NEW ORLEANS, March 23, 1880.

To His Excellency Governor WILTZ, of the State of Louisiana.

The undersigned, having pleaded guilty to trespass before Judge Augustin, holding court at St. Charles Court-House on Saturday, March 20th, and having been brought to New Orleans to serve out their sentence, ask you for a remission of the same on the following grounds:

We, as well as the majority of our people, were misled as to our rights when we acted as we did in the recent strike; and when we were guilty of trespass, we did not know we were exceeding our rights; we really thought we had a right to go where other laborers were working, even though it was on the property of an individual, and induce those laborers to join us.

We now understand we have no such rights; we understand we have no right to go on the property of other people against their will, and we propose to obey this law hereafter.

We feel sure the laborers in our parish understand this question now, and are equally certain they never understood it before.

We feel sure the laborers in our parish will respect the law, as we intend to hereafter, and believe quietness and peace will continue from this time, and that when laborers differ with their employers hereafter about the price of their labor, it will be in a peaceable manner, and with law always on their side.

For these reasons, your Excellency, we would ask a remission of our sentence, and allow us to return to our wives, our children, and our work.

This was signed by the prisoners, and the Judge and the militia officers concurred in recommending that Executive clemency be extended. They were accordingly released, and quiet was restored.

The crops for the year ending September 1, 1880, show a satisfactory condition. The Sugar-Planters' Association has done much to produce concert of action and improved methods of culture and manufacture. The progress in manufacture is proved by the out-turn of 60,000,000 pounds of clarified sugar. The season was not favorable, but the crop, though smaller, brought more money than its predecessor.

YEAR.	Hogheads.	Pounds.	Barrels of molasses.
1878-'79.....	208,571½	251,088,860	322,044
1879-'80.....	172,424	211,740,062	274,440

The comparative value of the sugar-crop, since 1850, is as follows:

YEAR.	Total crop, pounds.	Average price per hoghead.	Total value.
1850-'51.....	231,200,000	\$60 00	\$12,678,000
1855-'56.....	254,600,000	70 00	16,200,000
1859-'60.....	225,100,000	82 00	18,200,000
1861-'62.....	528,300,000	55 00	25,100,000
1865-'66.....	19,900,000	137 50	2,847,000
1869-'70.....	99,500,000	120 00	10,442,000
1870-'71.....	168,900,000	98 00	14,261,000
1871-'72.....	146,900,000	108 00	13,911,000
1872-'73.....	125,300,000	100 50	10,900,000
1873-'74.....	103,200,000	95 50	8,555,000
1874-'75.....	134,500,000	95 00	11,265,000
1875-'76.....	165,450,000	88 00	11,578,000
1876-'77.....	194,964,000	95 50	15,646,000
1877-'78.....	149,469,000	72 00	9,007,000
1878-'79.....	251,088,868	65 00	13,557,115
1879-'80.....	211,740,062	87 50	15,360,000

Cotton is still the great feeder of every other form of industry. The following tables give the

NEW ORLEANS COTTON STATEMENT.

STOCK.	1879-'80.	1878-'79.
	Bales.	Bales.
Stock at the beginning of the year....	4,595	4,086
Net receipts.....	1,459,049	1,174,894

Total.....	1,700,485	1,438,048

The succeeding table shows the comparative value of receipts:

SEASON.	Receipts at New Orleans.	Average price per bale.	Total value.
	Bales.		
1866-'67.....	780,490	\$125 10	\$97,639,299
1870-'71.....	1,548,136	65 25	101,015,874
1872-'73.....	1,407,821	84 87	118,760,758
1874-'75.....	1,157,597	65 40	75,706,843
1875-'76.....	1,604,441	52 55	84,473,849
1876-'77.....	1,889,774	52 00	72,268,248
1877-'78.....	1,689,453	40 05	81,159,658
1878-'79.....	1,426,081	48 00	61,221,483
1879-'80.....	1,112,999	55 00	94,213,845

This is the share of Louisiana in handling the crop of 1879-'80, which reached in the aggregate 5,761,252 bales.

The rice-crop has decreased from 154,518 barrels in 1878-'79 to 100,169 barrels in 1879-'80. Low water and storms alike proved disastrous. There is growing opposition to this culture. The rice-flumes too often prove the little rift which ends in the breakage of the levee and ensuing crevasses. Besides, the irrigation of the rice-fields is unwholesome. The malarial fever, not fatal but painful, which afflicted lower Louisiana during the autumn of 1880, is popularly attributed to this cause. The record of the foreign commerce of New Orleans shows that imports and exports have expanded nearly fifty per cent.

COMMERCE.	1879-'80.	1878-'79.
Domestic exports.....	\$93,335,880	\$68,624,797
Imports.....	10,915,042	7,141,989
Total.....	\$104,250,922	\$75,766,686

The value of the coffee imported was \$3,991,308, with an increase of 30,666,469 pounds.

The progress of the grain-trade movement by the Mississippi route, in spite of low water and insufficient tonnage, proves the natural advantages of river transportation for the surplus products of the West. The exports of grain were as follows:

EXPORTS.	Bushels of corn.	Bushels of wheat.
Total in 1878-'79.....	3,598,832	1,901,929
Total in 1879-'80.....	9,421,126	5,254,705
Increase this year.....	5,822,314	3,352,776

The barge system is found to be the most economical method of transportation. The capacity of a barge varies from 18,000 bushels to 100,000. The hull of the steamer Great Republic has been transformed into a barge of that dimension. From five to ten barges are towed at once. The run from St. Louis to New Orleans occupies about nine days. The average cost of transportation is about seven and one half cents a bushel. A stationary elevator was erected in New Orleans in 1868, with a capacity to transfer 30,000 bushels daily. There are five floating elevators, with a com-

bined capacity of 25,000 bushels daily. Besides these, there are others in process of construction. The floating elevators have proved very successful. The ships anchor in the stream, thus avoiding all wharfage dues, while an elevator on each side empties the contents of the barges into her hold, thus economizing storage dues. The charge for transferring is one half cent a bushel. The freight to Liverpool is about eight pence. The insurance is low. Four companies in New Orleans formed themselves into a syndicate for the purpose of insuring entire cargoes, dividing risks and profits. During the year the syndicate has not lost a vessel.

Besides the barge system, other projects are begun in regard to this trade. The Illinois Central Railroad Company are constructing an elevator and warehouse at Cairo, with a capacity of 600,000 bushels. Another elevator is being built at Belmont. These erections will allow easier transport down the Mississippi, as the barges will escape the numerous obstructions to navigation between St. Louis and Cairo. It has been demonstrated that no damage results to grain conveyed to Europe through Southern waters. On the contrary, it is the easier, cheaper, and safer route. During this year 135 sailing-vessels and 183 steamers, 318 vessels in all, cleared from the port of New Orleans, loaded wholly or chiefly with grain.

It has been contemplated to employ the Great Eastern in this trade. There is no obstacle to prevent her safe entrance to the harbor of New Orleans at any time. The jetties are an assured and permanent success. The walls extend about two and one eighth miles into the Gulf, one thousand feet apart. They are strongly built, and capped with a concrete as hard as stone. The action of the waves has thrown in sand and sediment outside the walls, forming a natural and permanent embankment, protecting them completely from injury by the water. An official report at the close of December shows that the condition of the jetties is excellent. No bar is forming in front, or anywhere in the vicinity. As required by law, there is a channel two hundred feet wide at the bottom, whose least depth is twenty-six feet, while its central depth is over thirty feet.

What is specially needed in Louisiana is small industries, which will give remunerative employment the year round. There has been some progress in manufactures. The census reports a capital of \$4,261,790 employed in boot and shoe manufacture, exclusive of custom-work:

Foundries and machinery.....	\$1,005,200
Moss-factories.....	153,000
Cotton-seed oil-factories.....	2,742,000
Saddlery.....	356,651
Slaughtering animals.....	1,793,560
Refining sugars.....	1,400,000
Tobacco.....	432,055
Rice-mills.....	1,505,000
Planing and lumber mills.....	267,280
Flour and grist mills.....	380,500
Cigars.....	512,862
Car-building.....	250,000
Artificial ice.....	158,000
Box-factories.....	151,128

Blacksmithing.....	\$186,000
Candies and confectionery.....	388,126
Cotton-presses.....	761,500
Cooperage.....	207,204
Carriage and wagon making.....	161,100
Copper and tin smithing.....	181,519
Coal-gas.....	789,800
Marble and granite works.....	127,390

These are all the manufactories in New Orleans which employ a capital of over \$100,000.

On the 12th of April the Democratic party elected the following delegation to the Cincinnati Convention: at large, John McEnnery, W. A. Strong, Patrick Mealey, and Charles Parlange; first district, John Fitzpatrick, J. D. Houston; second district, J. W. Patton, E. A. Burke; third district, J. L. Brent, John Clegg; fourth district, S. M. Morrison, James Jeffries; fifth district, G. W. McCranie, J. W. Goldman; sixth district, M. D. Kavanagh, William Duncan.

The following resolutions were adopted:

Resolved, By the Democratic and Conservative party of the State of Louisiana in convention assembled, for the purpose of electing sixteen delegates to the Cincinnati Convention, that we present to our political brethren the name of Winfield Scott Hancock as a candidate well adapted, in our judgment, to nationalize the issues of the approaching Presidential contest, and to give assurance of our desire to promote concord, insure tranquillity, the supremacy of the lawful authorities, and the perpetuity of our republican institutions. We hereby express our decided and unqualified preference for his nomination, and our belief that, if so nominated, his election will be ratified by the whole people.

Resolved further, That the sixteen delegates of this State are instructed to vote as a majority thereof may decide, except that they are hereby specially instructed to vote for the maintenance of the two-thirds rule, as it has been established in all the late Democratic Conventions.

Resolved, That the Democracy of Louisiana have heard with the deepest regret that certain Democratic members of the United States Senate have made objections to, and placed obstacles in the way of, the adoption of the majority report of the Committee on Privileges and Elections, in the matter of the illegal and fraudulent claims of William P. Kellogg, who now occupies the seat in that body justly and legally due to the Hon. H. M. Spofford.

Resolved, That the Democracy of Louisiana, in convention assembled, does most earnestly urge upon all the Democrats in the United States Senate to seat the Hon. H. M. Spofford, the rightful and duly elected member from Louisiana.

The Republican party in Louisiana sent two sets of delegates to the Chicago Convention. The Dumont faction, who were seated, were: H. C. Warmoth, James Lewis, H. T. Ludeling, A. J. Dumont, William P. Kellogg, Richard Simms, A. S. Badger, Samuel Wakefield, A. H. Leonard, Don A. Pardee, William Harner, J. S. Matthews, W. L. McMillen, David Young, I. Henri Busch, and Jack Wharton.

The Beattie contesting delegation were: At large, Taylor Beattie, P. B. S. Pinchback, S. T. Allain, W. P. Kellogg. Congressional district delegates: Cyrus Bussey, J. R. G. Pitkin, Dr. H. A. Duperrier, J. R. Beckwith, A. A. Maurice, J. S. Davidson, Dr. B. T. Kenney, Octave Ray, Governor Hawkins, Thomas A. Cage, Henry Demas, and J. B. Gaudet.

At the regular Republican State Convention the following resolutions were adopted on Monday, May 24th:

We, the Republicans of Louisiana, in Convention assembled, reaffirm our allegiance and devotion to the Republican party and the principles which gave it birth. Believing that it is on the threshold of a battle that will give it a new lease of life and power, we declare our firm belief that this is a nation and not a league; that the General Government has and ought to exercise the right of protecting the purity of the ballot-box by throwing around it the safeguards necessary to procure a full and free expression of its citizens, irrespective of race, nationality, or sections; that having taken charge of the reins of government at a critical period of the country's history, followed by a war that cost us thousands of lives and millions of treasure, we point with pride and admiration to its grand achievements, in the rapid payment of the public debt, the reduction of taxation, and the restoration of general prosperity, by giving us a bond which is at par the world over. We call upon the Republicans of the North in the coming struggle to see that the nation takes no step backward by denying or abridging the rights of any class of its citizens; that while we can not have our voice and influence felt in the affairs of state, we look anxiously and pray earnestly for the success of those principles where free speech is tolerated and where fair play obtains. Having confidence in the patriotism, character, and intelligence of those who will assemble in convention at Chicago, we hereby declare our hearty and united support for its nominees.

A university for the higher education of colored boys was opened in New Orleans, at the expense of the State of Louisiana, during 1880. There are no data from which the number of children, white and black, in this State, can be collected. The Superintendent of Education reports as follows:

No returns from the following twelve parishes have been received: Bienville, Calcasieu, East Carroll, Lafourche, Livingston, Lincoln, Morehouse, Natchitoches, Ouachita, Plaquemines, Sabine, and Webster.

In the table below is given a list of the educable youth of those parishes that have been heard from:

Ascension.....	5,022	Assumption.....	4,756
Avoynes.....	4,894	Baton Rouge, East... ..	5,534
Baton Rouge, West... ..	2,199	Bossier.....	5,160

Livingston.....	444 25	Winn.....	466 75
Total.....			\$68,750 00

Redistricting for members of Congress has not yet been ordered. The United States census of 1880 gives Louisiana a white population reaching 455,063, and a colored population of 485,200. The whole population is 940,263. This shows an increase during the last decade of 213,988. The population in 1870 was, whites, 362,065; blacks, 364,210; aggregate, 726,275.

The debt of the State of Louisiana on January 30, 1880, was as follows:

Consolidated bonds at 7 per cent. not yet accepting the provisions of the new Constitution.....	\$11,449,500
Consolidated bonds accepting new constitutional provisions, and stamped for reduced interest of 2 per cent.....	156,600
New constitutional bonds issued for \$238,300 old bonds, at 75 cents, and bearing interest at 4 per cent.....	175,025
Total debt, old and new bonds.....	\$11,781,125

Holders of old bonds are not compelled to scale at seventy-five cents on the dollar and take new four per cent. bonds, but the State Treasurer believes that they will prefer that mode. In that event the refunded debt will be \$8,879,550 at four per cent. interest. The option is the face of the consolidated debt with two per cent. for five years, three per cent. for fifteen years, and four per cent. thereafter. There can be no increase beyond the funding of a few outstanding bonds, which have not yet been converted into consolidated bonds, and which do not amount to \$250,000.

The assessment of the parish of Orleans in 1880 was.....	\$97,352,405 72
The assessment of country parishes in 1880 was.....	79,276,227 00

Total assessment of Louisiana in 1880 was \$176,628,632 72

The rate of taxation is six mills.

LUTHERANS. The following is a summary of the statistics of the Lutheran Synods in America, as they are given in the "Church Almanac" (Philadelphia) for 1881:

* This amount is subdivided as follows: Right bank, \$635.50; left bank, \$162.50.

SYNODS.	Minis- ters.	Congre- gations.	Communi- cants.
I. GENERAL COUNCIL.			
Ministerium of Pennsylvania.....	201	935	82,558
Ministerium of New York.....	70	67	22,683
Pittsburg Synod.....	71	133	12,309
Texas Synod.....	80	30	4,550
District Synod of Ohio.....	32	63	5,895
Augustana Synod (Swedish).....	141	311	39,979
Michigan Synod.....	28	45	4,432
Canada Synod.....	24	53	6,343
Indiana Synod.....	14	32	2,425
Holston Synod.....	13	27	2,900
Total in ten synods.....	624	1,151	184,974
II. GENERAL SYNOD, NORTH.			
Maryland Synod.....	66	95	12,614
West Pennsylvania Synod.....	63	112	18,290
Hartwick Synod.....	29	32	4,055
East Ohio Synod.....	45	90	5,252
Franeckan Synod.....	22	32	2,943
Allegheny Synod.....	56	141	11,560
East Pennsylvania Synod.....	74	105	15,151
Miami Synod.....	28	32	3,280
Wittenberg Synod.....	42	64	6,098
Olive Branch Synod.....	19	31	1,800
Northern Illinois Synod.....	34	47	2,074
Central Pennsylvania Synod.....	37	84	7,410
Iowa Synod.....	25	26	1,089
Northern Indiana Synod.....	44	80	4,000
Southern Illinois Synod.....	10	17	957
Central Illinois Synod.....	21	31	1,597
New York and New Jersey Synod.....	50	39	6,195
Susquehanna Synod.....	41	61	6,963
Pittsburg Synod.....	27	54	4,531
Kansas Synod.....	31	32	1,043
Nebraska Synod.....	25	30	1,344
Wartburg Synod.....	37	35	4,725
Middle Tennessee Synod.....	15	15	812
Total in twenty-three synods.....	841	1,255	128,813
III. GENERAL SYNOD, SOUTH.			
Synod of North Carolina.....	24	48	4,659
Synod of South Carolina.....	33	47	5,344
Synod of Virginia.....	29	49	4,150
Synod of Southwest Virginia.....	20	49	2,575
Mississippi Synod.....	7	9	365
Georgia Synod.....	9	12	1,100
Total in six synods.....	122	214	18,223
IV. SYNODICAL CONFERENCE.			
Joint Synod of Ohio (6 synods).....	183	236	99,651
Joint Synod of Missouri (5 synods).....	693	870	256,395
Wisconsin Synod.....	87	150	47,615
Norwegian Synod.....	172	522	135,251
Minnesota Synod.....	34	54	14,063
English Conference of Missouri.....	7	8	1,000
Total in six synods.....	1,176	1,990	554,505
V. INDEPENDENT.			
Tennessee Synod.....	27	78	7,636
Buffalo Synod.....	17	22	3,200
Synod of Iowa (German).....	189	235	20,500
Hange's Nor. Evan. Luth. Synod.....	22	80	6,000
Conference of Nor. Dan. Luth. Church.....	66	299	19,621
Augustana Synod (Norwegian).....	21	53	7,090
Synod of Maryland (German).....	39	45	1,420
Ansargi Synod.....	22	68	3,898
Dan. Evan. Luth. Church in America.....	9	13	1,500
Augsburg Synod (German).....	5	1.	1,378
Immanuel Synod.....			
Total in eleven synods.....	369	913	63,353
Grand total.....	8,182	5,553	944,868

The statistics given in other Lutheran almanacs widely differ from the above. An almanac published at Allentown, Pennsylvania ("Lutherische Kalender"), gives a total of 3,174 ministers, 5,683 congregations, and 700,418 communicants; while, according to the "Lu-

theran Almanac," of Chicago, there are 3,177 ministers, 5,693 congregations, and 703,382 communicants.

"The Church Almanac" gives lists of four theological institutions under the care of the General Council, four under the care of the General Synod, North, five under the care of the Synodical Conference, one under the care of the General Synod, South, one Norwegian-Danish, and one Swedish seminary; three colleges connected with the General Council, four with the General Synod, North, four with the Synodical Conference, two with the General Synod, South, and four with individual Synods; thirteen classical schools, and nine seminaries for young ladies.

The *General Council* met at Greensburg, Pennsylvania, in October. The Rev. D. A. Spaeth was chosen President. The business was almost entirely transacted in English, although the German language had heretofore been considerably used in the proceedings of the Council. The Constitution for congregations, which had been under consideration for several years, was completed and was adopted, and recommended to the churches. The continued discussion of the theses on pulpit and altar fellowship, which had been likewise under consideration for several years, was deferred. A plan for the reorganization of the mission work was adopted, although it was not considered wholly satisfactory, as the best arrangement that could be made at present. It directs that home missionary operations within the territory of the several synods shall continue to be under the care and control of such synods; makes provision for the special care of several missions, which it names by particular synods; authorizes the Executive Committee on Home Missions to assign unoccupied territory to any other district synod able to do work beyond its own bounds; directs that the reports of all missionary operations be sent to

the Executive Committee, and that the committee have regard to all demands for home missionary labor beyond the bounds cared for in the plan, and endeavor to make provision for the supply of it; and withdraws the recommendation formerly made by the Council that the district synods transmit to the Council's Treasurer of Home Missions one fifth of all the moneys collected for home missions. A silver medal which had been prepared in commemoration of the seventh Jubilee of the adoption of the Augsburg Confession and the third centenary of the publication of the Book of Concord was approved. The receipts for the Home Mission Fund were reported to have been \$3,385.

The *General Synod, South*, met in its twelfth Convention in Richmond, Virginia, May 6th. The district synods of South Carolina, Virginia, Southwest Virginia, and Georgia, were represented, and a commissioner was present from the North Carolina Synod. The Rev. J. Hawkins was chosen President. A proposition was made, in which was included the offer of a considerable gift of property, for the removal of the Theological Seminary from Salem, Virginia, to Charlotte, North Carolina. The Synod decided that, inasmuch as the seminary had been recently removed from Lexington, Virginia, to Columbia, South Carolina, and again from Columbia to Salem, Virginia, it was inexpedient at the present time to remove it again. The North Carolina Synod having sent a commissioner to inquire into the doctrinal position of the body with a view to organic union with it, the Synod recorded a declaration that it regarded the symbols and testimonies of faith which were adopted subsequently to the Augsburg Confession as in accord with, and an unfolding of, its teachings, and invited the North Carolina Synod to consummate the contemplated union as soon as possible.

M

MAINE. The decision of the Supreme Court of Maine, by which the organization of the Legislature by the Republicans was sustained, was rendered on the 16th of January. (See "Annual Cyclopædia" for 1879.) On the 17th Daniel F. Davis formally notified General Chamberlain that he had that day been "legally elected to the office of Governor and Commander-in-Chief," and "duly qualified to perform the duties of that office." He submitted at the same time a copy of the opinion of the Judges. In acknowledging the receipt of this communication, General Chamberlain said: "As it is manifest that this opinion establishes the legality of your election, and that you are duly qualified as Governor, I have the honor to report to you that I consider my trust under Special Order No. 45 as at an end."

On the 20th the following resolution, offered by Mr. Eugene Hale, of Ellsworth, was adopted in the House of Representatives, eighty-five votes being recorded in its favor, and sixty-four members being recorded as absent:

Whereas, The Fifty-ninth Legislature of the State of Maine, as elected by the people of the State at its last annual election, has met and has legally organized with a full quorum in each House, under the opinion of the Justices of the Supreme Judicial Court, and has duly and legally proceeded to elect a Governor and Executive Council and other State officers, all of whom have been duly qualified, and have entered upon their respective duties in the customary places of the State-House where the business of the State is transacted: therefore be it

Resolved, That the Senate and House of Representatives will forthwith proceed to legislative business touching the varied interests of the people of Maine, their finances, their courts, their public schools, the

fisheries, the adaptability of the laws to the new constitutional amendments, the fixing of a just and fair basis for the coming valuation of all the property in the State, so that taxation may fall justly and fairly upon the people, and such other subjects as may naturally and fittingly come before the Legislature. And we desire and hereby give notice to all the people of the State that any bodies or collection of men outside of the Legislature here and now duly and legally assembled and organized as before mentioned, who may meet in any place, claiming to act as the Legislature of the State of Maine, are wholly without right or authority so to act, and are proceeding in violation of the Constitution and the laws of the State.

The "Fusionists" made some show of resistance, and submitted to the Supreme Court their own statement of facts, with questions as to the legality of the Senate and House as organized, in view of the facts as stated by them. A reply, signed by all the Judges, was rendered on the 27th, with regard to the organization of the Legislature. It says:

It remains to be considered whether there is a legally organized Legislature in existence, entitled to enact laws that must be binding upon the people and the courts of the State. The action of those controlling the proceedings on the first Wednesday of January, 1880, has not been acquiesced in by a quorum of those appearing to have been elected to either House. It is a matter of history that after unsuccessful resistance to the illegal action of the officers attempting to create the legislative organization on that day, a majority of the persons who appeared to be elected to the two Houses formed an organization of themselves. They refrained from forming an independent organization until the 12th day of January, hoping until then to obtain their rights in some other way. They were forced into such a position by the illegal action of the minority of the members, whose action they were not obliged to submit to, and which they could in no other reasonable manner resist. The organizations made on January 12th were made by a majority of the members appearing to be elected, and having the *prima facie* right to seats. The point is raised by the statement and questions submitted, that no legal organization could be formed on January 12th, because no notice of the intended action was given to the minority, or non-attending members, so as to enable them to participate therein. The minority were not excluded. The organization was made in a public manner. The minority were at the time claiming to be, and are still claiming to be, the lawful Legislature. It is not to be presumed that they would have abandoned that organization at that time had notice been given. We do not think that the want of notice invalidates the organizations of January 12th. There may be irregularities in the manner in which such organizations were formed, but the voice of the people is not, on that account, to be stifled, nor the true government to fail to be maintained. No essential defects anywhere exist, but only such departure from ordinary forms as circumstances compelled. History can never fail to declare the vital fact that the organizations of January the 12th were formed by full quorums of persons appearing by the records and returns as duly elected members of either House.

It can not be that such a construction must be given to the Constitution of the State as will subvert the plain and obvious intention of its framers, or place it in the power of a few men to perpetuate their hold upon the offices in the gift of the people, in defiance of the will of the voters, constitutionally expressed and ascertained, because their own neglect of duty has made some departure from directory provisions and ordinary forms inevitable.

A legally organized Legislature being now in existence, and exercising its constitutional functions, it follows that no convention of members-elect of either

House can exist which can be treated as a nucleus for another organization. Two governments are claiming to be in existence as valid and entitled to the obedience of the people. Both can not rightfully exist at the same time; but one government can be recognized and obeyed. The responsibility and solemn duty are imposed upon us to determine which is entitled to judicial recognition.

We, therefore, after due deliberation and consideration of all matters involved, affirm and declare our judgment to be that the Senate, whose presiding officer is the Hon. Joseph A. Locke, and the House of Representatives, whose presiding officer is the Hon. George E. Weeks, constitute the legal and constitutional Legislature of the State.

On the 5th of February a joint order of the two Houses was passed, providing that a committee of three Senators and seven Representatives should "examine into the condition of the election returns lately given up to the Secretary of State, the warrant and appropriation books, and all other books and papers of the Governor and Council for the year 1879, and extending to the first Wednesday of January, 1880, and report to this Legislature what suppression or alterations, if any, have been made in said returns, and what means have been resorted to for such purposes; and, also, in what cases and in what manner the will of the people, as shown in the last annual election, has been disregarded and attempted to be defeated, either by illegal construction of said returns, or changing or tampering with them, or by whom the same has been done, or attempted to be done." The committee was further ordered to report upon all "undue and illegal expenditure of the money of the State by or under the direction of the Governor and Council for the period before mentioned, or by any officer of the State, or by any employee of or contractor with the State during said time."

The report of the investigating committee was made on the 18th of March. It gives an extended summary of the evidence taken, and enters into a discussion of the facts at some length. The conclusion of the report is as follows:

Your committee present to the Legislature all the testimony which has been taken up to the present time, and ask that it may be printed, as well as this report.

This testimony, in the judgment of your committee, justifies the following conclusions:

The returns from the cities, towns, and plantations in the State were, contrary to usage, kept by the Governor and Council from all inspection or scrutiny by candidates, their counsel, or any parties legitimately interested in them.

During such time as the returns were so kept, many alterations, erasures, and forgeries were made upon them, for the purpose of changing the result; and, in all cases which have been discovered, such improper treatment of the returns resulted against Republican candidates, and in favor of the Fusion candidates.

During the same time, from information which must in nearly all cases have come from the officials who were examining and tabulating the returns, or who had the custody of them, defects in Fusion towns were being cured by substituting new and correct returns, or by affidavits taken *ex parte* for the purpose of curing such defects. In addition to this, and by reason of information furnished in the manner stated, affi-

davits were being taken, and cases were gotten up for the purpose of throwing out Republican towns.

In all cases affected by such causes, the results invariably counted out Republican candidates and counted in Fusion candidates, and this to the extent that the majority in each House of the Legislature was illegally changed from the Republican side to the Fusion side.

In reaching this result the Governor and Council refused to allow Republican errors in the returns to be corrected by the records, although such correction was offered repeatedly by Republican candidates or their counsel.

The different rules of law laid down by the Governor and Council as their guide in tabulating the returns, and in certificating from such tabulations, were applied in different ways, as they were enforced where they would throw out a Republican candidate, but not enforced where they would throw out a Fusion candidate.

Many of these rules were contrary to law, and must have been made solely for the purpose of securing a Fusion quorum in each branch of the Legislature.

The illegal and fraudulent acts before referred to were a part of a premeditated plan, and the conspiracy, the object of which was to secure a quorum of Fusion members in each branch of the Legislature, embraced the members of the Executive Council, and the Governor of the State must have been in some degree in complicity with them.

Both Governor and Council must then be held accountable for the fraudulent practices under which the election returns were changed so that the will of the people was set aside, and illegal certificates issued to Senators and Representatives in sufficient numbers to change the political complexion of both branches of the Legislature.

Relative to misappropriations of the public moneys. Your committee conclude—

That the different appropriations by the Legislature have been diverted from their legitimate purposes, and in many cases have been overdrawn and exhausted;

That the public funds have been withdrawn from the Treasury of the State by Governor Garcelon and his Council without warrant of law, and have been applied to unauthorized uses, and for unlawful purposes;

That a large sum of money belonging to the State remains in the hands of Governor Garcelon and other officials of last year, which should be recovered and put back into the Treasury;

That the recklessness of management disclosed in the transactions of the past year, tends to destroy public confidence, undermine the public credit, and introduce practices which, if unrebuked, will prove fatal to the future progress and prosperity of the State.

ANDREW HAWES,	} On the part of the Senate.
AUSTIN HARRIS,	
EUGENE HALE,	} On the part of the House of Representatives.
A. A. STROUT,	
CHARLES V. LORD,	
C. C. SPRINGER,	
SILAS W. COOK,	

The following brief minority report was submitted:

Silence on the part of the undersigned would be construed as an assent to all the positions and conclusions of the majority report, as well as to the statement of facts.

The undersigned are unwilling and unable to give their assent to all of the arguments and conclusions of such majority report, though they can not deny that the recital of facts in the report is substantially in accordance with the evidence. Mr. Moody, of the Council of Governor Garcelon, was before the committee, but he failed to explain the irregularities which had been proved.

Governor Garcelon also testifies, at a later period in the investigation, that he had no previous knowledge

of much which has been shown by the testimony to need explanation.

A letter, courteous in its language, was addressed by the clerk of the committee to each of the other members of Governor Garcelon's Council, saying that an opportunity would be granted them to appear and testify.

The undersigned regret that the members of the Council have not seen fit to appear and explain the irregularities which seem to exist.

The evidence being uncontradicted, the undersigned can not make a denial of the facts proved by it, and can only withhold their assent to the conclusions arrived at by the majority of the committee.

HENRY INGALLS,
GEORGE F. HILL.

Charges of bribery, or attempted bribery, to induce certain persons returned as elected to the Legislature not to take their seats, were also the subject of an investigation by a committee of the House of Representatives. There were three cases examined by the committee: that of Bartholomew Wentworth, of South Berwick, said to have been offered \$500 in gold and \$10 a day for forty days by one Charles E. Rick, of North Berwick; that of Thomas B. Swan, of Minot, who alleged that Wallace R. White, of Winthrop, had paid him \$1,000 to resign his seat in the House, in order that the "Fusionists" might fail to have a quorum on first assembling; and that of Moses Harriman, of Kennebunkport, who charged that Wallace R. White had offered him \$100 for the same purpose as alleged in the case of Swan. Majority and minority reports were submitted on the 18th of March. The majority, consisting of four members of the committee, declared that the charges were not sustained in any of the cases. The minority, consisting of two members, agreed with the conclusion of the majority as to the case of Wentworth, but differed from it in regard to those of Swan and Harriman, and declared themselves of the opinion that the charges were "fully proved and sustained." There was also an investigation into the disappearance of the State seal, and certain documents and records of the office of Secretary of State. It was found that Mr. Prince A. Sawyer, who claimed to have been elected Secretary of State, had taken them away. In the course of the investigation they were returned, and the committee reported that "Prince A. Sawyer deserves the indignation of the members of the Legislature and the people of the State of Maine."

The Legislature adjourned on the 19th of March, having passed 191 acts and 71 resolves. The total amount of appropriations was \$1,368,957. The rate of taxation was fixed at five mills on the dollar. One of the resolves adopted authorized the Governor to appoint a commission of sixteen persons, one for each county of the State, to prepare a "full, just, and equal valuation" of property and enumeration of polls as a basis of taxation; and another provided for an amendment of the Constitution, so as to require only a plurality of votes for the election of Governor. The latter provided for the submission to a vote of the

people at the election to be held in September of the question, "Shall the Constitution be amended so as to provide for the election of Governor by a plurality instead of a majority?" and declared that "a plurality of the votes cast and returned for Governor, at the annual election for the year 1880, shall determine the election of Governor for the years 1881-'82." Acts were passed providing for the taxation of express, telegraph, and railroad companies. On express companies the tax is three fourths of one per cent. of their gross receipts; on telegraph companies $2\frac{1}{2}$ per cent. of the value of their lines, to be determined by the Governor and Council on report of corporations; and on railroad companies one per cent. of the appraised value of the property and franchises, the appraisal to be made by the Governor and Council. An act was passed providing at length for the organization, equipment, and discipline of the State militia. Other enactments of the session provide for the punishment of tramps, prevent obstruction of business on railroads by combination of employees or other persons, and impose penalties for the abstraction of the State seal, or public documents and records, or the assumption and exercise of a public office without legal authority.

The Greenback and Democratic parties of the State held their conventions simultaneously at Bangor on the 1st of June. In the Greenback gathering General Harris M. Plaisted, of Bangor, was nominated by acclamation as the candidate for Governor, and the following resolutions were adopted:

Resolved, That all currency, whether metallic or paper, necessary for the use and convenience of the people, should be issued and its volume controlled by the Government, and not by or through the banking corporations of the country; and, when so issued, should by a full legal tender be payment of all debts, public and private.

Resolved, That that portion of the interest-bearing debt of the United States which shall become redeemable in the year 1881, or prior thereto, being in amount \$782,000,000, should not be refunded beyond the power of the Government to call in said obligations and pay them at any time; but should be paid as rapidly as possible, and according to contract. To enable the Government to meet these obligations, the mints of the United States should be operated to their full capacity in the coinage of standard silver dollars, and such other coinage as the business interests of the country may require.

Resolved, That imprisonment for debt be abolished.

Resolved, That we favor such a change in the manner of voting as shall secure every citizen the free and full exercise of the true right of suffrage.

The Democrats chose delegates to the National Convention of the party, adopted no platform, and ratified the nomination of the Greenback Convention for Governor.

The Republican Convention was held at Augusta, on the 23d of June. Delegates to the National Convention had been chosen, according to custom, by the Republican members of the Legislature, and had been instructed to favor James G. Blaine as the candidate for President. Daniel F. Davis was renominated

for Governor, and the following platform was adopted:

Resolved, That the Republicans of Maine, by their delegates assembled in convention, endorse the platform adopted by the National Republican Convention held at Chicago, and pledge their best endeavors to the support and success of the principles therein laid down—principles breathing the spirit by which the Republican party has always been actuated, and through the ascendancy of which the nation has been honored and prospered.

Resolved, That the nomination of James A. Garfield, of Ohio, as the candidate of the Republican party for President, and Chester A. Arthur, of New York, for Vice-President of the United States, meet with our hearty approbation. Though we hoped for the nomination of Maine's distinguished Senator, James G. Blaine, as the candidate for President, we accept the result of the National Convention in good faith, and pledge ourselves to labor loyally for the noble candidates selected at Chicago to lead the Republicans in this campaign.

Resolved, That the Fusion party of this State has made for itself a record so infamous that every honest man of every party should pray and work for its speedy and complete overthrow. It came into power with loud professions upon its lips of reform and superior honesty, and it was driven out of power for giving to the State the most dishonest and corrupt administration ever known to our people. It robbed the State Treasury, and then attempted to steal the State government. It was not content with being voted out of power by the people at the polls, but tried to continue itself in control of the Government by most outrageous frauds and forgeries upon the election returns, and other acts subversive of the rights of the people and destructive of popular government. It placed an armed mob in the State-House and brought us to the brink of civil war. Our most honored citizens were spurned with contempt from the door of the Council Chamber when they sought their redress of their grievances. Men who were not elected were counted into seats in the Legislature, and men who were elected were counted out. Instead of endeavoring to give effect to the will of the people as expressed by the ballot, a systematic, deliberate, wicked conspiracy was entered into to set aside the result of the popular election and create a fraudulent government. The Governor whom they elected paid out thousands of dollars of the public money while in office, without authority, and after his term had expired he still kept thousands of dollars in his possession to distribute to the tools who aided him in his disgraceful and nefarious operations. These infamous acts are known to all our citizens. They confront and shame Maine men wherever they travel in other States. Unless we desire to have them repeated and the disgrace of them cling to us, the honest voters, the "plain people" of Maine, must stand up at this election and stamp them with overwhelming defeat and reprobation at the polls.

Resolved, That experience has demonstrated the wisdom of the policy of prohibition as auxiliary to temperance reform, and as contributing to the material wealth, happiness, and prosperity of the State, and that we refer with confidence and pride to our undeviating support of the same as one of the cardinal principles of the Republican party of Maine.

Resolved, That we are heartily in favor of the amendment to the Constitution providing for the election of Governor by a plurality vote, and recommend its adoption.

Resolved, That we hail with pleasure the second nomination of Daniel F. Davis as the Republican candidate for Governor of Maine. He has proved himself honest, incorruptible, able, and popular, and we again place the standard of the Republican party in his hands, feeling assured that he will give his best efforts to carry it to victory, and that it will be successful by an old-fashioned Republican majority.

A Temperance Convention had been held at Augusta on the 11th of February, at which the following declarations, among others, had been made:

2. That no political party shall receive our support that does not recognize the iniquity of the liquor-traffic, and demand its destruction as essential to the public welfare.

3. That the enforcement of the laws relating to the liquor-traffic can be secured by adopting as a living principle the motto "Vote as you pray," and by holding parties and officials responsible for righteous laws, and a non-partisan enforcement of the same.

4. That all effort to secure success at the polls by an alliance with those who are engaged in the liquor-traffic is destructive to political morality, and has our emphatic condemnation.

5. That in view of the fact that in some localities in the State county and municipal officers neglect or refuse to enforce the prohibitory law, we respectfully request the Legislature to enact a law providing for a State constabulary.

Another convention was held at Augusta on the 22d of July, which adjourned to meet in Portland on the 19th of August. At the latter meeting Joshua K. Osgood was nominated as a candidate for Governor, and the following declarations were made:

Whereas, The earnest temperance voters of Maine feel that they have been deceived by politicians, and that the "enforcement" of the law has been made purely as a matter of policy and not of principle; we, members of this Convention, this 19th day of August, 1880, assembled in Portland, do hereby resolve:

1. That we denominated ourselves the "Enforced Prohibitory Party of Maine."

2. That we have an honest conviction of heart, and an earnest belief that our "sacred cause" can be secured only by enforced prohibition.

3. That with the great end and aim in view that humanity may be elevated and a true morality may be advanced, we do demand that none but known honest temperance men shall hold offices of honor or trust in our gift.

4. God and humanity demand that Maine shows her belief in true temperance. Let her voice be heard with no uncertain sound.

5. That our motto is simply "Honesty, Economy, Sincerity, Enforced Prohibition."

Mr. Osgood shortly withdrew from the canvass in the following letter:

GARDINER, MAINE, August 24, 1880.

To the Honorable James M. Stone, President State Temperance Convention.

Sir: After mature deliberation and the fullest conference with trusted friends of the temperance cause, I feel it to be my imperative duty to withdraw my name as a candidate for Governor.

I am persuaded that the only effect of my candidacy would be to divide and distract those who should act in harmony and concord for the promotion of the common cause.

I have labored with zeal and with all the power God has given me to advance the doctrine of total abstinence among the people, and it would be a source of lasting regret with me if in any way my name could be used so as to divide the strength of the temperance army.

It may be true that Governor Davis has not used all the power at his command to stop the sale of liquor in our State, but, after a careful investigation of the charges brought against him, I find the charges not sustained, and common honesty compels me to deal justly with all men. I can not consent to remain in a position so heartily endorsed by our enemies.

With the highest and sincerest regard for the gen-

tlemen who tendered me the nomination, I very respectfully withdraw my name as a candidate for Governor. You will greatly oblige me by giving this letter to the public.

Yours truly,

J. K. OSGOOD.

The name of Joshua Nye was substituted by a committee of the "Enforced Prohibitory party." A Temperance Convention at Old Orchard Beach on the 1st of September issued an address which was a substantial approval of the course of Governor Davis and his party on the liquor question, and a condemnation of the action of those who nominated Mr. Nye.

The political canvass excited much interest on account of the peculiar division and combination of parties, and the fact that the election would be one of the first preliminary to the Presidential contest. The Republicans were particularly active under the personal leadership of Mr. Blaine, who was chairman of their Executive Committee.

The election took place on the 13th of September. The total vote for Governor was 147,802. Davis received 73,544, Plaisted 73,713, Nye 309, William P. Joy 124, "Harrison" M. Plaisted 57, and 55 were returned as "scattering." The constitutional amendment was ratified by a vote of 57,015 to 35,402, which fact was officially proclaimed by the Governor on the 9th of November. Of the five members of Congress the Republicans elected three and the "Fusionists" two. To the State Legislature the Republicans elected 22 Senators and 84 Representatives, and the Fusionists nine Senators and 67 Representatives.

After the State election a portion of the Greenbackers, under the lead of Solon Chase, withdrew from the "Fusion," and nominated an electoral ticket of their own. The total vote cast for Presidential electors in November was 143,899, of which 74,039 were for the Republican candidates, 65,171 for the "Fusion" ticket, which was pledged to General Hancock, and 4,480 for the straight Greenback or Weaver ticket. There were 92 votes for the Prohibitory or Dow ticket, and 127 were returned as scattering. Garfield's plurality over Hancock was 8,868; majority over all, 4,169.

When the vote for Governor was canvassed by a joint committee of the Legislature, in January, 1881, two reports were made of the result. The figures were the same, but while the majority of the committee reported that "Harris M. Plaisted, having a plurality of all the votes returned, is duly elected Governor for the current political term of 1881 and 1882," the minority raised the question whether the amendment to the Constitution, providing that a plurality should elect, could take effect upon the same election at which it was submitted for ratification, and recommended that the Supreme Court be asked to pass upon this question. The minority report was rejected by a vote of 26 to 3 in the Senate, and 129 to 8 in the House of Representatives, and Mr. Plaisted was inaugurated.

The following is the population of Maine by counties, according to the first official report of the Federal census of 1880:

Androscoggin	45,044
Aroostook	41,700
Cumberland	86,360
Franklin	18,184
Hancock	38,131
Kennebec	53,061
Knox	32,502
Lincoln	24,809
Oxford	32,613
Penobscot	70,473
Piscataquis	14,573
Sagadahoc	19,276
Somerset	32,339
Waldo	32,468
Washington	44,477
York	62,265

Total for the State..... 648,945

The population of the cities, as compared with that of 1870, was as follows:

CITIES.	1880.	1870.
Portland	33,810	31,413
Lewiston	19,083	18,600
Bangor	16,857	18,289
Biddeford	12,652	10,282
Rockland	7,599	7,074
Calais	6,172	5,944
Belfast	5,303	5,275

The receipts of the State Treasury for the year, including a balance of \$69,413.47, amounted to \$1,741,808.60. The expenditures were \$1,581,469.96, and the balance at the end of the year, \$160,358.64. The State has a bonded debt of \$5,883,900, and a sinking fund of \$1,307,857. The total resources, including the sinking fund, are \$2,513,822.39; liabilities, \$8,706,392.67. The bonded debt is made up as follows:

Bonds due, 1881, renewal of bounty loan..	\$50,000
" " 1882, renewal of bounty loan..	50,000
" " 1883, renewal of bounty loan..	50,000
" " 1884, renewal of bounty loan..	50,000
" " 1885, renewal of bounty loan..	50,000
" " 1886, renewal of bounty loan..	37,000
" " 1883, war loan.....	885,900
" " 1889, war loan.....	2,330,000
" " 1889, municipal war loan.....	2,826,900
Bonds due and uncalled.....	35,000

Total..... \$5,883,900

The amount of taxes assessed upon the railroads under the new law was \$55,250, but only three of the companies responded to the demand for payment. Suits were accordingly brought under the law, before the close of the year, against the Maine Central, the Boston and Maine, and the Portland, Saco and Portsmouth. The Western Union and International Telegraph Companies also refused to pay the tax assessed upon them, and proposed to test the validity of the law. The tax assessed upon the three railroads named was—Maine Central, \$22,000 on a valuation of \$2,200,000; Boston and Maine, \$18,000; valuation, \$1,800,000; and Portland, Saco and Portsmouth, \$12,000; valuation, \$1,200,000.

MANNING, AMOS REDUS, was born in the State of New Jersey in 1810; died September 17, 1880, at New York. In his early youth he removed from his native State to Alabama. His education was begun at the Green Acad-

emy, and at the end of his preparatory course he entered the University of Tennessee. Having graduated there, he studied law with Hon. A. F. Hopkins at Huntsville, and commenced his professional life at Linden in 1836, but subsequently removed to Demopolis, where he was associated at different times with Messrs. F. L. Lyon, D. C. Anderson, and William E. Clarke, in the practice of law. When his ability at the bar had won to him the popular interest, he was for a short time drawn into public life as a member of the Whig party. In 1845 he went to the lower House of the Legislature as a Representative from Marengo, and in 1847-'51 to the Senate from the district then composed of Wilcox and Marengo. In 1852 Judge Manning settled in Mobile in order to gain a large field for professional success. During the twenty-eight years that elapsed after that time, his fame as a lawyer occupied the public attention, and the professional firm of Manning & Walker was associated with the most serious and complicated litigation in the courts. In 1874 Judge Manning was elected to the Supreme Bench of the State, and in this high position acquitted himself in a manner worthy of his great professional experience, deep learning, exact scholarship, and spotless reputation. Patient, earnest, and profound, he was unruffled by prejudice or passion in the discharge of his judicial duties. Incessant labor, coupled with a painful disease, at length undermined a naturally strong constitution, and ended a distinguished life which the State he served is proud to hold in honored remembrance.

MANSFIELD, EDWARD DEERING, LL. D., was born at New Haven, Connecticut, in 1801. He was a son of Colonel Jared Mansfield, a mathematician and engineer, who was long a professor at West Point. Appointed Surveyor-General of the Northwest Territory by Jefferson in 1803, he removed to Marietta and Cincinnati. His son Edward was a student at the Episcopal Academy at Cheshire, until he was prepared in 1815 to enter West Point Military Academy. He graduated in 1819, fourth in his class-list. Instead of entering the army, he pursued a classical course at Princeton, graduating with honors in 1822. In 1825 he was admitted to the bar in Connecticut. He removed to Ohio, practicing in Cincinnati. In 1836 he accepted the professorship of constitutional law and history in Cincinnati College. Retiring from the practice of the law, he was editor of the "Cincinnati Chronicle" from 1836 until 1849; of the "Atlas" from 1849 to 1852; of the "Railroad Record," from 1854 to 1872. He was the correspondent of the "New York Times" under the well-known *nom de plume* of "A Veteran Observer." He was Commissioner of Statistics for Ohio from 1857 to 1867, and was an associate of the French "Société de Statistique Universelle." He wrote a "Treatise on Constitutional Law" (1835), "Political Gram-

mar" (1835), "The Legal Rights of Women" (1845), "The Life of General Winfield Scott" (1846), "The History of the Mexican War" (1848), "American Education" (1850), and "The Memoirs of Daniel Drake" (1853). He wrote many treatises on mathematics, politics, education, and the early history of Ohio. His most interesting production is a volume of "Personal Memories," published in 1879. These "Memories" extend to the year 1841, but it is understood that a second volume was in preparation. He received his degree of doctor of laws from Marietta College, Ohio, in 1854. He died at Morrow, Ohio, in the vicinity of Cincinnati, on October 27th, in the eightieth year of his age.

MARYLAND. The regular biennial session of the Legislature of Maryland began at Annapolis, on the 6th of January. On the 14th William T. Hamilton was inaugurated as Governor of the State for a term of four years. In his address on that occasion he said:

There will be upon the part of the Executive a most cordial coöperation with other departments of the government in promoting wise and unselfish legislation; in assuring fair, pure, and peaceful elections; in enforcing a rigid economy in all branches of the public service; in reducing taxation to the lowest point compatible with economical administration; in correcting all abuses, whether great or small, and wherever existing; in limiting official employment to the absolute necessities of the State, and in maintaining an elevated standard of official probity, capacity, and application, to the end that we and our children after us may continue to enjoy the blessings of free government; and, still further, that the just and well-founded expectations of the people may be realized.

A United States Senator was to be chosen, to succeed W. Pinckney Whyte. The Democratic members agreed upon Arthur P. Gorman as their candidate, and the Republicans decided to cast their votes for James A. Gary. The ballot was taken in the two Houses on the 20th of January, and resulted in 18 votes for Gorman, five for Gary, and one for S. Teackle Wallis, in the Senate, and 63 for Gorman and 19 for Gary, in the House. The election of Mr. Gorman was announced in joint session on the following day.

There appears to have been much interest excited on the subject of "reform legislation," and early in February the Governor submitted several propositions in a special message. Among these was the repeal of the laws requiring inspection of tobacco, and the weighing of hay and cattle, by public officers at designated places; the abolition of unnecessary offices, including those of the Tax-Commissioner, Insurance-Commissioner, and Commissioners of the Land-Offices; the reduction of salaries, and a general retrenchment of expenses. He also recommended an amendment of the Constitution which would enable the Governor to veto separate items in bills appropriating money. Other important propositions were a new registration law; an act regulating primary elections, strongly urged by the Governor in a special message; reorganization of the judiciary; a careful

revision of the tax laws, and a measure for the suppression of gambling. Antagonism developed between the Governor, as a promoter of "reform legislation," and some of the leaders of the dominant party in the Legislature, and the most important of the proposed measures were defeated. Among these were the bills providing for a registration of voters, regulating primary elections, abolishing public tobacco-inspection, reorganizing the judiciary, reorganizing the Board of Education and making its members elective, and several bills abolishing public offices and reducing salaries. Little of the legislation actually effected was of importance. Among the acts passed were two relating to taxation, one defining what property is subject to taxation and what is exempt, and the other taxing corporations on their capital stock; an insolvency act, amendments to the insurance law, providing for a tax on foreign companies; one providing for the election of judges of the courts in 1882; the anti-gambling bill; incorporation of three companies for the construction of the Maryland and Delaware Ship-Canal; and others providing for a new loan of \$3,000,000, to redeem the Maryland Defense Loan; reorganizing State Board of Health; enlarging the powers of the Baltimore and Ohio Railroad, to enable it to purchase and lease other roads, hold stock in dry-dock or other commercial and manufacturing enterprises, and be represented on the boards of directors; preventing the spread of infectious diseases among cattle; preventing cruelty to animals throughout the State; and abolishing the compulsory weighing of cattle.

The insolvency act makes provision for the settlement of bankrupt estates and the discharge of the bankrupt from liability on an equitable distribution of his assets.

Certain charges were made at a public meeting in Cumberland, in February, against Judge George A. Pearre, of the Fourth Judicial Circuit, which were made the basis of a memorial for his impeachment. The chief of these were taking pecuniary fees for legal advice or services, and sitting in judgment on cases in which he was personally interested. He made an explicit explanation, in a letter addressed to the people of the Fourth Circuit, and the special legislative committee to which the memorial for his impeachment was referred appears to have found no ground for taking action.

An investigation into the management of the Chesapeake and Ohio Canal Company, of which Arthur P. Gorman was president, was begun but not completed during the session. The charges were:

1. The canal has been managed as a political machine, not in the interests of the Democratic party, but for the purpose of promoting the political and personal ends of its managers.
2. The funds of the canal company belonging to the bondholders have been expended improperly and illegally.
3. The officers of the company have failed to obey any of the orders of the stockholders that monthly

statements of receipts and expenditures be published in the newspapers of the canal counties.

The session came to a close on the 5th of April, being limited by law to ninety days.

The Republican State Convention for the choice of delegates to the National Convention of the party was held at Frederick on the 6th of May. There was a sharp division between those who favored James G. Blaine and those who preferred General U. S. Grant as the candidate for President. A conflict over the organization of the Convention resulted in favor of the Grant men, but a resolution was adopted by a vote of eighty-nine to fourteen, declaring the overwhelming sentiment of the Republicans of the State to be in favor of Mr. Blaine, and requesting the delegates to use all honorable means to secure his nomination. A resolution expressing unalterable opposition to the nomination of any person for a third term was tabled by a vote of eighty-one to twenty-seven. No platform was adopted.

The Democrats held their convention in Baltimore on the 9th of June. Delegates to the Cincinnati Convention were chosen, and candidates nominated for electors. A resolution in favor of the "two-thirds rule" was adopted, together with the following declaration of principles:

The Democratic Conservative party of Maryland, in State Convention assembled, declares that—

1. It firmly adheres to the principles which have guided and controlled the policy of the National Democratic party since the formation of the Federal Constitution.

2. It recalls to the recollection of the people of this State the events of the Presidential election in November, 1876. The decision of the people of certain of our sister States lawfully expressed at the ballot-box was reversed after the polls were closed, by fraudulent counts deliberately planned and executed. The Republican party, instead of repudiating this great wrong, kept the advantage thus unlawfully gained. Being in possession of the military power of the Government, it left to the great majority of the people of the United States, upon whom this wrong had been inflicted, no choice, except between civil war and such form of arbitration as the representatives of the Republican party in Congress might see proper to devise. These representatives, in providing a tribunal for such arbitration, so formed it and molded its proceedings as to secure by a partial judgment the fruits of an unlawful success. An offense was thus committed against a whole people, which ought never to be forgotten or condoned.

3. The Republican party, during its tenure of power, has used the public money and the public lands in fostering great monopolies. It has filled the public Treasury by means of tariffs intended to promote the advantage of particular manufacturers and communities, at the expense of the producing States. It has created a system of laws under which the national Executive may unduly and directly influence both Federal and State elections. It has increased the number of its officers until they form in every State an immense civil force, governed by and dependent upon its will; and it has used that force to promote its political designs. It has employed the Federal army as a means of increasing its political power. It has centralized the Government, and inaugurated an imperial system of expenditures. The people of the United States, brought more than once to the verge of bankruptcy by the legislation and policy of the Republican party, owe their returning prosperity only to the bless-

ings of God and to their own increased economy and untiring labor.

4. The Democratic Conservative party of this State, faithful to the supremacy of the Constitution of the United States, rests its construction of that instrument upon the express words of the tenth amendment, adopted in 1791: "The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively or to the people."

5. We declare our belief that the National Democratic Conservative party will maintain the equality of all citizens before the law, and uphold and enforce their constitutional rights; that it will check the present extravagance in the expenditure of the public money, and restore the practice of economy in all departments of the Government; that it will reform the injustice and inequality of existing tariffs, and again build up the commerce of the United States; that it will maintain, absolutely, the supremacy of the civil over the military power, and that it will check the progress of centralization, and keep the Executive and Congress within the limit of the powers confided to them by the Federal Constitution. We, therefore, commend the candidates whom it will nominate to the approval of the good people of this State.

6. This Convention, confiding in the good judgment of the delegates from the State of Maryland to the Democratic National Convention, gives them no instructions. It declares, however, its sense of the distinguished ability and services of Thomas Francis Bayard, of Delaware. His unblemished public and private character command the confidence and respect of the people of the United States.

There was no State election this year. The vote for Presidential electors was in the aggregate 172,221, of which 93,706 was for the Democratic, and 78,515 for the Republican candidates. The majority in favor of Hancock for President was therefore 15,191.

The tobacco merchants and exporters have united in requesting a more thorough inspection of repacked tobacco, and in petitioning the Legislature for a board of arbitration between buyers and sellers.

The population of the State of Maryland, as shown by the first official report of the United States Census Bureau for 1880, is 934,627, of which 462,003 is male and 472,624 female; 851,980 native, and 82,647 foreign; 724,714 white, and 209,913 colored. The following tables present the statistics by counties:

COUNTIES.	Total.	Male.	Female.
The State.....	934,627	462,003	472,624

Included in the colored population of the State are five Chinese, one Japanese, and eleven Indians.

The receipts of the State Treasury during the fiscal year ending September 30th were \$2,007,686.77; the expenditures, \$2,050,869. The balance on hand at the beginning of the year was \$556,208.99; at the close, \$513,026. The largest items in the tables of receipts were the following: Dividends on preferred stock Baltimore and Ohio Railroad, \$58,116.94; dividends on the Washington Branch Baltimore and Ohio Railroad, \$55,000, and interest on Baltimore and Ohio bonds, \$21,960; oyster-house licenses, \$107,154; licenses to traders, \$186,982; brokers' licenses, \$26,496; marriage licenses, \$26,668; oyster-dredgers' licenses, \$18,606; Northern Central Railway, \$90,000; bounty taxes, \$245,845; public-school tax, \$454,386; taxes on commissions of executors' bonds, \$81,831; on collateral inheritances, \$111,467; on gross receipts of railroad companies, \$59,836. The total amount of State taxes was \$840,628.53, of which the city of Baltimore paid \$395,605.41.

The Constitution of Maryland contains the following provision:

All civil officers appointed by the Governor and Senate shall be nominated to the Senate within fifty days from the commencement of each regular session of the Legislature, and their term of office, except in cases otherwise provided for in this Constitution, shall commence on the first Monday of May next ensuing their appointment, and continue for two years (unless removed from office), and until their successors, respectively, qualify according to law; but the term of office of inspectors of tobacco shall commence on the first Monday of March next ensuing their appointment.

The tobacco-inspectors appointed by the Governor in February were not confirmed by the Senate until April 5th, and then it was claimed by the incumbents of the offices that the appointment could not take effect until March, 1881. This view was upheld by the

Attorney-General, but in May the Superior Court granted a mandamus in favor of the new appointees. An appeal was taken, which has not yet been decided.

The one hundred and fiftieth anniversary of the founding of the city of Baltimore was celebrated from the 10th to the 15th of October. On Sunday, the 10th, the demonstration partook of a religious character in the churches. On Monday there was a grand procession, made up largely of representations of trades and industrial interests. It was ten miles long, and occupied five hours in passing a given point. On Tuesday there was a parade of the Masonic order and of school-children, and a banquet of the Historical Society in the evening, with addresses and an ode. Wednesday was devoted to a military display, in which organizations from different portions of the country took part. On Thursday there was another parade, of which national societies and benevolent associations were a conspicuous feature. The site of Baltimore was first surveyed in the early part of 1730, authority for laying out the town having been granted by the Maryland Assembly the year previous. The original town occupied sixty acres, purchased of Charles and Daniel Carroll for forty shillings an acre. In 1750 it was a little village surrounded by a board fence, with two entrances. Jones's Town had been united with it in 1745, and in 1796, when it was incorporated as a city, Fell's Point was also included. The census of 1791 showed a population of 13,758, of whom 1,255 were slaves. It was a place of considerable commercial importance at the close of the last century. The present population is 332,191, and it ranks seventh among the cities of the country.

MASSACHUSETTS. The regular annual session of the Legislature of Massachusetts began on the 7th of January, and came to a close on the 24th of April, having occupied ninety-nine days in actual proceedings. The amendment to the Constitution proposed at the session of 1879, which provided for biennial elections and sessions of the Legislature, failed to receive the necessary two-thirds vote in the House of Representatives. The final vote on the motion to pass the resolution submitting it was 140 to 77. The question of biennial elections was then divided, and two separate amendments were proposed, one providing that the Governor and executive officers shall be elected for terms of two years, beginning with the election of 1882, and the other that members of the two branches of the Legislature shall be chosen biennially. These propositions will require the approval of the Legislature in 1881, before they can be submitted to a vote of the people, and they make no reference to the subject of legislative sessions. The amendment proposed in 1879, declaring that no Massachusetts soldier or sailor in the late war shall be disfranchised on account of being a pauper, was so modified as to remove the restriction

that made it apply only to those who served as citizens of the State, or in its quota of forces. This change made it a new proposition requiring the approval of another Legislature.

The subject of revising the laws of the State occupied considerable attention in the early part of the session, and finally the Governor was authorized to appoint three commissioners to perform the work. Their report must be made to the Governor not later than January 1, 1882, and by him submitted to the Legislature.

The question of regulating the traffic in intoxicating liquors occupied a good deal of attention, as usual. There were several propositions for the amendment of the law, but only two were adopted. One of these modified the "Civil Damage" act of 1879, so as to relieve from liability for damages the lessor of real estate occupied for the sale of liquors, when the occupant is licensed to carry on the business. The other change requires licenses to specify the room or rooms in which liquors are to be sold or kept, and prohibits their sale elsewhere on the premises, except in the case of innholders; authorizes the Licensing Board to close all entrances to the premises except those from the public street, and to remove any screen or obstruction that may interfere with a view of the interior; prohibits the sale of intoxicating liquors to any minor for the use of another person, or to any person known to have been intoxicated within six months; and declares that any beverage containing three per cent. of alcohol shall be deemed to be an intoxicating liquor.

There was considerable discussion upon matters pertaining to railroad and insurance companies, but the changes made in the laws were of little general importance. An act was passed intended to put an end to the rivalry of the Eastern and Boston and Maine Railroads, two competing lines between Boston and Portland, by authorizing them to make an arrangement, by contract or lease, for the joint operation of the two roads. Provision was made for an excise tax on life-insurance business of one half of one per cent. on a valuation equal to the aggregate net value of policies, on the 31st of December preceding the assessment, held by residents of the State.

Among the other acts of the session was one providing for the inspection of milk, regulating its sale and prohibiting adulteration under severe penalties; a stringent measure for the suppression of "tramps"; a special charter of the American Bell Telephone Company, which provoked much discussion; an incorporation of a new "Cape Cod Canal Company," to construct a ship-canal from Buzzard's Bay to Barnstable Bay through the town of Sandwich, in case the old "Cape Cod Ship-Canal Company" should fail to have paid into its Treasury \$400,000, and to have spent \$100,000 on work actually performed or materials used by the 1st of November, 1880; an act authorizing

the sale of a part of the Commonwealth lands or "flats" in South Boston to the New York and New England Railroad Company, to be used for depots, stations, warehouses, and other terminal appliances. An old law prohibiting smoking in the streets of Boston was repealed; persons not residents of the State were made eligible to the Board of Overseers of Harvard College. A law was also passed excusing pupils in the public schools from reading the Bible or any particular version of it when their parents or guardians had conscientious scruples against the exercise; and a memorial to Congress was adopted in favor of measures looking to a renewal of reciprocal trade between the United States and Canada.

The annual attempt to secure action in favor of woman suffrage suffered another defeat, and by an unusually large adverse vote. A bill to allow women to vote at town meetings, at which the question of granting licenses to sell liquor is acted upon, was also defeated. Among the other defeated measures was a stringent prohibitory law, an act to reduce the tax on the deposits in savings-banks, and one to prevent double taxation in certain cases.

The joint special committee appointed in 1879 to consider the subject of convict-labor, made a report comprising three hundred and forty-eight printed pages, the bulk of which was made up of testimony, statistical tables, etc. The points specially considered were:

1. The effect of said system upon the general industries of the State.
2. The effect of said system upon the interests of free labor.
3. The effect of this system upon the reformation of the convict.
4. What advantage, if any, the products of prison-labor have over other manufactures in the matter of profits and cheapness of labor.
5. The effect of any prison-contract upon the particular kind or kinds of goods mentioned in said contract.
6. The feasibility of abolishing the contract system and substituting therefor some other, whereby the profit shall not go to private contractors, but to the State.
7. Such other points not here enumerated as will give said committee full statistics and information upon the subject mentioned.

The committee was present by invitation at a conference of the Prison-Labor Commissioners of New Jersey and Connecticut, held at New Haven, Connecticut, October 9, 1879, at which the following propositions were unanimously adopted:

1. The general purpose of incarceration is the protection of society by the punishment of crime; and in carrying out this purpose the reformation of the prisoner should be constantly kept in view.
2. Partisan politics should be absolutely excluded from the management of penal and reformatory institutions.
3. The welfare of the State and the prisoner both demand that the latter should be employed in productive labor.
4. The right of the State to make its prisons self-supporting should be conceded; but it should not expect to make a profit out of the labor of its criminals.

at the expense of their reformation, or to the injury of the industrial classes.

5. The product of convict-labor, when compared with that of the entire mechanical industry of the nation, is insignificant; but its concentration upon a very few branches of industry may be seriously injurious to the citizens engaged in those branches.

6. The burden of the competition of convict-labor should be distributed as widely and equally as possible.

7. The injury to any branch of industry from prison-labor may be reduced to very small proportions by the greatest practicable diversity of employments in the prisons.

8. Where the contract system prevails, contracts for convict-labor should be so drawn as to give the State absolute control of the discipline of the prisoners, and the State should prescribe all rules governing contractors and their employees.

9. The proper diversity of employment in the prisons should be secured by limiting the number of convicts to be employed in any one industry; such limitation should be adequate to secure the industrial interests of the country from serious injury, and to afford the convict a reasonable certainty of employment upon his release.

The following resolution was also unanimously adopted by the committee, but was rejected by the New Jersey Commission, and had not been acted upon by the Commission of Connecticut at the time the report was prepared:

Resolved, Under existing circumstances, and while the reformation of the prisoner is made subordinate to the question of gain in our prison institutions, it is not expedient to abolish the contract system; but this system, during its continuance, should be so guarded and restricted by legislation as to protect the interest of the State, promote the moral and industrial condition of the convict, and interfere as little as possible with free labor.

The committee, after describing briefly the systems of discipline and reformation pursued in the Penitentiaries of New York and Pennsylvania, makes the following statement concerning Massachusetts:

In this Commonwealth, as in most, if not all, the States of the Union, the system of selling the labor of prisoners for a term of years to the highest bidder prevails in State and county institutions with but two or three exceptions, the most notable of these being the Houses of Correction at East Cambridge and New Bedford, the institutions at Deer Island, and the Reformatory School at Westborough. The House of Correction at South Boston is managed partly on the contract system and partly on a modified public-account system by which work is done under charge of prison instructors for outside parties. Those in charge of the management of our prisons have, doubtless, reasoned that self-sustaining labor is an established law of nature in civilized society; that it is as imperative upon the bond as upon the free; and that, further than this, no human being will be redeemed from criminal associations without the habit of patient and productive industry. The adoption of the contract system of handling this involuntary labor has grown out of the desire for the most economical administration of penal institutions, and the necessity for relieving prison-keepers of ordinary ability from attempting to manage large manufacturing industries about which they know nothing. In fact, the congregate system of prison management and the contract form of labor are usually found inseparable.

The usual method of selling the labor of convicts seems to be by inviting bids by public advertisement. The highest bidder, if a presumably responsible party,

obtains the labor for a term of years; furnishes his tools, machinery, and stocks, his foreman, instructors, and clerks; receives his convict-laborers in a shop provided by the prison; teaches the details of the industry during the hours prescribed by prison rules; and makes his wares and sells them in his own way. He looks to the warden for discipline and guards; the warden looks to him for the pay for labor furnished. The contractor and his agent are expected to observe the prison rules so far as applicable to them; and there is an implied obligation on the part of the prison authorities to maintain the discipline at such a point that work will go on with but little friction or interruption.

After discussing at length the advantages and disadvantages of the contract system, the committee came to the conclusion practically that the contract system should be continued, for the public-account system seems open to as many objections, and idleness is out of the question. It deplores the fact that so little real, earnest effort is made to save or redeem men from crime. It suggests, as the first step toward remedying the evils, the classification of prisoners, so that the influence of incorrigibles may not so powerfully militate against efforts to reform accidental criminals; the second step, the introduction of a greater number of industries into the prisons, and the abolition of the system of the subdivision of labor, so that each discharged man shall be fortified by the knowledge of a trade. In no other way can the convict be made more easily interested in his own improvement, and helped to become a better citizen. It may be urged that classification is impossible under the present system; but legislation can devise a new system, whereby the old prison at Charlestown may be used for incorrigibles, and the Concord Prison for first-offense men, or those in the opinion of the Court worthy of special effort for their salvation. In case the present system is to remain as the best the wisdom of the State can devise, there is one avenue open to convict-labor which is utilized but little, viz., the employment of short-term, weak, and crippled prisoners upon the soil.

The report concludes as follows:

In conclusion, your committee would submit that, under the present system, the prisons of the Commonwealth appear in the main well managed by those who try to do the best they can with the limited opportunities at their disposal; but, as a question of ultimate economy, they are impressed with the belief that the more complete and effective the reformatory process, the less likelihood there is of the return of a prisoner to his former habits; the broader and better the industrial system, the more hope there is of changing bad men into good men, and protecting society by the moral regeneration of those not positively vicious but prone to become offensive by the lack of wholesome, preventive agencies.

The Governor and Council, in pursuance of a resolve of the Legislature, made an investigation into the management and conduct of the officials of the State Prison at Concord, and at its close in August made a record of the results. Although there were some criticisms of the methods employed and of particular acts of the warden and his subordinates, the record

was on the whole favorable. After declaring the most serious charges against the prison officials to be unsustainable, the Governor and Council say:

Desirous to bring out every fault and to note every opportunity for improvement, and believing that the convict, though a violator of the law, should have the wisest and most humane treatment consistent with his punishment, and that attention can not too often be called to his condition and welfare, we also feel that it is high time that something were said for those who in the service of the State discharge the trying duties of the prison official. They stand between a great body of criminals on the one hand, fretting at confinement, and many of them of the most abandoned, malicious, and violent character, and on the other a critical and sensitive public. Most of these officials are under small pay. They are subject to temptation. Their patience is sorely tried. They are under the stress of constant vigilance. Their kindness is often rewarded by treachery and deceit, and they carry their lives in their hands. In most cases they do the best they can. No evidence reflected on their honesty and competency; and though, as above stated, sometimes under provocation lacking discretion, yet to accuse them of systematic or frequent barbarity and inhumanity is gross injustice. Whatever else be desirable, the discipline should not be relaxed. The warden is trying to do his duty. We do not intend to excuse a single error on his part, but the result of our investigation has dissipated many false and unjust impressions regarding him. It will be still more to his credit if he corrects, as he seems cordially ready to do, such faults as we have pointed out. We invoke, too, the good sense of the community in sustaining public officers who are charged with the heavy responsibility of the confinement, punishment, and discipline of those who violate the laws and endanger its safety, and who carry into the prison-walls the same elements of desperation, lawlessness, treachery, and violence which make so many of them when at large the terror of its peace.

The first political convention of the year was held at Worcester, on the 6th of March, by an organization styled the Young Republicans, though many of the delegates were by no means specially youthful. The general character and aims of the organization were indicated in the following resolutions:

We declare our adhesion to the principles of the Republican party. Especially do we urge the establishment of the public service on the basis of intelligence and good conduct; the maintenance of specie payments; the passage of laws depriving greenbacks of their legal-tender quality; the management by the States of their own affairs; the enforcement of all national laws, and the maintenance of equal rights throughout the country.

Earnestly desiring the success of the Republican party at the approaching Presidential election, we protest against the nomination of any candidate who is certain to lose the support of any important portion of the party. The decline of the Republican power from 1873 to 1875 showed plainly that the Republicans can not hope for success while supporting candidates who, in office, do not uphold the principles which the party has affirmed. It is our belief that to submit to such leadership is to invite disaster as well as to deserve it. Nor can the plea of necessity be urged to induce us to serve under those leaders, for there are many Republicans whose record is free from every taint of personal or political corruption, whose fidelity to the principles above declared is proved, and whose fitness for the highest office can not be questioned. We therefore strenuously oppose the nomination of Ulysses S. Grant or of James G. Blaine, since many

considerations will lead large portions of the Republican party to vote against either.

We will gladly support any man who, like President Hayes, has shown in words and acts that he is in sympathy with the principles declared by us, and whose personal character is pure and above suspicion.

We heartily approve the principles of the Independent Republican Committee of New York and of the National Independent Republican League of Philadelphia, and the Executive Committee are hereby instructed to correspond with those organizations with the view of joint action in the future, if desirable.

An effort was made to have the reference to Grant and Blaine stricken out, but without success.

A Republican Convention for the selection of delegates at large to the National Convention was held at Worcester, on the 15th of April. The delegates chosen were George F. Hoar, R. Codman, John E. Sandford, and Julius H. Seeley, and were understood to favor the nomination of George F. Edmunds, of Vermont, for President. The following platform was adopted:

1. We declare our steadfast adherence to the ideas and principles of government and policy which have made the Republican party distinctively the party of freedom and equal rights, of patriotic devotion to the Union, of progress and reform.

2. We believe in an honest currency, with every dollar equal in value to every other dollar, and in a financial system which shall sacredly guard the national faith and credit, and assure the continuance of specie payments; and we congratulate the Administration and the country upon the conspicuous success with which resumption has been accomplished, commercial confidence restored, and the public debt refunded and reduced under the able management of the present Secretary of the Treasury.

3. We believe in the inviolable sovereignty of the national Union as established by the Constitution over all the States and all the people, and in the duty of the national Government by wise laws, efficiently executed, to protect the ballot in all national elections, and to maintain and vindicate the constitutional right of all citizens of the United States, wherever and under whatever fiction of State sovereignty or other pretense such rights may be assailed.

4. We hold that free and honest elections are essential to the stability and success of government by the people, and that any attempt to thwart the will of the majority, whether by preventing the lawful exercise of the right of suffrage by fraud in casting or in counting votes, or by unseating, for partisan purposes, fairly-elected members of Congress or of State Legislatures, is a crime which will not be tolerated by a free people.

5. Grateful for what has been done during the Administration of President Hayes to improve the tone and methods of the civil service, we again invoke Congress to complete the work by necessary legislative enactments, in order that there may be adequate and permanent security against the misuse of the public service as a machinery of party organization and personal influence, and so that, in the language of a distinguished Senator, "the holders of office may feel that they are servants of law and not the personal tenants-at-will in their place of either heads of departments or of Congressmen."

6. We have one country and common interests as a nation. We deplore the existence of sectional strife and animosity, and of parties bounded by territorial lines. We earnestly desire that the resources of the South, as well as of the North and West, may be developed under just and harmonious policies by the united energies of our whole people. To this end

there must be an actual recognition of the equal rights of all by all. The privileges of citizenship must everywhere be respected. Results and settlement of past issues that have been reached at great cost and once accepted must not again be brought into question, and we hold that they who seek to reverse or set them aside, or to revive past controversies for political purposes, are unwise statesmen and dangerous political leaders, justly responsible for disturbing the peace and obstructing the welfare of the country.

7. The duty of all Republicans loyally to support the candidates of the party, and the duty of nominating conventions to present candidates who are acceptable to all Republicans, are reciprocal duties of equal force and obligation. Profoundly sensible of the importance of the impending election to the nation's safety, honor, and well-being, the Republicans of Massachusetts demand of the delegates to the National Convention that they use all proper efforts for the nomination of a candidate who, having the requisite qualities for the high office of President, will also have the confidence and approval of all who have hitherto acted with the Republican party; who will invite the support of other patriotic citizens desiring good government more than party success; whose nomination will be most expedient because most worthy and least objectionable, and whose triumphant election, to which we pledge our hearty and united efforts, will give assurance of the continuance of sound and beneficial policies of administration and of uninterrupted and growing national prosperity. While we do not instruct our delegates, we commend to their consideration, as a Republican statesman who possesses in an eminent degree such qualities and requisites for the nomination, the Honorable George F. Edmunds, of Vermont.

The district delegates were chosen at local conventions, and the Democratic delegates at large were designated by the Executive Committee of the party organization. On the 1st of September a Democratic Convention was held at Worcester for the purpose of nominating candidates for State officers and electors. The division in the party which had been occasioned by the action of General B. F. Butler, was healed by his public acceptance of the principles of the national organization, and the announcement that he would not contend this year for the position of Governor of the State. He made an address in the Convention defining his position and declining the use of his name as a candidate. Charles P. Thompson, of Gloucester, was placed at the head of the ticket, receiving 536 votes out of 1,026 on the first ballot, and being immediately after nominated unanimously. William Gaston, of Boston, received 448 votes on the first ballot. The remainder of the ticket was—for Lieutenant-Governor, Alpha E. Thompson, of Woburn; for Secretary of State, Michael T. Donohoe, of Somerville; for Treasurer, Francis J. Parker, of Newton; for Auditor, Charles R. Field, of Greenfield; for Attorney-General, P. A. Collins, of Boston. The platform adopted was as follows:

1. The delegates of the united Democracy of Massachusetts, now met in State Convention at Worcester, heartily endorse the declaration of principles and policy adopted by the Democratic National Council at Cincinnati in June last as a correct statement of the Democratic faith and doctrine as applied to the present condition of our public affairs, and we also endorse with complete satisfaction the distinguished

candidates nominated for the highest offices in the republic. We maintain that the Republican party, so called, is sectional and not national; that its persistent fanning of the embers of sectional strife weakens the sentiment of union and retards the prosperity of the country; that the people are longing for one country in reality as well as in name, no longer shared in North and South; and we condemn the utter abandonment in the present canvass, on the part of the Republican Presidential nominee and his party, of the sentiment and words of the former named, "The man who attempts to get up a political excitement in this country on the old sectional issues, will find himself without a party and without support." We believe that the election of the eminent and patriotic men, the candidates of our party, by the support of the people of all parts of the country, would be the end of sectional contention and the complete reconciliation of our countrymen to the union of our common ancestry.

2. We believe there are too many commissions in this State, and too little Executive and legislative control over them; too many sumptuary laws, too much special legislation, too many officials, too much legislative effort to restrict liberty and invent new crimes and misdemeanors, too many obsolete laws left on the statute-book; and we arraign the Republican party in all its cliques, that its legislation in this State is adverse to the progressive spirit of civil liberty, tends to the degradation of the citizen and to the creation of an official aristocracy with long tenures of office and without responsibility to the people.

3. We believe in manhood suffrage, and we demand the removal of the unreasonable restrictions now upon it in this Commonwealth. The municipal and district courts of the State should be permitted to exercise jurisdiction as Congress intended and provided over the naturalization of voters. We enter anew our protest against laws which render the right of man to vote dependent upon the payment of a paltry tax, which is often paid by other parties than the person taxed. The system is undemocratic and demoralizing, tends to a loss of self-respect in the party taxed and to a false expression of the unbiased will of the voter, and is a fruitful source of corruption and fraud; and we demand that all laws for the registration of voters and the conduct of elections should, in the language of Chief-Justice Shaw, "secure and facilitate the exercise of the right of suffrage in a prompt, orderly, and convenient manner;" and not, under the pretense and color of regulating, subvert or injuriously restrain the right itself.

4. The inefficient way in which the State administration has executed the laws regulating the hours of labor for employees merits our condemnation, and we demand the execution of these laws and of other laws for the protection of the lives and health of operatives.

5. The Republican party of this State has at two successive elections deceived the people by promises of a radical reform in the basis and methods of taxation, and we call upon the people to demand of their legislators a just and equal system of taxation.

6. We congratulate the Democratic party of the Commonwealth upon the honorable settlement of the differences recently existing within it, which has brought harmony to its councils and unity to its action, and we ask from the people their cordial and united support for the nominees of this Convention.

A resolution declaring against biennial elections and legislative sessions was voted down.

The Prohibitory party held a State Convention at Worcester on the 8th of September. Charles Almy, of New Bedford, was nominated for Governor; Timothy K. Earle, of Worcester, for Lieutenant-Governor; Solomon T. Root, of Dalton, for Secretary of State; Thomas J. Iothrop, of Taunton, for Treasurer; Jonathan Buck, of Harwich, for Auditor; and

Samuel M. Fairfield, of Malden, for Attorney-General. The following resolutions were adopted after considerable discussion :

Whereas, The law of God, as revealed in the Bible, never provides for the licensing of any wrong, but is a thoroughly prohibitory enactment throughout, with penalties for every violation ;

Therefore, be it resolved, as the sentiments of this Convention, that the traffic in alcoholic drinks is an infamous wrong against society, and a shameful dishonor to a Christian nation ; and as all history shows that every license law for the sale of such drinks, whether stringent, judicious, or otherwise, has always proved a failure, we affirm that our State and national Legislatures should legally require its entire suppression within their respective jurisdictions.

That as the prohibition of the importation, manufacture, and sale of alcoholic beverages transcends in importance every other question affecting our national prosperity, we declare our paramount object is to relieve the State and national Governments from all complicity with this wicked business, by electing men to office who will put the seal of their condemnation upon it.

That a party opposed to the prohibitory policy, or refusing to make it an issue in its platform, has no claim upon us for support. That with "malice toward none, but with charity for all," we are logically compelled to separate ourselves politically from those who are unwilling to grapple earnestly with this gigantic crime of crimes, the liquor traffic.

That, relying upon the Giver of all good for aid and strength, we will work on and work ever for the entire abolition of the drinking customs of society.

That the cowardly and vacillating course of the Legislature of 1880 upon the liquor question deserves and should receive the earnest condemnation of all Prohibitionists.

That we are pledged to the ballot for women by past declarations, by present convictions, and by the nature of our organization.

That we accept the platform of principles of the National Prohibition Reform party, adopted in Cleveland, Ohio, June 17, 1880, and commend to the suffrages of the voters of Massachusetts the candidates there nominated, viz., Hon. Neal Dow for President, and Rev. H. A. Thompson for Vice-President.

The Republican Convention was held at Worcester on the 15th of September. Its proceedings were very quiet and harmonious, and the existing State officers were renominated, with the exception of the Treasurer, whose term of office had reached the constitutional limitation. The candidates were John D. Long, of Hingham, for Governor; Byron Weston for Lieutenant-Governor; Henry B. Peirce for Secretary of State; Daniel A. Gleason for Treasurer; Charles R. Ladd for Auditor, and George Marston for Attorney-General. A long platform declaring the position of the party in the State was unanimously adopted. The following is the material part of the document :

We heartily desire that a cordial feeling of brotherhood and friendship should exist between the States and citizens of the Union. We are willing to make any concession save that of principle to accomplish such a result. We rejoice that the Southern States have, notwithstanding great disadvantages, made substantial progress in material wealth, and we hope that time will soon heal the wounds made by civil strife, and that the political rights of all the inhabitants of the South will, in the not remote future, be universally recognized and maintained. But we owe it to our self-respect, to the settled convictions of Massachusetts, to our obligations to the freedmen of

the nation, and to truth, unequivocally to declare that so long as the colored or any other citizens of the United States are prevented by intimidation or violence from exercising the great rights of free discussion and free suffrage, or are defrauded of the results of their ballots by false counting, so notorious that it is scarcely denied, our voices shall be heard in loud, constant, and indignant protest, and we will invoke the public opinion of the country and of mankind in condemnation of these atrocious acts not only upon their authors but also upon that political party which tolerates or condones them ; and we call upon the national Government, acting under the provisions of the Constitution and in the exercise of its inherent right of self-protection, to take all necessary means to insure a peaceful election for national Representatives, and to put forth all its power to maintain in such elections the right of all citizens of the United States to a free ballot and an honest count.

The resumption of specie payments, by which the national promises to pay are made equal in value to coin, and the great and satisfactory progress that has been made toward the extinguishment of the national debt, are results of Republican legislation and administration which have been effected in despite of the opposition of the Democratic party. It is therefore to the Republican party alone that the friends of a currency based upon the value of gold coin can look for a repeal or modification of the laws relating to the coinage of the silver dollar which derived their chief support from Democratic votes, and which were passed over the veto of a Republican President. And the Republicans of Massachusetts are of the opinion that the continued coinage of silver dollars of the present standard while the monetary relations of gold and silver remain substantially as they are now, will bring about the expulsion of gold from the country, and impose upon our commerce and industry the disadvantages of a currency depreciated in the markets of the world ; and that the coinage of these dollars, now going on at the rate of two millions a month, ought to be suspended until the relation between gold and silver as money has been uniformly established by the leading commercial countries. We have faith to believe that the Republican party of the country, as it is a party of progress that can profit by the lessons of experience, will, if intrusted with the power, remove by appropriate legislation the only serious obstacles that now exist to placing the currency of the country upon an absolutely sound and durable basis.

We take the occasion to express our satisfaction that the National Convention of the party declared in favor of legislation by Congress for the establishment of a system of appointments to the subordinate offices of the national Government, which, by providing for practical tests to determine the competency of applicants, will relieve the Executive, heads of departments, and members of Congress from the solicitations of persons seeking office for themselves or their friends, and will place the civil service upon a permanent basis of fitness and merit, and no longer upon that of partisanship. We believe that not only is it true that the nation needs and may justly claim the services of the ablest and the fittest, but that every loyal citizen should have the right fairly and freely to compete for the honor and advantage of holding official place ; that no appointments or removals should be made from favoritism or for the obtaining or holding of political power ; that public examinations, directed to subjects of knowledge essential to an efficient performance of official work, and an open competition of merit, should place all citizens upon a footing of absolute equality in presenting their claims for office, and that a tenure of office of reasonable permanency should protect faithful and competent officials from capricious and arbitrary dismissal.

We oppose as Republicans and good citizens the giving over of the Federal Administration to the Democratic party :

1. Because the great prosperity that the country

now enjoys will be jeopardized by ill-considered and sweeping changes in the tariff, and by the destruction of the national banking system which the Democratic leaders have proclaimed their determination to effect.

2. Because there is no hope of economical and efficient conduct of the public business from the party that originated the pernicious doctrine that "to the victors belong the spoils," which by its recent action in distributing the patronage of the two Houses of Congress, by expelling Union soldiers to give place to those who fought against the Union, has shown that it not only has no intention of abandoning that doctrine, but that it clings to it even to the point of defying the patriotic sentiments of the loyal people.

3. Because the advocates of inflation are chiefly members of the Democratic party, and many States under Democratic rule have scaled or repudiated their debts, a Democratic success in a national election would impair the public credit and depreciate the national securities.

4. Because the introduction of numerous bills in the present Congress by Democratic members gives reason to fear that if the Democratic party control the executive as well as the legislative department of the Government, legislation will be enacted for the exclusive benefit of States and individuals formerly in open rebellion.

5. Because the Democratic party, by countenancing the late attempt to usurp the government of Maine, by ignoring or condoning the criminal violence and fraud that has been practiced upon the colored men and other Republicans of the South, and by its half-executed threat to starve the Government when unable to control it, has demonstrated that in its desire to obtain power it is restrained by no principles, and that it has yet to learn the lessons of patriotism which were taught by the civil war; and can not, therefore, safely be trusted to maintain those great principles of justice and of freedom, to vindicate which this nation has been lavish of its money and of its blood.

The Greenback party held a Convention at Worcester on the 22d of September, and nominated General Horace Binney Sargent, of Boston, for Governor. The rest of the State ticket was as follows: For Lieutenant-Governor, George Dutton, of Springfield; Secretary of State, Jonathan Arnold, of North Abington; Treasurer, Wilbur F. Whitney, of Ashburnham; Auditor, Charles T. Warner, of Northampton; Attorney-General, John M. Raymond, of Salem.

The following platform was adopted:

Resolved, That we affirm the Chicago platform of June 9, 1880, and pledge our undivided support to the candidates there nominated.

Resolved, That as business prosperity depends upon stability in the value of money, and stability in the value of money depends upon stability in the volume thereof, the control of the volume of money is all-powerful over the industries of a nation, and if trusted to corporate greed can be used to the impoverishment of the people and the enrichment of the issuer: therefore we demand the substitution of full legal-tender greenback for national-bank notes, and that the national Government only issue the money of the people and control its volume.

Resolved, That the burden of interest is no more desirable for a nation than for an individual, and that common prudence dictates the speedy payment of public as well as private debts; and we deprecate the action of the Secretary of the Treasury in buying bonds at a premium when they might be paid at their face, and demand that the bonds falling due this year and next be not refunded, but be paid off as far as possible with the cash now on hand, and by the substitution of greenbacks for national-bank notes.

Resolved, That giving to corporations the power to

use the national debt as a basis for the issue of money with the privilege of receiving back nine tenths of the capital invested for use, thus enabling them to draw interest on one hundred and ninety thousand while the owners of only one hundred thousand, thus giving them an enormous gratuity, interesting them in the payment of the debt, the payment of which would deprive them of this enormous but unjust profit, and through the issuing of the money the power to impoverish the people and prevent its payment, tends to the subjugation of the people and the destruction of republican institutions, and needs but to be understood by the people to be for ever abolished.

Resolved, That the soldiers should receive as good a dollar as the bondholder. The soldier received thirty-eight cents where one dollar was promised, and the bond-receivers one dollar for forty cents loaned. Honest equity and national honor demand that justice be done to brave men who defended their country with their lives, and we condemn the legislation which gives the bondholder more than was promised, and fails to recognize the just claims of the soldier.

Resolved, That the hours of labor should be shortened, and the employment of young children in exhausting factory-labor be prevented; that labor-saving machinery is a boon of God to the sons and daughters of toil rather than an engine of torture to wring out larger profits for capital by bringing the laborer into heart-breaking competition with the muscles that never tire. The vast powers of nature are not harnessed by invention to secure even six per cent. dividends, but to relieve human slaves; not hours of toil, but the product of this new partnership of man with natural forces, should be the ruling compensation, and demand a new system of dividing the profits of capital and labor. We demand the rigid enforcement of the ten-hour law, now on the statutes of this Commonwealth relating to the employment of women and children, and we insist that the grasping corporation which filches an hour's labor from a thousand operatives deserves the same proportionate punishment meted out to lesser offenders.

Resolved, That we favor a graduated income-tax, that being the only method of forcing capital to share with labor the burden of taxation.

Resolved, That we are opposed to an increase of the standing army in the time of peace, and to the insidious military power under the guise of the "general militia law."

Resolved, That the right of suffrage is the inalienable right of all persons, without money or price.

Resolved, That we oppose the granting of our public lands to railroads or other corporations, or the sale of the same to speculators, and demand that they be retained for actual settlers. We also demand that the laborers of our overcrowded cities be afforded governmental aid to settle on said lands instead of granting subsidies to wealthy institutions. Land, light, air, and water, are the free gifts of Nature to all mankind, and any law or custom of society that allows any person to monopolize more of these gifts than he has the right, to the detriment of the rights of others, we earnestly condemn and seek to abolish.

The total number of votes cast for Presidential electors on the 2d of November was 282,512, of which 165,205 were for the Republican, and 111,960 for the Democratic ticket; 4,548 were cast for the Greenback candidates, 682 for those of the Prohibitory party, and 117 were returned as "scattering." The Republican plurality over the Democratic vote was 53,245; majority over all others, 47,898. The total vote for Governor was 282,216, of which 164,825 were for Long, 111,410 for Thompson, 4,864 for Sargent, 1,059 for Almy, and 58 "scattering." Long's plurality over Thompson was 53,415; his majority over all, 47,484.

Republicans were elected to Congress from all the eleven districts except the fourth, where Leopold Morse, Democrat, was reelected by a plurality of only 115 over F. B. Hayes, Republican, 222 Democratic votes being cast for William Gaston, and 142 votes for other candidates. The Governor's Council in 1880 consisted of six Republicans, one Democrat, and one Greenbacker; that elected for 1881 consists of seven Republicans and one Democrat.

The Legislature of 1880 consisted of thirty-two Republicans, five Democrats, and three Independents in the Senate, and one hundred and seventy-five Republicans, forty-seven Democrats, twelve Independents, and five Greenbackers in the House. That chosen for 1881 consists of thirty-five Republicans and five Democrats in the Senate, and one hundred and ninety-one Republicans, forty-seven Democrats, and two Greenbackers in the House.

JOHN DAVIS LONG, elected a second time Governor of Massachusetts, was born at Buckfield, Maine, October 27, 1838. He enjoyed the best advantages for education in his boyhood, and entered Harvard College before he was fifteen years of age, graduating in 1857. He stood high in his class, and was chosen class-poet by his fellow-members. After graduating he accepted the position of Principal of Westford Academy, which he held for two years. He then entered the Law School at Cambridge, and subsequently studied in the offices of Peleg W. Chandler and Sidney Bartlett, in Boston, being admitted to practice in 1861. He began practice in his native town, but shortly returned to Boston, where he formed a partnership with Stillman B. Allen, which was continued until he became Governor of the State. He has resided in the town of Hingham, and his first public service was as Representative of the first Plymouth district in the Legislature of 1875. He was Speaker of the House during the sessions of 1876 to 1878 inclusive, and was chosen Lieutenant-Governor in 1878, and Governor in 1879 and 1880, and was a prominent candidate before the Legislature of 1881 for the position of United States Senator. Aside from his exceptionally early and rapid legal and political success, he has appeared creditably in the field of literature as author of a translation of Virgil's "Æneid."

The two hundred and fiftieth anniversary of the founding of the city of Boston was celebrated with a brilliant parade, and literary and festive exercises, on the 17th of September. Cambridge had a similar celebration on a smaller scale on the 28th of December.

The financial condition of the State is very favorable. The funded debt on January 1, 1881, was \$32,799,464, showing a decrease of \$221,000 during the year. It is classified as follows:

Railroad loans	\$17,738,996
War loans	10,468,188
Public buildings, etc.	4,592,280
Total	\$32,799,464

The maturity of the remaining portions of the debt is shown in the following table:

1883.....	\$1,088,000	1894.....	\$10,921,244
1888.....	3,061,300	1895.....	4,840,260
1889.....	3,142,128	1896.....	1,100,000
1890.....	503,468	1897.....	520,600
1891.....	3,815,040	1900.....	3,599,024
1893.....	209,000		

The aggregate of the several sinking funds amounted on January 1, 1881, to	\$12,990,812 59
Amount of the same January 1, 1880.....	12,285,248 23

Showing an increase of..... \$755,564 80

The operations of the Treasury for the year are shown in the following statement:

Cash in the Treasury January 1, 1880..... \$1,383,783 13

RECEIPTS.

On account of revenue.....	\$7,691,141 60
On account of funds.....	4,832,742 12
	\$12,163,883 72

Total..... \$13,497,616 85

PAYMENTS.

From revenue.....	\$6,992,451 61
From funds.....	3,822,362 19
	\$10,314,813 80

Total cash on hand January 1, 1881..... \$3,182,803 05

The expenses of 1880, compared with those of 1879, show the following aggregates:

	1880.	1879.
Ordinary expenses	\$1,565,899 50	\$1,562,712 98
Exceptional expenses.....	4,520,974 15	4,040,687 66
Total.....	\$6,086,873 65	\$5,603,400 64

The valuation of property in the State for the year beginning May 1st, not including corporation and savings-bank investments, was \$1,584,756,802, a gain of \$55,235,788 over that of 1879. Of the total, \$659,462,495 belonged to the city of Boston, an increase for the year of \$26,139,803. The rate of taxation in the different cities and towns varies from \$4 to \$33 per \$1,000 of valuation. The aggregate valuation for purposes of taxation of the capital stock of corporations was \$251,565,377, a gain for the year of \$36,936,313. The amount of taxes derived from this source was \$430,994.13. The aggregate net value of life-insurance policies on the 31st of December, 1879, on which the new tax of one half of one per cent. was to be imposed was \$349,488,935. One result of the year's experience in imposing this tax is a recommendation of the Tax Commissioners that it be reduced to one fourth of one per cent.

On the 30th of October there were one hundred and sixty-four savings-banks in operation. The total amount of their deposits was \$218,047,922.37, an increase of \$11,669,212.08 during the year preceding that date. The surplus amounted to \$4,758,194.88, an increase of \$456,419.99; the guarantee fund was \$2,670,152.85, or \$599,103.23 more than the previous year. The number of open accounts was 706,395, an increase for the year of 30,840, making the average of the account \$308.68, or \$3.18 more than the year before. The amount

of the deposits received during the year was \$42,751,557.43, which was \$14,264,753.46 more than in 1879, and the amount withdrawn was \$34,403,428.23, or \$2,322,901.02 more than in 1879. The number of deposits made during the year was 532,594, an increase of 154,333, and the average amount of each was \$80.27, an increase of \$4.96.

The aggregate interest-bearing debt of all the cities and towns of the State on the 1st of May was \$88,656,058, from which there is an offset of \$18,204,610 in sinking funds. Thirty-eight per cent. of the net debt of municipalities is for water-supply.

The population of the State, as shown by the Federal census, is as follows by counties:

STATE AND COUNTIES.	Total.	Male.	Female.	Native.	Foreign.	White.	Colored.*
The State	1,783,086	858,521	924,565	1,339,970	443,116	1,764,082	19,004
Barnstable.....	31,945	15,534	16,411	29,732	2,213	31,433	512
Berkshire	69,049	33,741	35,308	54,834	14,215	67,728	1,321

Worcester.....	226,885	112,126	114,759	173,135	53,750	225,442	1,443

The population of the cities of the State is as follows: Boston, 362,535; Lowell, 59,485; Worcester, 58,295; Cambridge, 52,740; Fall River, 49,006; Lawrence, 39,178; Lynn, 38,284; Springfield, 33,340; Salem, 27,598; New Bedford, 26,875; Somerville, 24,985; Holyoke, 18,551; Chelsea, 21,785; Taunton, 21,213; Gloucester, 19,329; Haverhill, 18,475; Newton, 16,995; Newburyport, 13,537; Fitchburg, 12,405. The following unincorporated towns have over 10,000 inhabitants: Brockton, 13,608; Pittsfield, 13,367; Northampton, 12,172; Malden, 12,017; Waltham, 11,711; Chicopee, 11,325; Attleborough, 11,111; Woburn, 10,938; Weymouth, 10,571; Quincy, 10,529; North Adams, 10,192; Marlborough, 10,126.

The number of public schools reported by the Board of Education was 5,570; number of teachers, 8,595; number of different pupils, 306,777; average attendance, 233,127. This includes 215 high-schools, with 494 teachers and 18,758 pupils. There were also reported 73 academies, with 10,398 students; and 350 private and parochial schools, with 15,891 pupils. Besides these, there were 116 evening-schools, with an average attendance of 4,503. The average length of day-schools was eight months and seventeen days. The amount raised by taxation and expended upon public schools, exclusive of expenditures upon schoolhouses, was \$4,732,286.06. There was expended upon the same schools \$173,859.17 not raised by taxation. The amount expended upon school-

buildings was \$610,585.89. There are six normal schools for the training of teachers, and a normal art-school, which belong to the State system of education.

The number of persons in the penal institutions of the State, including those of counties, was 3,821 on the 30th of September. The number of commitments on sentences during the year that preceded was 17,053, of which 10,434 were for drunkenness.

There were thirty-one and one fourth miles added to the railroad system of the State during the year ending September 30th. The thirty-four corporations making returns to the Railroad Commissioners owned 2,667,352 miles of main line and branches, of which 651,480 were provided with double track. The total length of sidings was 938,947 miles, and the aggregate of track, considering double track and sidings as so much additional length, was 4,257,779 miles, an increase of 107,793 for the year. Of the whole amount, 1,893,080 miles of main line, 454,792 of double track, 696,693 of sidings, or 3,044,655 miles in all, were within the limits of the State. The average cost of construction and equipments for standard gauge roads is \$63,671.70 per mile. The aggregate of capital stock of all the companies was \$118,758,871.58, and the net debt \$59,172,520.25. The total gross income was \$35,140,374.77, an increase for the year of \$4,827,410.25, or more than fifteen per cent. The total expenses were \$23,948,559.24, an increase of \$3,789,608.56; net income, \$11,191,815.53, or \$1,037,801.67 more than in 1879. The number of passengers carried was 45,151,152, an increase of 5,933,518; tons of freight, 17,221,567, an increase of 2,819,690. The amount distributed in dividends was \$5,987,718.64. Twelve companies, with \$5,229,000 permanent investment, had no net income; fifteen companies, with \$34,790,000 investment, had an income of 3½ per cent. or less; eleven com-

* Including, in the State, 237 Chinese, 8 Japanese, 841 Indians, and 11 East Indians; in Barnstable County, 2 Chinese and 100 Indians; in Berkshire County, 19 Chinese and 1 Japanese; in Bristol County, 2 Chinese and 84 Indians; in Dukes County, 67 Indians; in Essex County, 16 Chinese, 7 Indians, and 11 East Indians; in Franklin County, 1 Japanese and 1 Indian; in Hampden County, 16 Chinese, 1 Japanese, and 4 Indians; in Hampshire County, 20 Chinese, 1 Japanese, and 1 Indian; in Middlesex County, 25 Chinese, 1 Japanese, and 10 Indians; in Norfolk County, 17 Indians; in Plymouth County, 41 Indians; in Suffolk County, 135 Chinese, 3 Japanese, and 21 Indians; in Worcester County, 2 Chinese and 38 Indians.

panies, with \$12,590,000 investment, had a net income from $3\frac{1}{2}$ to $5\frac{1}{2}$ per cent.; eleven companies, with \$22,216,000 invested, had $5\frac{1}{2}$ to $7\frac{1}{2}$ per cent.; eight companies, with \$67,965,000 of investment, had from $7\frac{1}{2}$ to $9\frac{1}{2}$ per cent. of net income; and five companies, with a permanent investment of \$37,299,000, had a net income of $9\frac{1}{2}$ to $11\frac{1}{2}$ per cent.

The total expenses of the Hoosac Tunnel and Troy and Greenfield Railroad for the year were \$986,257.23, of which \$709,627.78 was for interest. The receipts from earnings were \$239,295.69; from rents, etc., \$28,699.17; total, \$267,994.86, leaving the net outlay \$718,262.37. The total cost of the tunnel to the State at the end of the year had been \$20,241,842.31. A contract has been made with the Fitchburg Railroad for a period of seven years from September 30, 1880, to operate the tunnel and connecting road at a compensation which shall be the actual expense of such operation. Similar contracts have been made with the Boston, Hoosac Tunnel and Western Railroad, the New Haven and Northampton, and the Troy and Boston. The Troy and Greenfield Railroad Company is still in existence, and claims the right to redeem the whole property from the State. The claim appears not to be denied, but the terms on which redemption can be made are in dispute.

MCCLELLAND, Hon. ROBERT, ex-Secretary of the Interior, was born at Greencastle, Pennsylvania, in 1807. Through sudden reverses in his family, he was thrown upon his own resources at the age of seventeen. In order to pursue his course at Dickinson College, Carlisle, Pennsylvania, where he graduated in 1829, he supported himself by teaching school. He was admitted to the bar at Chambersburg in 1831. After residing a year at Pittsburg, he removed in 1833 to the Territory of Michigan. He practiced law at Monroe, and rose with the country. Governor Mason offered him the attorney-generalship, which he declined. In 1840 he was elected to the State Legislature. In 1843 he was made Speaker. In that same year he was elected to Congress, where he soon earned a national reputation. He was one of eighteen Democrats who joined with David Wilmot, of Pennsylvania, in passing the famous "Wilmot Proviso," which abridged the further extension of slavery into the Territories of the United States. He was a member of the Democratic Nominating Convention of 1852. He took a zealous part in the campaign which resulted in the defeat of General Scott and the election of Mr. Pierce. He had been provisional Governor of Michigan in 1851, and in 1852 he was reelected for a term of four years. Leaving the Treasury full, and the State in prosperous condition, he resigned in 1853 in order to accept the position tendered him in the Cabinet of Mr. Pierce, of Secretary of the Interior. This office he filled with honor to himself and credit to the country, during the four years of Mr. Pierce's Ad-

ministration. He returned to Michigan, and was drawn from his retirement to become a delegate to the Convention of 1867, which revised the Constitution of the State. Mr. McClelland died August 27th, at his home in Detroit, Michigan.

METHODISTS. The "Methodist Year-Book for 1881" gives the following estimates:

CHURCHES.	Itinerant ministers.	Local preachers.	Lay members.
Methodists in churches in United States.....	24,304	26,875	2,485,999
Methodists in churches in Dominion of Canada.....	1,682	4,323	163,611
Methodists in churches in Great Britain and missions.....	5,089	48,691	948,038
Methodists in churches in affiliating conferences.....	706	5,571	96,327
Total Methodists in 1880....	31,731	85,460	4,608,990

The Methodist population of the world is estimated at 23,455,655.

I. METHODIST EPISCOPAL CHURCH.—The following table shows its growth by decades:

YEARS.	Lay members.	Gain during decade.	YEARS.	Lay members.	Gain during decade.
1777....	6,968	1837....	658,574	276,577
1787....	25,842	18,874	1847....	636,471	22,103,108
1797....	58,863	33,021	1857....	820,519	184,618
1807....	144,590	85,727	1867....	1,146,081	325,562
1817....	224,553	80,263	1877....	1,671,605	521,527
1827....	381,997	157,144

The following is a summary of the statistics of this Church for 1880:

Fall Conferences.....	7,009	856,690	75,961
Grand total.....	12,096	1,564,105	178,817

Whole number of members and probationers, 1,742,922, showing an increase of 42,620 over the number returned in 1879; number of

local preachers, 12,555. Number of Sunday-schools, 21,093, with 222,379 officers and teachers, and 1,602,334 scholars; number of baptisms during the year, 58,535 of children and 59,330 of adults; number of churches, 17,561, valued at \$64,131,306; number of parsonages, 5,844, valued at \$8,750,513. Of the traveling preachers, 1,152 are returned as "on trial," 8,719 as in full connection, 752 as "supernumerary," and 1,314 as "superannuated."

The total sales of the Book Concern at New York and Cincinnati, for the year 1879-'80, amounted to \$1,465,522 in value. The Concern at New York issued during the year 585,835 volumes of books, and 1,052,500 pages of tracts. Twenty periodicals are published under the authority of the General Conference, and fifty-three other periodicals are published in the interest of the Church.

The educational institutions under the direct supervision of the Church comprise eleven theological seminaries and institutes, forty-four colleges and universities, and about one hundred and thirty seminaries and women's schools, which give instruction to about 21,000 students, and have property valued at \$11,560,000.

The annual meeting of the *General Missionary Committee* of the Methodist Episcopal Church was held in the city of New York, beginning November 3d. The principal duties of the committee were to examine the reports of the condition of the missionary funds, to determine the amount that would be required for the support of the domestic, foreign, and other missions during the ensuing year, to fix the amount that should be contributed by each conference and mission-field toward this sum, and to decide upon the amount to be appropriated to each mission-field. The Treasurer reported that the total receipts of the Society from November 1, 1879, to October 31, 1880, had been \$557,371 against \$551,859 received in the previous year, and that the liabilities of the Society had been increased by \$49,113, its total indebtedness now being \$112,150. About \$105,000 had been spent upon missions during the past year more than were spent on the same missions during the previous year.

Appropriations were made for the work on the various mission-fields as follows:

I. FOREIGN MISSIONS:

Africa (including Liberia and work in the interior).....	\$9,000
South America (Buenos Ayres and Montevideo, etc.).....	11,517
China.....	58,359
Germany and Switzerland.....	24,000
Scandinavia (Denmark, Norway, and Sweden).....	43,953
India.....	62,927
Bulgaria and Turkey.....	12,854
Italy.....	23,000
Mexico.....	27,564
Japan.....	80,000

Total for foreign missions..... \$299,174

II. MISSIONS IN THE UNITED STATES NOT IN ANNUAL CONFERENCES (in the Territories and among Indians).....

40,700

Brought forward.....	\$389,874
III. DOMESTIC MISSIONS:	
Welsh.....	150
Scandinavian.....	17,600
German.....	41,700
Chinese.....	14,160
American Indian.....	8,550
English-speaking.....	170,850
IV. Miscellaneous appropriations.....	78,000
For the liquidation of the debt.....	112,150
Total.....	\$778,034

The statistics of the missions for 1880 were: *Foreign missions:* Number of foreign missionaries, 97; of assistant missionaries, 63; of foreign missionaries of the Woman's Foreign Missionary Society, 30; of native workers of the Woman's Foreign Missionary Society, 188; of native ordained, unordained, and local preachers, 686; of teachers and other helpers, 536; of members, 26,702; of probationers, 8,807; average attendance on Sunday worship, 26,283; number of baptisms, 725 of adults, and 1,609 of children; number of day-schools, 316, with 10,282 scholars; number of Sunday-schools, 929, with 44,627 scholars; number of orphans, 576; amount collected for benevolent societies, \$11,376; for the Missionary Society, \$5,236; for self-support, \$134,226. The missions returned 264 churches, valued at \$1,121,748; 701 other places of worship, 190 parsonages or homes, valued at \$316,287, and other property of the value of \$156,967.—*Domestic Missions:* Number of missionaries, 2,246; of local preachers, 292; of members, 24,154; of probationers, 3,418; of baptisms, 62 of adults, 200 of children; of Sunday-schools, 577, with 26,935 scholars; of churches, 70; amount of collections for the Missionary Society, \$15,173.

The *General Conference* of the Methodist Episcopal Church met at Cincinnati, Ohio, May 1st. The quadrennial report of the bishops reviewed the history and the progress of the Church and its various societies during the preceding four years, and gave accounts of the visits which the bishops had made to the foreign conferences and missions in Germany and Switzerland, Sweden and Norway, where annual conferences were organized; Denmark, Bulgaria, India, Italy, Japan, China, and Mexico. The visitation of the missions in South America, which had been contemplated, was prevented by the death of some of the bishops, and other causes. A committee which had been appointed by the preceding General Conference to consider the subject of lay delegation in the annual conferences, made a report recommending that lay delegates be chosen from the presiding elders' districts in the ratio of one delegate for every six quarterly conferences; that the lay delegates and ministers sit and deliberate together in the annual conferences in one body; and that the lay delegates have power to speak on all questions coming before the conferences, and to vote on all questions except those affecting the character and relations of traveling elders, and the election of ministerial delegates to the General Conference.

The subject was not definitely acted upon by the Conference. The commission which had been appointed by the previous General Conference to arrange for a basis of fraternal relations with the Methodist Episcopal Church, South, made a report of the conference which had been held at Cape May, New Jersey, in August, 1876, and transmitted the terms which had been arranged there for fraternal recognition and for the adjustment of disputes concerning property. The binding force of the agreement made by the commission upon a succeeding General Conference was questioned, but the agreement was shown to be of the nature of a contract, and the Conference decided by a nearly unanimous vote that it was binding and final. The report of the committee on an Ecumenical Conference of all Methodist bodies, recommending that such a conference be held in London in 1881, was approved. Four new bishops were elected, viz.: Henry W. Warren, of Philadelphia, Pennsylvania; Cyrus D. Foss, D.D., President of Wesleyan University; John F. Hurst, D. D., President of Drew Theological Seminary; and Erastus O. Haven, D. D., Chancellor of Syracuse University. The Conference recommended that the bishops reside at New York; Boston; Philadelphia; Syracuse, New York; Cincinnati, Ohio; Chicago, Illinois; Atlanta, Georgia, or Chattanooga, Tennessee; Des Moines, Iowa; St. Paul or Minneapolis, Minnesota; St. Louis, Missouri; Washington, Texas; and San Francisco, California. The question arose whether a person became bishop upon his election to the office or on his ordination. The Conference decided by common consent that his entrance upon the office took place on his being set apart to it by the laying on of hands according to the provisions of the Book of Discipline. A committee to whom the subject was referred made a report recommending that a bishop of African descent be elected; but the Conference refused to recognize color as in any way constituting a qualification for the office, and postponed the recommendation indefinitely. A report was adopted concerning the freedmen and the Southern work, ordering that the organization of the Freedmen's Aid Society remain unchanged, but that the Board of Managers of the Society be advised to give aid also during the next four years, so far as it can be done without embarrassment to the schools for the freedmen, and to the schools which had been established by the Church among the white people in the Southern States. A new ecclesiastical code, which had been prepared by the order of the previous General Conference, was amended and adopted. A plan was presented for the organization of the General Conference into two houses, one to consist of ministers, the other of laymen, meeting and voting separately, but was rejected by a vote of one hundred and ten to two hundred and eleven. A division of the Conference to vote by orders, as provided for by the plan under which lay representation was introduced into

the body, was had for the first time on a proposition to discontinue the official papers published at Atlanta, Georgia, and New Orleans, Louisiana. The papers were continued, conditionally. Amendments were made to the phraseology of certain sections of the Discipline for the purpose of obviating the inference of an intention to exclude women from the offices of class-leader, steward, or superintendent of the Sunday-school. Two cases of appeal came up against the decision of the bishop: in the one case, that the law of the Church does not authorize the ordination of women, and his refusal to submit to the Conference a vote to elect women to orders; and in the other case, that the Discipline does not contemplate the licensing of women as local preachers, and that the action of a district conference in licensing a woman was unauthorized. The action of the bishop was sustained in both cases, as being in accordance with the law of the Church, and with the uniform course of administration under it. The Conference refused to authorize a provision for compelling members of the Church to contribute to the support of the gospel. A committee of German ministers was appointed to translate the Book of Discipline into German. A plan was presented for the celebration of the centennial anniversary of the organization of the Methodist Episcopal Church in 1884 by appropriate exercises to be arranged by the appointment of a commission for the purpose, and the collection of funds for various objects of the Church; it contemplated also the appointment of a Centennial Educational Commission to devise plans for endowing and making secure the educational institutions of the Church, and enlarging the funds under the charge of the Board of Education for the assistance of needy students. The subject was referred to the bishops, who are to report a plan of action. The bishops were recommended to report to the General Conference all decisions on questions of law which should be made by them. The organization of an Annual Conference in Italy was recommended, on condition that the bishop presiding at the meeting of the Italian mission shall approve the measure. Resolutions were adopted declaring it to be the duty of the Government to enforce all the rights guaranteed by treaty to the Chinese upon American shores, and to afford them the protection which is accorded to citizens of the United States residing within the bounds of the Chinese Empire; instructing the official papers "to speak boldly and explicitly" on this subject and to this purpose; and advising the people to exercise charity toward Chinese immigrants, and seek to allay the hostility which has been stirred up against them.

II. METHODIST EPISCOPAL CHURCH, SOUTH.—The following is a summary of the statistics of this Church for 1879, as they were published in 1880. It shows the number of preachers and members.

ANNUAL CONFERENCES.	Traveling preachers.	Local preachers.	Total preachers and members.

Total in 1878.....	3,763	5,762	798,862
Increase.....	104	70	83,313

Number of Sunday-schools, 8,941, with 8,528 teachers and 42,137 scholars; number of baptisms during 1879, 28,011 of children and 49,798 of adults; amount of collections for conference claimants, \$66,823; for missions, \$129,713. The lay members are classified as follows: White members, 816,294; colored members, 1,251; Indian members, 4,931.

The *Board of Missions* had missions among the North American Indians, including an Indian Mission Conference, with 5,723 preachers and members, and a mission among the Eehota Indians in North Carolina, with 135 members; in China, where there were 5 missionaries, 8 native preachers, 2 woman missionaries, 6 Bible women, 19 Sunday-school teachers, 11 day-school teachers, 97 members, 186 scholars in Sunday-schools and 105 in day-schools; in Central Mexico, with 30 stations, 14 preachers, 10 teachers, 11 day and night schools, a school for young preachers, 15 Sunday-schools, and 531 members; on the Mexican border (Rio Grande), with 13 stations, 14 missionaries, 651 members, 4,800 in congregations, and 25 Sunday-schools, with 472 scholars; and in Brazil, with stations at Rio Janeiro and Piracicaba, with 2 missionaries and 36 members.

III. METHODIST PROTESTANT CHURCH.—This Church includes forty-four annual conferences, with 1,200 itinerant ministers and 130,000 lay members, holding church property which is valued at \$3,000,000.

The *General Conference* of the Methodist Protestant Church met at Pittsburg, Pennsylvania, in May. The Rev. G. B. McElroy, President of Adrian College, was chosen President. Measures were adopted for the participation of the Church in the Ecumenical Conference of Methodist Churches, to be held in London in 1881; for the appointment of a minister and a layman as members of the Western division of the Committee of the Conference; and for the appointment of three ministers and three laymen as delegates to the body. A petition was presented asking the Conference to take action against the connection of members of the Church with the Masonic order, the obligations and principles of which, it was alleged, were "repugnant and antagonistic to Christ and holiness." To this the Conference replied that, as the petitioners did not state what were the features of Masonry to which objection was made, and as they were unknown to the body, and as the fact was indisputable that many of the most exemplary members of the various Christian denominations were connected with the Masonic institution, "therefore it is to be assumed that the petitioners are mistaken in their estimate of freemasonry. While it is evident," the Conference report said, "that that estimate is based, at best, upon a mere guess or conjecture, and as the General Conference can not, consistently with its dignified character as a church legislature, undertake to work in the dark, especially if in doing so it would gravely pronounce many of our brethren in Christ to be antagonistic to him," the Conference therefore decline to take any action with reference to freemasonry. A resolution was adopted declaring the endowment of additional theological chairs in all the denominational colleges to be a positive necessity, which should be provided for as soon as practicable. With reference to the salaries of ministers, the Conference declared that the declaration in the Book of Discipline on elementary principles, that pastors should be given "a religious compensation for their labors," implies such a compensation as shall, by mutual agreement of pastor and people, be acceptable to both; therefore, that the pastor's consent to the amount of salary allowed him is necessary to constitute a binding obligation on all the parties concerned. The Colorado Conference (colored) was recognized as a mission conference. Provisions were made for putting the two Book Concerns of the Church at Baltimore, Maryland, and Pittsburg, Pennsylvania, under the control of the General Conference.

IV. AFRICAN METHODIST EPISCOPAL CHURCH.—The *General Conference* of the African Methodist Episcopal Church met at St. Louis, Missouri, May 3d. Among the more important

items of business transacted were the election of three bishops (the Rev. R. H. Cain, the Rev. W. F. Dickerson, and the Rev. H. M. Turner, LL. D.), the appointment of delegates to the Ecumenical Methodist Conference, and the adoption of a proposition to negotiate for a union with the British Methodist Episcopal Church in Canada. The bishops met at Newport, Rhode Island, August 12th, to make arrangements for carrying out some of the orders of the General Conference. A committee was appointed to prepare and publish Mr. Wesley's Liturgy and Ritual. It was ordered that as soon as practicable all the bishops should wear robes. A constitution was adopted for a connectional literary, historical, and educational association. A committee was appointed on the subject of union with other colored Methodist bodies. Other committees were appointed to prepare a course of studies to be published in the Book of Discipline, and to arrange for giving public notices of the festivals of the ecclesiastical calendar, etc., and call attention to the observance of them. Bishop Turner was deputed to visit Africa, and Bishop Dickerson to visit Hayti, Samana, and Santo Domingo, in the interest of the missions of the Church.

The commissioners appointed to arrange for a union of the British Methodist Episcopal Church, met at Toronto, Ontario, September 8th, during the session of the General Conference of the British Methodist Episcopal Church at that place, to execute the duty with which they were intrusted. A resolution was passed by the General Conference of the British Church, expressing a desire for union with the African Methodist Episcopal Church, and commissioners were appointed to treat with the commissioners of that body. Articles of agreement were prepared providing for the acceptance of the members of the British Methodist Episcopal Church into the African Methodist Episcopal Church, and the recognition of Bishop Disney, of the former body, as junior bishop of the latter body, and the organization of the British Churches into the tenth Episcopal district, with Bishop Disney as bishop in charge; the union to become of force when the articles of agreement shall have been ratified by a majority of the members of the British Methodist Episcopal Church and by two thirds of the Annual Conferences of the African Methodist Episcopal Church. The British Church became an independent body in 1860. Its jurisdiction extends over the Dominion of Canada and the West Indies; and it had in 1880 three Annual Conferences—the Ontario, Nova Scotia, and West Indies Conferences—one bishop, 77 itinerant and local ministers, 2,684 members, 37 Sunday-schools with 1,727 scholars, and one newspaper, "The Missionary Messenger." It had also foreign missions in the West India Islands.

V. WESLEYAN CONNECTION.—The following is a summary of the statistics of the Wesleyan

Methodist Connection, as published in connection with the minutes of the British Conference for 1880:

COUNTRIES.	Members.	On trial.	Ministers.
I. In Great Britain	376,678	25,824	1,478
II. In Ireland and Irish missions.	24,463	723	185
III. In foreign missions	86,758	10,636	881
IV. French Conference	1,782	62	29*
Total	489,711	37,245	2,023

The tables give also 328 ministers on trial, viz., 164 in Great Britain, 21 in Ireland, and 143 in the foreign missions; and 321 supernumeraries.

The anniversary of the *Wesleyan Missionary Society* was held in London, May 3d. The receipts of the Society for the year had been £165,498, of which £118,808 were described as "home receipts," or contributions from the stations and auxiliaries within the United Kingdom, £9,068 as "foreign receipts," or contributions from the mission-stations, and £37,622 had been received through the Wesleyan Methodist Thanksgiving fund.

The general summary of the statistics of the missions is as follows: Missions under the immediate direction of the Wesleyan Missionary Committee and British Conference, in Europe, India, China, South and West Africa, and the West Indies, as far as ascertained:

Central or principal stations called circuits	429
Chapels and other preaching-places in connection with the central and principal stations	2,599
Missionaries and assistant missionaries, including supernumeraries	445
Other paid agents, as catechists, interpreters, day-school teachers, etc	1,924
Unpaid agents, as Sunday-school teachers, etc	7,806
Full and accredited church-members	86,753
On trial for church-membership	11,079
Scholars, deducting for those who attend both the day and Sunday schools	98,208
Printing establishments	8

In Western Africa explorations had been made with a view of extending the missions into the interior as soon as the resources of the Society should permit such an experiment. A Proprietary High School for Girls had been begun at Freetown, Sierra Leone. A Zenana mission had been begun prosperously in Bengal. Much medical relief had been given in China. Arrangements had been recently made to put the missions in the West Indies upon a better basis, with a view to the development of local resources, which should result in self-support and self-government, and satisfactory progress had already been made in carrying them out.

The number of Sunday-schools was reported to be 6,376—121 more than were reported in the previous year. Of these, 2,629, or rather more than one third, belonged to the Connectional Sunday-school Union. The whole number of officers and teachers was 119,911, and of scholars 787,143. These returns showed an

increase of 1,151 officers and teachers and 20,386 scholars. The total cost of Wesleyan Sunday-schools during the year had been £66,574.

The *Wesleyan Conference* met in its one hundred and seventh session, in London, July 20th. The Rev. E. E. Jenkins, one of the missionary secretaries of the Connection, was elected President. The numerical returns showed that a net decrease of 934 had taken place in the number of members during the year, while the number of persons on trial had increased by 1,840. It appeared by comparing the details of the statistical report that while more than 43,000 new members had been received, 5,572 had died, and 37,000 persons who had been members were no longer represented on the class-rolls. This number was made up of 14,000 persons who had removed, and more than 23,000 persons who had ceased to contribute and attend class-meeting. The decrease was greatest in Cornwall, and was attributed there to financial depression. This was the third year in which a decrease was reported. The project for holding an Œcumenical Conference of Methodist Churches was finally approved, and full arrangements were made for calling and holding the Conference at the City Road Chapel in London, in September, 1881. It was decided that the meeting should be called a Congress rather than a Conference. The Executive Committee of the Thanksgiving fund which was instituted by the Conference of 1878, and which the Conference of 1879 had resolved to make £244,975 if that amount could be raised, reported that the subscriptions to the fund amounted on the 15th of July to £287,155, of which £134,007 had been paid in, and that subsequent subscriptions had raised the amount promised to £289,000. The committee had resolved to increase the fund to 300,000 guineas, or £315,000. Meetings had been held in behalf of the fund in all the districts, and in all but fifty of the circuits. The Sabbath Committee, after a detailed statement of what had been done, especially with reference to the closing of public-houses and the opening of museums on Sunday, reported that "upon a review of the events of the year bearing upon the Sabbath question, we can not but think, notwithstanding discouraging circumstances, that, all things considered, an advance favorable to our most cherished aims and hopes has been made." A declaration was adopted in reference to the use of trust property for amusements and other purposes not contemplated in the formation of the several trusts, by which the members and officers of churches were reminded that such properties can be legally used only for such purposes as are in accordance with the provisions of the deeds, which are religious worship and "public and other meetings and services held according to the general rules and usages of the people called Methodists as they appear in the Annual Minutes of Conference from time to time published." The Home Mission Committee was authorized to

* Exclusive of the French ministers who are employed in the Channel Islands.

employ, in addition to district missionaries, ministers and lay agents for general evangelistic work. The subject of establishing a Conference in South Africa was considered, but such a measure was judged to be not yet expedient.

VI. PRIMITIVE METHODIST CONNECTION.—The following is a summary of the statistics of this Connection (exclusive of the Canadian Conference), as they were reported to the Conference of 1880: Number of members, 174,469; of ministers, 1,041; of local preachers, 14,244; of class-leaders, 10,220; of chapels, 4,072; of other places of worship, 1,846. The return of members shows a decrease of 101.

The thirty-seventh anniversary of the *Primitive Methodist Missionary Society* was held in London, May 11th. The receipts of the Society for the year had been £23,820 distinctively styled missionary money, and £15,354 contributed for various special purposes, making in all £39,175. The debt of the Society amounted to £7,000. The missions included 72 stations, with 107 missionaries, in the United Kingdom; 66 stations, with 94 ministers and missionaries, in Canada; 90 stations, with 112 ministers and missionaries, in Australasia; three stations, with three European and two native missionaries, in Africa; in all, 231 stations, with 318 missionaries and colonial ministers. The only missions to the heathen were at Fernando Po, West Africa, and Aliwal North, South Africa. The mission at Fernando Po had been closed in the previous year in consequence of the repressive measures of the Spanish authorities; but the work had been resumed, and was going on prosperously, under a suspension of the unfriendly restrictions.

VII. UNITED METHODIST FREE CHURCHES.—The following is a summary of the statistics of this body as they were presented to the Conference in July, 1880: Number of ministers, 391; of supernumeraries, 35; of local preachers, 3,391; of leaders, 4,249; of members, 72,044; of persons on trial, 7,433; of chapels, 1,356; of preaching-rooms, 199; of Sunday-schools, 1,345, with 26,913 teachers and 189,033 scholars. The returns show a decrease of 425 members in the home, and an increase of 160 members in the foreign, stations; a decrease of 1,000 persons on trial, and an increase of 402 Sunday scholars.

VIII. METHODIST NEW CONNECTION.—The eighty-fourth annual Conference of the Methodist New Connection met at Longton, June 14th. The Rev. W. Cocker, D.D., Principal of Ranmoor College, Sheffield, was chosen President. A special fund was established, to be known as the Connectional Auxiliary fund, to consist of £12,000, and to be apportioned among the foreign missions, the Paternal fund, the College fund, and a contemplated Connectional loan fund. The Missionary Committee was instructed to prepare a plan for the employment of Bible women among the destitute. A resolution was adopted approving the Government "Burials Bill."

IX. WESLEYAN REFORM UNION.—The statistical reports of the churches connected with this body, made to the representative assembly in August, showed that the number of preachers was 605, and the number of members was 7,360. One hundred and eighty-nine Sunday-schools included 3,011 teachers and 19,078 scholars. These figures showed an increase during the year of 73 preachers, 120 members, 6 Sunday-schools, 115 teachers, and 557 scholars.

X. ŒCUMENICAL CONFERENCE OF METHODISM.—The committee appointed to represent the different branches of the Methodist family of churches in reference to an *Œcumenical Conference of Methodism*, held meetings in Cincinnati, Ohio, May 6th and 10th, and decided to call such a conference to meet in the City Road Chapel, London, about the middle of August, 1881. The Conference, it is stated in the call, is not to be for legislative purposes, nor for doctrinal controversies, nor for an attempt to harmonize the various polities and usages of the Methodist churches, but for co-operation rather than consolidation, and to devise such means for prosecuting the home and foreign work of the churches as will result in the greatest economy and efficiency, to promote fraternity, and to increase the moral and evangelical power of a common Methodism. Among the subjects which such a conference might properly consider are mentioned the duty of Methodism with reference to diverse and antagonistic faiths, and toward evils and vices; its relation to education; the means of evangelization; Methodism as a missionary movement; the relation of the home to the foreign work, and the best mode of avoiding waste and rivalries, and of securing sympathy and co-operation between different Methodist bodies occupying the same or contiguous mission-fields; the use of the press; the resources of Methodism and its corresponding responsibility; the spiritual unity of Methodism, and the best way to secure its maintenance and increase, and to manifest it to the world; and other kindred topics. The Conference is to be composed of four hundred members, including as nearly as possible equal numbers of ministers and laymen, who are to be assigned so that the British and Continental Methodists and their affiliated conferences and mission-fields shall have two hundred, and the conferences and churches in the United States and Canada and their foreign work shall have two hundred representatives. The distribution of the British and Continental delegates is to be determined by the British churches through consultation and correspondence. The delegates assigned to the United States and Canada are to be distributed as follows: The Methodist Episcopal Church, 80; the Methodist Episcopal Church, South, 38; the African Methodist Episcopal Church, 12; the Methodist Episcopal Zion Church, 10; the Colored Methodist Episcopal Church of America, 6; the Evangelical Association, 6; the Union American

Methodist Episcopal Church, 2; the Union American Protestant Church, 2; the Methodist Protestant Church, 6; the American Wesleyan Church, 4; the Free Methodist Church, 2; the Independent Methodist Church, 2; the Congregational Methodist Church, 2; the Methodist Church of Canada, 12; the Methodist Episcopal Church of Canada, 4; the Primitive Methodist Church in the United States and Canada, 2; the Bible Christian Church, 2; and the British Methodist Episcopal Church, 2. The remaining six members are left to be distributed by the Western section of the General Executive Committee.

A General Executive Committee is constituted, to be composed of one minister and one layman from each Methodist body, which shall be divided into two sections, meeting separately: the Eastern section, for English and Continental Methodists and affiliated Conferences; and the Western section, representing the American Methodists. Bishop Matthew Simpson was constituted chairman of the Western section of the committee.

MEXICO (ESTADOS UNIDOS DE MÉXICO). For details concerning area, territorial division, population, etc., reference may be made to the "Annual Cyclopædia" for 1874, 1875, and 1879. In a semi-official publication for the present year, the population is set down as follows: Indians, 3,200,000; whites, 1,600,000; mestizos ("forming the nation proper, being intrusted with the collection of the revenue and the political direction of the country"), 5,200,000; total, 10,000,000.

The President of the Republic from May 5, 1877, to November 30, 1880, was General Porfirio Díaz; and the Cabinet was composed of the following Ministers: Foreign Affairs, Señor M. Ruelas; * Interior (*Gobernación*), Señor Felipe Berriozábal; Finance, Señor Manuel Toro; Justice, and Public Instruction, Señor Ignacio Mariscal; † Public Works (*vacant*); War, General Carlos Pacheco.

On December 1, 1880, was inaugurated the new constitutional President, General Manuel Gonzalez (elected in July of the same year); and the new Cabinet was made up as follows: Foreign Affairs, Señor Ignacio Mariscal; Interior, Señor Carlos Díez Gutierrez; Finance, Señor Francisco Landero y Cos; War, General Gerónimo Treviño; Justice and Public Instruction, Licentiate Ezequiel Montes; Public Works, General Porfirio Díaz.

The President of the Supreme Court (and consequently, by the terms of the Constitution, Vice-President of the Republic) is Licentiate Ignacio L. Vallarta; and the magistrates are: Licentiates Pedro Ogazon, Manuel Alas, Miguel Blanco, José María Bautista, Juan de Mata Vazquez, Eleuterio Avila, Jesus M. Vazquez Palacios, Mannel Contreras, Juan Manuel Saldafia, Pascual Ortiz, and José Fernando Coro-

na; with Señor José Eligio Muñoz, Attorney-General, and the Procurator-General.*

The Governor of the Federal District (appointed by the President for an unlimited term) is General Carlos Pacheco. The other Governors, with their respective salaries, were as follows:

Aguas Calientes.....	Señor Miguel Guinchart.	\$2,000 00
Campeachy.....	Señor Arturo Shielz.	3,000 00
Chiapas.....	Colonel Miguel I trilla.	3,000 00
Chihuahua.....	Señor Luis Terrazas.	?
Coahuila.....	Señor Evaristo Madero.	1,400 00
Colima.....	Señor Francisco Santa Cruz.	3,000 00
Durango.....	Licentiate Francisco Gomez del Palacio.	3,600 00
Guanajuato.....	Licentiate Manuel Muñoz Ledo.	?
Guerrero.....	Señor Rafael Cuellar.†	3,000 00
Hidalgo.....	General Rafael Cravioto.	4,000 00
Jalisco.....	Señor Fermin G. Riestra.	6,000 00
Mexico.....	Señor Marino Zuñiga.‡	3,908 25
Michoacan.....	Señor Octaviano Fernandez.§	?
Morelos.....	Señor Carlos Quaglia.	?
Nuevo Leon.....	Señor Bibiano L. Villareal.	3,000 00
Oajaca.....	General Francisco Melguero.¶	4,000 00
Puebla.....	General Juan N. Mendez.	5,000 00
Queretaro.....	Señor Francisco G. de Cosío.	3,000 00
San Luis Potosi.....	Señor Francisco Bustamante.¶	4,000 00
Sinaloa.....	Señor Mariano Martinez de Castro.	?
Sonora.....	Señor Luis E. Torre.	2,600 00
Tabasco.....	Señor José Francisco de Lanz.	2,700 00
Tamaulipas.....	Señor Antonio Canales.	3,600 00
Tlaxcala.....	Señor Miguel Lira y Ortega.**	3,000 00
Vera Cruz.....	Señor Apolinar Castillo.	6,000 00
Yucatan.....	Señor Manuel Komero Ancona.	3,000 00
Zacatecas.....	Señor Jesus Aréchiga.	4,000 00
Lower California (Ter.).....	Señor Tiburcio Montiel.	?

The State Governors are elected for a term of four years. The Governor of the Territory of Lower California is appointed by the Federal Government.

The Mexican Minister to the United States was Señor M. de Zamacona; and the Mexican Consul-General in New York is Dr. Juan N. Navarro. The United States Minister to Mexico is P. H. Morgan; and the United States Consul-General at the capital is David H. Strother.

The Archbishop of Mexico is the Rt. Rev. P. A. de Labastida (1863).

The army is composed approximately as follows: 21 batteries of foot, 14,680 men and 777 officers; 10 corps of horse, 4,990 men and 370 officers; 5 brigades (of 4 batteries each) of artillery, 1,618 men and 171 officers; coast-guards, 71 men and 22 officers; rural guards (*guardias rurales*), 1,692 men and 153 officers; and Invalids, 267 men and 19 officers; total, 28,830 rank and file.

The navy consists of four gunboats.

The national revenue for the fiscal year 1877-'78 was reported at \$19,424,539, and the expenditure at \$19,838,699, leaving a deficit of \$14,160, unusually small for Mexico. But the unfavorable disproportion has since that year been much greater, as shown in the following schedule:

* The functions of this office were discharged by Licentiate Francisco Gomez del Palacio until November, 1880, when he was elected Governor of the State of Durango.

† Until March, 1881.

‡ To be succeeded, March 20, 1881, by Licentiate José Zubia.

§ Until September 15, 1881.

¶ Until November 30, 1881.

¶ Until April, 1881.

** To be succeeded, on January 15, 1881, by Señor Mariano Grajales.

* Died September 22, 1880.

† Minister to the United States during the Administration of President Lerdo de Tejada.

YEARS.	Revenue.	Expenditure.
1878-'79.....	\$16,128,807	\$22,108,046*
1879-'80.....	16,808,455*	23,334,636*
1880-'81.....	17,511,125*	23,128,218*

According to these figures the resulting deficit for the first of the three periods would be \$5,979,239; for the second, \$7,031,181; and, for the third, \$5,317,093.

The estimated amount and sources of the national revenue for the year 1880-'81 are exhibited in the annexed table:

REVENUE.

Custom-house (maritime and frontier):	
Import duties.....	\$3,523,625
Export duties.....	953,271
In transitu.....	60,063
	\$10,546,964
Custom-house of the city of Mexico, etc.....	1,013,434
Stamped paper.....	3,003,147
Direct taxation.....	559,217
Post-Office.....	679,392
Mint.....	375,093
Public Instruction (old fund).....	83,957
National property.....	27,254
Lottery.....	82,856
Sundries.....	1,529,761
Total.....	\$17,511,125

The following table shows for the same year the estimated amount and distribution of the

EXPENDITURE.

Legislative.....	\$1,022,842
Executive.....	43,832
Judicial.....	855,578
Ministry of Foreign Affairs.....	228,460
“ of the Interior.....	2,574,209
“ of Justice and Public Instruction.....	1,174,805
“ of Public Works.....	3,570,077
“ of Finance.....	4,263,619
“ of War.....	9,736,964
Total.....	\$23,128,218

Yet President Diaz, in his message to Congress, at the opening of the fall session of 1880, spoke hopefully of the financial condition of the country. We give an extract from that document at the end of the present article.

In a report published by the Minister of Finance in September, 1879, the sources and amount of the revenue for the fiscal period ending June 30th of the same year, were as follows:

REVENUE.

Customs (maritime and frontier).....	\$3,949,708
Customs of the city of Mexico.....	1,013,433
Stamped paper.....	3,003,258
Direct taxation.....	559,217
Post-Office.....	679,392
Mint.....	367,922
Public Instruction (old fund).....	24,725
National property.....	27,254
Lottery.....	81,822
Sundries.....	234,942
Balance from previous year.....	1,404,144
Total.....	\$17,350,867

The estimated expenditure for that period having been \$22,108,046, there was a consequent deficit of \$4,757,179.

The lottery-tax consists of an impost of 10 per cent. on the prizes drawn in the State lotteries.

* Official estimates.

In the table above given of the estimated expenditure for the year 1880-'81, the item "Executive" is made up of the following branches: Salary of the President of the Republic, \$30,000; department of the President's private secretary, \$5,200; President's staff, \$10,292; service, \$3,340.

In the "Annual Cyclopædia" for 1878 and 1879 may be found important remarks concerning the national debt of Mexico, the estimated amount of which then, exclusive of the claims referring to the Maximilian empire—claims never yet recognized as valid by the republican Government—was \$131,914,665. The following interesting observations on the revival of Mexican securities is transcribed from a British financial journal published in February, 1880:

An improvement in Mexican bonds is exciting the attention of the speculative community, the more especially from its occurring after a series of alternate spurts and relapses in this now, perhaps, the most speculative of all foreign stocks. It is noticed that no public announcement of adequate importance has appeared in explanation of these occasionally very contradictory movements. Those operators seem to have done best who have acted upon the plan of always buying when the price gets low, and turning out their stock when it shows a good profit; for between certain limits there have been of late numerous oscillations, affording proportionate opportunities of profit to the quick and ready speculator always on the spot. But, while to the ordinary operator Mexican bonds supply the place of the mysteriously "dark" horse of the turf-gambler, it does not escape notice that each successive relapse in prices that has taken place during the last few months has induced purchases by houses of first-rate position in the city of London; and these purchases do not seem to have been "undone" by subsequent sales. As to the motives which dictate them, nothing definite can be said, but it can not be doubted that they have a sufficient basis, though whether in connection with projects for the settlement of the debt, or with plans for railway extension in Mexico, or (which is very likely) with proposals in which both these projects are to be welded together, remains to be seen. Even within the last day or two a very confident belief is expressed in speculative circles that a good deal of profit will yet be got out of Mexican bonds as a market "counter" this year. Upon these views it is probable that, should the price relapse again, the number of persons who will seek to "get in" will be larger than for some time past. It is believed that the dealers in these bonds are oversold; and this circumstance, as implying inherent strength in the market, may be considered adverse to the prospect of a relapse in quotations. Last evening the price rose to 14 to $\frac{1}{4}$, being an advance of nearly £2 on the week. Another of the market anomalies of the moment may be here pointed to. Up to a day or two ago, the Mexican bonds of 1864 were quoted about 6. During the last few days they have come into demand, and last evening their price had risen to 8 $\frac{1}{2}$ to 9. Even at this improvement they are absurdly low. This can be easily shown. What do these bonds represent? They were issued for the arrears of interest at the last settlement of the debt. Upon every principle of right, therefore, they represent what must be regarded as the most sacred part of a debt, viz., overdue interest, upon which, even when thus funded, the unfortunate holders have received no return. It is, therefore, to be expected that, when the settlement of the Mexican debt comes, as come it must in some form sooner or later, these 1864 bonds will be treated with special respect. And yet they are ranked far below the other bonds!

As the result of the study of the debt question by the special committee appointed therefor (see President's message hereafter), the officially recognized amount of the nation's indebtedness on June 30, 1880, was: principal, \$98,521,789.53½; interest, \$46,431,996; total, \$144,953,785.53½.

As to the foreign commerce of Mexico, we have here again to repeat, what has been stated in our volumes since 1873, namely, that in the absence of adequate and reliable statistics, it is only possible to say that the exports, as calculated from custom-house returns, are of a mean annual value of \$30,000,000, and the imports \$27,000,000. But such is the prevalence of systematic smuggling that these returns can never be regarded as correct; indeed, the whole of the figures therein representing the imports, and those standing for bullion in the exports, may safely be doubled.

Among the commodities most extensively exported are silver and gold coin, silver and copper ore, cochineal, indigo, and other dye-stuffs, coffee, sugar, vanilla-beans, hides, timber, cabinet-woods, Sisal hemp (*henequen*), ixtle, etc., and the chief imports are linen, cotton, woolen, and silk fabrics, iron wrought and unwrought, machinery, hardware, provisions, etc. The Minister of the Interior, in his report to Congress on May 1, 1880, took special pains to refute the statement, made by "prominent persons," that the annual imports from European countries into Mexico were of the value of \$70,000,000, and to demonstrate, with the aid of "European official returns, *having no trustworthy Mexican data at hand*," that the total imports from all countries did not reach one half that sum. It would appear from the Minister's report that the mean *invoice* value of the imports for each of the years 1877-'78 and 1878-'79 is \$19,576,500. This invoice value, formerly increased 50 per cent. by the Mexican officials, to give the *market* value, has of late been increased 60 per cent. "It is very plain, however," observes the United States consul at Matamoros, "that the only proper basis for computation is the original invoice value. In this connection it must be noted that the invoice values are in Mexican eagle dollars, and that these dollars have a declared value in the United States of 90·9 cents. If we reduce the \$19,576,500 to United States gold, we find it amounts to only \$17,896,038. But, while this computation is on the basis of 90·9 cents, the actual local market value of eagle dollars has been known for some years not to exceed 85 cents, which would give an actual value in United States gold of \$16,640,·025." The following table exhibits the various commodities exported in the year ending June 30, 1878, and their value respectively:

Coffee.....	\$1,275,058
Sisal hemp (<i>henequen</i>), ixtle, etc.....	1,259,288
Gold.....	1,265,199
Silver, coined and bullion.....	20,493,129
Ores, unrefined.....	267,311
Hides.....	578,822

Carried forward.....	\$25,138,752
Skins, goat, etc.....	461,156
Orechilla.....	284,312
Sugar.....	276,479
Vanilla.....	846,193
Woods:	
Mahogany.....	879,365
Cedar.....	357,340
Campeche, etc.....	174,898
Mulberry (called <i>moral</i> in commerce as in Mexico).....	549,654
Sundries.....	859,424
Total.....	\$28,777,509

According to British official statistics, the Mexican imports from and exports to Great Britain were of the values shown in the annexed table for the decade ending in 1879:

YEARS.	Exports.	Imports.
1870.....	\$1,499,065	\$4,554,410
1871.....	1,986,670	5,245,065
1872.....	2,217,620	4,215,430
1873.....	2,497,660	5,970,620
1874.....	2,733,255	5,623,065
1875.....	3,609,535	4,424,505
1876.....	3,810,619	2,511,120
1877.....	3,994,285	4,977,500
1878.....	2,535,410	3,866,655
1879.....	2,913,795	3,465,615

The figures here given, however, represent the values of Mexican exports for *British markets* and of imports of *British and Irish* produce into Mexico. But large shipments are frequently made to Great Britain of commodities for *distribution among other European markets*; and, conversely, extensive quantities of Continental products are transshipped or shipped *last* in British ports. Thus in the official statistics of Mexican trade for the year 1875, the total exports to Great Britain were of the value of \$13,481,000, and the total value of the imports from Great Britain \$12,523,000. Hence, considerably more than one third of the Mexican exports are shipped directly to Great Britain, either for consumption there or for distribution among other European markets; and by far the largest share of the imports are directly from England. The exports to and the imports from the United States in 1879 were of the values of \$6,090,574 and \$5,671,·134 respectively, against \$12,820,000 and \$7,·133,000 in 1875. The balance of trade in favor of Mexico and against the United States in the first of these two years was consequently \$419,·440, and in the second \$5,687,000. The United States consul at Vera Cruz, in a report to the State Department of Washington under date of October 30, 1880, speaks of the progressive popularity in Mexico of articles manufactured in this country. He says:

We can hold the ground we have, and extend the field of occupation if our artisans and manufacturers continue to excel in the superior quality of articles they produce. Our machinery, tools, cutlery, clocks, watches, sewing-machines, arms, wooden-ware, hardware, brooms, and woven fabrics are justly more popular and more eagerly sought for than the same articles from Europe. Some of these articles are being imitated in Europe, and are finding their way here. The tendency of this nefarious trade is in two ways to depress and injure our good name and intentions: first, by destroying our well-earned reputation by

making our manufacturers seem to acknowledge somebody else's illegitimate offspring by forging to worthless articles some well-established name or mark; and, secondly, by ruining the prices and confidence of the consumers, who may not have the means of comparison and distinguishing the genuine from the false. When Europeans resort to such dishonorable practices, they acknowledge thereby their own inferiority, and offer a potent admonition to our citizens not to seek to lower in anything the present standard of their excellence. We can not compete with them in worthless manufactures, and we ought not to exercise our faculties in that direction. Many articles, such as flour, canned groceries of all kinds, potatoes, etc., could find a ready and extensive market here if the tariff were not prohibitory. Eight dollars a barrel on flour makes it impossible to import it into Mexico without loss. These high rates on the staple articles of family consumption render living very expensive in a land where it should be the cheapest.

Touching the question of extending our commercial relations, the following suggestions, extracted from the United States consul's report from Matamoros to the State Department, will doubtless be found useful:

Nothing can be well done in haste or without labor, and in no country is this more true than in Mexico. In those places where American goods are already sold, the sale can be continued and increased. There are many places which American goods have not yet reached, or where they are not handled with a view to their increased sale. If the American merchant is desirous to enter into the trade, it is necessary that the work shall be carefully studied, and then pushed steadily. The best way is to establish either a branch house or an agency. All things considered, the first plan may be given the preference. This involves a good capital, long credits, and efficient managers at both ends of the partnership. The manager of the branch house must be able to study the market, the customers, and the import laws with care and patience not needed in the United States. He must be able to use his eyes and ears and control his tongue; must not only be honest and of good habits, but must have these qualities in a marked degree. It will be found necessary that the local house select or determine the goods to be sent out, and that such be sent exactly. The indifference of some American houses in filling orders for Mexican purchasers has been prejudicial to the interests of the purchaser, and, of course, to an increase of trade. To illustrate: in an order given for prints, or goods of certain width, the American house does not seem to realize, or to care, that a small deviation from the width in the invoice or import declaration will not only make very heavy fines and vexatious delays, but subject the really innocent importer to imprisonment. I have been led to believe that at least some few American dealers have spells of enthusiasm and relapses of indifference regarding the export trade to Mexico. In their time of enthusiasm they send circulars, circular letters, and even individual letters to every consular officer or other person whose address they may have in the section in which they wish to operate. They usually desire immediate and full replies to several queries, but omit to inclose return stamps. Many private persons would hardly feel like taking a great deal of pains to answer all such letters. The replies to these letters come in slowly. Many of the recipients may be busy for two weeks and then use two weeks more to get all the information desired. The two letters may easily use up a month or more *en route*, and it is thus from two to three months before they are all in and a careful study of them can be made. Long before this the inquiring house has got disgusted at the delays or difficulties in the way. Whoever thinks of the Mexican trade should study it for some time, and in all situations. Having once decided to undertake the work, calculate not only to spend money and time

and talent, but to give infinite care and patience in return for future profits. No one can be guaranteed success, but others, notably Germans and Spaniards, do succeed, and, without doubt, there is a fair chance of our doing as well as they if we give the same care and have the same amount of capital and credits. Trade journals which reach this office do a good work in the direction of trade increase, and I have thought that they might do good service by showing the weak spots which must be improved to enable our trade to reach its proper development. It is plain that, to study the subject of Mexican trade, statistics, which will show for a series of years the routes, kinds, and values of the imports and exports, are a primary necessity. These statistics have not often been so kept as to make it possible to give reliable reports, and when kept at the various custom-houses have not been published with the regularity that is desirable. Besides this, the Spanish language is almost an unknown tongue in the United States, and anything published in Spanish is comparatively buried. These causes, added to the ignorance of Mexico which prevails in the United States, have given credence to very exaggerated reports as to the wealth and commerce of the country. Mexico is a land of wonderful beauty and natural advantages. Perhaps the loveliest spots on the face of the earth may be found within her borders, and to the beauty of the landscape may be added climate and natural products as fine. Her mines of great known wealth have yet, according to rumor, marvelous unknown riches, and the number yet unworked is fabulous. Such has been the effect of this ignorance or this romance, or both together, that the actual facts and figures of the total Mexican commerce have been difficult things to determine.

The value of the exports to the United States through the now termed *free* port of Nuevo Laredo, for the five years 1875-'80, was reported as follows:

YEARS.	Value.
1875.....	\$206,125 09
1876.....	206,705 52
1877.....	400,425 56
1878.....	411,552 50
1879.....	457,459 84
1880.....	648,160 90

"My belief," says the United States vice-consul at that place, "is that these figures do not show much over 50 per cent. of what actually crosses into the United States, and I base my conclusions on these facts: It is generally conceded that the growth of late years of these two cities* on the Rio Grande is owing to the excellent facilities for smuggling, and that three fourths of the native population is engaged in it, on a larger or smaller scale. The Rio Grande is fordable at scores of places between these two cities, and for miles up and down at near intervals. I personally have seen loads and loads of American prints, muslins, and other goods, leave from stores in Laredo at night, bound for convenient points to smuggle into Mexico. They are generally done up in packages weighing about one hundred and fifty pounds, covered with canvas. When they reach a certain ranch, and the coast is clear, packages are strapped on each side of a mule, and they cross the river and generally reach their destination on this side. As a further proof, in many of the interior cities American prints, on which the Mexican duty is twelve cents a *vara*

* Nuevo Laredo on the Mexican and Laredo on the American side of the river.

(about thirty-three inches), sell at retail at twelve and a half cents a yard. It is not reasonable to believe that men who live by smuggling and have all these facilities, return from their trips unloaded; the small number of custom-house officials can not prevent it. The Mexican custom-house requires the following force: One collector, a deputy, who is cashier, an examiner, three clerks in office, one commandant, and sixteen mounted inspectors. They have about the same territory to cover as the American officials at Laredo. The customs officials at Laredo are a collector (deputy), one guard at river (no one to relieve him for meals, etc.), and two mounted inspectors, with a territory of sixty miles up the river and thirty miles down the river to patrol. It is no wonder to me that smuggling is so extensively carried on. The United States force is entirely inadequate."

Of the single article *henequen* (Sisal hemp), 97,351 bales, of the aggregate weight of 39,501,725 Mexican pounds, and of the value of \$1,805,848.18, were shipped through Progreso, the port of Mérida, in 1880. The several destinations of the same, and the quantities to each, are exhibited in the subjoined table:

PORTS OF DESTINATION.	Quantities.
Havana.....	10 bales.
Bremen.....	10 "
Marseilles.....	50 "
Barcelona.....	235 "
Falmouth.....	302 "
Bolbec (France).....	411 "
Hamburg.....	900 "
Gibraltar.....	904 "
New Orleans.....	1,450 "
Havre.....	1,833 "
London.....	1,923 "
Liverpool.....	5,234 "
New York.....	83,984 "
Total.....	97,351 bales.

Interesting details concerning this important industry were given in the "Annual Cyclopædia" for 1876, page 544.

The yield of the Progreso Custom-House for the month of April, 1880, amounted to \$30,501.81.

Referring once more to the subject of contraband trade, it should here be said that the system has become of late so general as to cause material prejudice to legitimate commerce, and affect the national revenue to an alarming extent. Here follows the translation of a law promulgated in the second half of 1879, and the vigorous terms of which it was hoped, but too sanguinely, would have the effect of diminishing, if not altogether eradicating, that illicit traffic.

The Congress of the United Mexican States decrees:

ARTICLE I. Besides the penalties established in chapters xx and xxi of the maritime and frontier custom-house tariff of the 1st of January, 1872, the authors of contraband or fraud against the rights of the Treasury, their accomplices, the receivers of the goods, and the employees who may be in collusion with any of the persons as before described, shall be punished with the penalties hereafter stated.

ART. II. In the cases mentioned in the clauses one,

two, and three of Article CLXXXVI of the said tariff, if the owners, conductors, captains, or any other persons transporting the goods should be apprehended, they will undergo five years' imprisonment, and their names shall be published in the newspapers; if it be proved that any commercial house established in the republic has carried on or favored contraband after this law shall have gone into force, besides the foregoing penalties which shall be applied, according to the case, its name shall also be published in the newspapers, its name shall not be recognized in any transactions with the public Treasury, and will not be admitted in any official or commercial transaction by any Government office.

ART. III. In all the other cases stated in Articles LXXXVI and LXXXVII of the tariff, a corporal punishment of from six months to five years' imprisonment will be imposed, under the following conditions: If the total amount of the duties defrauded passes one hundred dollars without exceeding a thousand dollars, an imprisonment of from two to six months will be imposed; if it exceeds a thousand dollars without reaching two thousand, double the time; if it passes two thousand and does not reach three, triple the time; and thus successively, without exceeding the maximum of five years.

ART. IV. Corporal punishment shall not be inflicted in the cases comprehended in clauses four, five, and six of Article LXXXVI, chapter xx of the said tariff, when the amount of the duties does not exceed two hundred dollars.

ART. V. When the manifestation of the goods in the consular documents is done in an ambiguous manner, without being subject to the nomenclature of the tariff, the penalty of double duties will be imposed on the goods which arrive ambiguously manifested; in this case every package of the cargo should be examined.

ART. VI. Accomplices in the offenses of contraband or fraud in which the penalty of imprisonment is imposed, half of the punishment shall be inflicted on the first named, and a fourth on the second, which should or may be imposed on the principal authors of the contraband or fraud.

ART. VII. The Government employees who may be proved to be complicated in the aforesaid offenses shall suffer the penalties established in the present law, and those imposed by the tariff in force, and other laws on the subject; but in every case with the understanding that the imprisonment inflicted can never be less than double the time imposed upon the principal delinquent or delinquents of the contraband or fraud.

The protection of home manufactures has long been an object of earnest solicitude on the part of the Mexican Government; and, in consequence, those articles, particularly the cotton and woolen fabrics, have been partially exempted from imposts, while corresponding foreign goods have been subjected to duties exceeding in many cases the cost of the same. For instance, here follow some of these duties in the existing tariff: Unbleached domestics, nine cents per square metre; bleached domestics, sixteen cents; prints or calicoes, fourteen cents; white cotton thread, sixty cents per kilogramme; colored thread, ninety-six cents; cassimeres and similar woolen goods, \$1.40 per square metre. The annexed extract is from the revenue law passed at the spring session of Congress, taxing all this class of goods of domestic manufacture:

The Congress of the United Mexican States decrees:

ARTICLE I. The revenues of the Federal Treasury

for the fifty-fifth fiscal year, commencing July 1, 1879, and ending June 30, 1880, shall be composed of the following items: . . .

ART. XIV. Of the proceeds of the new imposts hereby established as follows, and which shall be collected on and after July 1st of the present year, and the articles manufactured in factories or shops whose capital does not exceed \$500, are excepted.

A. Three cents for each gross kilogramme of cotton woven goods, smooth and brown, manufactured in national territory under the denomination of domestics (*mantas*) or otherwise.

B. Four cents for each gross kilogramme of smooth cotton goods, white or colored, manufactured in national territory.

C. Two cents for each gross kilogramme of cotton thread of whatever class or factory, manufactured in national territory.

D. One cent for each gross kilogramme of yarn of all classes, and of cotton, manufactured in national territory.

E. Two cents for each square metre of carpet, rug, counterpane, and other analogous woven woolen goods, or wool and cotton or of other materials with a mixture of any other, manufactured in national territory.

F. One cent for each square metre of baize, nubias, and other analogous woolen goods, or wool and cotton, manufactured in national territory.

G. One cent for each gross kilogramme of woolen thread, white or colored, manufactured in national territory.

H. Duties of importation on the foreign goods similar to the national goods taxed in the clauses A, B, C, D, E, F, G, adding to the duties which the former now have fixed by the existing tariff, a sum equivalent to that established by this law on each one of the latter.

The value of the total annual production of the home-made cotton and woolen fabrics is estimated at \$20,000,000, and the yield of the tax thereon at \$500,000; hence the rate of the impost is about two and a half per cent. It will be observed from the tenor of the foregoing decree that, in order to prevent this new tax from operating favorably upon the importation of foreign goods, the same rate of taxation is also levied upon all similar articles imported through the custom-houses, so that the foreign goods, whose duties are above stated, are to be burdened in addition with the same tax as that levied on domestic fabrics. This measure provoked determined opposition on the part, not only of the manufacturers, but also of the trade-unions and protectionists generally, and "nothing but the urgent necessities of a Government with an exhausted Treasury could have secured the passage of the law."

The state of things to be inferred by the following extract from the President's message to Congress at the opening of the fall session, September 16, 1880, is one of singular prosperity for Mexico:

The legal and peaceful renovation of the public powers, at all times an event of great political importance, has rarely had a significance so clear and opportune as to-day. Our relations with the friendly powers continue with the same reciprocal and benevolent cordiality, and are carefully maintained by the worthy representatives of those powers and by the agents of Mexico abroad. The Government of the United States of America appointed a new Minister Plenipotentiary, who, having been received in the month of April, of the present year, is now in the exercise of the functions of his high investiture. The

representative of Guatemala, being accredited to the Government of Mexico as Minister of the Republics of Salvador and Honduras, has been received in this character, which will contribute to strengthening the ties which unite us to the states of Central America. The Argentine Confederation has appointed a consul in Mexico. The Government of his Majesty the King of Spain has invited that of Mexico to take part in an international conference for adopting measures to prevent conflicts of jurisdiction in cases of maritime disasters. This invitation has been accepted, with the promise to appoint, at the proper time, a representative to attend the conference. The negotiations for the reestablishment of relations between Mexico and France have resulted to the satisfaction of both countries.* The general elections have been held without any serious disturbance of public order. The telegraphic network has continued to be extended over the vast surface of our territory, and the lines belonging to the States and private companies comprise a total of 9,375 miles. The estimate in force assigns \$620,000 for roads and bridges and drainage of the valley of Mexico and works in the ports.

With reference to the progress of railways, it is pleasant for me to state that in the State of Morelos work is continued with great activity in the direction of Cuautla, the road to Ozumba, forty-four miles, being already constructed and in operation. In the State of Hidalgo, ten miles have been terminated; on the line from Mérida† to Peto, five; on that from Vera Cruz to Alvarado, four; and on that from Puebla to Izúcar de Matamoros, eight. The railroad company of the district has increased the number of miles in operation to fifty-five. The railroad from Celaya to Leon has become the property of the Central Railway Company, with an extension of thirty-eight miles recently completed. On the San Martín Texmelucan Railway, which is being constructed on account of the Government, an extension of sixteen miles is prepared for the superstructure, and rails for that distance have been ordered. In Tehuantepec, three miles are ready to receive the rails, and three more will soon be completed. Work on the Central Railway is prosecuted with activity. The Executive has granted various railway concessions to the States of Tamaulipas, Guerrero, Chihuahua, Michoacan, Sinaloa, Oaxaca, Puebla, Vera Cruz, Tlaxcala, Hidalgo, and Yucatan, and has been authorized to reform the contracts made with foreign companies for the construction of international and interoceanic railways and to make new contracts, subjecting them to the law giving the authorization. In the exercise of those rights, the Executive has made contracts with several companies. To one has been given the line starting from this capital and passing by the cities of Querétaro, Leon, Zacatecas, and Chihuahua, and terminating on the frontier of the north, and besides, another line which will go to the Pacific, passing by Guadalajara. To another company has been granted a concession for a line to the Pacific, passing by Toluca, Morelia, and Zamora, it being stipulated that from a convenient point on this line another will branch to the frontier of the north, touching the cities of San Luis, Saltillo, and Monterey. The Mexican Cable Company, of New York, reports having made a contract for making and laying the cable, with a company in London, which engages to lay it during the month of January, 1881, from a point in the State of Texas to Vera Cruz, with a connection at the mouth of the Pánuco. The Executive, as on former occasions, is now prepared to pay the fifth installment of the debt which is due in January next to the United States Government, and will place the amount before the time in that country in order to fulfill this national

* Baron Boissy d'Angley was appointed Minister Plenipotentiary to Mexico, October 15, 1880.

† For already existing railways, see "Annual Cyclopaedia" for 1873 and following years. Four lines are being built in Yucatan; that from Mérida to Progreso (twenty-five miles) was to be terminated by the end of 1880.

obligation. The payment of the Mexican creditors of the United States is being made with all regularity by the Treasury of Mexico, in conformity with the stipulations of the convention of the 4th of July, 1868. The Executive has submitted the question of the national debt to the study of a special committee. Two nautical schools have been established, one in Campeachy and one in Mazatlan, both for commercial pilots. Both the national arms factory and the ordnance department have been supplied with machinery and apparatus for increasing their production and hastening the completion of their different works. A practical medical military school has been established in the hospital of instruction, and professors appointed. The Executive appointed a special committee to study reforms of the general ordinance of the army. This committee, fulfilling the trust placed in it, has terminated its interesting work, which will be submitted to the deliberation of Congress. As a rule, peace has been preserved throughout the republic. The events which took place in Lower California, Sonora, and Sinaloa have not been of serious consequences.

MICHIGAN. The financial condition of the State, as shown by the annual report of the State Treasurer, is as follows:

Cash balance September 30, 1879.....	\$606,267 63
Receipts for the year.....	2,793,321 90
Total resources.....	\$3,399,589 43
Payments during the year.....	1,820,946 42
Cash balance September 30, 1880.....	\$1,578,643 01

There were demands against this balance, maturing on or before December 31, 1880, of \$260,820.12.

The indebtedness to trust funds at the close of the fiscal year, September 30th, was:

To the sinking fund.....	\$908,895 27
" " Canal fund.....	43,664 75
" " primary-school interest fund.....	94,381 73
Total.....	\$1,051,891 35

Adding the latter amount to the maturing indebtedness stated above, and the total demands against the Treasury aggregated \$1,312,711.47, leaving a net cash surplus of \$265,931.54.

The trust debt of the State, the principal of which never matures and can not be paid, is as follows:

To primary-school fund.....	\$2,554,590 96
" 5 per cent. primary-school fund.....	826,350 95
" University fund.....	465,753 46
" Agricultural College fund.....	153,137 70
" Normal School fund.....	56,635 32
" Railroad and other deposits.....	8,052 63
Total.....	\$3,564,556 02

On this debt the State pays seven per cent. interest, except on the Normal School fund, which draws six per cent. The interest paid to these several funds during the year was:

To primary-school fund.....	\$190,876 86
" Agricultural College fund.....	10,240 23
" University fund.....	32,393 51
" Normal School fund.....	3,373 72
Total.....	\$236,889 37

During the year the State received as interest on surplus funds, \$32,763.05; on specific taxes overdue, \$6,640.54; on United States bonds, \$13,500—total, \$52,903.59; and paid a total interest on its bonded debt of \$55,770. Of the bonded debt of the State, \$15,149.97 is overdue, draws no interest, and has a reserve

for its payment. The debt to become due is \$890,000. The sinking fund, applicable to its payment, amounts to \$1,208,895.27, leaving a surplus of \$318,895.27. By a decision of the Supreme Court, made since the date of the Treasurer's report, the constitutional provision setting apart the specific taxes for the payment of the bonded debt of the State, is held complied with by holding a sufficient reserve for that purpose; and the surplus on hand, with the future proceeds from specific taxes, is ordered turned over to the primary-school fund.

The State taxes for the fiscal year, as apportioned to the several counties by the Auditor-General, October 6, 1880, were:

For general purposes.....	\$518,000 00
" the university.....	64,250 00
" State Normal School.....	17,800 00
" Agricultural College.....	12,040 12
" State Public School.....	43,950 00
" Institution for Deaf, Dumb, and Blind.....	40,100 00
" State Reform School.....	35,500 00
" Michigan Reform School for Girls.....	10,000 00
" School for Blind.....	10,000 00
" Military purposes.....	46,691 00
" Fish Commission.....	5,000 00
" Improving Capitol grounds.....	1,500 00
Total current taxes.....	\$504,881 21
Add indebtedness of counties to State.....	262,322 14
Total apportionment.....	\$1,067,153 35

The State taxes are apportioned on an aggregate property valuation, real and personal, of \$630,000,000.

The annual report of the Commissioner of the State Land-Office shows:

Acres held by State, September 30, 1879.....	2,501,659 41
Patented to State by United States during year.....	1,519 95
Forfeited to State during year.....	10,581 50
Total.....	2,513,760 96
Sold during year.....	94,040 05
Held by State, September 30, 1880.....	2,719,720 51

Of these lands, 2,136,727 58 acres are swamp-lands, 426,860 39 acres primary-school lands, 151,345 45 Agricultural College lands, 2,195 63 acres salt-spring lands, 1,760 Asylum lands, 454 50 asset lands, and 377 26 acres university lands. Of the whole amount, 1,739,427 83 acres are reserved from sale, for homesteads, on drainage contracts, and for railroads, leaving 980,292 98 acres subject to sale, September 30, 1880. The receipts for lands sold during the year, and for interest, penalties, trespasses, fees, etc., were \$287,919.93. The sales for the year have been mainly to actual settlers.

The workings of the liquor-tax law for 1879 (reports for 1880 not yet made) show:

Number of dealers paying taxes.....	4,296
Amount of taxes collected.....	\$398,819 04
Taxes uncollected.....	41,129 61

Three fifths of the uncollected tax are chargeable to the county of Wayne, in which the city of Detroit is located. The saloons or dealers also increased in Wayne County 137, the total increase in the State, Wayne excluded, being only 93. During the year 1880 a concerted effort was made to array the temperance sentiment of the State against the tax law, against any regulating or restraining legislation, and in favor

of prohibition. The Legislature of 1881 will be pressed to adopt and submit a constitutional amendment to the people, prohibiting the manufacture and sale of spirituous, malt, and vinous liquors, except for mechanical, medicinal, and sacramental purposes, and declaring that there shall be no property-right in such liquors made or held for any other purpose.

The following extract from the message of Governor Jerome to the Legislature, at the opening of the session for 1881, is a favorable statement of the railroad interests of the State:

The forty-nine railroad corporations doing business in this State own a total of 5,358½ miles of railroad, and operate 6,166.71 miles. Within the State on January 1st last there were 3,657.74 miles. During the year there have been constructed 260 miles, making a total at present of 3,918 miles. The increase since 1878 in miles of road is 353, and the number of corporations has increased eight. The portion of these roads in Michigan represented on January 1, 1880, a capital stock of \$104,266,695.15, and a debt of \$105,802,008, or a total stock and debt liability of \$210,068,703.15, an average of \$57,431.28 per mile. These roads are improving financially, yet twenty-nine out of the forty-nine are unable to pay their interest obligations after paying current expenses. The volume of business for 1879 was very large, and the freight-rates were the lowest ever reached, the average being nine and two tenths mills per ton per mile. While the business has largely increased, the reduction in freight-rates has made the gross earnings much smaller than they were on a smaller traffic in 1873. The gross receipts for 1880, partly estimated, but from reliable data, will show an increase over the amount for 1879 of about 18 per cent. The increase in specific taxes to be assessed on the business for 1880 will be still more marked. These taxes for 1878 amounted to \$410,453.06; for 1879, to \$445,399.80; and, for 1880, will probably reach from \$550,000 to \$575,000.

The total income of the reporting roads from all sources, for the year 1879, was \$46,619,207.05, an increase over the previous year of

\$3,582,960.38. The total operating expenses of the year were \$26,906,685.44, an increase over the previous year of \$1,272,950.77. These railroads employed in the State 14,774 persons, and have within the State 809 stations—one for each 4.52 miles of road. The following is a statement of the extension of track and new road built during 1880:

<i>Chicago and Northwestern:</i>	Miles.
Menominee River, Quinnesec northwest to Wisconsin line.....	7½
<i>Chicago and West Michigan:</i>	
Hart branch, Mear's northeast to Hart.....	8½
Detroit, Butler and St. Louis, Detroit southwest to Adrian.....	57
<i>Detroit, Lansing and Northern:</i>	
Stanton branch, extending from Mecosta northwest to Big Rapids.....	15
<i>Detroit, Mackinac and Marquette:</i>	
Point St. Ignace northwest.....	34
Marquette.....	25
<i>Flint and Pere Marquette:</i>	
Clare County branch extending north to Harrison....	6
Round Lake branch, Butler Junction north to Webber	4
Michigan Air Line, extending from Rochester west by south to Pontiac.....	10
Port Huron and Northwestern (three-feet gauge), extending from Crowell to Sand Beach.....	44½
Extension in Port Huron.....	1½
Mariette branch, Balmer's northwest to Mariette.....	38½
St. Joseph Valley, Buchanan northwest.....	2
Tawas and Bay County, extending from Camp Watson southwest.....	11
Total.....	255

The report of the Commissioner of Insurance shows a large increase of fire and marine risks during the year (about \$7,000,000). The capital represented by the stock companies doing business in the State is \$46,077,290; admitted assets, \$126,267,148; surplus as regards policyholders, \$82,343,172; and a surplus over capital and all other liabilities of \$36,298,781. But a single company doing business in the State shows an impairment of capital. The business done in the State during the year was:

CLASSIFICATION OF COMPANIES.	MICHIGAN BUSINESS, 1880.			
	Risks written.	Premiums received.	Losses incurred.	Losses paid.
Michigan companies, totals.....	\$10,812,165 00	\$96,987 15	\$34,499 44	\$31,165 12
Companies of other States, totals.....	140,520,406 12	1,526,188 45	706,105 12	624,950 10
Canadian companies, United States branch, totals.....	2,698,998 00	48,727 22	26,947 49	25,545 49
Foreign companies, United States branch, totals.....	22,625,620 33	805,506 23	189,157 71	117,829 05
Aggregates.....	\$176,357,129 45	\$1,977,359 05	\$906,709 76	\$799,489 76

The report does not cover the local mutual fire-insurance companies incorporated under the laws of this State. Fifty such companies were in operation in 1879, with a membership of 69,000 and risks in force aggregating \$120,000,000. Michigan has one stock life-insurance company, with risks amounting to \$8,000,000. The life-insurance risks held by other companies on the lives of citizens of this State exceed \$30,000,000. A large number of co-operative life companies are in operation, with an aggregate of risks not ascertainable.

The reports of the fifteen savings-banks of the State, dated October 4, 1880, show: capital, \$1,160,000; surplus, \$116,131.64; due depositors, \$8,236,094; due other banks, \$114,926.24; total liabilities (including lesser items),

\$9,772,941.19. Their leading resources were: loans and discounts, \$4,505,715.90; bonds and mortgages, \$2,732,488.55; due from banks and bankers, \$1,158,535.49; cash, \$968,895.18; real estate and fixtures, \$377,231.83.

The reports of the thirteen State banks bear date July 1, 1880, and show: capital, \$873,750; surplus, \$167,809.39; due depositors, \$2,533,833; total liabilities, \$3,744,129.38. Leading resources: loans and discounts, \$2,464,756.27; bonds, \$84,671.17; cash, \$422,648.76; real estate and fixtures, \$82,329.83; due from banks and bankers, \$656,702.21. The banking business of the State is very largely done by the national banks, whose latest reports are not accessible.

From the second annual report of the Secre-

tary of State relating to farms and farm products the following tables are taken. The first gives the "totals of the agricultural statistics of the State, as shown by the cereal reports for 1878-'79":

PRODUCTS.	1879.	1878.
Wheat, acres harvested.....	1,605,636	1,575,530
Wheat, bushels raised.....	30,983,340	29,511,589
Wheat, average number of bushels per acre.....	19-30	18-77
Corn, acres harvested.....	742,859	761,123
Corn, bushels raised—ears.....	42,764,123	36,663,299
Corn, average number of bushels per acre.....	75-57	45-17
Oats, acres harvested.....	440,723	453,685
Oats, bushels raised.....	15,089,855	13,454,517
Oats, average number of bushels per acre.....	34-25	29-52
Clover-seed, acres harvested.....	194,899	122,043
Clover-seed, bushels raised.....	313,063	166,465
Clover-seed, average number of bushels per acre.....	1-61	1-36
Barley, acres harvested.....	44,007	40,169
Barley, bushels raised.....	991,659	806,463
Barley, average number of bushels per acre.....	22-53	20-14
Peas, acres harvested.....	33,079	89,772
Peas, bushels raised.....	537,732	641,063
Peas, average number of bushels per acre.....	15-95	16-13
Potatoes, acres harvested.....	89,441	75,826
Potatoes, bushels raised.....	8,923,475	6,285,406
Potatoes, average number of bushels per acre.....	89-13	105-39
Hay, acres harvested.....	943,371	856,536
Hay, tons raised.....	1,051,115	1,124,931
Hay, average number of tons per acre.....	1-11	1-31
Sheep, number sheared.....	1,828,580	1,670,790
Wool, pounds sheared.....	9,582,034	8,666,467
Wool, average number of pounds per head.....	5-23	5-19
Apples, bushels sold.....	1,831,910	8,944,206
Peaches, bushels sold.....	229,570	107,244
Grapes, pounds sold.....	2,956,437	1,014,950
Cherries, currants, plums, and berries, bushels sold.....	161,316	100,493

The second gives the "farm statistics for 1879-'80":

	1880.	1879.
Farms, number of.....	118,941	111,816
Farms, acres of improved land in.....	6,217,209	5,785,102
Farms, acres of unimproved land in.....	4,761,058	4,590,486
Farms, total number of acres in.....	10,977,105	10,315,588
Farms, average number of acres in each.....	92-19	92-63
Wheat, acres now on the ground.....	1,532,366	1,599,992
Horses, number of.....	293,210	272,653
Milch-cows, number of.....	304,142	291,243
Cattle, other than milch-cows, number of.....	344,791	338,910
Hogs, number of.....	468,629	493,109
Sheep, number of.....	1,892,311	1,772,312
Apple-orchards, number of acres in.....	226,349	229,263
Peach-orchards, number of acres in.....	13,901	10,771

Ten counties produced each over one million bushels of wheat. Clinton, the largest wheat-producing county, is credited with 1,509,611 bushels. Three other counties, Ionia, Washtenaw, and Calhoun, had each over 1,449,000 bushels. Twenty towns raised each over 100,000 bushels, one of them going over 150,000 bushels. The largest township yield was 31-90 bushels, and sixteen townships report an average yield of over twenty-five bushels per acre.

Since the establishment of the Fish Commission in 1873, the work of stocking the inland

lakes and streams has progressed with favorable results. The total "plant" up to date of latest report was:

Young shad.....	40,000
Atlantic salmon.....	220,000
Landlocked salmon.....	100,000
California salmon.....	1,769,000
White-fish in inland lakes.....	16,000,000
White-fish in great lakes and Detroit River.....	64,000,000 = 80,000,000
Lake-trout in inland waters.....	1,080,000
Brook-trout.....	500,000
Silver-eels.....	1,000,000

Considerable work has also been done with the grayling, bass, and pike.

The total lumber cut by the leading Michigan districts is given as 3,398,187,227 feet, an increase over the cut of 1879 of 651,510,514 feet. The lumber on hand at the close of the year was estimated at 886,617,679 feet. These estimates are exclusive of the millions of feet cut into shingles and stave-bolts and square timber and logs shipped from the State or towed down the lakes to supply the mills of Ohio and New York ports. Some of the lumber centers are reported as follows:

	Feet.
Saginaw River mills.....	863,356,009
Huron Shore.....	363,327,609
Flint and Peze Marquette mills.....	213,771,033
Mackinaw Division of Michigan Central Railroad.....	48,275,513
Manistee.....	208,880,000
Muskegon.....	594,458,526
Miscellaneous points.....	705,361,242

An article prepared for the Saginaw "Courier" says:

There has been an extraordinary demand for pine-timber lands during the past year, and prices have appreciated \$10 to \$50 per acre, according to locality and quality of the timber. Good tracts of timber range in value from \$50 to \$100 per acre, and sales have been made the past year in which it seems hardly possible that the buyers can realize enough to save loss in the end. A tract of pine on one of the tributaries of the Tittabawassee, which was lumbered over nine years ago, is a five-mile haul and was bought five years ago for \$2,500, was sold last fall for \$6,000 cash. Another eighty-acre tract on the same stream, ten years ago, was purchased for four dollars per acre. The owner within the past two months has refused \$8,000 cash for it, holds it at \$10,000, and it is said to be only an ordinary tract as regards quality. About 1,640 acres in Gladwin County, on the Cedar River, were recently sold for \$35,000 cash, and during the fall 4,000 acres in Montcalm County were sold for about \$225,000. These are only instances showing the value of timbered lands.

The same is true of other lumber-producing localities, and the fact is important as showing the rapidity with which the forests of the State are being stripped of their treasures.

The salt production of the State for the inspection year ending November 30, 1880, was as follows:

	Barrels.
Fine.....	2,262,987
Packers.....	6,691
Bulk.....	343,257
Second quality.....	48,623
Total.....	2,676,588

This was produced in the following localities:

	Barrels.
In Huron County.....	254,841
In Iosco County.....	149,400
In Bay County.....	1,083,466
In Saginaw County.....	1,145,150
In Midland County.....	83,731

The average price obtained for salt during the year was 75 cents a barrel, against \$1.02 obtained in 1879. The improvements made during the year have materially increased the salt-producing capacity of the State. The bulk of Michigan salt finds a market in the Western States. The Saginaw "Courier's" annual review says:

The expense of putting down a salt-well varies, of course, according to the depth. In Saginaw County the average depth of the well is 800 feet, while down the river the average is about 1,000 feet. The average expense of sinking a well, including drill-house and machinery, is about \$3,000. The expense of erecting a block ranges from \$3,000 to \$25,000, according to capacity, and the blocks produce from 75 to 250 barrels per day.

The following statistics from the report of the Superintendent of Public Instruction show continual progress in the public schools of the State:

Number of districts, September, 1889.....	6,352
Increase over previous year.....	100
Number of schoolhouses.....	6,490
Increase.....	75
Number of children between five and twenty years.....	506,221
Increase during year.....	19,223
Number of children attending public schools.....	362,556
Increase over last year.....	20,418
Number of sittings in public schools.....	446,029
Increase over 1879.....	4,738
Number of private and select schools.....	264
Number of teachers employed, male.....	4,072
Number of teachers employed, female.....	9,877
Increase over 1879.....	333
Wages paid teachers.....	\$1,917,983 99
Increase over 1879.....	37,083 75
Estimated value of school property.....	8,977,344 00
Received from one-mill tax.....	879,757 93
" " primary-school fund.....	223,525 21
" " tuition from non-residents.....	5,859 77
" " direct taxation.....	2,074,073 37
" " all other sources.....	286,320 78
Total receipts of year.....	\$2,998,602 97
Total expenditures of year, including build- ings, payments on debts, etc.....	\$3,109,915 14

The income from the primary-school interest fund was forty-six cents on the dollar, but a recent decision of the Supreme Court will add to that sum the coming year over \$300,000, increasing the distributive ratio per scholar to over one dollar; and unless the Constitution of the State shall be so amended as to turn the specific taxes into some other fund, the increase will be still larger the next and future years. The receipts from specific taxes during 1880, exclusive of the Upper Peninsular mining taxes, were \$584,889.24, with no prospective diminution. This will meet the interest on both the bonded and trust fund debt, to which it must be first applied, and give over \$350,000 annually to the primary-school interest fund.

The Superintendent of Public Instruction finds the weakest point in the school system in the examination and licensing of teachers by a single township superintendent, the creature of a political caucus. He recommends:

1. The county should be the unit of territory over which the examining authority should have control; 2. The choice of this authority should be removed so far as possible from the influence of the political caucus; and, 3. The examining authority should be a board rather than an individual.

The total attendance at the State Normal School during the school year, 1879-'80, was 462. Of these, 71 were in the professional department. At the annual commencement 56 diplomas were given to graduates in the several courses. The courses of study are now so arranged that an applicant for a diploma in either professional course, having the requisite preliminary training, may complete the course in one year. This change makes it more of a professional than a preparatory school, and less a competitor of the high-schools of the State.

The number of students in attendance upon the State Agricultural College during the year was 264, classified as follows: resident graduates, 12; seniors, 26; juniors, 38; sophomores, 57; freshmen, 83; specials, 48. The 26 seniors were graduated at the annual commencement. Thirty-two of the students came from without the State. The expenses for the fiscal year were \$62,652.13, and the cash earnings of students and farm were \$21,690.56. The accumulated land fund is now \$153,137.70.

In his annual report to the Board of Regents of the State University, Acting President Frieze (President Angell being temporarily absent as Minister to China) says: "The year has been distinguished by a largely increased attendance, by a decided improvement in all departments of the university in the standard of scholarship, and by uninterrupted order and harmony in all its internal working." The faculties number fifty-two officers and instructors, with very little change from the previous year. The law department was, however, materially strengthened by the establishment of another (the Tappan) professorship, and the appointment to it of ex-Governor and ex-United States Senator Alpheus Fitch, eminent in his profession and ripe in experience. During the year attendance upon the several departments was 1,430, an increase of 54 over that of the previous year, as follows: In the Department of Literature, Science, and the Arts, 448; Department of Medicine and Surgery, 353; of Law, 395; in School of Pharmacy, 81; in Homeopathic Medical College, 70; in College of Dental Surgery, 83. The President says: "This increase is the more gratifying, inasmuch as it has taken place in spite of more stringent requirements for admission and graduation, especially in the professional schools." Four hundred and ten degrees were conferred on examination, and four honorary degrees. Of the degrees conferred on examination, 67 were conferred upon the several graduates from the Department of Literature, Science, and the Arts, and 343 from the professional schools.

Changing the fiscal year from July 1st to September 30th, to make it correspond with the fiscal year of the State and its other institutions, the receipts were for fifteen months (including balance of \$28,710.49, July 1, 1879), \$296,163.66; the expenditures, \$277,096.42; balance on hand, September 30, 1880, \$19,067.24. The expenditures include \$39,022.88 on account of the new museum building, and \$19,898.01 on account of the central steam-heating building and apparatus. The receipts from students were \$76,707.93; and from interest on endowment fund, \$51,451.78. The payments for salaries of officers, professors, and employees aggregated \$124,777.92.

The seventh annual report of the State Public School for Dependent Children, located at Coldwater, is a flattering statement of the work that institution is doing for a class of children which in former years found a home in the poor-houses of the several counties, or had not even that apology for a home. The tables accompanying the Superintendent's report show: Number received during the year, 168 (114 boys and 54 girls); indentured, 216; returned to counties from which they were sent to the school, 31; died, 1; number remaining in the school September 30, 1880, 292. The average attendance during the year was 285½; supported, clothed, educated, cared for when sick, etc., at a total cost for the year of \$34,966.78, or \$122.33 per capita. The inventory of real and personal property aggregates \$187,228.18. The school is wholly dependent for support upon the biennial appropriations made by the Legislature, and is yearly proving itself more and more deserving increased bounties from the State.

The State Reform School, to which only boys are admitted, closed its twenty-fourth year September 30th. The statistics following are gathered from the report of the superintendent: Inmates of school September 30, 1879, 307; received during year, 177; released, 168; in school September 30, 1880, 216. These are classified: White, 183; colored, 31; Indians, 2. They were committed for the following offenses: Grand larceny, 7; burglary, 10; assault and battery, 15; larceny, 115; attempt to murder, 1; vagrancy and disorderly, 29. One hundred and twenty-five were natives of Michigan; 93 had white American-born parents, and 14 colored parents of American birth. Twenty-six had no father, 37 no mother, and 11 had lost both parents. Sixty-nine had been in jail one or more times before being committed to the school. One hundred and twelve were of Protestant parentage, 44 of Catholic, and 21 could not give the religious connection or preferences of parents. Exclusive of cost of alterations, repairs, etc., the cost of the school, including salaries of officers, teachers, other employees, food, clothing, and all expenses of boys, was \$29,873.78, or \$96 per capita. The prison system has been entirely abolished, and neither walls, nor cells, nor grated win-

dows, nor degrading punishments are parts of the machinery of discipline.

The biennial report of the Board of Trustees of the Institution for the Deaf and Dumb shows an aggregate attendance during the two years of 358, with an attendance September 30, 1880, of 243. This number is six in excess of the number of pupils September 30, 1879, notwithstanding the transfer of 38 blind pupils to the new school for the blind, now temporarily located at Lansing. The graduates for the year ending September 30, 1880, numbered 16 deaf-mutes and 5 blind. The trustees commend the administration of the new principal, Thomas MacIntire, Ph. D., who came to the charge of the institution at the beginning of the fiscal year. The total expenses of the year were \$46,354.34, and the earnings of the several industries, \$4,618.98.

The reports of the two Insane Asylums also cover a period of two years. During that period, in the Michigan Asylum, at Kalamazoo, 935 patients received treatment; 278 were discharged—69 recovered, 121 improved, 33 unimproved, and 55 by death—leaving under treatment, September 30th, 657 patients. Since the opening of this institution, 3,164 patients have been treated, and, as the statistics of so long a period may be professionally important, the following table is appended:

ASSIGNED CAUSES.	Males.	Females.	Total.
Intemperance (use of narcotics included).....	128	16	144
Exhaustion from vicious habits..	261	9	270
Prolonged draft on vitality (physical).....	145	200	345
Prolonged draft on vitality (emotional).....	242	344	586
Sudden prostration of vitality, not diseases.....	19	28	42
Acute diseases and injuries, general.....	55	39	94
Acute diseases immediately affecting the nervous system.....	55	4	59
Chronic diseases, general.....	84	128	212
Chronic diseases, especially affecting the nervous system.....	21	5	26
Diseases and disorders of female sexual system.....	...	126	126
Puerperal.....	...	125	125
Abortion.....	...	23	23
Epilepsy.....	100	89	189
Popular errors and delusions.....	33	14	47
Exposure in the army.....	20	...	20
Unassigned.....	251	206	457
Defective training.....	5	15	20
Defective organization, heredity not established.....	24	27	51
Previous attacks.....	104	85	189
Heredity.....	51	58	109
Total.....	1,628	1,536	3,164

During the same period the Eastern Asylum at Pontiac received 363 patients and treated 669. The number discharged from the institution was: Recovered, 54; improved, 79; unimproved, 40; died, 51; not insane, 2. Remaining under treatment September 30, 1880: Males, 231; females, 212; total, 443. The medical superintendent says that the number of recovered seems small, but claims as the reason the extreme care which has been exercised in

making up the returns. The capacity of the two institutions is found short of the demand upon them. The number of insane in the State needing asylum care is estimated at one in each 1,000 inhabitants, or over 1,600, while only 1,100 remained in the two asylums September 30th. At that date numerous applications were on file, and vacancies were anxiously being waited for.

The Commissioners appointed under an act of the Legislature, approved May 31, 1879, to locate a school for the blind, a class before cared for at the Institution for the Deaf, Dumb, and Blind, at Flint, being unable to agree upon a permanent site, made a temporary lease of a building at Lansing, and the school was opened on the 29th day of September, 1880, with 33 pupils in attendance. From applications on file, and the number of blind children in the State known to be entitled to the privileges of the school, the Commissioners estimate that the number will reach 75 during the year. The design of the school is to educate the blind to maintain themselves, and the teaching force includes instructors in instrumental and vocal music and sewing. At the date of the report but \$6,081.87 of the appropriation of \$45,000 had been expended.

The first annual report of the Board of Control of the Michigan Reform School for Girls, established under an act of the Legislature of 1879, shows the location of the school at Adrian on forty acres of land lying just north of the city limits. The site, together with \$3,000, was donated by the citizens of Adrian. The school has not yet been opened. Two cottages are in process of erection.

The annual report of the State House of Correction and Reformatory at Ionia shows:

Inmates September 30, 1879.....	232
Received during the year.....	866
Discharged by expiration of sentence.....	730
Discharged by order of courts.....	26
Escaped.....	8
Died.....	8
Pardoned by the Governor.....	8
In institution September 30, 1880.....	837
Average daily number of inmates.....	247
Average cost of each inmate per year.....	\$121 77

The infractions of the law for which the inmates were committed include almost every crime or offense known to the law, except murder, and range from simple assault, or "failing to file a liquor bond," to manslaughter; 656 are credited with their first conviction, 132 with their second, 59 with their third, while one each is charged with a ninth and tenth; 146 claim to have been temperate, 172 moderate drinkers, and 548 confess to intemperate habits. Evidencing remarkable degeneration, 802 report temperate parents and 798 pious parents, while only 34 acknowledge intemperate parents and 44 parents not pious. The warden questions the correctness of these figures, and asserts that "idleness and illiteracy are undoubted producers of crime," regardless, it is to be presumed, of the alleged or real piety or impiety of parents.

The annual report of the Inspectors of the State Prison gives the following facts:

In prison October 1, 1879.....	777
Admitted during the year.....	281
.....	1,058
Discharged by expiration of sentence.....	253
Died.....	5
Released on order for new trial.....	2
Released on order of Supreme Court.....	4
Pardoned by the Governor.....	13
Escaped.....	3
.....	280
Remaining in prison September 30, 1880.....	778

The average number in prison during the year was 812.5, and the total expense of sustaining the prison \$84,517.66, or an average of \$104 and a fraction per man. The net earnings for the year were \$95,129.67, or \$10,-612.01 in excess of the expenses.

The following table, carefully compiled from official sources for the Lansing "Republican," bears flattering testimony to the growth of the State in population during the last decade:

The total population of this State, June 1, 1880, is officially reported by the Census Bureau to be 1,636,335, of whom 862,278 are males and 774,057 females; 1,247,989 are native-born and 388,346 foreign-born; 1,614,087 are classed as white and 22,248 as colored. The division by counties is as follows, with comparative statements of the population in the various counties organized in 1874, when the last State census was taken, and in 1870, when the ninth census of the United States was taken:

COUNTIES.	1880.	1874.	1870.

The Republican party of the State held a convention at Jackson, August 5th, nominated a full State ticket, and put forth the following platform:

1. The Republican party of the State of Michigan, assembled by its delegated representatives in the city of Jackson, upon the spot where the national Republican party was born, after an unbroken supremacy in the State of a quarter of a century, and in the nation of twenty years, grateful to an overruling Providence and a loyal people for the grand achievements of the past, here declares itself now, as ever, faithful to the great principles of liberty, equality before the law, the perpetual union of the States, the supremacy of the nation, free thought, speech, press, and ballot, and the inviolable sacredness of the constitutional results of the war for the Union.

2. With pride and satisfaction it challenges scrutiny of its records during the past twenty-five years—a record unequalled in the history of parties since the foundation of the government.

Among the accomplished results we here recall the consecration of the Territories to freedom; the abolition of slavery in the District of Columbia; the preservation of the integrity of the Union against the great

est and most cruel rebellion in history; the provision of free homesteads for freemen; the emancipation of four million slaves; the conferring of equal civil and political rights on the emancipated race; the creation of a war currency never equaled, and the restoration of that currency, by good faith and honesty, to equality with the best money in the world; the payment with heroic fidelity of more than two thirds of the cost of the war; the vast reduction of the principal and interest of the public debt, and the elevation of the public credit until the nation's four per cent. bonds are eagerly sought at par; the linking of the two oceans with bonds of iron; the enactment of just and equal pension and bond laws for the defenders of the Union and their widows and orphans; the settlement of momentous international questions by peaceable arbitration, and the elevation of the United States to the rank of a first-class nation, grand in peace and mighty in war, making a "government of the people, by the people, and for the people," respected around the whole earth.

During this same period the Democratic party has been as a party abjectly pro-slavery, timeserving, unpatriotic, in part treasonable, reactionary, and obstructive. It prostrated the nation's credit; it undermined the bulwarks of the Constitution with the pernicious doctrine of State supremacy; it armed the rebellion; it encouraged treason; it discouraged the defense of the nation's life; it opposed the draft; inaugurated bloody riots; declared for a truce with rebels in arms; pronounced the war a failure; defamed the greenback out of a share of its honest value; bitterly opposed freedom for the slave, civil rights for the freedman, and the franchise for the black citizen; denounced the constitutional amendments as "revolutionary and void"; denied freedom of speech, press, and ballot in the South; by shot-guns, intimidation, and tissue-balloons, gained control of both Houses of Congress; and attempted to revolutionize the government by refusing necessary supplies, and by coercion of the Executive, after having failed to steal the Presidency by bribery.

It is now conspiring, under pretenses of repentance false upon their face, to install "the lost cause" in the capital of the nation; to reorganize the Supreme Court; to undo all war legislation, and to make it easy to annul the constitutional amendments, and bankrupt the Treasury with rebel war claims and compensation for emancipated slaves.

With this record behind us, and our face set courageously and confidently to the duties and responsibilities of the future, we do here declare:

1. That the administration of the Constitution, the protection of the Union, and the enforcement of the constitutional amendments, should be intrusted to their friends, and not to their enemies, who have relentlessly sought to destroy them each and all.

2. That the blight of slavery will not have been wholly eradicated until all men shall be in fact, as they are of right, equal before the law.

3. We demand for every citizen, rich and poor, white and black, North and South, the right and privilege of casting his ballot once, and but once, at each election, and of having that ballot fairly counted and returned, without terror of shot-guns, frauds of tissue-balloons, or cheats of cipher dispatches.

4. We believe that the United States are a Union, not a Confederacy; a nation and not a league. The Constitution is a supreme law, and not a treaty between foreign powers.

5. The Union must and shall be preserved; the public faith must be maintained; the public debt must be faithfully paid; the pensions of the nation's defenders and their dependents must be sacredly guarded; the public lands preserved for actual settlers; fidelity, intelligence, and efficiency, exacted in the public service, without destroying the freedom of the office-holding citizen; specie resumption must be maintained; the laws for the protection of the purity of elections must be adhered to and enforced; education must be fostered; industry, economy, temperance, and morality

encouraged and stimulated, and the public funds strictly devoted to public and unsectarian uses.

6. In collecting revenues for the current expenses of the Government and the payment of the public debt, imposts should be so arranged as to relieve from taxation as far as practicable the necessities of the poor, and at the same time to afford incidental protection to American labor from competition with the ill-paid labor of other lands.

7. The Republican party has ever been the friend of the laboring class.

It has abolished the competition of slave-labor.

It enacted the homestead law, placed on the statute-book "the eight-hour law," and framed beneficent measures for the protection of immigrants.

It recognizes the fact that the great mass of our people must ever belong to the laboring class; and, while it denounces all agrarianism and communism, and will hold sacred all rights of property and contract, it will make the rights and interests of the great laboring class the objects of its jealous care.

8. *Resolved*, That the ticket for State officers this day nominated is confidently commended to the electors of Michigan as one eminently worthy of their support.

9. The Republicans of Michigan recognize in James Abram Garfield, our nominee for President, the patriotic volunteer soldier, the wise and experienced statesman, the profound political economist, and the pure and noble man; and in Chester A. Arthur a patriot, jurist, and statesman worthy of the great Empire State, and to be associated in honor with our great leader. And, without reference to our original choice, we now pledge ourselves to work earnestly and unceasingly, from now until November, to secure their election.

The Democracy convened at Detroit, August 12th, nominated a ticket, and adopted the following resolutions:

Resolved, That the Democracy of Michigan enthusiastically approve and reaffirm the platform of principles adopted by the Democratic National Convention at Cincinnati, and especially on the subjects of centralization, sumptuary laws, home rule, honest money, a free ballot, and a fair count.

Resolved, That the malignant effort of the Republican Convention, held last week at Jackson, to transmit to another generation a tradition of hate, was not an acceptance in a proper spirit of the significant rebuke to the hinderers of reconciliation which had just been given by the colored voters of Alabama when they organized in Hancock clubs, and wearing Hancock badges, aided to prevent any breaches of the public peace and to outvote the allied Republicans and Greenbackers in every county of that State, and to give the first response of seventy-five thousand majority to the nominations made at Cincinnati.

Resolved, That the flagrant and continued interference with the administration of justice in the State courts by Federal officials demands the attention of Congress; and the House of Representatives should apply the remedy constitutionally provided to check the growing evil.

Resolved, That reforms should be made in our State legislation by reducing to proper sums and percentages the expenses of advertising tax-sales and legal notices, the interest charged upon delinquent taxes, the sums paid for official salaries to those filling newly-created offices and the numbers employed therein; and that such reform is not likely to be accomplished as against the interests of a subsidized party press and of an official class, except by a change of administration.

Resolved, That in the hero of Gettysburg, who led the Union army to its most glorious victory, we recognize a most worthy standard-bearer to lead the Democracy of the nation to a certain victory in November next, and we pledge to Hancock and English our enthusiastic and earnest support, and will make

any and every sacrifice to an honest effort to secure for them the electoral vote of the Peninsular State.

Resolved, That we hereby reiterate, as we shall at every recurring convention, our grateful remembrance of the dead, and our thanks to the living soldiers and sailors, through whose sacrifices and blood the Union was preserved, and by whose votes its perpetuity may be maintained by the election of our most illustrious leader, General Hancock.

Tickets were also placed in nomination by the National-Greenback party and by the Prohibitionists. The result of the election was an unexpectedly large majority for the Republican ticket. The vote for Presidential electors, Governor, and Lieutenant-Governor was:

FOR PRESIDENTIAL ELECTORS.

Garfield electors.....	185,836
Hancock electors.....	181,591
Weaver electors.....	34,895
Dow (Prohibitionist) electors.....	942
Antimasonic electors.....	812

FOR GOVERNOR.

David H. Jerome, Republican.....	173,944
Frederick M. Holloway, Democrat.....	187,671
David Woodman, Second, National-Greenback.....	35,122
Isaac W. McKeever, Prohibitionist.....	1,114
Cornelius Quick, Antimason.....	220

FOR LIEUTENANT-GOVERNOR.

Moreau S. Crosby, Republican.....	180,685
Edwin H. Thomson, Democrat.....	185,595
Sullivan Armstrong, National-Greenback.....	35,051
Darius H. Stone, Prohibitionist.....	1,102
G. H. M. Rosebacker, Antimason.....	808

The following State officers, all Republican, were elected by about the same majorities as given the Presidential electors (the vote for the Democratic candidates for Governor and Lieutenant-Governor having run largely ahead of their ticket, receiving the votes of a large number of Republicans in protest against the liquor tax legislation, and the proposed incorporation of a prohibitory amendment in the Constitution): Secretary of State, William Jenney; State Treasurer, Benjamin D. Pritchard; Auditor-General, W. Irving Latimer; Attorney-General, Jacob J. Van Riper; Superintendent of Public Instruction, Cornelius A. Gower; Commissioner of the State Land-Office, James M. Neasmith; member of State Board of Education, Edgar Rexford.

In the several Congressional districts the vote was:

FIRST DISTRICT.		Votes.	Plurality.
Henry W. Lord, Republican.....	15,962		574
William C. Maybury, Democrat.....	15,888		
Lyman E. Stowe, National-Greenback.....	628

Scattering.....	121		

The Legislature chosen at the same election may be classified politically: Senate—Republicans, 30; Democrats, 2. House—Republicans, 86; Democrats, 13; Fusionist, 1.

But a meager vote was polled on the constitutional amendment authorizing the city of Detroit to vote an appropriation in aid of a tunnel or bridge across the Detroit River. The vote was: for the amendment, 37,340; against it, 58,040.

MINNESOTA. The Treasury accounts of the State of Minnesota cover a fiscal period of two years. On the 1st of December, 1878, there was a balance on hand of \$48,499.20. The receipts of the twelve months following were \$1,427,174.40, and the expenditures \$1,343,644.17; the receipts of the year ending November 30, 1880, were \$1,563,026.45, and the expenditures \$1,420,903.89. This left an unexpended balance, at the latter date, of \$264,151.99, of which \$78,644.33 belonged to trust-funds liable to investment in bonds. The recognized debt of the State, at the beginning of the fiscal period, was \$500,000, of which \$210,000 were paid during the two years, leaving \$290,000 still due. There remain unprovided for, and, thus far, dishonored, the bonds issued in 1858 in aid of railroads. The Constitution authorized a loan of \$5,000,000 for this purpose, and \$2,275,000 of the bonds were issued, bearing seven per cent. interest, and payable in twenty-five years. The principal and accumulated interest at the beginning of 1881 amounted to \$5,850,000. The Governor, in his message to the Legislature, made a strong appeal for the recognition and payment of this old debt. He said:

The fact that the principal of these bonds will become due so soon after the next regular session that too little time thereafter will be left to provide for meeting them, invests the subject at this time with new importance, and renders the prompt and final adjustment of this long-standing indebtedness a matter of solemn and imperative duty. However good citizens may honestly differ as to the nature and force of the obligation represented by these bonds, the absolute necessity that some kind of disposition should

be made of outstanding paper bearing the sovereign pledge and attestation of our State, will be conceded by all. Without questioning the sincerity of those who oppose full payment of the debt, it is difficult to see why there should be serious differences among honorable parties where the essential conditions of the contract are undeniable.

That the original proposition was amply discussed, deliberately adopted, and overwhelmingly endorsed by the people, is a matter of record. That the railroad companies faithfully performed their part of the contract so far as to entitle them to the bonds conditioned upon such performance, is attested by the sworn statements of official inspectors, as well as by the high character of the faithful executive by whom full compliance was exacted. That the taking possession of the property and franchises of the companies obliges the State to pay the bonds is beyond question, since she acquired such property and franchises upon that sole condition; while the sole justification and purpose of such acquisition was reimbursement to the State, for payment by the State. These, it seems clear to me, include all the considerations that need be embraced for an honorable settlement upon the legal aspects of the question. When to these is added the unquestionable fact that our magnificent railroad system of to-day is largely due to the early labor performed upon the trunk lines for which these bonds were issued, there can be little need of more words to establish the justice of this claim upon the State. . . .

The State having chosen foreclosure as her remedy, and disposed of the property thus acquired unconditionally as her own, the conclusion seems to me irresistible that she assumed the payment of the debt resting upon such property, by every principle of law and equity. The liability having been voluntarily incurred, whether it was wisely created or no, is foreign to the present question. It is certain that the obligations were fairly given, for which consideration was fairly received; and the State having seized the railroad property and franchises to indemnify her for payment of the bonds, it is difficult to see what possible justification there can be for her refusal to make such payment. . . .

The discharge of this debt is demanded as a simple act of justice, which would be none the less imperative were it to involve serious sacrifices. But these are not required. The task is plain and easy and level to the simplest comprehension. The half-million acres of lands, which cost us nothing and came opportunely to hand, as if Fortune would lure us from dishonor, can be so advantageously employed in this direction that scarcely an appreciable increase of taxation would be required to liquidate the debt. Indeed, the exhibit of the State Auditor shows that, with a wise use of these lands, this can be accomplished at the present rate of taxation without any increase of taxation. There would thus seem to be every incentive to favorable action, and none for shrinking from a duty so clear and imperative. . . .

Minnesota has, in most respects, a proud place among the States of the Union. She has evinced her patriotism in war and her wisdom in peace. She has shown more financial sagacity and concern for the national credit than older and wealthier States of which more was expected. She has been permitted to grow in prosperity and power. There are everywhere within her broad limits, progress, order, thrift, and contentment. All industries prosper, and all interests point to a glorious future. Only this dishonored debt dims the bright promise of her proud career. But it meets her at every turn. In every civilized community her citizens are shamed with the scathing taunt of repudiation.

The total amount of land under cultivation in the State during the year was 4,503,716 acres, of which 2,963,325 acres were devoted to wheat. The wheat-crop of 1879 yielded 31,218,634 bushels from 2,762,527 acres. That

of 1880 was estimated at 40,000,000 bushels and upward. The total product of wheat, oats, corn, and barley was estimated at 85,000,000 bushels. The average of oats was 688,415; corn, 455,512; barley, 118,856. Culture of the early amber-cane is on the increase, and 7,317 acres of land were planted with it. Trees have been planted on 25,331 acres of land, besides 329,806 rods along highways and the boundaries of farms. The sales of land for two years made by the United States and State Land-Offices and the railroad companies aggregate 3,600,000 acres. The number of acres of land assessed for taxation is 17,815,310, and the value, with structures and improvements, \$138,802,999. This is independent of town and city lots, which, with structures and improvements, were valued at \$64,670,638, making the total valuation of real property \$203,473,637. That of personal property is \$54,581,905, which raises the total of taxable property to \$258,055,543.

There were 536 miles of railroad constructed in the State in the last two years, making the total completed at the close of 1880, 3,110 miles. The gross earnings for the year ending June 30th were \$8,047,834 in 1879 and \$10,774,826 in 1880. The State revenue from railroad companies in the latter year was \$284,824.

The total number of banks in the State is 128, of which 30 are national, 17 State, six savings, and 75 private banks. The capital stock of the State banks is \$2,047,900; their loans during the year amounted to \$4,496,592; deposits, \$3,186,735. The total of deposits in the savings-banks was \$991,404, of which only \$769,842 was classed as "savings deposits."

There are 4,244 school districts in the State, in which 3,693 schoolhouses have been built. Of these, 2,963 are frame, 158 brick, 69 stone, and 504 log structures. The total value of sites and buildings is \$3,156,210.10. There were during the year 1,874 male teachers employed at an average compensation of \$35.29 per month, and 3,341 female teachers at \$27.52 per month. There was a total enrollment of 180,248 pupils, and the total cost of the schools for the year was \$1,328,428, or \$7.37 per scholar.

At the close of the year there were 254 inmates in the State Prison. The current expenses for two years were \$96,041.22, and the earnings of the convicts \$45,679.40. The labor of the convicts is let on contract.

There were 880 patients treated at the Asylum for the Insane at St. Peter during the year, the average number of inmates being 644. The north wing of the asylum building was destroyed by fire on the night of November 15th, the calamity being attended by the loss of some thirty lives.

The Institution for the Deaf, Dumb, and Blind had during the last two years 140 deaf and dumb and 35 blind pupils. The Reform School had 114 inmates at the close of the year.

The first of the State Conventions prelimi-

nary to the Presidential canvass was that of the Republicans, held at St. Paul on the 19th of May. The sentiment of the local conventions in choosing delegates had been divided between Senator Windom and the Hon. James G. Blaine as the candidate for President. In the State Convention the supporters of Windom were in a majority, and the following resolutions were adopted:

Resolved, That while we do not detract from the high qualifications of other distinguished men for the office of President, with friendship for all and enmity toward none, we hold it to be the duty of Minnesota Republicans first to be loyal to their own State; and as we have an eminent Senator whose qualifications are such as to command wide and favorable attention of the whole country as an available candidate, we who know him best take pleasure in adding our testimony to his entire fitness for the high position. His ability, purity of personal character, his unswerving fidelity to Republican principles through twenty years of honorable public service, and his trained and liberal statesmanship, have endeared him to the hearts of his constituents.

Resolved, Therefore, that it is with pride that the Republican party of Minnesota, in convention assembled, present the name of William Windom as a candidate for President who would harmonize all factions and sections of the country, and insure Republican success in the contest of 1880; and the delegation to Chicago, selected by this Convention, are hereby instructed to use all honorable efforts to secure his nomination as the first choice of the Republicans of Minnesota.

Resolved, That the Republicans of Minnesota hereby express their unqualified approval of the present Administration of the General Government, and in President Hayes recognize an able, wise, and firm representative of the principles of the Republican party.

Resolutions declaring against a third term and the candidacy of General Grant, and favoring Blaine in case it should appear that Windom could not be nominated, were introduced and referred to the Committee on Resolutions, but not reported. Delegates to the National Convention were chosen, and candidates for Presidential electors were nominated.

The Democratic Convention was held at St. Paul on the 20th of May. Delegates to the national nominating body were chosen, and an electoral ticket was put in nomination. The following resolutions were adopted:

Resolved, That the centralizing doctrines and tendencies of the Republican party; the notorious corruption of its officials while in control of all the departments of the Government; their reversal by fraud and disregard of law of the expressed will of the people at the last Presidential election; their disregard of the traditions and usages of the republic, demonstrate that, if the people desire to save the government established by their fathers, the control of that government must be taken from that party.

Resolved, That the peace of the nation was placed in the hands of the people's representatives to enable them to guard the people's rights, and that Congress should make no appropriations to be used to further partisan purposes.

Resolved, That we favor the retention of the two-thirds rule in national conventions.

Resolved, That our delegation to the next National Democratic Convention be requested to act and vote unitedly on all questions.

Resolved, That we hereby pledge ourselves to the whole country that the Democracy of Minnesota will never again submit to the reversal by force or fraud

of the will of the people expressed by their votes at an election.

Resolved, That we recognize in the custom recommended and established by Washington and by our fathers, that no person should occupy the Presidential chair for more than two terms, thus far scrupulously adhered to both in theory and practice by the people of the United States, the enunciation of a principle salutary and necessary to the preservation of our liberties, and that a departure therefrom must be deemed a dangerous infraction of what has become the unwritten law of this country; that the proposed election of ex-President Grant for a third term is such a violation of this high safeguard of American liberty as to excite serious alarm, and to call upon all good citizens to prevent by all lawful means the consummation of the intended wrong.

The "Greenbackers" held a State Convention at Minneapolis on the 27th of May, made nominations for electors, chose delegates to the national nominating assembly of the party, and adopted a platform whose declarations have been summarized as follows:

Adopting the Weaver resolutions introduced in the House of Representatives;

Demanding that all taxation be made equal, and that incomes be made to pay their share of the public debt;

Reserving the public lands for the occupancy of settlers;

Protesting against Government subsidies of all kinds;

For the protection of labor by repealing all class legislation, and for constituting eight hours as a day's work;

Favoring a soldiers' and sailors' homestead law, giving them lands without cost, except district and office fees;

Making up to soldiers the depreciation of money in which they were paid for their services, and praying for the passage of the "Weaver soldier bill";

In favor of taxing mortgages;

The passage of punitive laws by Congress forbidding any combination or arrangement by which railroads and other common carriers may discriminate on rates of transportation;

Holding railroad and other public corporations amenable to law, and so regulated and restrained as to subserve the ends for which they were created, by promoting and not thwarting the public good;

Against any limitation or curtailment of the right of franchise and in favor of a secret ballot;

For a direct vote for President and Vice-President of the United States, and limitation to one term of office;

Against the labor of convicts; the employment of children under fourteen years of age; against dealing in options in stocks, and making all such contracts void;

Against the payment of the old State railroad bonds by taxation, grants, improvement lands, or in any other manner whatever;

Calling on all citizens to aid in restoring honesty, fidelity, economy, and justice in the administration of government, and obliterating sectional animosities.

There was to be no election for State officers, and no other general conventions were held. An incident of some interest was a division of the Republicans in the First Congressional District. The Hon. Mark H. Dunnell, the Representative of the district, was a prominent candidate for renomination, but there was a strong opposition to him, and the Convention split into two organizations, one of which unanimously nominated Dunnell, while the other set up W. G. Ward as the candidate. Both claimed to be the regular nominees, the dispute turning on certain contested delegations in the district convention. An effort

was made, which was favored by Mr. Ward, to secure the withdrawal of both candidates and the holding of a new convention; but this, as well as all other attempts at compromise, failed, and both candidates remained in the field.

The total vote for Presidential electors was 150,771, of which 93,903 were cast for the Republican and 53,315 for the Democratic ticket. There were also 3,267 "Greenback" and 286 Prohibitory votes. The Republican majority was 37,085.

Republicans were chosen to Congress from all the three districts. The vote in the first district was 22,392 for Dunnell, 7,656 for Ward, and 13,768 for Wells, the Democratic candidate. The Legislature, elected at the same time, is composed of 29 Republicans, 11 Democrats, and 1 "Greenbacker" in the Senate, and 87 Republicans, 15 Democrats, and 4 "Greenbackers" in the House of Representatives; making the Republican majority 17 in the Senate, 68 in the House, and 85 on a joint ballot. A vote on continuing in force for five years more the act relating to school text-books resulted in 44,739 in favor of the proposition, and 45,465 against it, defeating it by a majority of 726. The law in question was passed in 1877, and provided for a uniform series of text-books for all the schools of the State, to be furnished by a contractor at fixed prices. It provided that the question of continuing it in force should be submitted to a vote of the people in 1880.

The following statement of the population of Minnesota by counties is furnished by the United States Census Bureau:

Aitkin	366	McLeod	12,849
Anoka	7,108	Meeker	11,739
Becker	4,407	Miller Laes	1,501
Beltram	10	Morrison	5,875

Martin	5,242		
Total			780,807

The population of the city of Minneapolis is 46,887, that of St. Paul 41,498, Winona 10,208.

The second centenary of the discovery of the Falls of St. Anthony was celebrated at Minneapolis on the 4th of July.

MISSISSIPPI. The Legislature of Mississippi began its regular biennial session on the 8th of January, and brought it to a close on the 6th of March. It was occupied with the transaction of business fifty-three days. A United States Senator was chosen to succeed Mr. Blanch K. Bruce, for the term beginning March 4, 1881. The Democrats held a caucus on nine successive evenings, and took forty-nine ballots before they could agree on a candidate. Those highest in favor on the early ballotings were E. Barksdale, O. R. Singleton, and E. C. Walthall. Later, the name of J. Z. George was introduced, and took a high place. Finally, Mr. Barksdale withdrew his name, and General George was nominated. The ballot in joint session of the Legislature, which resulted in a choice, was taken on the 22d of January. There were one hundred and twenty-seven votes for J. Z. George, fourteen for A. M. West, four for B. K. Bruce, one for E. C. Walthall, and one for T. W. Harris, and General George was elected.

The Hon. J. A. P. Campbell, who had been commissioned in 1878 to revise and codify the laws of the State, submitted the result in the form of the "Revised Code." In an accompanying report he said:

I have taken as the basis of my action the existing statutes, and have presented them, for the most part, making only such changes as experience has suggested to be necessary, and adding such new provisions as appear to be required to complete the statutes and make them an harmonious and efficient body of laws, plainly expressed, conveniently arranged, and easily to be understood by those for whom they are designed as rules of action. Many of our statutes have existed, in the language in which they are now, since 1822, and some of them since long prior to that. Much of the Code of 1857 was transferred from the Code of 1822, and, in turn, was copied into that of 1871. While there has been growth, by addition to the statutes, in successive years, there have been preserved, unchanged for more than fifty years, the most important provisions affecting the affairs of the living, and the administration of the estates of the dead. Amid revolutions and changes of the Constitution, the statutes have remained unchanged. Generally, suited to any Constitution likely to be accepted by the people, a change of the Constitution requires no change in the great body of the statutes. Secession required only the substitution of "Confederate" for "United," before States, and the statutes harmonized with the new conditions. The Constitution of 1869 (a faithful copy of that of 1832, with few changes and a few additions) necessitated little other change in the statutes it found in force, than to make the Probate Court Law a part of the Chancery Court Law. The Code of 1871, under the Constitution of 1869, retained nearly all of the articles of the Code of 1857, and the very few omitted, except the chapter on slaves, free negroes, and mulattoes, were probably left out by inadvertence. Of the twenty-nine hundred sections into which the Code of 1871 is divided, about twenty-six hundred were copied from the Code of 1857.

The fidelity of the copy to the original is not appar-

ent to the casual observer, only because the excellence of the Code of 1857 is obscured by the derangement and confusion of that of 1871.

Imbued with the spirit of conservatism, apparent in the history of legislation in this State; firmly convinced of the error of sudden and violent changes in the laws generally understood and acquiesced in; believing that a rule, not the wisest and best, but which is understood and accepted, is more desirable than a better one not demanded by the popular will, and apprised that through successive generations little change has been demanded or made in the statutes familiar to the great body of the people, and affecting their everyday life, I have faithfully preserved the main body of these statutes, which have proved their excellence by long toleration by those who could have changed but chose to preserve them, and have endeavored to perfect the system by judicious pruning and careful grafting, guarding against a spirit of change, and never changing, except cautiously, and thereby surely to improve. . . .

I have introduced changes which will lead to great saving of money in the conduct both of public and private matters; have called to my aid the bench and bar of the State in my effort to improve the machinery for the assertion of rights and the redress of wrongs through the courts; have endeavored to provide for increased efficiency of the laws for the prevention and punishment of crimes; have had in view the great agricultural interest of the country, and tried to promote it by drawing together and reciprocally protecting land-owners and laborers, and hope, by the aid afforded me, I have succeeded in so improving the statutes of the State as to make them acceptable to the intelligent, and worthy of the people on whom they are to operate.

Much time was occupied throughout the session in considering the Code, and it was finally adopted without material change.

On the second day of the session Governor Stone submitted a message vetoing a bill passed near the close of the session of 1878 "relative to excessive charges and unjust discrimination by railroad companies." The bill declared all railroads to be public highways, and all transportation companies to be common carriers; prohibited the consolidation of parallel and competing lines and discriminations in dealing with customers, and fixed maximum charges for the transportation of cotton. The general ground of the veto was that the act was in violation of the provision of the Federal Constitution which forbids the passing of laws that impair the obligation of contracts. The Governor said:

As this provision of our State and Federal Constitutions admits of but a single construction, it is only necessary to present such argument as will show conclusively that the rights and powers conferred upon a corporation by its charter are contracts between the State whose Legislature granted the charter, and the corporation accepting it; that certain rights were conferred upon every corporation operating a railroad in this State by its charter; and that the effect of this legislation is to divest them of those rights. To accomplish this I submit a few legal and judicial authorities, and contrast them with the provisions of the bill under consideration, and those of the various railroad charters in the State. The parties in support of the principle here maintained are numerous, but I have sought in vain for a single decision in any of the books holding a contrary view on the subject.

After quoting numerous authorities and statements of principle, he concluded as follows:

It is too late to raise the question whether it was wise to grant to these corporations the exclusive right to regulate their rates of charges; it has been granted; the Constitution under which the grants were made, empowered the Legislature to make them; the companies have accepted the grants, and any legislation that seeks to alter one of those charters in any material point, without the consent of the corporators, is absolutely prohibited. Any power exercised under a general law may be taken away, but if granted in a charter, and the charter is accepted, it is thereby placed beyond the reach of the Legislature, and must so remain as long as the charter exists.

A bill was afterward introduced in the Senate by W. W. Humphries, and known as the "Humphries Bill," which was entitled "An act to prevent extortion and unjust discrimination in the rates charged for the transportation of passengers and freights on railroads in this State and to punish the same, and to prescribe the mode of procedure and rules of evidence in relation thereto, and for other purposes." It fixed no maximum of charges, but prohibited discrimination and unreasonable rates, and imposed severe penalties for the abuse of corporate powers. It also provided for a Railroad Commissioner, to be elected by the Legislature, to supervise the operations of railroads and look after the execution of the law. The bill was debated with spirit and at great length in both Houses, passed the Senate, and was amended in the House, but failed on the last day of the session to reach a final vote in the latter body.

The following memorial to Congress was adopted:

Whereas, Doubts have arisen whether the Legislature of the State of Mississippi can constitutionally enact a law regulating the tariffs on inter-State railroads, and the freights on navigable streams in this State; and

Whereas, Unjust discrimination is made on all railroads in this State, as well as by steamers and other water-craft, on said navigable streams, respecting tariff and freight rates in favor of different localities along said roads and streams; and

Whereas, Gross injustice is thus done to persons passing freight over said roads and streams, by leaving them to the mercy of large and powerful corporated monopolies, without any means of resisting their extortionate and unjust demands: therefore

Be it resolved, by the House of Representatives, the Senate concurring therein, That we, the representatives of the people of the State of Mississippi, do solemnly memorialize the Congress of the United States to provide, by appropriate legislation, some adequate means of restraining such unjust discrimination by the passage of a general law regulating the tariff and freight rates on all railroads and navigable streams in the United States.

The question of calling a convention to revise the Constitution of the State was referred to a joint committee, and two antagonistic reports were made. No definite action was taken on the subject. An act was passed providing for an enumeration of the population and of the qualified electors of the State. This is required by the Constitution as a basis for the State apportionment. The public health-laws were thoroughly amended, so as to provide for health officers in each county, to authorize local boards of health, under the gen-

eral supervision of the State Board, and to extend and define the powers of the latter. Among other things it may establish a strict quarantine in case of an epidemic. An act for the prevention of cruelty to animals was also passed.

The following resolution was unanimously adopted by the Senate on the 3d of March, and afterward concurred in by the House:

Whereas, The late Mrs. Sarah A. Dorsey, of Beauvoir, Mississippi, bequeathed at her death to the State of Mississippi a crayon-portrait of the Hon. Jefferson Davis, taken in the apparel which he wore when, as President of the Confederate States, he was captured at the close of the late war by United States troops; and

Whereas, Said portrait is valued by us not only as a likeness of one who faithfully and ably represented the patriotism and manhood of the South during our four years' struggle for self-government, but also for its historic value in presenting ex-President Davis in the true garb in which he was attired at the time of his capture, as appears from an autograph letter from her accompanying said picture:

Be it therefore resolved by the Senate (the House concurring), That the people of Mississippi, through their representatives here assembled, do hereby express their appreciation of the gift, and their gratitude to the giver, who has thus linked her name with that of the illustrious President of the Lost Cause.

Resolved, further, That the Librarian take charge of said portrait and put it in a suitable place in the State Library, and that the autograph letter of ex-President Davis be framed and preserved with said portrait.

Resolved, further, That a copy of these resolutions be transmitted by the Secretary of the Senate to Hon. Jefferson Davis.

There was no State election this year, but conventions were held for the purpose of choosing delegates to the national nominating assemblies of the several parties. That of the Republicans took place at Jackson on the 5th of May. The sentiment of its members was divided on the subject of a candidate for the Presidency between supporters of General Grant, Secretary Sherman, and Senator Blaine. It was freely charged that the Secretary of the Treasury had used his official power to secure control of the Convention, and a caucus of the Grant men adopted the following resolution:

Resolved, That when it shall become evident that the friends of Ulysses S. Grant can hope for no justice and look for no fair play at the hands of the majority, which, ruled by the office-holders, grossly misrepresents the Republican masses of this State, we withdraw in a body, organize a truly representative convention, send our own delegates to Chicago, and formally protest against the action of the clique which has attempted to betray and misrepresent us.

Those opposed to General Grant's candidacy succeeded in organizing the Convention and directing its proceedings, and a resolution declaring General U. S. Grant to be "the choice of the Republican voters of Mississippi for President of the United States" was laid on the table. The Grant delegates remained after the adjournment of the Convention, and, besides adopting a resolution declaring General Grant to be the "choice of this Convention," unanimously agreed to the following:

Resolved, That we still adhere with unflinching devotion to the principles of the Republican party as set forth in its national platform, and that we recognize in Grant the statesman best of all able to enforce these principles as the Executive of the United States.

At this time Mr. J. M. Bynum, of the committee on resolutions, produced the following, which had been framed by his committee. They were adopted:

The Republican party of Mississippi, in convention assembled, reassert and adopt as the cardinal principles of the party:

A stable currency for the people. The equal political and civil rights of every American citizen.

Free schools, free speech, and free elections; the right of every man to vote once, and have his vote counted.

We pledge a hearty support to the nominee of the Chicago Convention.

The Democrats held their convention at Jackson on the 27th of May. Delegates to the Cincinnati Convention were chosen and candidates for Presidential electors were nominated. The following resolutions were unanimously adopted by the Convention, but the Committee on Resolutions reported that as the contest was a national one, and the National Convention would soon "declare the platform of principles of the Democratic party," it was "unnecessary to declare any platform of the party in this State":

Resolved, That this Convention recognizes the necessity of the harmony and the hearty coöperation of the friends of good government throughout the Union in the approaching Presidential election. That it deems the election of the nominee of the Cincinnati Convention of supreme moment to the whole country; and that this success should not be jeopardized by the indulgence of personal aspirations, nor by the gratification of personal preferences; and while individual members of our party in this State may have their preferences as to who should receive the nomination, this Convention deems it unwise to make any other declaration on that subject than to say that the choice of the Democratic party of this State is he who shall be nominated by the National Convention; and that we will give him our hearty support, and with it the electoral vote of this State.

Resolved, That our delegates to the Democratic National Convention be instructed to act in the spirit of the foregoing resolution, and to cast their votes for that man whom they shall find, after full consultation with the delegates from the other States, will best harmonize the opposition to the longer continuance of the unconstitutional and unwise methods of the Republican party.

A Greenback mass-meeting, at Jackson, near the end of May, appointed delegates to the National Convention of the party, and left it to the Executive Committee to make nominations for electors.

The result of the Presidential election in the State was 75,750 votes for the Democratic ticket, 34,854 for that of the Republicans, 5,797 for that of the Greenbackers, and 677 "scattering." The total was 117,078, and the Democratic majority 34,422. Democratic Representatives were elected in all of the six Congressional districts. The vote, as officially returned, was as follows: First district, Muldrow, Democrat, 14,456; Morphis, Republican, 3,828; Da-

vidson, Greenbacker, 1,058; scattering, 3; total, 19,345—Muldrow's majority, 9,567. Second district, Manning, Democrat, 15,250; Buchanan, Republican, 9,996; Harris, Greenbacker, 3,585; total, 28,856—Manning's plurality, 5,257. Third district, Morey, Democrat, 11,722; Gunn, Greenbacker, 2,790; scattering, 22; total, 14,534—Morey's majority, 8,910. Fourth district, Singleton, Democrat, 13,745; Drennan, Republican, 4,177; scattering, one; total, 17,927—Singleton's majority, 9,561. Fifth district, Hooker, Democrat, 11,771; Deason, Independent Republican, 6,193; Osborn, regular Republican, 125; Patterson, Greenbacker, 222; scattering, 10; total, 19,121—Hooker's plurality, 5,578. Sixth district, Chalmers, Democrat, 9,172; Lynch, Republican (colored), 5,393; scattering 2; total, 14,565—Chalmers's majority, 3,777.

Among the provisions of the new election laws was the following:

All ballots shall be written or printed with black ink, with a space of not less than one fifth of an inch between each name, on plain white news printing-paper, not more than two and one half or less than two and one fourth inches wide, without any device or mark by which one ticket may be known or distinguished from another, except the words at the head of the ticket; but this shall not prohibit the erasure, correction, or insertion of any name by pencil-mark or ink upon the face of the ballot; and a ticket different from that herein described shall not be received or counted.

In the sixth district it was alleged that no fewer than 5,358 Republican ballots were thrown out by the election commissioners because they contained distinguishing marks in the form of dashes separating the different parts of the ticket. Mr. Lynch gave notice of his purpose of contesting the election of General Chalmers, enumerating cases of alleged fraud and illegal exclusion of votes from the count in several counties. General Chalmers made a reply, which was mainly devoted to a legal argument in support of the rejection of the ballots containing the so-called "distinguishing marks."

The State census which was taken under the direction of the Secretary of State, to serve as a basis of apportioning representation in the Legislature, places the total population at 1,145,480. It gives the number of legal voters as 240,478, of whom 109,995 are white, and 130,483 colored. It also reports the number of bales of cotton raised in 1879 by white labor at 290,957½; by colored labor, 549,990½. There are in the State 4,995 public and 964 private schools, the number of children of school age being 178,218 whites, and 251,438 colored.

The returns of the tenth census of the United States for the State of Mississippi, as officially announced on January 15, 1881, shows the total population to be 1,131,592. Of this number 567,137 are males, and 564,455 females; 1,122,424 are natives of the United States, and 9,168 of foreign birth; 479,319 are white, and

652,221 colored. Among the colored inhabitants are included 1,832 Indians and half-breeds, and 52 Chinese. The following is a classified table of the population by counties:

COUNTIES.	Total.	Male.	Female.	Native.	Foreign.	White.	Colored.

MISSISSIPPI RIVER IMPROVEMENT. A comprehensive and complete survey of this great highway with a view to its improvement was first ordered by the bill approved June 28, 1879, entitled "An act to provide for the appointment of a Mississippi River Commis-

sion for the improvement of said river from the head of its passes near its mouth to its head-waters." Pursuant to this act, a commission was appointed, consisting of seven members—General Q. A. Gillmore, General C. B. Comstock, and Major Charles R. Suter, all

of the Engineer Corps of the Army; Mr. Henry Mitchell, of the Coast and Geodetic Survey; and three civilians—Mr. J. B. Eads, engineer and constructor of the jetties; Major B. M. Harrod, Chief-Engineer of the State of Louisiana; and Mr. Benjamin Harrison. The commission, thus ably constituted, made a preliminary report, which was presented to Congress and referred to the Committee on Commerce, March 10, 1880.

The work assigned to the commission was:

1. To direct and complete such surveys of the Mississippi River, between the head of its passes near its mouth and its head-waters, as were then in progress, and to make such additional surveys and examinations of said river and its tributaries as might by it be deemed necessary.

2. To take into consideration and mature such plan or plans as will correct, permanently locate, and deepen the channel, and protect the banks of the Mississippi River; improve and give safety and ease to the navigation thereof; prevent destructive floods, and promote and facilitate commerce and the postal service; and, with such plans, to prepare and submit estimates of the cost of executing the work.

3. To report specifically upon the practicability, feasibility, and probable cost of the plans known as the jetty system, the levee system, and the outlet system.

Finding that accurate surveys of the upper Mississippi had been already completed, the commission directed its attention chiefly to the eleven hundred miles along the channel, from the junction of the Ohio to the head of the passes. Of this part of the river, detached surveys give some available data. Such necessary work as was done to connect these was permanently marked, to furnish a basis for future operations. For this purpose a line of secondary triangulation was begun, its triangles closing within six seconds.

Physical phenomena were investigated, and the results compared with those of previous researches. Lines of precise level were run. The gauging-stations between Cairo and New Orleans were increased to twenty, which, in addition to those recently established between Cairo and St. Louis, measure the rise and fall of the river at every fifty miles of its course. Thus the progress of floods and the peculiarities of the river-slope may be traced. Width, depth, and curvature were noted at different and contrasted points. This survey is being executed, the employees of this commission beginning at Cairo and moving down-stream, while the Geodetic and Coast Survey are ascending, having begun in the lower river. Mr. Patterson, Superintendent of the Coast Survey, has four triangulating parties in the field. All marks are placed beyond reach of erosion during the next twenty years. The Hydrographical and Topographical Corps have established theirs in pairs, about three miles apart on each bank of the river. The leveling parties began their work at Columbus, twenty miles below Cairo, General Comstock having previously executed a series of levels to that point. The localities selected for these lines were those where similar inquiries had been

frequently repeated, in order thus to ascertain the varying relations of the river and its bed. "The observations at these places comprise the changes in the figure of the river-bed at different stages of the water, the kind of material forming or moving along the bed, the figure and movement of sand-waves, the slope of water-surface, the discharge, and the transverse currents of velocity." Boring-parties were employed in determining the depth of alluvial deposit and the nature of underlying strata in those portions of the river requiring improvement.

Systems of Improvement.—After mature deliberation a majority of the commission passed unfavorably upon the outlet system, as one of diffusion and waste and not of concentration. From irrefragable data and through close reasoning, they extract these general principles:

If the normal volume of water in a silt-bearing stream, flowing in an alluvial bed of its own formation, be permanently increased, there will result an increase of velocity, and consequently of erosion and silt-bearing power, an increase in area of average cross-section, and an ultimate lowering of the surface-slope; and, conversely, if the normal flow be decreased in volume, there will ensue a decrease of velocity, silt-transporting power, and mean sectional area, and an ultimate raising of the surface slope.

The outlet system has been advocated because, during a flood, a crevasse has the effect of lowering the surface of the river in its vicinity and below it. Hence, it is argued that natural or artificial outlets, conveying the surplus waters to the sea by a shorter route, must tend to prevent the recurrence of disastrous floods. This might be true were it not that the Mississippi holds in suspension a vast proportion of silt, borne onward by its mighty current to the Gulf. The velocity of this current must be maintained; if checked, a deposit of sediment occurs. Shoals, caused by loss of velocity, are formed below crevasses. If the crevasse is kept open indefinitely, the shoal continues to extend down the stream. Only when the width of the river has been reduced and the current restored does it wash out its channel.

The Mississippi, not only in its main line but in its outlets, is no exception to the law that silt-bearing streams, flowing through alluvial deposits, have the power to increase or steepen their surface-slopes, so adjusting them as to allow their currents to carry onward the sedimentary matter with which they are charged. Other conditions being the same, the slope is least where the volume is greatest, and, conversely, the slope is increased where the volume is diminished. The following examples are cited:

The fall of the Atchafalaya is about six inches per mile from its head to the Gulf-level, while the fall of the Mississippi from the same point is less than two inches per mile. The volume of the Atchafalaya is only about one twelfth as great as that of the Mississippi where they separate. The fall of the South Pass is three inches per mile, while that of the Southwest Pass is but two inches per mile. The volume of the

South Pass is only about one quarter as large as that of the Southwest Pass.

As water selects the line of least resistance in flowing from a higher to a lower level, it follows that, inasmuch as that portion of the Mississippi floods which enters the Atchafalaya seeks the Gulf-level through a route not half so long as that which follows the main river, the resistance in the shorter and steeper route of the Atchafalaya must be so much greater, that these elements which tend to increase the current are so far neutralized as to produce in both routes to the sea that rate of current which is capable of transporting the sediment without loss or gain to the Gulf-level, and thus a condition of equilibrium is established between these two routes to the sea. It seems unnecessary to state that the ratio of frictional resistance to volume of water, resulting from the smaller size of the Atchafalaya, is so much greater than that in the main river that this condition of equilibrium or regimen of the two channels is the result. Anything which will tend to increase the flow permanently through either route would, if unchecked, have a tendency to cause the entire river to find its way ultimately through that route to the sea, by lessening in it, as it enlarged, the ratio of frictional resistance to volume of water flowing in it. The sub-delta building ability of the smaller passes, by which they prolong their length and thus flatten their slopes, will invariably tend to cause their extinction, by results similar to those, hereinafter referred to, at Cubitt's Gap, The Jump, and the extinct outlets below them. This cause has tended to the extinction of many well-known bayous below the Atchafalaya. That the Atchafalaya remained so long unaltered, and is now evidently enlarging, is owing to important changes in the bed of the Mississippi near it, by which a large portion of the floods of Red River have been recently discharged through it.

This explanation of the relation between slope and volume is, of course, applicable to the other existing outlets referred to in this connection. For this reason the commission believes that no surer method of ultimately raising the flood-surface of the river can be adopted than by making lateral outlets for the escape of its flood-waters. The raising of the flood-surface necessitates an increase in the height of the levees, and leaves shallower channels for navigation.

As the system of improvement proposed by the commission is based upon a conservation of the flood-waters of the river, and their concentration into one channel of an approximately uniform width, it would seem scarcely necessary further to consider a system based upon theories and arguments so diametrically opposed to it as the outlet system is thus shown to be.

An outlet, ten miles below New Orleans, into Lake Borgne, was proposed by Engineer Ellet in 1852, in a report to the Secretary of War. His plan was examined and rejected by Humphreys and Abbot, and again in 1875 by the Levee Commission. It is an erroneous idea to suppose that such an outlet would be permanent. Similar openings in the river show that a sub-delta formation immediately begins, which in a few years effects a closure. Several extinct channels are found on either side of the great passes. The largest and most recent of these, known as Cubitt's Gap, occurred about seventeen years ago, caused by a narrow canal. The river and gulf were then about a thousand yards apart, with a mean difference of three feet between their surface-heights. This fall gave such rapidity to the escaping flood that it soon made a crevasse over two thousand feet wide and at least one hundred feet deep where the river-bank once rested. Once through the gap, the velocity of the water

was checked, and the sediment deposited over an area of possibly thirty square miles, forming innumerable islands and shoals. The breach in the bank is rapidly closing, and must shortly disappear by a natural process.

The same result has followed at The Jump, at the great Bonnet Carré Crevasse, and at all openings, natural or artificial, made through the bank. Hence the commission argues that the outlet into Lake Borgne could only be kept open by continued dredging, while a shoal would certainly form below, to the manifest injury of navigation. The slope of the river being increased from the head of the passes to the outlet, the flood-surface above that opening would be raised.

In regard to the Atchafalaya outlet, except such work as is requisite to prevent its enlargement, the commission makes no recommendation, as Major Benyaud, United States Engineer Corps, who is in charge of the Government work on that part of the river, is preparing a special report concerning the mouth of Red River. The proposition to turn the waters of the Red River into the Calcasieu is impracticable, the bed of the Calcasieu being from sixty-three to seventy-three feet higher than the water-surface of the Red River at the closest connectable points, which are 23-86 miles apart. If it is proposed to make the connection near the mouth of the Calcasieu, the expense is prohibitory.

The effect of crevasses and other outlets in lowering floods has been exaggerated. In 1858, when the Bell Crevasse was pouring through the break at the rate of 80,000 cubic feet per second (about one twelfth of the total discharge of the river at the time), the water-surface was only lowered one and five tenths' foot at the site; while at Baton Rouge, one hundred and twenty-four miles above, no sensible effect was produced.

The influence of the Gulf on the river is not felt during high water so far as Red River. The Raccourci and Red River cut-offs, which shortened the course of the river thirty-nine miles and lowered the high-water mark near the mouth of Red River four and six tenths feet in the flood of 1851, produced no effect one hundred miles above. Therefore, both Gulf tides and crevasses are restrained in their action to a limited area, and this influence decreases rapidly in ascending.

The Levee System.—Though levees have been built solely to protect alluvial lands from overflow, they have a direct action on the river itself, deepening its channel and enlarging its bed during seasons of flood, restraining its dispersion and causing its attainment of a higher level within its banks. During the period between 1850 and 1858, when the levees were kept in best order, the channel of the river was in better navigable condition than it has been since that time. During the last twenty years the levee system has been interrupted by numerous crevasses between Cairo and Red

River. According to the laws already stated, a closure of these crevasses ought to wash out shoals formed by them and by contraction deepen the channel. The commission believe that the reduction of the flood-level thus attained would ultimately eliminate the necessity for levees above Red River, while below it they need be maintained at a less height.

While levees may not be necessary to the securing of a deep channel for navigation, they hasten the work of improvement and are a valuable adjunct. As a protection to life and property along the banks, they are essential. They promote and facilitate commerce by establishing landing-places above the reach of floods. They aid the postal service by protecting its carriers, the railroads and common roads, from destruction by floods, as well as give safety and ease to navigation by their influence on the channel. On some of these points the views of two members of the commission, not being entirely in accord, are given in a minority report, which differs more in degree than in essentials. The breaks in the levee, according to the statement of the commission for the reclamation of the alluvial basin of the Mississippi River, amounted in 1875 to 8,065,700 cubic yards. Repairs accomplished since then in Louisiana and Mississippi fully equal new cavings in Arkansas and Missouri. To restore the levees to their former height, closing all gaps, would require an expenditure of about \$2,020,000. The cost of maintenance can not be computed exactly without further data. The commission are of opinion that a continuous line of levee, giving, beyond a peradventure, security from overflow, would stimulate commerce and foster agricultural and manufacturing interests, bringing unprecedented prosperity to the riparian region.

The Jetty System.—This is the plan of improvement recommended by the commission. Bad navigation is produced by the caving and erosion of the banks, by excessive width, and by bars and shoals as results. The contraction of the water-way to a comparatively uniform width, and the protection of caving banks, are the essential features of improvement. The effect of narrowing the width is to remove shoals and fill up holes, thus giving an even bed, regularizing the discharge and reducing the friction, all of which tend to lower the flood-surface. Of the river below Cairo, it is known by observation that, wherever the low-water width does not exceed three thousand feet, the channel is good; wherever there is a wide low-water water-way, there are bars and shoals.

By contracting the low-water channel to an approximate width of three thousand feet, and causing by appropriate works the deposit of sediment on shoals outside of that channel, the improvement can be effected. The works for which estimates are given in the report are expected to maintain a depth of at least ten feet at low water on all bars. The commission

deprecate attempts to straighten the river or to shorten its course by cut-offs. Borings made in 1875, 1879, and at various other times, confirm the conclusion that the strata forming the river-bed are throughout of a yielding character. If in exceptional spots there is gravel or tough material too heavy for the current to scour, dredging may be required.

Experience both in Europe and at home demonstrates that light and inexpensive hurdles, mattresses of brush, or wire nettings, permeated by the stream, check it sufficiently to produce a deposit of silt. At certain points works of a more solid character are undoubtedly necessary; but such slender impediments have been used both in the Missouri and Mississippi. By these means, in the area to be reclaimed, silting-basins are established, where, during high water, the arrested current leaves its deposit as it flows onward. The accretion of this deposit may go on through one or more seasons, on varying levels, until the formation is complete. The new bank may be protected by a mattress or revetment.

An accurate estimate of the cost can not be made until the close of surveys now in progress. Improved methods of construction, developed while the work is under way, may reduce the aggregate amount required.

The initial works recommended by the commission as to be advantageously undertaken during the fiscal year ending June 1, 1881, have an aggregate length of two hundred miles of the shoalest water in the Mississippi below Cairo. The localities are New Madrid, Plum Point, Memphis, Helena, Choctaw Bend, and Lake Providence. Careful and comprehensive estimates are given of the inclusive cost of these improvements, which are thus summed up:

Estimates for works of improvement during first fiscal year.

Initial works for channel contraction and bank protection	\$411,800
Closing gaps in levees	1,010,000
Checking enlargement of Atchafalaya	10,000

Estimate for surveys and expenses of commission for fiscal year ending June 30, 1881.

For surveys and examinations above and below Cairo, and the necessary salaries and other expenses of the Mississippi River Commission	\$200,000
---	-----------

The report further suggests that Congress arrange some equitable mode of appraisal and purchase of lands and materials needed in the prosecution of the improvements. It further recommends that execution and disbursements be not placed in the hands of the commission, but that their duties be confined to the making of plans and modifications, and a general advisory supervision.

This is a brief synopsis of a report which is at once minute and comprehensive. It is one of the most valuable scientific contributions ever made on the treatment of rivers. A bill is pending before Congress to enable the commission to carry forward the plan they have suggested.

The sub-committee of the Committee on Levees and Improvements of the Mississippi were directed by Congress to proceed down the Mississippi to its mouth . . . for the purpose of acquiring a knowledge of its peculiar conditions and wants, and to gather information relative to the best methods for its improvement."

The members of this sub-committee were Mr. Dum, of Arkansas; Mr. Myers, of Indiana; Judge Harris, of Massachusetts; Mr. Prescott, of New York; and Mr. Humphrey, of Wisconsin—representatives of different sections of our country, and of both the Democratic and Republican parties. On the 6th of May they took passage at St. Louis for New Orleans, on board the steamer James Howard. Her carrying capacity is about 3,000 tons on a draught of eleven feet. The river at St. Louis was about midway between high and low water. Frequent soundings were necessary, and in the upper part of the river it was found necessary to tie up at night. The channel shifts and soundings showed at times as little as twelve feet. In the low-water period the channel shows about four feet. Thus, for four months of the year, as far as the larger craft are concerned, navigation is practically interrupted. This steamer carried her cargo unbroken as far as Vicksburg, after which she made about seventy landings. The committee saw everywhere traces of the general and disastrous overflow of an earlier season. Although they did not see the river at high or low tide, they saw enough to convince them that narrow banks make deep channels, and that wide waters and dangerous bars and shoals are so universally associated as to suggest cause and effect. The observations of these practical men confirm the scientific views of the picked engineers forming the commission:

Wherever the width of the river is unusually great, or where it is divided into separate channels, serious obstructions occur. Through a narrow and undivided bed deep water is always found. Inequalities of width are caused by the caving of the banks. As bars and islands are formed by this process, they serve to intensify the original cause.

No natural cessation of the agencies now at work, destructive to navigation, can be anticipated.

We are of opinion that a process that will arrest the caving of the banks, and will develop the bars outside the width of the channel assumed as necessary into new shore-lines, conserving and strengthening the scouring power of the current instead of retarding, diverting, and dissipating it as they do in their present condition, is eminently necessary, not only for restoring the measure of navigation already lost, but to arrest the progress of deterioration which is steadily going on.

Your sub-committee have found that the parts of the levee system remaining range from about four to twenty feet high, comprising dikes attaining the height of thirty-five feet over bayous and sloughs. Where such dimensions are reached, their maintenance is important in preventing the depletion of the river and the resulting injury to navigation through the outlets which their destruction would cause.

The present provision by the States in which these works are located for their preservation or restoration

is inadequate and uncertain. It is also doubtful whether these States should be solely charged with these works, which, while they were built by them exclusively for protection from overflows, serve a national purpose in preventing destructive floods and in maintaining and improving by the removal of sand-bars the navigation of our inland waters. . . . From a careful comparison of our observations with the report of the Mississippi River Commission, we are of opinion that the description and explanation contained therein of the natural operations now progressing to the detriment of the navigation of the Mississippi River are apparently correct; and also that the methods therein recommended for the treatment of the Mississippi River appear to be correct and should be tested.

This is demanded both by the steady increase of the evils to be abated, and by the trade of the great Mississippi Valley seeking distribution and outlet.

After drawing a glowing but true description of the great valley whose cereal, cotton, and meat products form over 75 per cent. of the entire crop of the country, the sub-committee assert:

It is not unreasonable to estimate that the deepening of the Mississippi River will lessen the freight, carriage, and insurance rates of the cereals alone to the seaboard at least five cents per bushel, which gives in round numbers \$75,000,000 per annum on the present yield.

In accordance with the recommendations of this sub-committee, a bill was adopted by the Committee on Levees and Improvements of the Mississippi River, which was reported to the House May 28, 1880.

The purchase-money for the Great Father of Waters was paid by the people of the United States with cheerfulness, so well did they understand the force of Napoleon's words in the Treaty of Paris in 1803: "I have just given to England a maritime rival that will sooner or later humble her pride." During the war between the States many a sluggish spirit was roused by the determination that the whole Mississippi from Itasca to the Gulf should belong to the United States alone. The destruction of the levees was in part due to the war, but no one at this day could be found who would assert that therefore the Government is not called upon to rebuild them. On January 11, 1865, Secretary Stanton sent Major-General Humphreys to Louisiana to inspect the river and initiate repairs, because it had been represented to the department that the levees "require the immediate attention of the Government for the purpose of repairing them at certain places and placing them in a condition to protect the country from inundations that might occasion great injury to the agricultural interests of that region as well as to its commerce."

States imbued with any degree of civilization, even when laws are silent, respect and preserve the arteries of commerce. During the recent conflict between Russia and Turkey, Prince Gortchakoff hastened to assure the great powers that works on the Danube, impaired or destroyed during that war, should be restored to more than their previous efficiency

by the Russian Government. In times of peace, the facilitation of communication and transportation has been the proof of enlarged and liberal statesmanship. In a distant province, India, the British Government has expended \$500,000 on this sole object. The United States have not been niggardly in these respects. Nameless streams, which can scarcely be traced upon a map, have had a portion of the public bounty. The Pacific Railroad cost the Government \$90,000,000. The Welland Canal is about to be widened at an expense of \$40,000,000. The Cumberland River has received \$6,000,000; the Harlem, \$2,500,000; the canal round the Des Moines Gap, \$4,500,000. Nearly as large an appropriation has been made for the canal at Portland, on the Ohio. At a cost of \$5,250,000 the jetties have succeeded in opening and maintaining a channel twenty-eight feet deep, in which the Great Eastern may safely float. Yet the great river, a little way above it, is little better than a shifting network of shoals and bars. During four months of the year, just when the grain and other crops of the Northwest ought to be moved, the agriculturists of the valley of the Mississippi are deprived of their natural outlet to the sea. Thus freed from river competition, great corporations have only to combine and fix the rates of transportation. A difference of five cents a bushel makes \$75,000,000 a year saved or lost to the farmers of the great basin. The Mississippi flows from the northern to the southern limit of our country. It belongs to no special district, whose representatives concentrate their efforts on its interests. No influential corporation asks a subsidy. Yet it is not to be doubted, that when the people are roused to a knowledge of its condition, the recommendations of the national commission will be enforced. They will demand a solid bank and safe channel, deliverance alike from destructive floods and obstructed navigation. Systems of levees must be continuous or they are futile. The States are constitutionally prohibited from forming combinations for such or any purpose. They are legally debarred from exacting tolls or imposts, through which such works could be constructed or maintained. The Constitution reserves to Congress the right to regulate commerce, and provides that it shall have power to dispose of and make all rules and regulations respecting the territory or other property belonging to the United States. The Mississippi by purchase, by treaty, by law, is national property. Its levees were originally built with the proceeds of public lands set apart by the national Government for that purpose. For ten years, before the war, the Government maintained a Mississippi River Commission to investigate methods of protection.

The recommendations of the present commission ask an outlay, small in proportion to the benefits to be attained. Their plan is no mere untried theory. So early as 1817, on the

river Rhine, contractions were made between the French frontier and Germersheim, and the system has been continued to our time, with the invariable result of a deepening of the bed and a sinking of the flood-surface. In 1869, according to the report of M. Henri Grebe-neau, inspector of public works at Germersheim, "the fall of the water-surface of the Rhine amounts to $2\frac{2}{100}$ metres, and all the spots exposed to inundation before 1817 continue now to remain dry."

The jetties afford proof positive of the adaptation of the contraction system to the peculiar formation of the Mississippi. President Hayes and the Secretary of War alike advert to the improvement of the Mississippi as a measure of "transcendent importance." In his letter accepting the nomination to the Presidency, General Garfield writes:

Fortunately for the interests of commerce, there is no longer any formidable opposition to appropriations for the improvement of our harbors and great navigable rivers, provided that the expenditures for that purpose are limited to works of national importance. The Mississippi River, with its great tributaries, is of such vital importance to so many millions of people that the safety of its navigation requires exceptional consideration. In order to secure to the nation the control of all its waters, President Jefferson negotiated the purchase of a vast territory, extending from the Gulf of Mexico to the Pacific Ocean. The wisdom of Congress should be invoked to devise some plan by which that great river shall cease to be a terror to those who dwell upon its banks, and by which its shipping may safely carry the industrial products of twenty-five million people. The interests of agriculture, which is the basis of all our material prosperity, and in which seven twelfths of our population are engaged, as well as the interests of manufactures and commerce, demand that the facilities for cheap transportation shall be increased by the use of all our great water-courses.

It is to be borne in mind that there have never before been any save local surveys on the Mississippi. There has neither been triangulation nor levels. The Mississippi River Commission are continuing the work begun by General Comstock and the Coast and Geodetic Survey. According to their last report, their intention of continuing their observations below St. Louis, extending over the year, on and below each of the main tributaries, has been defeated by the reduction of the appropriation by Congress. This part of their project having been reluctantly postponed, the commission turned their attention to the river above St. Louis, a work of inferior importance, but all that the appropriation justified. The commission made two tours of inspection from St. Paul to the mouth of the Illinois. They report as follows:

The drainage basin comprises 33,719 square miles above St. Paul, 52,399 square miles on the right and 48,156 square miles on the left bank above the mouth of the Illinois. The immediate valley has an average width of about three miles; often, however, double this. . . . The rocky limits of this valley have been filled, in some places one hundred feet deep, with sand and gravel, in which the present river excavates and shapes its bed, in curves to which the bluffs are tangents, but never reaching the bed-rock

below. To these general characteristics there are two exceptions, at Rock Island and Keokuk. . . . In these localities are found rocky beds, forming rapids which obstruct low-water navigation. Similar formations exist at Fountain Bluff and at the Chain of Rocks below St. Louis. At Rock Island a channel four feet deep and two hundred feet wide at extreme low water has been cut in the rock, while at Keokuk has been built a canal, affording a minimum navigation of five feet and a maximum of eight feet. . . . The entire valley, except the sand terraces, is subject to inundation.

The water is nearly free from suspended matter. There are none of the complications attending the improvement of sedimentary streams. There are lakes and sloughs on both sides of the river, which enable the engineer to control the force he employs in deepening the main channel.

Many of the tributaries sweep in large quantities of sand, forming a lake-like expansion and depth above, with slight fall, and a steep, uncertain, and difficult channel below. The most marked example of this is caused by the Chippewa from the head of Lake Pepin down to the Alma. All indications show that the bed is still rising.

The present condition of the river does not afford a navigable depth of five feet for a sufficient part of the year to justify the construction of boats of greater draught. Yet economy in transportation depends upon the capacity of carriers.

Barges on the upper river, built with a limit of draught of five feet, carry about 12,000 bushels of grain; while those used below Cairo, when an average depth of eight or nine feet can be obtained for a large part of the year, carry 20,000 bushels on five feet, 30,000 on seven feet, and 60,000 on eight to nine feet.

An economical system of transportation demands not less than six feet throughout the channel at all seasons. Even if this depth can be attained with difficulty at Keokuk and Rock Island, two obstructions would not affect transportation so injuriously, provided the rest of the channel for 700 miles were free from danger and delay. The report continues:

The plan of improvement adopted for this part of the river consists of low-water dams, closing sloughs or side-channels, to augment the flow through the main channel; of spur-dikes, or jetties, or wing-dams, built out from convex shores where the width is too great to direct and concentrate the flow, and produce scour over that part of the bed promising the best channel; and of revetments to protect such parts of the banks as may be attacked by the direction and concentration given to the current by the dikes. The construction is of layers of stone and of brush, bound into fascines or mats.

At first these dams were raised only one foot above low water; they are now built four feet above. They now produce more rapid results to the channel, besides serving to define it, and affording protection against ice. In the opinion of the commission, this system of improvement is completely successful. Dredging has been occasionally resorted to, where erosion is slow, or landings must be secured in front of towns.

The results obtained are thus tabulated:

Practicable depths on bars on the upper Mississippi River at low water.

PART OF RIVER.	Before improvement.	After improvement.	Remarks.
St. Paul to St. Croix...	16 inches.	2 feet.	But two of the worst bars on this stretch improved.
St. Croix to Chippewa...	1 05 feet.	8 feet.	
Chippewa to Wisconsin	20 inches.	8 feet.	
Wisconsin to Illinois...	2 feet.	2½ to 4 feet.	

The following local results are more indicative, as the appropriations have not permitted work on all the shoals in any one reach:

SHOALS.	Before improvement.	After improvement.
Pig's Eye.....	1-8	4-5
Numinger.....	1-0	3-7
Smith's.....	1-3	4-5
Mount Vernon.....	2-0	4-5
Betsy Slough.....	1-5	4-5
Winona.....	1-5	8-0
Queen's Bluff.....	2-5	8-6
Cassville.....	1-9	4-5

The commission approve the system of improvements now being carried on in the upper river under Captain Mackenzie, United States engineer. They recommend that the sums appropriated be large enough to procure the extensive and expensive plant which is durable, and therefore economical; and that the Des Moines Canal be duly maintained. The progress of the surveys during the year is as follows:

Triangulation, Illinois River to Ohio River, completed to Powers Island, fifteen miles below Cape Girardeau, 205 miles.

Triangulation below Cairo, completed to Gaines's Landing, seven miles below Arkansas City.

Precise levels, Illinois River to Ohio River, completed to Cape Girardeau, 190 miles.

Precise levels, below Cairo, completed to Greenville.

Topography below Cairo: Survey of Vicksburg Harbor is completed, and work is resumed near Commerce.

The Coast and Geodetic Survey report on December 23d and 30th that the following work is complete, or it will be completed by February 1st:

1. The triangulation from the Gulf of Mexico to Greenville, Mississippi, a distance of 535 miles; and that from Helena, Arkansas, to Memphis, Tennessee, a distance of 85 miles.
2. The line of levels from Carrollton, Louisiana, to Greenville, Mississippi, a distance of 460 miles.
3. The topography from the Gulf to Donaldsonville, Louisiana, a distance of 195 miles.
4. The hydrography from the Gulf to Baton Rouge, Louisiana, a distance of 255 miles.

A leveling party began at Greenville, working down the river, and was below Vicksburg on December 30th, at which time a detachment, which began work at Carrollton, Louisiana, was above Natchez; and the two parties were to meet in January. This is the point of progress reached at the close of 1880 in this work on "the great inland sea."

MISSOURI. The message of Governor Phelps, delivered to the Legislature before retiring from office, presents more cheerful and hopeful views of the prosperity and prospects of the State than any similar document ever issued. The Governor recommends the reduction of the legal rate of interest to six per cent. That has been the prevailing rate in St. Louis during 1880, though eight per cent. was sometimes obtained, and money was loaned also at as low a rate as three per cent. It is proposed to have the census law amended, so that the census may be taken in 1885, and thereafter at decennial periods. An enlargement of the judiciary is demanded, and some additional reforms in criminal administration. The common schools are being improved at a gratifying rate. The population of the State is estimated to have increased in the last four years at the rate of 60,000 a year. Governor Crittenden, in his inaugural address, recommended a general registration law, and a revision of the revenue law.

The entire receipts into the State revenue fund for the two years 1879 and 1880 were \$3,145,664, including a balance on hand, January 1, 1879, of \$120,224. Of these receipts, \$2,766,189 was from revenue sources, and \$256,875 from the sale of revenue bonds. The disbursements have been \$2,861,638, leaving a balance on hand of \$284,026. Of the expenditures, \$327,057 was for eleemosynary institutions for the two years, including the cost of erecting the new Asylum for the Insane at St. Joseph. The expenditures for education have been \$1,145,381, of which \$363,720 was interest on bonds and certificates of indebtedness held in trust for the schools. The total taxable wealth of the State has increased from \$555,240,555 in 1878, to \$558,361,443 in 1879. The entire receipts into the State interest fund for the two years were \$2,329,039, which, together with a balance of \$156,039, makes a total of \$2,585,080. The disbursements were \$2,511,451, leaving a balance on hand of \$73,629. The indebtedness of the State, not including \$3,000,000 Hannibal and St. Joseph Railroad bonds, is \$16,259,000.

The bulk of receipts into the State Treasury is divided into two funds, the revenue fund and the interest fund, each mainly made up of the proceeds of a tax of twenty cents on the \$100 on all taxable property in the State, which, by the assessment of 1878, is \$558,361,000. One fourth the proceeds of the twenty cents tax paid into the revenue fund is set apart every year for the support of the public-school system, and the remaining three fourths suffices for all the expenses of the State government, including the eleemosynary, penal, and other public institutions, the Legislature, the judiciary, and the cost of criminal prosecutions; \$1,115,000 sufficed for all these objects in 1879, and about \$983,000 in 1880. The interest fund is set apart for interest and other payments on the State debt, and is com-

posed of the proceeds of a tax of twenty cents on the \$100. These proceeds yielded in 1879-'80 \$2,429,041. The disbursements for the two years were \$2,512,451. The balance on hand January 1, 1881, was \$73,629. The annual proceeds of the interest tax are about \$1,100,000, and the annual interest on the State debt is about \$975,000; so that there is always a small surplus to devote to the reduction of the debt. The fact that the debt is not subject to the discretion of the Legislature, but is permanently provided for by this constitutional interest fund, which the Legislature can not impair, and a constitutional tax which the Legislature can not reduce below a sufficiency, amply guarantees the annual payment of the interest, and the ultimate payment of the debt. The debt is now \$16,259,000. This does not include \$3,000,000 bonds issued to the Hannibal and St. Joseph Railroad, because these bonds are provided for by the road to which they were loaned. The railroad company has made a proposition to pay this debt off in cash. The loan made was in bonds of the State of the par value of \$3,000,000, which bear a higher interest than the current rates, and were therefore worth about \$700,000 more than their face value in the market. Of the debt, \$3,031,000 consists of non-negotiable bonds held in trust for the public-school system, the interest only on which is annually expended. These bonds will probably never be paid, as there is no reason why they should be, since, in that case, it would be necessary for the money to be invested in something else for the schools. The State debt is being gradually reduced by the payment of at least \$250,000 a year. It might be reduced more rapidly, but the last Constitutional Convention thought it wiser to reduce the taxes on the people from fifty to forty cents on the \$100, and leave the debt to be steadily diminished by a tax on a steadily increasing valuation. A plan is proposed for refunding the State debt, which now bears six per cent. interest, in non-taxable bonds bearing interest at 4 or 4½ per cent. The feasibility of the project depends upon the question of the constitutionality of making State bonds exempt from taxation. The amount of the State debt which is convertible at present is limited to the renewal funding bonds, known as the 5-20s, \$4,350,000 in all, the larger portion of which are held by the school fund. The large issue of railway bonds also is supposed by many to be redeemable at the option of the State, although the Auditor is of the opinion that they can not be discharged before maturity. A clause in one of the authorizing acts makes them redeemable ten years before maturing; but the acts are so conflicting and confused in their terms, that the holders of the bonds are generally ignorant of such a provision, which, therefore, could not be carried out, it is thought, without violating the good faith of the State.

The retiring State Treasurer, Colonel Gates, had deposited on his behalf, by his sureties, in the St. Louis Bank of Commerce, a sum sufficient to cover the amount of the State funds remaining in default, owing to the failure of the banks in which they had been deposited. This amount, which was \$184,970, being \$183,522 due to the Treasury from the insolvent Mastin Bank, of Kansas City, with accrued interest, was made payable to the State contingently, the condition being the enactment of laws to enable Treasurer Gates to proceed against the bankrupt institution, one of these being a bill to give the State a prior claim to the assets of insolvent debtors. When Gates entered upon his term of office, the moneys of the Treasury were deposited in the Missouri State National Bank, of St. Louis, and the banking-house of Mastin & Co., of Kansas City. The new Constitution contained a provision for a different method of placing the State deposits. It was considered that an enactment of the Legislature was requisite to enable the Treasurer to conform to this regulation. He deposited the funds with the State National Bank, from which no security was required, and with the Bank of St. Joseph. The following year, the Legislature having passed no law for the purpose, he advertised, on his own responsibility, for bids for the State deposits. Before satisfactory offers were obtained, the State National Bank suspended, June 19, 1877, with a large amount of State funds in its keeping. The Mastin Bank, which aided the Treasurer in maintaining the credit of the State at this juncture, was made the State depository; but on September 30, 1878, it also failed, with \$506,187 belonging to the State in its hands. The total amount of Treasury funds which were rendered unavailable by the two failures was some \$1,010,000. The moneys of the Treasury were subsequently placed in the Bank of Commerce, of St. Louis. Notwithstanding the embarrassments of the position, the Treasurer succeeded in meeting punctually all the obligations of the Treasury, leaving the finances of the State in admirable condition at the expiration of his term of office. With the exception of the balance stated above, the funds which were held by the bankrupt institutions were repaid out of successive dividends. The deposits had been made, as Governor Phelps declared in his message, without consulting the Attorney-General or the Governor as to the adequacy of the security, and entirely upon the responsibility of the Treasurer.

The assessment of property for taxation purposes for 1880 is about \$584,000,000, or some \$30,000,000 more than the valuation of 1878. This valuation is much below the actual value of the property of the State. There is a decided upward movement in the prices of farming lands, and a large increase each year in the aggregate value of railroad property. Personal property is returned as less than one third

of the total taxable wealth. In the assessment for 1878 the amount of "money, notes, and bonds" returned footed up only \$43,817,000. The Auditor states that many persons ship bonds and notes out of the State to escape taxation, and that others convert such taxable property into Government bonds and legal tenders, and then change them back again after making their returns.

From the Auditor's report for the two years it appears that the number of convicts being received at the Penitentiary is on the decrease. The number received, according to the warden's certificates for each of the last six years, was as follows: In 1875, 746; in 1876, 628; in 1877, 595; in 1878, 570; in 1879, 532; and in 1880, 466. The cost to the State Treasury of criminal prosecutions is usually estimated at \$200,000 to \$225,000 a year, and the Legislature of 1879 appropriated for this purpose \$491,000 for the years 1879 and 1880. But of this sum there was expended only \$376,578, leaving the large balance of \$114,466 unexpended. The sum expended for the preceding two years was \$511,547, so that the reduction was \$134,969. This reduction, the Auditor says, "is largely attributable to the revival of all business industries and commercial pursuits, which gave employment to thousands who, from the necessities of the extreme hard times, had become reckless and vicious from enforced idleness, and sought a livelihood by unlawfully preying on society and property." The costs of criminal prosecution in 1880 were \$126,697, against \$208,836 in 1879. The delays which formerly occurred in the administration of the criminal laws in a large portion of the State, now no longer happen, as stated by Governor Phelps in his message.

The number of convicts in the Penitentiary on the 31st of December was 1,218, a decrease of 62 from the preceding year, and the institution shows an excess of earnings over expenses for the last two years of \$32,901. During this period the expenses of the Penitentiary amounted to \$178,715, the earnings being \$211,617.

The number of children of school age, five to twenty-one years, in 1880 was 723,484, of whom 681,995 were white and 41,480 colored. The total school population in 1877 was only 676,153. The number attending school was 482,989, of whom 460,090 were white and 22,896 colored. The number of schools taught was 8,641, of which 8,149 were white and 492 colored. The value of all the public-school property in the State was \$7,353,401, and the number of schoolhouses 8,270. The number of teachers employed was 11,659. The wages paid to teachers during the year amounted to \$2,118,637, and the total sum expended for schools to \$3,151,178. The several funds in the State devoted to free education are the State school fund, \$2,903,457; State seminary fund, \$122,000; county school funds, \$2,392,723; township school funds, \$1,-

950,732; special school funds, \$1,523,903—total, \$8,898,816. In addition to the annual income from these several funds, one fourth of the State revenue is devoted to the support of the schools. On the 1st of November there were in attendance on the three normal schools 513 students at Kirksville, 237 at Warrensburg, and 184 at Cape Girardeau; and there were 497 students at the State University, 105 at the Lincoln Institute for colored youth, and 71 at the School of Mines. At the Lincoln University an entire corps of colored instructors was in charge for the first time in 1880.

The State Board of Immigration was created by an act passed in 1879. By a subsequent act, the appropriation, which the original law provided should be \$10,000 per annum, was cut down to \$4,000 per annum for the ensuing two years. An office was opened at St. Louis. Information was solicited concerning the products, prices, and quality of lands, and capabilities for receiving immigrants of the different sections of the State. A pamphlet, succinctly describing the resources of the State, was issued, with an accompanying map showing the railroad extensions to date. Andrew McKinley was appointed Superintendent of Immigration. On the recommendation of the State Board, county immigration societies were organized. There are not over 2,000,000 acres of public lands remaining, of which only a small portion is of superior quality, and this is not easily available, owing to the destruction of the records during the war. The need and capacity of Missouri for immigration are, however, felt to be great, the county societies are active, and a warm interest is generally taken in the State board, which asks for an appropriation of \$30,000 for the next two years in order to take advantage of the large immigration movement from Europe, and spread information as to the prospects afforded in the undeveloped parts of Missouri.

A census bulletin gives the following footings for the State of Missouri: Males, 1,127,424; females, 1,041,380; natives, 1,957,564; foreign, 211,240; white, 2,023,568; colored, including 92 Chinese and two half Chinese, and 96 Indians and half-breeds, 145,236—total, 2,168,804.

Missouri now has 4,007 miles of railroad in operation, 390 miles having been built in the last year. The number of miles of steel track increased from 1,500 to 2,000 in the same time. The narrow-gauge system is represented by 195 miles. There is not a county north of the Missouri without a road, and only twenty-two south of the river. The gross earnings of all the roads in the State in 1880 were \$21,000,000, which is but a little less than the taxable valuation of the roads. There is one mile of railroad to every 542 inhabitants in the State, and one mile to every 400 inhabitants in the northern part of the State. Many of the southern counties embraced in the Ozark Hills do not possess the areas of productive valley and prairie

which are found in the central and northern parts of the State, but these counties possess other elements of wealth—iron, lead, zinc, and valuable earths suitable for the manufacture of porcelain and paint, large forests of valuable pine and cedar, and a considerable number and variety of healing springs.

A destructive wind-storm swept over the southern part of the State, April 18th, causing the loss of over one hundred lives. The town of Marshfield was almost entirely destroyed. Such whirlwinds seem to have become more frequent of recent years, Houstonia and Richmond having been devastated in the same manner within two or three years, as well as Mount Carmel in Kansas.

The city of St. Louis, after a long period of quiescence, seems to have entered upon a new career of commercial growth. During the year 1,854 building-permits were issued, and \$3,790,650 were expended upon the construction and alterations of buildings. The cotton receipts for 1879-'80 amounted to 480,000 bales; but a considerable portion of this trade belonged properly to Memphis, the yellow fever having caused the temporary transfer of the business to St. Louis. The receipts of the year 1877-'78 were 246,674 bales, and the receipts for 1880-'81 promise to be far greater. The quantity received in 1870 was less than 20,000 bales. For this business, which now amounts to over \$30,000,000 a year, a new Exchange Building is to be erected. A call board has been organized, and dealings in futures were commenced September 1st. The grain-trade has grown with a like rapidity. The receipts of wheat in 1876 were 7,604,265 bushels; in 1879 they had increased to 17,093,362 bushels; and in 1880 to 18,349,403 bushels. The consumption of the St. Louis mills in 1880 was fully 5,000,000 bushels. The receipts of corn in 1880 were 21,227,358 bushels, against 13,360,636 bushels in 1879. Exports to Europe through the port of New Orleans have within the short time that the jetties have been open reached a high figure, and already exceed in quantity the consignments by rail. In 1879 the river shipments from St. Louis amounted to 2,390,897 bushels, being about one half the quantity sent overland. In 1880, 5,578,240 bushels were shipped in bulk to New Orleans, nearly as great a quantity as was shipped eastward by railroad. The quantity of corn shipped in barges down the Mississippi was 9,450,358 bushels in 1880, against 3,585,589 bushels in 1879. The total grain receipts of St. Louis aggregated 50,629,940 bushels in 1880, against 38,001,398 bushels in 1879. The shipments of pork and meats fell off from 216,207,923 to 198,672,105 pounds. The receipts of horses and mules increased from 33,289 to 46,001 head. The elevator capacity, which was 4,950,000 bushels, had been increased to 6,850,000 bushels in 1880. The bank clearings increased from \$1,119,368,256 to \$1,422,918,978. The confidence of the people in the banking institutions of Missouri was

greatly shaken by the failures which followed the panic, and the lax methods of business which were disclosed. The law requiring a certain proportion of the capital stock subscribed to be paid up, the general discontinuance of the custom of paying interest on deposits, and the fact that none of the twenty-five banks of St. Louis has failed during 1880, though some of them had been considered infirm, and had lost many customers, restored the feeling of security in the banking system of the city.

The United States Supreme Court has rendered a decision which, probably, finally disposes of the question of the liability of the township for railroad subsidy bonds. This third decision of the Supreme Court, affirming the former decision that the bonds are valid and binding, has been awaited for about two years. All the township bonds and railroad bonds of the State are issued under an act known as the "Township Aid Act," which appeared to be in violation of the State Constitution; and, when the question was presented to the United States Supreme Court in 1875, they were declared to be unconstitutional and void by that tribunal. Another case was brought before the Court, and a second decision was rendered which reversed the principle established by its first decision, citing in support of the new decision certain rulings of the State Supreme Court. The latter Court subsequently denied that its rulings bear such a construction, and decided that the act was unconstitutional. In accordance with the principle that the United States courts are bound to follow the State courts in the interpretations they make of the State Constitution, the matter was again brought up in the United States Court, with the expectation that it would reverse its second decision. While acknowledging the general application of that rule, the United States Court refused to adopt the construction put upon the Constitution in this case, declaring that the rights of parties in the litigation are to be determined by the law as it was judicially construed by the State court at the time when the bonds in question were put on the market. "At that time," say the Court, "the State Supreme Court held, and had repeatedly held, that the Township Aid Act was constitutional. It now thinks that act is unconstitutional. This Court is of the opinion that it is not bound to adopt the latest ruling of the Supreme Court of Missouri, if, by such adoption, the rights which have become vested under an earlier ruling are to be injuriously affected."

The Republican Convention to select delegates to the Presidential Convention assembled at Sedalia, April 14th. The following resolutions were adopted:

1. That we reaffirm the time-honored principles of the Republican party, that all men are created free and equal; that this is a nation, and not a confederation of States; that all of the issues settled by the late war and all of the legislation regarding the same are final, and any attempts to in any way annul or affect the same are revolutionary.

2. That we hereby endorse the Administration of that patriot, soldier, and statesman, Ulysses S. Grant, as President of the United States, and hereby instruct the delegates appointed to the National Republican Convention, to be held in Chicago, to vote as a unit on all questions, and for Ulysses S. Grant as the candidate of the Republican party of the United States for the Presidency.

The Democratic Convention met at Moberly to elect delegates on May 26th. The resolutions adopted expressed confidence in Tilden and Hendricks, denounced the methods by which the popular vote of 1876 had been nullified, and declared for the two-thirds rule.

The Greenback State Convention, meeting at Sedalia, July 14th, nominated the following State ticket: for Governor, Luman A. Brown; for Lieutenant-Governor, H. F. Fellows; Secretary of State, O. D. Jones; Auditor, Dr. A. C. Marquis; Attorney-General, A. N. McGindley; Supreme-Court Judge, Peter Bland; Register of Lands, James A. Matney; Railroad Commissioner, J. B. Alexander.

The Democratic Convention for the nomination of State officers met in Jefferson City, July 21st. The following ticket was nominated: for Governor, Thomas T. Crittenden; Lieutenant-Governor, Robert A. Campbell; Secretary of State, M. K. McGrath; State Auditor, John Walker; Attorney-General, Daniel H. McIntyre; State Treasurer, Philip E. Chappel; Supreme-Court Judge, Robert D. Ray; Railroad Commissioner, George C. Pratt; Register of Lands, Robert McCulloch. The following platform was adopted:

Resolved by the Democratic party of Missouri in Convention assembled:

1. That we accept and endorse the principles embodied in the platform adopted by the National Democratic party in June, 1880.

2. That the nomination of General Winfield Scott Hancock and the Hon. William H. English for President and Vice-President by our National Convention is a matter of earnest congratulation not alone to Democrats but to all patriots irrespective of party; that it means the strict and constitutional subordination of the military to the civil power, and that through the national triumph of the Democratic party in November, of which that nomination is a sure prelude, sectional asperities will disappear, and the era of good feeling again return throughout our common country.

3. That we congratulate the citizens of the State that the Administration of the State government by the Democracy during the last decade has increased her population, national wealth, and means of social happiness; that our institutions of learning are taking rank among the best in the Union, and we cordially invite the industrious immigrant to make his home in our midst.

4. That the Democratic party will ever encourage and maintain the common schools and institutions of learning established by our State, believing a general diffusion of useful knowledge promotes the happiness and protects the rights of the people.

5. That as one of the objects of good government is to so administer public affairs as to afford the largest measure of protection to the greatest number with the least possible uncertainty and burden, therefore we recommend the enactment of the fairest and plainest laws consistent with this end, their rigid enforcement and exact observance, and the strictest practice of economy in every department of the State government consistent with the growth, development, and neces-

sities of the State, together with the most exacting accountability on the part of those intrusted with the custody and disbursement of the public revenue.

6. That we recommend the reduction of the rate of interest on the State debt so soon as it can honorably and legally be done.

7. That this Convention, speaking for the people of Missouri, bear cheerful testimony to the eminent public services of John S. Phelps, Chief Magistrate of this State; that by his matured statesmanship, wise and efficient administration of our laws, full protection to life, liberty, and property has been guaranteed to every citizen of our State.

The Republican State Convention met in St. Louis, September 15th, and made the following nominations: For Governor, D. P. Dyer; Lieutenant-Governor, Milo Blair; Secretary of State, J. C. Broadwell; Auditor, L. A. Thompson; Treasurer, W. Q. Dollmeyer; Supreme Court Judge, J. V. C. Carnes; Railroad Commissioner, Howard Barnes. The platform contained the following resolutions relating to State affairs:

We arraign the Democracy of Missouri for their infamous legislation during their administration of the affairs of state—their cotton bill, which strikes at and means to prevent the further introduction of capital into our State, and which is in effect open repudiation.

We arraign them for their unjust and unauthorized construction of the revenue laws, whereby our farmers are for the first time doubly taxed; first on their growing crops, and again on their crops after they are harvested.

We arraign them for their laws concerning the collection of taxes, whereby a large per cent. of those assessed are not collected, and another large per cent. of those collected never reach the Treasury.

We arraign them for the crime of aiding and abetting the robbery of the State Treasury, and their refusal to bring the defaulting State Treasurer to trial after they had impeached him for high crimes and misdemeanors.

We arraign them for their policy which has prevented immigration into the State, and the introduction of capital and the growth and development of industries.

We arraign them for their unjust and infamous redistributing law, whereby for the purpose of disfranchising 175,000 Republican voters they made some districts to contain but 20,000 voters, and others with over 50,000; some two miles long and thirty wide, and one to cross the Missouri River three times, and none compact but all Democratic.

We arraign them for their abject and servile submission to the dictates of the Confederate wing of their party, recognizing in their conventions no other qualification for their nominees but their devotion to the lost cause, except when the party outside the State warned them that such course would be impolitic.

We arraign them for squandering the school funds of the State, and their spirit of opposition to the public schools.

We arraign them for their failure to prosecute the notorious criminals of the State, and for permitting a Republican State to perform that duty.

We arraign them for their misappropriation of the sinking fund, and their neglect to provide for the payment of the State debt as required by the Constitution.

We arraign them for their effort to levy a poll-tax, and make the payment of such tax the basis of the right of suffrage.

The election returns show the following vote for Governor: Crittenden, 207,670; Dyer, 153,636; Brown, 36,342. Crittenden's plu-

rality over Dyer, 54,034; his majority over all, 17,692. The composition of the Legislature of 1881 is as follows: Democratic Senators, 26; Republican, 6; Greenback, 2; Democratic Representatives, 97; Republican, 43; Greenback, 3.

The vote for President gave 153,587 to the Garfield electors, 208,609 to the Hancock electors, and 35,045 to the Weaver electors; total, 397,241 votes, against 351,765 in 1876. The Greenback vote was larger than in any other State, Michigan casting nearly as many votes for the third party, and Iowa the next nearest number.

MOHAMMEDANISM. The number of Mohammedans is known but very imperfectly, because, in most of the countries in which Mohammedanism prevails, no trustworthy census has as yet been taken. It may, however, be regarded as highly probable that it can not fall short of 230,000,000. The latest estimates of the Mohammedan population of the states of the Balkan Peninsula given by Mr. Jakshilich, a distinguished statistician of Servia, vary somewhat from those given in former volumes of the "Annual Cyclopædia." The following is an approximate statement of the statistics of Mohammedanism at the close of 1880:

I. In Europe:	
Turkey proper.....	1,883,000
Bulgaria.....	760,000
Eastern Roumelia.....	850,000
Bosnia and Herzegovina (inclusive of Novibazar).....	510,000
Roumania.....	120,000
Servia.....	75,000
Montenegro.....	4,000
Russia.....	2,365,000
Total Europe.....	6,076,000
II. In Asia:	
Russia.....	5,064,000
Turkey.....	13,000,000
Persia.....	6,900,000
Arabia.....	3,700,000
India.....	50,000,000
China.....	5,000,000
Afghanistan and Beloochistan.....	4,630,000
States of Central Asia.....	3,000,000
Indian Archipelago.....	23,000,000
Anam.....	50,000
Total Asia.....	114,244,000
III. In Africa.....	110,000,000
Grand total.....	231,220,000

The decay of the Mohammedan states continues to advance without interruption. The most powerful among them, Turkey, was again obliged to cede territory to Montenegro, and will hardly escape, in the course of 1881, the cession of a considerable portion of its southern provinces in Europe to Greece. The Mohammedan population of Roumania, Eastern Roumelia, Bulgaria, Bosnia, Servia, Montenegro, Russia, the Netherlands, and the British possessions, lives under Christian Governments, without any prospect of ever gaining their independence. Of the 121,000,000 Mohammedans of Europe and Asia, 4,000,000 are now subjects of Christian Governments, and this number is likely to increase steadily. In Africa, Tunis is threatened with destruction by both France and Italy; and Morocco received, in

1880, a warning from an International Congress of the Christian powers of Europe, that it must cease to oppress its Jewish and Christian inhabitants. (See Morocco.)

MONTENEGRO, a principality of South-eastern Europe. Reigning Prince, Nicholas I, born October 7, 1841; declared Prince on August 14, 1860, upon the death of Prince Danilo I. He was married, November 8, 1860, to Milena, daughter of Peter Vukotitch. The children of this marriage are two sons—Danilo Alexander, born June 30, 1871, and Mirko, born in 1879—and six daughters. The area of the country in 1880, before the new regulation of the frontier, was about 9,475 square kilometres, and the population was officially estimated at 236,000, of whom about 4,000 were said to be Roman Catholics, as many Mohammedans, while the remainder belonged to the Greek Church. According to Gopkevitch, a writer of note on the Balkan Peninsula, the population amounted to 299,400, among whom there were about 34,000 Mohammedans and 18,000 Roman Catholics.

Efforts to adjust the complications which had arisen concerning the rectification of the Turkish frontier, according to the provisions of the Treaty of Berlin, engaged attention during most of the year. The Montenegrin Government had grown weary of the delay of the Porte in executing the cession of Gussinje, and had, among the last acts of 1879, sent a circular to the powers urging them to energetic action to remedy the existing state of things, but promising that it would not for the present regard the attitude of the Porte, contrary as it was to the stipulations of the treaty, as a *casus belli*. The Turkish Government had proclaimed to the inhabitants of Gussinje and Plava that those districts no longer belonged to Turkey, but to Montenegro, and had warned them that opposition to the Montenegrin authorities would be illegal. Osman Pasha was appointed Ottoman commissioner for the delimitation of the Turko-Montenegrin frontier; and the Porte replied to the Montenegrin circular with a statement to the powers that it was not responsible for the delay in surrendering Gussinje, but that Montenegro had brought on the conflict by dispatching a large force to the frontier. The Albanian chiefs resolved to resist the Montenegrins to the utmost, and Moukhtar Pasha professed to fear to use force lest his soldiers should join with them. The question of the cession was taken up in February on a new basis, and the substitution of other territory for Gussinje was talked of. Italy proposed a new line of frontier, by which the boundary, starting from the Gulf of Kastrati, should follow the mountain-range as far as the Sem, and continue thence to Mount Visitor, thence to the Line, thence northeasterly till it should coincide with the frontier marked out by the Congress of Berlin. Montenegro laid a further claim to the district of Mercovic, on the Adriatic. Turkey objected to ceding the plain ly-

ing between Podgoritzza and the Lake of Scutari, on the ground that it comprised three elevated points which could be fortified by the Montenegrins, and would dominate Turkish territory. The Russian Government approved the Italian proposition, provided it should be accepted by the other powers and by Montenegro; and the Montenegrin Government expressed a willingness, while it preferred to take its stand unconditionally upon the Treaty of Berlin, to enter into negotiations for the substitution of other territory instead of Gussinje and Plava. The Sultan agreed to the concession of a line that should leave to Turkey the eastern half of the plain of Podgoritzza as far as Poula on the Lake of Scutari. The Montenegrin Government demanded a modification of the line as proposed, and declared that, if its views were not acceded to, it would not further entertain the idea of territorial compensation for the districts of Gussinje and Plava. A line was finally agreed upon, on the basis of the Italian proposal, with some modifications respecting the country near the Lake of Scutari in concession to the views of the Turkish Government, and the preliminary act of ratification was signed at Constantinople, April 12th, by Savas Pasha, Minister for Foreign Affairs, and M. Vukovitch, the Montenegrin *chargé d'affaires*, and the ambassadors of the powers were instructed by their governments to signify their adhesion to the arrangement. By the terms of the new agreement, the Turks were to evacuate the ceded positions by the 23d of April, giving twenty-four hours' notice of their intention. They removed, however, within seven hours after they had given notice, and before the Montenegrins had sufficient time to enter into the ports. The positions were thereupon immediately occupied by the Albanians, who were in possession when the Montenegrins came up, and refused to give way to them. A Montenegrin and a Turkish officer, who went from Podgoritzza to Tusi to hold a conference with the Albanians assembled at the latter place, April 21st, were received with a volley of musketry, and had to fly for their lives. An engagement took place on the 23d, on the Montenegrins advancing to occupy Tusi, with losses to the Montenegrins. The Government of Montenegro addressed a note to the representatives of the powers at Cetinje, accusing the Turkish authorities of connivance with the Albanians in their resistance, and demanding the fulfillment of the convention, together with compensation for the delay in the surrender of the territory. The representatives of the powers at Constantinople addressed a collective note to the Porte, demanding that the territory occupied by the Albanians be immediately reoccupied by the Ottoman troops, and then surrendered to Montenegro. The Porte replied to this note with a statement that the facts and circumstance which accompanied the evacuation had been misrepresented, and proposed that an international commission should be

sent to the spot to make a searching inquiry, conceding, as an unequivocal proof of its sincerity, to the powers the care of determining the form and the conditions of the execution of the investigation. As soon as the affair was made clear, it would, after consulting the powers, "consider the measures to be taken for the smoothing down of present difficulties without giving rise to fresh conflicts and new bloodshed." The reply was not considered acceptable by the ambassadors. An identical note of the powers, respecting all the stipulations of the Treaty of Berlin which remained unsettled, was presented to the Porte on the 12th of June. Concerning Montenegro, it stated that the convention of the 12th of April for an exchange of territory was sanctioned by Europe, but the Albanians, by occupying the points ceded to the principality, had jeopardized the situation and rendered a collision possible. The question required a prompt solution, and the powers consequently called upon the Porte to communicate to them within a brief space of time and in explicit terms, its intentions in regard to the rights acquired by Montenegro. If this was not acceded to, the responsibility for the grave consequences which might ensue would fall upon the Porte. The Porte replied to this note, expressing a wish to carry out the convention, but urging that a certain time must be allowed for that purpose. The ambassadors replied that their powers were opposed to the further delay asked for; and, taking into consideration an offer which the Porte had made to accept any other proposal to settle the difficulty, suggested the cession to Montenegro of the territory of Dulcigno. The report of this proposition was received with great indignation by the Albanians. The Turkish Governor of Scutari, when asked by a deputation from Dulcigno for explanations with regard to it, replied that he had no official information on the subject, and advised them to take measures for the defense of their city. Men were sent by the Albanian League to occupy the heights around the place, and were even allowed by the Turks to enter it, the Ottoman garrison retiring to Scutari. The Porte replied to the last proposition of the powers that it was most anxious that the matter should be settled, but, in view of the resistance offered by the Albanians, it would be impossible to surrender Dulcigno and the Bojana district to the principality. The Montenegrin representative at Constantinople, having received a proposal to accept a money compensation instead of territory, was ordered to break off relations with the Porte; but the Turkish Government suggested afterward that it could surrender to the Montenegrins the territory around Scutari, and the *chargé* was instructed to postpone his departure. The Albanians, having learned that the Turks had promised to execute the convention for a surrender of territory, made an attack on the Montenegrin advanced posts, July 13th. Prince Nicholas ordered his troops to keep on

the defensive, as he was desirous of acting only by diplomatic means. A collective note was presented to the Porte, August 3d, in which the powers invited Turkey to execute the convention of the 12th of April within three weeks, or, as an alternative, to surrender Dulcigno to Montenegro. The Ottoman Government replied to this demand that it had decided to send a member of the Ministry to Dulcigno with troops to put into execution the convention of April. In the event, however, of its being unable to execute the convention within the time fixed by the powers, it asked for an extension of the time for a period of a week or a fortnight, within which interval the town and district of Dulcigno would be handed over to Montenegro. Failing such an extension of time, it would decline all responsibility. Before the three weeks granted by the powers had expired, the Albanians still refusing to give up Tusi and Dinosh, the Turkish Government again put forward the plan of surrendering Dulcigno, which it suggested the Albanians might be induced to accept if it were so modified as to leave Dinosh in their possession. A proposition was also talked of to cede Dulcigno without the Bojana district. The surrender of Dulcigno not having been accomplished at the end of August, the powers resolved to make a naval demonstration, which they had contemplated for several weeks, in case Turkey should continue to delay the execution of the provisions of the Treaty of Berlin. The Porte made strenuous exertions to avoid the demonstration, and the Council of Ministers, September 8th, decided to issue a circular informing the different governments that Turkey was firmly resolved to hand over Dulcigno to the Montenegrins without more delay, and the display of force would not be necessary. Instructions were sent to the commanders of the troops in Albania to take the most efficient measures to execute the decision of the Government, and use their utmost endeavors to obtain a pacific submission of the Albanians. The authorities of Dulcigno were notified that the transfer of the territory would take place on the 12th. The preparations for the naval demonstration went on notwithstanding these movements of the Turks; the vessels of the six great powers were assembled in the harbor of Gravosa; and it was decided that, in case the demonstration took effect, the fleet should be under the command of Vice-Admiral Seymour, as the senior officer of highest rank among all the commanders. A joint note of the powers was presented to the Porte September 16th, demanding the surrender by Turkey of the territory mentioned in the note of August 3d, with the exception of the districts of Dinosh and Gruda. On the 17th the Porte issued a circular of protest against the employment of force, asking the powers to await the equitable and moderate execution of the decision to surrender Dulcigno, and pleading: "Shall not the inhabitants of the ceded town enjoy the privi-

leges of natural right common to all as regards their faith, their homes, and their lives? Will not the line of the *status quo* which was previously fixed on the side of Podgoritzza for the surrender of Dulcigno receive, as it ought, the adhesion of the powers?" On the 20th the Porte was officially informed that the combined fleet had assembled, and a letter from Admiral Seymour was delivered to Riza Pasha, demanding "a definite categorical reply" in regard to the surrender of Dulcigno. The Sultan was said to have declared on the same day that he would not admit any cession of territory to Montenegro, and, if the powers were determined it should be made, they must take the territory themselves. A fresh communication on the part of the powers informed the Porte that, if Dulcigno and Magatosh were made over to Montenegro within the next three or four days, the demonstration would not take place. The movement of the combined squadrons against Dulcigno had been arranged to take place in the last week of September. The purpose was, by commanding the shore batteries from the ships, to cover the Montenegrin forces while they should advance to the attack upon the town. On the 26th, however, Admiral Seymour was informed by the Montenegrin Minister of War that Riza Pasha had declared to Prince Nicholas that any attempt to cross the Albanian frontier would be regarded by Turkey as a declaration of war, and would be resisted by the whole strength of the Ottoman force. In consequence of this declaration, the Montenegrins hesitated to make the attack, for they felt that they were unable to cope with the Albanians and the Ottoman regulars combined. The admirals accordingly agreed to delay the attack while they awaited new instructions from their several governments. On the 4th of October the Ottoman Government presented a note to the powers, in which it declared in regard to Montenegro it would undertake to "cede Dulcigno and cause it to be evacuated, while maintaining the line of the *status quo*, as soon as the powers shall have given the assurances it has demanded by its last note, and which it now demands once more. The imperial authorities will inform the local population that they are free to remain in their homesteads, or to emigrate to other parts of the empire. The imperial authorities will give the said populations all the advice and use the means of persuasion required for that end. If these attempts should fail, the troops and local authorities shall retire from the frontier, and the Ottoman Government shall not be held responsible for any complications that may arise on the spot from the failure of such attempt." These provisions it would carry out only on condition that the powers should forego the design of a naval demonstration and all other means of pressure. The effect of this note was to add strength and persistency to the concert of the powers. A plan was submitted by the British Government,

and favorably received by the other governments, for suspending the direct proceedings against Dulcigno and seizing several of the chief ports of the Ægean Sea. This plan finally took the form of a determination to seize the port of Smyrna and sequester its revenues in case the Sultan's Government should persist in trifling with the question of the surrender. The harmonious and evident resolution of the powers to act upon it brought about the desired change in the mind and bearing of the Turkish Government; and on the 10th of October the ambassadors at Constantinople were informed that it would direct the immediate transfer of Dulcigno, and the Sultan would issue an *irade* to that end. In answer to a request for more definite explanations of the intentions of the Porte, the Minister for Foreign Affairs informed the ambassadors that the cession would comprise both the town and district of Dulcigno, and that instructions had been given to arrange the most satisfactory way of making it over to the principality. Delay still ensued while the Turkish and Montenegrin Governments could come to an agreement relative to the terms of the transfer, keeping alive the suspicion that Turkey was only trying to gain time. The Ottoman Government proposed a convention on the following terms: 1. The property and liberty of the Mussulman inhabitants of the ceded district to be guaranteed; 2. The maintenance of the *status quo* to the east of Lake Scutari; 3. Montenegro to assume a portion of the Turkish debt corresponding to the importance of the ceded district, and an arrangement to be made respecting the *vacoufs*; 4. Liberty of emigration for the inhabitants of Dulcigno; 5. Maintenance of the Ottoman flag on the trading-vessels belonging to the inhabitants of Dulcigno; 6. The property of the Ottoman Government to be guaranteed; 7. Maintenance of the Turkish laws. The Montenegrins objected to the second and fifth of these stipulations. New conditions were offered, and the question was finally referred to the commanders of troops. The surrender was persistently opposed by the Albanians. Riza Pasha summoned the chiefs of the Albanian League to Scutari, where he explained to them the absolute necessity of making the surrender, and stated that, if they refused to consent to it, they would probably be the means of inflicting serious injury upon Turkey. The chiefs still refused to give their consent. A messenger, who was dispatched by Riza Pasha with a proclamation addressed to the inhabitants of Dulcigno in reference to the surrender of the place, was murdered. Dervish Pasha was appointed governor of Albania late in October, and was charged with the duty of effecting the surrender. He arrived near Dulcigno, October 30th, with eighteen battalions. A body of regular Turkish troops marching from Scutari upon Dulcigno was stopped by Albanians, November 3d, and compelled to retire. Dervish Pasha sought to

disembark six battalions of Nizams, but was refused admission to the town, and his troops encamped outside. The Sultan and his ministers professed great anxiety to have the surrender accomplished, and authorized the commanders of the combined fleet to use force to crush the resistance of the Albanians if necessary. Dervish Pasha, however, hoped that he would be able to effect the cession without bloodshed, and entered into communication with the chiefs of the League at Scutari, while those at Dulcigno refused to have any intercourse with him. He finally demanded the surrender of the town by the chiefs under a threat that he would employ force if it were refused. The chiefs asked for a delay of thirty days, which he denied, whereupon he proceeded to more decisive measures. On the 18th of November he occupied the heights of Biela with a large force of men and guns. On the 21st he moved upon Dulcigno, where he was opposed by the Albanians at Lake Sas, on the north bank of the Bojana River, in a contest that continued through the day. He renewed his advance on the next day, but was beaten back, and was compelled to pass the night in the open country, an hour's march from Dulcigno. On the 22d he undertook to carry the heights of Mazura without success, and was again obliged to pass the night outside of the town. On Wednesday, the 23d, he entered Dulcigno after a short engagement. Satisfactory arrangements having been made between the envoy of Prince Nicholas and Dervish Pasha, the town was formally surrendered to Montenegro, Friday, November 26th. On the next day, Bajo Petrovics entered the place in state, and was met at the gates by all the head men of the villages and other leading Mussulmans, tendering their allegiance. A thanksgiving service was celebrated, and the Montenegrin standard was hoisted on the fortress with a salute at noon. Prince Nicholas sent a dispatch of acknowledgment to the Sultan for the manner in which the cession had been accomplished, and also addressed a note to the six powers expressing warm thanks for the support that had been accorded to his government in the naval demonstration. The Montenegrin force, occupying the whole district of Dulcigno, was well received, with entire tranquillity prevailing. The Government promised the inhabitants of the ceded territory liberty of worship, an amnesty for past resistance, and security in the tenure of their property, and thus induced many, who had intended to remove, to remain. After a few days, diplomatic relations were resumed with Turkey. The delimitation of the frontier still remained to be adjusted, and pending the settlement of this question the Turks continued to occupy the district of San Giorgio. The Turkish Government, with a view to the fulfillment of its engagements, stationed seventeen battalions of troops on the frontier, with instructions to prevent the Albanians

from interfering with the Montenegrin occupation of Dulcigno.

The port of Dulcigno, the town which made so prominent a figure in these transactions, was a famous resort of pirates during the sixteenth century. Old Dulcigno was captured by the Turks in 1571. The Porte undertook to suppress piracy, but failed, on account of the connivance of the local governors with the pirates, until the Pasha Suleiman, more earnest and determined than his predecessors, burned the five hundred vessels of the Dulcignote fleet in the harbor. The blow was fatal to the old town, and a new town, New Dulcigno, was built a little farther inland. This place was occupied for a short time by the Venetians in 1722. It was taken by storm by the Montenegrins in 1878, but Austria objected at the Conference of Berlin to their retaining it, and caused the adoption of the provision to give them Gussinje and Plava in its stead. The harbor of Old Dulcigno is one of the oldest on the Adriatic, and is the best one between the southern point of Dalmatia and the mouth of the Drin. It enjoys a secure protection from the sirocco, and is favorably situated for the navigation of the Bojana River. New Dulcigno has about 5,000 inhabitants, of whom 3,500 are Mohammedans. The whole district contains about 8,400 Mohammedan and 4,000 Catholic Albanians, 1,500 Slavs, and 1,200 gypsies.

MOROCCO, a Mohammedan country in Northern Africa. Sultan, Muley-Hassan, born 1831, eldest son of Sultan Sidi-Muley-Mohammed; ascended the throne at the death of his father, September 13, 1873. The Sultan bears at home the title of "Emir-al-Numemin," or Absolute Ruler of True Believers.

The present Sultan is the fourteenth of the dynasty of the Aïdes, founded by Muley-Achmet, and the thirty-fifth lineal descendant of Ali, uncle and son of the Prophet. The crown is hereditary in the family of the Sharifs of Fiheli, or Tafilet. Each Sultan has the right to choose his own successor among the members of his family, and, if this privilege is not exercised, the crown devolves upon the eldest member of the family.

The Sultan of Morocco and his Mohammedan subjects differ in some respects from the Mohammedans of Turkey, Persia, and other countries, by adopting as their text-book of faith the commentary upon the Koran by Sidi Beccari, the original of which is kept at the imperial palace, and deposited in time of war in a tent within the center of the army, around which the soldiers rally as both a symbol of religion and national standard.

As the southern frontier toward the Sahara is unsettled, the area of Morocco can not definitely be given. It is approximately estimated at 672,300 square kilometres, of which about 197,100 belong to the Tell, or the fertile coast and mountain region, 67,700 to the steppes, and 407,500 to the Sahara without Taat. The population has sometimes been estimated as low as

2,500,000; Rohlf's and several others assume 6,000,000; and Tissot even assigns to the country as many as 12,000,000. About two thirds of the population belong to the race commonly known as Moors, the remaining third consisting mainly of Bedouin Arabs, Jews, estimated at 340,000, and negroes. The number of Christians is very small, not exceeding 1,000. The capital, Fez, has about 150,000; Morocco, from 40,000 to 50,000 inhabitants.

The movement of commerce, including precious metals, was in 1879 as follows, value expressed in francs (1 franc=\$0.19).

COUNTRIES.	Imports.	Exports.
Great Britain.....	14,102,000	7,808,000
France.....	8,529,000	9,229,000
Spain.....	220,000	541,000
Portugal.....	22,000	290,000
Italy.....	325,000	420,000
Belgium.....	206,000	54,000
Netherlands.....	25,000
Other countries.....	88,000	309,000
Total 1879.....	23,867,000	18,651,000
Total 1878.....	23,955,000	23,469,000

The movement of shipping in 1879 is given in the following table:

VESSELS.	LADEN.		IN BALLAST.		TOTAL.	
	Vessels.	Tons.	Vessels.	Tons.	Vessels.	Tons.
Entered.....	1,084	820,428	854	46,179	1,488	866,607
Cleared.....	1,140	883,065	295	30,191	1,435	868,256

The entrances were distributed as follows among the flags under which the vessels sailed and among the ports which they entered:

FLAG.	Vessels.	Tons.	PORT.	Vessels.	Tons.
English.....	548	138,548	Tanger.....	685	94,056
French.....	367	205,340	Larache.....	69	18,588

Dutch.....	2	224	Tetuan.....	280	4,005
Others.....	5	1,042	Total.....	1,488	866,607

The condition of the Jewish population of Morocco and the treatment to which they have been subjected have attracted the attention of Europe, and have been made the subject of an international conference. The Jews in this empire are more numerous in proportion to the whole population than in any other country. They are estimated to number 340,000 souls, of whom about 200,000 came to Morocco directly from Palestine, and the remainder are the descendants of the Jews who were expelled from Spain during the reign of Ferdinand and Isabella. A letter published in the Gibraltar "Guardian," in January, gave an account of serious disorders which had broken out at Fez. The Moors, it was stated, had attacked the Jews, wounding several, and "amid shouts of joy" had killed a man seventy years of age by pouring petroleum over his body and setting fire to it while he was still alive. Two Frenchmen were wounded during the disturbance. A remonstrance was immediately addressed to the Emperor against this and other outrages by the American consul, who informed his Majesty that considerable agitation had been excited in Europe, and even in America, over the treatment to which his Jewish subjects were exposed; and that such a state of affairs could not continue without great prejudice and injury to the empire; demanded that the perpetrators of outrages should be punished; and warned him that "it is indispensably requisite that the Israelites of Morocco should be pro-

tected by the local authorities, otherwise it will not be long before they will all be protected by foreign nations." The consul also stated that several representatives of foreign nations, as well as himself, had received instructions to inquire into the condition of the Jews of Morocco, and to consult concerning the means of ameliorating it. Five Kabyle chiefs arrived at Malaga, Spain, near the end of January, bringing with them a petition from several thousand Moors, asking to be placed under the allegiance of Spain. They declared that, if the Spanish Government declined to assume the protectorate over their country, they would ask for the protection of France or England. The Spanish papers expressed strong hopes that the authorities would accede to this request, and urged in favor of it that, while Germany, Italy, England, and Austria had made annexations at the expense of costly wars, Spain was, in this case, freely offered a territory with some forty-five miles of seaboard, extending thirty-five miles inland, and inhabited by fifteen thousand persons. The Kabyles came to Spain, the journals said; "Spain does not seek them—and therefore the acquiescence of Spain with the request made to her can offend no one." The King of Spain called an international conference to meet in Madrid in May, to consider the affairs of Morocco, and the best means of securing to Moorish subjects of all classes and creeds protection and the full enjoyment of their rights. This conference concluded its labors in June, having

as the result of its deliberations put in the hands of the envoy of Morocco a memorandum signed by all of the eleven plenipotentiaries demanding of the Emperor liberty of conscience and equality of rights for his Christian and Jewish subjects. The Emperor replied to the propositions of the conference with a letter to his envoy at Madrid, which was attached to the protocol of proceedings, in which he said that he wished all his subjects to be on an equal footing before the tribunals, and that he deprecated and would punish all outrages against those who were not Mohammedans. The protocol of the conference was signed by all the plenipotentiaries on the 4th of July. Very little, if any, actual amelioration of the condition of the people was expected to result from these proceedings, for it was generally believed that, whatever the Emperor might profess to desire or promise to do, he was wholly incapable and unwilling to carry out any genuine reform. A correspondent holding a consular position in the empire was quoted by the "Pall Mall Gazette" in July as writing: "Nothing that has been published can be more than a pale reflection of the condition of humiliation and degradation in which the Jews of Morocco exist under the rule of Muley-Hassan. I can not say whether the promises made to the Madrid conference by the representative of the Sultan will produce any improvement in their state. I confess I doubt it. But it is only fair to say that the Jews do nothing to escape from their wretched condition. . . . The demand of Morocco at the conference came to nothing less than the almost complete removal of foreign protection; yet, if there is one country more than another where this protection ought to be increased rather than diminished, it is Morocco. It is unfortunate that the European powers are not of one mind on this subject. Instead of a single concession, their representatives ought to have asked Mohammed Bargash if his master would try to introduce a little civilization into his country, and what means he would employ to rescue Morocco from its present position as a hot-bed of fanaticism and barbarism."

The outrages on Jews continued. An old man was bastinadoed in August on an accusation which was said to be false. The Governor of Arzila summoned the members of the Jewish community before him, and made a threatening address to them. A Jewish messenger who was sent by the Italian minister plenipotentiary with a dispatch to the Sultan was attacked and beaten in the streets of Fez for wearing shoes in violation of the law which requires all Jews in the principal cities to go barefooted. Other outrages were reported in November; and the Government showed a disposition to be punctilious in carrying out the rules established by the convention of Madrid, by limiting the number of Jewish subjects to whom it gave protection, according to their exact letter.

The Emperor in March informed the foreign

legations in Tangier that he would not recognize the naturalization of any Moorish subjects in foreign countries. The internal condition of the country was disorderly, and disturbed by insurrections; and the Emperor's authority was defied in many towns.

A proposition has been made by M. Bombonnel to the French Government, for the construction of a railway through Morocco to Oran in Algeria, for the sake of doing away with the sea-voyage from Marseilles to Algiers. M. Bombonnel shows that the scheme involves no great difficulties. The line to be taken through Morocco would traverse a country without ravines or mountains, inhabited by an industrious population who would favor the scheme. The only sea-passage necessary in connection with it would be one of a quarter of an hour from Gibraltar; and the length of railway to be laid down would be only five hundred kilometres, costing, it is estimated, a hundred million francs.

MOTT, LUCRETIA, the Quaker philanthropist, was born on the Island of Nantucket in 1793. Her maiden name was Coffin, and her progenitors belonged to the Society of Friends. She was educated partly in Boston, partly at the Friends' Boarding School in Dutchess County, New York. She must have been precociously advanced, for, according to her own statement, she was already a teacher at the age of fifteen. In 1809 her parents removed to Philadelphia, where she was married in 1811. She was fluent in speech, and as early as 1818 was widely known as a preacher in the Society of Friends. When that body was riven in twain by theological dissensions, she cast her lot with the Hicksite or Unitarian branch. Long before there was any organized agitation on these topics, Lucretia Mott was antislavery and woman's rights in her proclivities. She took part in the first Antislavery Convention, which was held in Philadelphia in 1833, and which organized the American Antislavery Society. The following year the Philadelphia Female Antislavery Society was founded, of which she was a zealous member. As its emissary, she lectured throughout the Northern States, where the subject was then unpopular. She also extended her tours into some of the slave States. In 1840 she was one of the female delegates sent by the Philadelphia society to a World's Antislavery Convention, assembled in London. These women were refused admission, and the fiery indignation caused by this action led to the establishment of woman's-rights journals in England and France, and to the calling of the first Woman's-Rights Convention in America. This was held at Seneca Falls, New York, in 1848. Its president was James Mott, the husband of Lucretia. This is the sole public mention made of him, but he is understood to have echoed his wife's opinions. After the disposal of the antislavery subject, she devoted herself to woman's rights. She actively promoted the founding of the Woman's Medical College, of Pennsyl-

vania. Each philanthropic novelty found in her an untiring advocate. She espoused the cause of temperance, and latterly the movement for universal peace. She attained the age of eighty-eight years, dying on November 11th, in Philadelphia.

MYER, ALBERT J., an American meteorologist and Chief Signal-Officer of the United States Army, born at Newburgh, New York, September 20, 1828; died at Buffalo, New York, August 24, 1880. Graduated from Hobart College, Geneva, New York, in 1847, appointed Assistant Surgeon United States Army, with the rank of first-lieutenant, September 18, 1854, and assigned to duty in Texas. While serving on the frontier he elaborated a system of day and night signaling with flags and torches, by which parties within telescopic range of each other could converse as fully and accurately as by the electric telegraph, although with less rapidity. This was effected by framing an alphabet from simple numerical combinations, and representing these numerals by movements to the right or left of a stationary object or of the human figure. The apparatus required was inexpensive, readily attainable, and easily transported, while the whole work came within the capacity of the average soldier. The system, after careful experiment, was adopted by the War Department, and Dr. Myer, refusing a money compensation, was made Signal-Officer of the Army, with the rank of major, June 27, 1860, the position being especially created for him by necessary legislation. The first field work with the new signal code was in New Mexico, where Major Myer took part in an expedition against the Navajo Indians, and its usefulness was fully demonstrated. When the civil war broke out, Major Myer was ordered to Washington, and assigned to duty with the Army of the Potomac. He secured the detail of a number of officers and enlisted men, and organized a camp of instruction, at which matters were pushed so rapidly that he was enabled to furnish each army corps as it took the field with a competent force of skilled signalists. On March 3, 1863, he succeeded in getting this temporary detail of officers and men organized into a distinct and permanent corps, of which he was appointed the head, with the rank of colonel. On November 10, 1863, owing to a want of harmony between himself and the Secretary of War, he was relieved from charge of the corps and assigned to duty in a Western department, where he remained until July, 1864, when, his appointment as Chief Signal-Officer failing of confirmation by the Senate, he retired to his home in Buffalo and devoted himself to the preparation of the "Manual of Signals," until reappointed and confirmed as Chief Signal-Officer, July 28, 1868. During his administration in the field he introduced for the first time in the history of military warfare the use of movable or field telegraphs on the actual field of battle. For his

services in organizing, instructing, and commanding the Signal Corps during the war, he was brevetted brigadier-general, to date from March 13, 1865. From the date of his restoration to active service until 1870, General Myer devoted himself to perfecting the details of the Signal Service. On February 9, 1870, Congress passed a joint resolution authorizing the Secretary of War to provide for taking meteorological observations at the military stations in the interior of the continent and at other points in the States and Territories of the United States, and for giving notice on the Northern lakes and seaboard by telegraph and signals of the approach and force of storms, and the execution of this duty was confided by the Secretary to General Myer as Chief of the Signal Service and as having been previously interested in the subject of storm telegraphy. The preparatory work of organization was prosecuted with energy. Soldiers were detailed and instructed as observers, instruments and stations selected, arrangements made with the telegraph companies for transmitting the observation, and on November 1, 1870, at 7.35 A. M., the first systematized simultaneous meteorological observations ever taken in the United States were read from the instruments by the observer-sergeants of the Signal Service, at twenty-four stations and placed upon the telegraphic wires for transmission. On the first day of report, weather bulletins were posted at each one of the twenty-four selected stations, and the practical working of this division of the service was assured. The field was virtually a new one. A few venturesome spirits from the first days of the electric telegraph had dreamed of the possibility of such a work, and some had even made unsuccessful attempts to realize their dream, but they failed to grasp the great principles on which General Myer built the success of the Weather Bureau—the *simultaneity* of the observations—and the military discipline by which their regularity was assured. The work of the Weather Bureau soon became popular and was rapidly extended, having increased at the date of General Myer's death to over three hundred stations, with a force of five hundred men, each one of whom was a practical meteorologist. In 1873 General Myer represented the United States at the International Congress of Meteorologists convened in Vienna, and secured the concurrence of the Congress in the proposition that at least one uniform observation of such character as to be suitable for the preparation of synoptic charts should be taken and recorded daily and simultaneously at as many stations as practicable throughout the world, for the purpose of mutual exchange. This action extended the system of simultaneous observation over the whole northern hemisphere, and was the beginning of a new era in international meteorology. On July 1, 1875, General Myer began the publication of a daily "International Bulletin," comprising the reports from

all coöperating stations, and on July 1, 1878, this was supplemented by a daily international chart, both publications being the natural outgrowth of his Vienna proposition. In 1879 General Myer was a delegate to the Meteorological Congress at Rome, and arranged for an additional daily international observation, the details of which were completed but a few days before his death. On June 16, 1880, he was promoted to the full grade of brigadier-general, as a special reward by Congress for his distinguished services in the line of his profession. General Myer's success in taking an abstract science like meteorology and in ten years making it one of the most important bureaus of the Government, was due to his practical knowledge of human nature and to the indomitable will and courage with which he met and overcame obstacles that would have crushed weaker or less resolute men. To collect and distribute these reports by telegraph daily, required a perfection of work not attainable by any method then in use. This he overcame by insisting upon a system of telegraphic circuits, by which unity of action was assured at certain fixed hours daily. The amount of telegraphing was enormous, and at usual rates much in excess of the whole appropriation made for the service. He met this difficulty by securing the application to the telegraph companies of an old and forgotten law, by which the cost of telegraphing was materially reduced, and this action soon forced a general

reduction of telegraphic rates throughout the United States, a result directly traceable to the early work of the Signal-Office. General Myer was the first person in the United States, or in the world, to make or have made a series of simultaneous reports by which alone it is possible to ascertain the atmospheric condition of an extent of territory at a given moment of time. Under his administration as Chief Signal-Officer a line of telegraph was constructed along several hundred miles of the worst seacoast of the United States, and interior lines, aggregating a total length of more than five thousand miles, were built, and the settlement of a vast area of unimproved country greatly hastened and facilitated. He established a system of cautionary day and night signals for the benefit of lake and ocean commerce and navigation, a system of reliable river reports for the benefit of interior commerce, special series of reports for farmers, and for cotton and sugar planters. Scarcely an industry escaped his watchful care, and it was the knowledge of this vigilance that made Congress support him with liberal annual appropriations. As a writer General Myer was methodical, painstaking, and accurate. His manual of signals is used as a text-book at the Military and Naval Academies in the United States and in similar institutions abroad. His annual reports contain a vast fund of special information of value to the student of meteorology and kindred sciences.

N

NEBRASKA. The State of Nebraska is growing rapidly in population and wealth. The fertility of its soil and the extent of the unoccupied lands attract a large immigration. The crops of 1880 were generally good, notwithstanding unfavorable meteorological conditions in the beginning of the season. Railroads have been rapidly extended into the new settlements. Companies have been formed for the development of the coal-fields, which are believed to be very rich. The abundant water-power of the streams and rivers is being utilized for manufacturing purposes. Wild lands are being brought under cultivation with rapidity. After the next Congressional apportionment, based on the census of 1880, the State will send three Representatives to Congress instead of one as at present.

The Treasury statement for the two years ending November 30, 1880, of the total receipts and expenditures, is as follows:

Balance in the Treasury December 1, 1878.....	\$460,181 99
Receipts from all sources during the two years ending November 30, 1880, including transfers	1,451,817 52
Total amount.....	\$1,911,999 51
Disbursed during the same period, including transfers.....	1,568,980 90
Balance in hand November 30, 1880.....	\$343,018 61

The last General Assembly limited the rate of taxation for the general revenue to two mills on the dollar. This rate is reckoned to be inadequate to support the general expenses of the government. There was to the credit of this fund, at the beginning of the biennial fiscal term, the sum of \$162,577. The receipts have amounted to \$560,014, and the expenditures to \$669,435; leaving a balance of \$53,156, and showing an excess of expenditures over receipts of \$109,421. This unfavorable result was obtained from a tax-levy of four mills on the dollar. With a two-mill tax the levy is estimated to amount to \$180,999 for the year 1881, while the usual expenses of the government amount to \$350,000 at least a year. To avert a deficit of over \$300,000 at the close of the next fiscal term, and serious embarrassment in the administration of the finances, the Legislature is expected to establish a different rate of taxation.

F. W. Liedtke, the Auditor of Public Accounts, from the beginning of his term of office, deposited the fees received from insurance companies for examining their statements in the capacity of insurance commissioner, in the banks as his private funds, and drew against them for his own use. The Con-

stitution adopted in 1875 abolished all official perquisites, and requires every species of office fees to be turned over to the Treasury. The salary of the Auditor was consequently raised from \$800 to \$2,500 a year. The duties of Land Commissioner, which had been united to those of the Auditor, and for which that officer had drawn an additional salary of \$1,000, were by the same instrument intrusted to a separate officer. The salary attached to the new office of Commissioner of Public Lands was fixed at \$2,000. The Auditor before Liedtke, J. B. Weston, had administered the duties of the Land Commissioner until the expiration of his term of office and the election of the special officer for that service, and the Supreme Court had decided that he was entitled to the salary belonging to that office in addition to his salary as Auditor. The Governor, upon learning of the practice of Auditor Liedtke of appropriating the insurance fees, called upon him, July 28, 1880, for an accounting, demanding a sworn statement of the fees of all kinds paid into the Auditor's office. The Auditor reported \$1,165.37 office fees and \$7,498 insurance fees received. Treasurer Bartlett reported the amount of fees paid over by the Auditor as \$1,103. The Auditor based his claim for the insurance fees as his official perquisites upon two dicta of the Supreme Court, one deciding that the Secretary of State was entitled, when acting as adjutant-general, to the perquisites appertaining to that office, by virtue of which decision the State pays to the Secretary of State \$500 in addition to the salary of his office for this extra service, and the other ruling that a public officer may perform extra labor, that is, labor not required of him by the law establishing his office. The Auditor claimed that the fees collected as Insurance Commissioner were his personal perquisites because that was a separate office, for which no pay was assigned. Attorney-General Dilworth commenced proceedings by mandamus against him in the Supreme Court, and obtained judgment. The Auditor failed to satisfy the judgment, and proceedings were instituted against his bondsmen. He subsequently vacated his office and left the State. The Governor appointed as temporary Auditor John Wallichs, who was nominated for the office and elected at the general election to be Auditor for the next term.

The collections of taxes in Nebraska are excessively lax. Governor Nance, in his biennial message, calls upon the Legislature to enact laws which will remedy the "evident neglect of official duty," declaring that "under the loose practice that has prevailed, many property-holders have escaped taxation, while others have been compelled to bear increased burdens." The Auditor's books on the 30th of November showed uncollected revenues of the enormous amount of \$861,213, the delinquent taxes due to the several funds being as follows:

General fund.....	\$392,119 09
Sinking fund.....	118,296 84
School fund.....	287,448 07
University fund.....	85,980 40
Penitentiary fund.....	20,978 58
Normal Building fund.....	2,292 08
State Board fund.....	1,145 95
Total.....	\$861,213 56

The aggregate amount of taxable property in the State, as shown by the assessment of 1879, was \$75,359,798. The taxes levied by the State for all purposes were six mills on the dollar. The returns to the various funds on that levy were as follows:

General fund.....	(4 mills)....	\$301,489 17
Sinking fund.....	(1 mill)....	49,188 90
Temporary school fund.....	($\frac{1}{2}$ mill)....	75,359 75
University fund.....	($\frac{1}{2}$ mill)....	28,259 86
Total.....		\$454,192 68

The property valuation of 1880 was \$15,139,820, or nearly 25 per cent, greater; and the amounts which will accrue to the various funds, with the rate for the general fund reduced to two mills, will be as follows for the year 1881:

General fund.....	(2 mills)....	\$180,999 18
Sinking fund.....	(1 mill)....	51,054 92
Temporary school fund.....	($\frac{1}{2}$ mill)....	90,499 66
University fund.....	($\frac{1}{2}$ mill)....	83,987 29
Total.....		\$356,490 95

The bonded indebtedness of the State at the close of 1880 was as follows:

Ten per cent. ten years' relief bonds of 1875....	\$50,000 00
Eight per cent. funding bonds issued in 1877....	449,267 85
Total.....	\$499,267 85

The debt has been reduced by \$100,000 in accordance with the scheme of gradual liquidation adopted by the General Assembly in 1879. The surplus funds of the Treasury were directed by the Legislature in 1879 to be invested in interest-bearing securities, and in pursuance of that act they have been placed to the amount of \$50,000 in United States four per cent. bonds. State funding bonds to the amount of \$100,000 held by the permanent school fund have been redeemed and canceled, and the money reinvested for the school fund in registered county bonds.

The total assessed valuation of property in Nebraska for 1880 was \$90,499,618. The value of real estate was assessed in the aggregate at \$48,694,375. The acreage taxed was 13,267,281 acres, of which 3,498,906 acres were improved, and 9,768,375 acres unimproved lands. Of the quantity on the assessment-rolls, about 28 $\frac{1}{2}$ per cent. of the total area of the State, which aggregates 46,636,800 acres, a large proportion belongs to railroad companies or is the property of private speculators. The valuation of the improved lands taxed was assessed at \$16,325,483; of the unimproved, \$27,368,892. The statistical reports of arboriculture show that 57,739,894 forest-trees, 465,636 grape-vines, and 2,009,627 fruit-trees have been planted in the settled parts of the State. The acreage reported as planted to

wheat was 1,054,691 acres; the area under corn, 1,124,709 acres; under oats, 173,058 acres; barley, 85,180 acres; meadow, 39,863 acres; flax, 8,215 acres; millet, 6,554 acres; rye, 8,537 acres; potatoes, 1,500 acres; hay, 1,378 acres. The number of horses returned was 198,381, valued at \$5,677,653; cattle, 675,244 head, value \$5,966,855; mules and asses, 20,032 head, value \$693,630; sheep, 194,959, value \$237,430; hogs, 767,702, value \$930,804. The valuation of railroad property was \$9,943,192; of telegraph property, \$45,076. Other items in the assessment-roll were carriages and wagons, \$1,148,379; merchandise on hand, \$3,043,413; agricultural tools, \$1,599,574; investments and improvements on real estate, \$957,573; furniture, \$974,834; property of corporations, \$404,876; moneys of banks and brokers, \$413,465; of other persons, \$571,544; credits of banks, etc., \$139,972; of other persons, \$960,957; bonds, stocks, etc., \$439,779; bridge property, \$264,845.

The population of Nebraska, as shown by the returns of the census supervisors, is 452,542: the inhabitants in the counties north of the Platte numbering 173,205; south of the Platte, 279,337. The total population of Nebraska in 1855 was 4,494; in 1860, 28,841; in 1870, 122,933; in 1875, 246,200. The population of the city of Lincoln has increased from 2,441 in 1870 to 13,697 in 1880.

The aggregate number of persons of school age in the State in 1880 was 143,343. The total attendance of the public schools in 1879 was 76,956; in 1880, 92,545. The number of schoolhouses was increased from 2,112 in 1877 to 2,231 in 1878, 2,409 in 1879, and 2,700 in 1880. The valuation of school property was \$1,805,466 in 1878, \$1,810,288 in 1879, and \$2,064,768 in 1880. There were 70 graded schools in 1880. The average wages of male teachers was \$36.12; of female teachers, \$31.92. The per capita cost of tuition computed on the enrollment was \$8.05 in 1877, \$7.08 in 1878, \$6.06 in 1879, and \$5.93 in 1880.

The number of acres of school lands remaining unsold on November 30, 1878, was 1,025,556.78; the number of acres deeded during the years 1879 and 1880, 7,991.60; leaving 1,017,555.18 acres of public lands still unsold. In the unorganized counties, and counties having no record of lands, there are estimated to be 889,720.33 acres of school lands; in unorganized territory belonging to the State, 527,360 acres. There were sold at public auction 11,741.22 acres in 1879 for \$88,448, and 2,482.03 acres for \$31,055 in 1880; and there were sold to lessees at private sale 16,881 acres in 1880 for \$122,008. There were leased in 1879 134,697 acres valued at \$572,078, and in 1880 122,843 acres valued at \$539,321.

The amount paid in to the temporary school fund during the two years was \$543,506, of which \$143,905 was derived from the State school-tax, \$97,169 was interest on school land sold, \$127,071 receipts from leases of school

land, and \$175,361 interest from invested funds, etc.

The Land Commissioner and the Attorney-General presented a claim on behalf of the State to the Department of the Interior at Washington for indemnity for lands lost from the sale of the Otoe and Pawnee reservations. The Interior Department has admitted the justice of the claim. The quantity of land which will be added to the school lands by virtue of the claim is 22,372 acres. The permanent school fund, invested in registered county bonds, United States 4 per cent. consols, and other securities, has reached the sum of \$639,086.

The aggregate number of acres of land owned by the State on the 30th of November, 1880, was as follows:

Common-school lands.....	2,434,645.51
University lands.....	45,089.93
Normal lands.....	12,722.39
Saline lands.....	13,285.00
Penitentiary lands.....	676.71
Agricultural College lands.....	89,452.78
Internal improvement lands.....	480.00
Total.....	2,596,302.32

The saline lands were donated to the State by the General Government for the development of salt-springs within the State, toward which no steps have yet been taken by the Legislature.

The General Assembly in 1879 appropriated \$50,000 from the general fund for the purpose of defraying the expenses of the State University and the Agricultural Farm. As a special fund had been created for these objects, the Auditor refused to pay this appropriation from the general fund. He was obliged to make the payment by a mandamus issued by the Supreme Court. The expenses of these institutions have in this manner been paid out of that fund, and the Governor recommends that the amounts drawn be refunded from the temporary university fund, when the collections for this fund are sufficient for that purpose. The endowment of the university from the lands donated by the General Government will probably make the institution ultimately very wealthy. The students of the university come from all parts of the State, and a good number of them from other States. The State Normal School at Peru is in a prosperous condition. The reports show 275 scholars enrolled in 1880, and 90 graduates during the two years.

The number of prisoners in the Penitentiary at the close of the year was 266, of whom 11 were United States prisoners and 59 convicts from Wyoming Territory. The effects of the "good-time act" and of a humane system of discipline have proved very salutary. Only three have died in the two years. In the Insane Hospital the number of patients has increased from 122 in 1878 to 192 at the close of 1880. The building has been enlarged. The number of inmates in the Deaf and Dumb Institute on the 30th of November was 75, an increase of 50 per cent. in the two years. Improvements have been made, and a further enlargement is

demanded. The pupils have been instructed in different branches of industry, and the trades which have been introduced have each proved self-sustaining. The buildings of the Institute for the Blind are large enough for present requirements. On November 30th the number of inmates was 27. The proportion of blind persons to the total population is very low in Nebraska. The building of the Reform School which has been established at Kearney has been completed.

The necessity of calling upon the United States authorities for aid to preserve the peace during the Olive trial in April, 1879, suggested to the Governor and the Adjutant-General the advisability of making the State militia more efficient. There was no militia law in existence, and no appropriations had been made for the purpose. Nevertheless, a force of 598 officers and men was organized and uniformed, without aid from the State, upon the call of the Governor.

The Fish Commissioners placed 190,000 California salmon-fry in the streams of the State in 1879, and 300,000 in 1880; they also distributed a number of German carp. There are 6,485 miles of streams and rivers in Nebraska, and 11,160 acres of lakes.

The Republican Convention for the nomination of a State ticket assembled at Lincoln, September 2d. The incumbents of all the offices, with the exception of the defaulting State Auditor, the Superintendent of Public Instruction, S. R. Thompson, who declined a renomination, and the Land Commissioner, were renominated by acclamation, as was also Congressman E. K. Valentine. The ticket was composed as follows: For Governor, Albinus Nance; Lieutenant-Governor, E. C. Carns; Secretary of State, S. J. Alexander; Auditor of Public Accounts, John Walliehs; Treasurer, G. M. Bartlett; Attorney-General, C. J. Dilworth; Commissioner of Public Lands, A. G. Kendall; Superintendent of Public Instruction, W. W. W. Jones. The following platform was adopted:

1. The Republicans of Nebraska most heartily endorse the profession of principles formulated by the National Republican Convention at Chicago, and pledge their unwavering support to the candidates there nominated.

2. We affirm that the doctrine of national sovereignty is the fundamental principle upon which the perpetuity of the nation rests, and that the principle of home rule as enunciated by the Democratic party is but the cautious expression of the Calhoun doctrine of State rights, is revolutionary in its character, and destructive to the unity of the nation.

3. We regard the recent seizure of the polls and wholesale robbery of the franchises of the Republican citizens of Alabama, by the Democratic party officials, surpassing in the magnitude and effrontery of the crime any former effort of that party under the Tweed plan in New York and the Mississippi plan in the South, as a fair specimen of Democratic methods, and a foretaste of Democratic dominance in national affairs, that should incite every honest man and tax-payer in the country to the most earnest endeavor to defeat the party of brigandage and fraud at the polls in November.

4. We have considered what "Lee and Jackson

would have done if they were alive," and have determined to employ our best energies in preventing the seizure of the national Government by their living comrades through the fraud of a "solid South."

5. We congratulate the people of the State upon its rapid increase of population and wealth, and upon the good measure of prosperity that has rewarded their labor, and upon the rapid rebuilding of our material interests since the success of resumption and the revival of trade.

6. We pledge our support to such legislation in Congress, and such measures by the State Legislature, as may be necessary to effect a correction of the abuses, and prevent extortion and discrimination in charges by railroad corporations.

7. We most cordially invite the aid and coöperation in this defense of the national integrity and the nation's purse, of all Republicans and war Democrats who have differed with us on temporary issues, or have clung to a party name honored by their forefathers, but dragged in the dust by the degenerate party leaders of to-day.

The regular Democratic State Convention met at Hastings, September 29th, and made the following nominations for State officers: For Governor, Thomas W. Tipton; Lieutenant-Governor, S. H. Calhoun; Secretary of State, G. W. Johnson; Auditor of State, D. C. Patterson; State Treasurer, Frank Folda; Commissioner of Public Lands and Buildings, E. H. Andrus; Superintendent of Public Instruction, Alexander Bear; Attorney-General, George E. Pritchett. The platform included the following strictures on the Republican management of State affairs:

The Democracy of Nebraska declare that under Republican fundamental laws, under Republican statutory enactments, and under the administration of Republican officials, during its thirteen years of State existence, its people have been plundered, as to their public domain (which has been divided out ostensibly for the purpose of constructing railways, but really for enriching political favorites), to the extent of nearly all the five hundred thousand acres of internal improvement lands, and that taxes under a Republican Constitution which provided for them, and under special laws which made them collectable, have been levied upon the many for the purpose of constructing and giving railroads to the few; that the fundamental proposition, that no citizen shall be deprived of his property without due process of law, has been ignored and trampled under foot by the Republican system of subsidizing corporations, and by the imposition and collection of taxes from the people as a subsidizing sequence.

Therefore the Democrats of Nebraska protest against the further endowment of private corporations, either at the expense of the public domain, or at a cost to the people's pockets, by the further issuing of county bonds, or other evidences of public debt.

The Democrats demand an amendment to the State Constitution which shall for ever prohibit the vesting, by gift from this State, of another acre of land in a private corporation, and which shall make it for ever impossible to donate county or precinct bonds, or any other evidence of public debt, to any corporation whatsoever.

Many of these obligations, incurred for the purpose of inducing the construction of railroads, are undoubtedly legal, and should be paid; and many of them are undoubtedly illegal and void. The former should be refunded, at a rate of interest not exceeding six per cent. per annum, and the latter should be legally resisted in every county, precinct, and town in the State.

They demand the calling in and liquidation of State bonds at the earliest possible moment, and the reduction of the rate of interest thereon at once by refunding.

The Democrats denounce the extravagance which has characterized the Republican party in the construction of the former Insane Asylum, the Penitentiary, the University, and other public buildings in Nebraska, and demand a thorough and searching investigation by the next Legislature into all contracts heretofore made, or now existing, between the State and certain contractors and jobbers, who are known to have eaten up many hundreds of thousands of dollars of the people's money.

Resolved, That we are in favor of such a change by the next Legislature of the existing revenue laws of the State, that the property of corporations for all objects shall be subjected to taxation for county, city, and school purposes, the same as individual property.

At the general election Albinus Vance received 52,237 votes for Governor; T. W. Tipton, 28,167; and O. T. B. Williams, 3,898. The other Republican candidates also were elected by large majorities as usual. In the Presidential election the Garfield electors received on the average 54,967 ballots, the Hancock electors 28,502, and the Weaver electors 3,856.

NETHERLANDS, THE,* a kingdom of Europe. King, William III, born February 19, 1817; succeeded his father March 17, 1849. He was married first to Sophie, daughter of King William I of Wurtemberg (died June 3, 1877), and secondly to Emma, Princess of Waldeck-Pyrmont. He has one son, Alexander, Prince of Orange, born August 25, 1851; and one daughter, Wilhelmine, born August 31, 1880.

The area of the kingdom is 32,972 square kilometres, or 12,731 square miles. The population in December, 1879, was 4,037,010.

The movement of population in 1879 was as follows: Marriages, 30,655; births, 155,134; deaths, 98,099 (the births and deaths include the still-births, numbering 8,075); surplus of births, 57,035.

The following cities had, at the close of 1879, more than 30,000 inhabitants:

Amsterdam.....	316,590	Groningen.....	43,246
Rotterdam.....	150,370	Leiden.....	41,236
The Hague.....	114,936	Arnhem.....	41,313
Utrecht.....	69,667	Haarlem.....	37,772

In the budget for 1880 the expenditures and revenues are estimated as follows:

EXPENDITURES.		Dutch florins.
1. Royal house.....		750,000
2. Cabinet, supreme state authorities.....		615,127
3. Ministry of Foreign Affairs.....		696,890
4. " of Justice.....		4,447,597
5. " of Interior.....		7,482,863
6. " of Navy.....		12,611,546
7. " of War.....		20,600,000
8. Public debt.....		27,956,667
9. Ministry of Finance.....		35,182,296
10. Colonies.....		1,441,041
11. Public Works, Commerce, and Industry.....		19,771,025
12. Unforeseen.....		50,000
Total.....		114,545,052
REVENUE.		
1. Direct taxes.....		24,451,444
Land-tax.....		10,699,044
Poll-tax.....		9,810,000
Patent-tax.....		3,942,400
2. Excise.....		83,775,000
On spirits.....		22,400,000
On other liquors.....		16,375,000
3. Taxes on stamps, registration, inheritances.....		22,452,600

* For a detailed account of the population of the several provinces, for latest statistics of the army, navy, and merchant navy, and of the movement of shipping, see "Annual Cyclopædia" for 1879.

	Dutch florins.	
Brought forward.....		85,679,044
4. Customs.....		4,611,040
5. Taxes on gold and silver wares.....		386,100
6. Domains.....		1,625,000
7. Post.....		8,750,000
8. Telegraph.....		846,600
9. Lottery.....		430,000
10. Taxes on game and fishery.....		146,000
11. Pil-taxes.....		900,000
12. Taxes on mines.....		2,300
13. State railroads.....		1,572,000
14. Miscellaneous.....		10,639,885
Total.....		110,537,969
Deficit.....		4,007,038

The financial estimates are always framed with great moderation, mostly exhibiting a deficit, which in the final account becomes a surplus.

In 1880 the national debt was represented by a capital of 933,215,604 florins, divided as follows:

DIVISION OF DEBT.	Capital.	Interest.
1. Debt bearing interest at 2½ p. c.	618,300,204	15,332,505
2. " " " " 3 " "	90,312,400	2,709,372
3. " " " " 3½ " "	10,626,000	374,535
4. " " " " 4 " "	132,075,000	7,283,000
5. Bonds bearing 4 per cent. interest, issued in accordance with law of June 5, 1878.....	36,902,000	1,476,116
6. Miscellaneous.....		55,639
7. Bearing no interest.....		
8. Amortization.....		
Total, 1880.....	933,215,604	27,291,167
Total, 1879.....	10,000,000	725,500

The imports and exports in 1878 were as follows (in florins):

COUNTRIES.	Imports.	Exports.
Great Britain.....	216,541,000	131,044,000
Zollverein.....	193,065,000	231,552,000
Hanse Towns.....	10,218,000	12,465,000
Austro-Hungary.....	69,000	11,000
Belgium.....	116,516,000	90,479,000
Russia.....	62,901,000	9,837,000
Denmark.....	833,000	3,274,000
Sweden and Norway.....	9,247,000	5,600,000
France.....	15,528,000	17,191,000
Italy.....	2,903,000	6,835,000
Spain.....	6,763,000	2,345,000
Portugal.....	975,000	1,220,000
Other countries.....	6,130,000	1,976,000
1. EUROPE.....	641,487,000	508,829,000
United States.....	51,995,000	3,460,000
Cuba and Porto Rico.....	864,000	134,000
Brazil.....	1,548,000	95,000
Rio de la Plata.....	1,468,000	265,000
Peru.....	10,204,900

The aggregate length of railroads in operation on January 1, 1880, was 1,930 kilometres, of which 914 were state railroads.

The aggregate length of the state telegraph lines on January 1, 1880, was 3,761 kilometres; aggregate length of wires, 13,654 kilometres; number of offices, 346; number of telegrams carried in 1879, 2,704,794; revenue, 922,883 florins; ordinary expenditures, 1,287,635 florins; extraordinary expenditure, 123,128 florins.

The number of post-offices in 1879 was 1,290; the number of inland letters was 42,039,163; of foreign letters, 12,693,123; of postal-cards, 14,202,277; of newspapers, etc., 34,858,810. The revenue of the department amounted to 3,863,381 florins; the expenditure to 2,763,425 florins.

The colonies of the Netherlands are considerably larger and more populous than the mother-country itself. In the East Indies, Java and Madura have an area of 131,733 kilometres, and a population of 18,807,320. The aggregate area of the other colonies amounts to 1,700,000 kilometres; their native population is not accurately known, but estimated at about 7,800,000. The foreign population was as follows:

Europeans, civilians.....	36,860
Europeans, army.....	17,730
Members of their households.....	1,919
Chinese.....	824,943
Arabs.....	14,013
Hindoos.....	11,366

In America, Surinam or Dutch Guiana had, in 1878, an area of 119,321 square kilometres, with a population of 68,405 inhabitants; the colony of Curaçoa, in the West Indies, 1,130 square kilometres, with 42,506 inhabitants.

The budget estimates of the Dutch colonies for the year 1880 were as follows (in florins):

COLONIES.	Revenue.	Expenditure.	Deficit.
East Indies.....	142,450,020	145,773,494	3,323,474
Surinam.....	1,380,700	1,687,663	306,963
Curaçoa.....	352,691	523,277	140,586

The revenues of the East Indian colonies in 1877 were as follows: Imports, 153,705 florins; exports, 220,509 florins. The movement of shipping in the East Indian ports was as follows: Entered, 7,858 vessels, of 1,816,121 tons; cleared, 8,046 vessels, of 1,734,161 tons. The commercial navy consisted of 1,430 vessels, of 122,883 tons.

A new session of the States-General was opened September 20th. His Majesty, in the speech from the throne, stated that the trade and industry of the kingdom showed a certain improvement. Agriculture was in a flourishing condition, the harvest generally was very satisfactory, and the pneumonia that had been prevalent among the cattle had nearly disappeared. The revenue from taxation was progressively augmenting, but increased resources were nevertheless necessary to effect a financial equilibrium. The King announced the pres-

entation of bills relative to the constitution of the militia and Communal Guards, with a view to the completion of the system of national defense, and also a bill for improving the canals. Adverting to colonial affairs, his Majesty said that, although armed resistance had not yet been entirely subdued in Acheen, Dutch authority was so far established there that the Government could now prepare the organization and regular administration of the colony. The general condition of the Dutch East Indies could be described as satisfactory, were it not for the sickness among the population and the disease affecting the cattle.

M. Dullert was reelected President of the Second Chamber. The First Chamber voted the address in reply to the speech from the throne, in which was inserted a clause pointing out that the present condition of the finances made a reduction of expenditure necessary. During the discussion of the address in the Second Chamber motions to insert a paragraph recommending a revision of the electoral laws were rejected by fifty-one votes to sixteen. An animated debate took place on the paragraph of the address relative to the East Indian colonies, in the course of which the views held by the Government respecting affairs in Acheen were criticised as optimistic. The Minister of the Colonies replied to the criticisms, and maintained that the condition of the settlements in question was in all respects favorable. The address was adopted, September 29th. The Dutch-Indian budget for 1881 was presented, September 23d, to the Second Chamber. Both the revenue and the expenditure were estimated in round numbers at 144,000,000 gulden. An actual deficit was reported of about one third of a million, against one of three millions in 1879-'80, thus showing a considerable improvement in the finances of the colony. The expenditure in most of the departments was increased, but as a set-off a diminution of rather more than three millions in the war charges was calculated upon. The estimates were unanimously voted by the Chamber in November, after rejecting a proposal by the Minister to fix, by law, the proportion of the expenses of the East Indian colonies which the Netherlands should pay. They were afterward approved by the First Chamber.

The home budget for 1881 was introduced, October 2d, by the Minister of Finance. The expenditure was estimated at 126,333,000 gulden, and the revenue at 105,000,000 gulden, thus showing a deficit of about 21,000,000. The Minister proposed to meet this deficit for the time being by the issue of Treasury bills, and ultimately by a fresh loan of sufficient amount to include the outlay necessary for the improvement of canals. The Government, at the same time, deemed it requisite to provide for a permanent increase of revenue by the imposition of a tax on rentes.

A new penal code was proposed in October,

and underwent an active discussion in the Second Chamber. A motion for reestablishing capital punishment was rejected. Provisions were adopted, imposing life-long and limited terms of imprisonment, the latter not to exceed twenty years; fixing the minimum term of imprisonment for any offense at one day; founding a conditional release to be bestowed upon prisoners who should conduct themselves well after three years of imprisonment, and when three fourths of their punishment should have been endured; defining the crime of inciting minors to immorality, and affixing a punishment to it; and imposing a punishment for the offense of cruelty to animals, whether the maltreatment takes place publicly or not, with an exemption in favor of vivisection. The code was adopted, November 9th, by a vote of fifty-eight to ten. The Chamber decided, after protracted debates, that a priest who should anticipate a civil marriage, by performing the religious ceremonies before it takes place, should be punished for a contravention of the law. An appropriation was voted for the equipment of the vessel William Barentz for an Arctic voyage in 1881.

The Minister of the Colonies had stated, in the Second Chamber, before its adjournment in 1879, that, although the war in Acheen might be considered as terminated, a considerable force must still be maintained there. A dispatch was received by the Colonial Office in January, which was dated from Kotta Radja, December 15th, stating that Tengkoë Arab, the spiritual chief of the XXVI, Moskims, and several other chieftains had made their submission and taken the oath of allegiance. The "Staats Courant," the official journal, in September published a statement on the war, showing that the principal Acheenese fort had been only partially razed by the Dutch troops. General Van der Heyden had returned to Kotta Radja because the forces under his command were insufficient to inflict a decisive defeat upon the enemy. Kraton and its environs in Acheen were visited in November by a sudden inundation, which caused great damage.

A statue erected in memory of Spinoza at the Hague was unveiled, September 14th. The Prince of Orange was represented at the ceremony by the Minister of the Interior, and the novelist Herr Berthold Auerbach was mentioned as among the foreign persons who were present. M. Van Vloten delivered an address eulogizing the character and writings of Spinoza, whom he described as the promoter of civilization and of the progress of humanity. The Cosmophile Club of Leipsic sent a wreath to place on the statue, which is the work of the sculptor Hexamer.

NEVADA. The financial condition of this State seems to have undergone a change, and not for the better, the various sources of her revenue since 1878 having materially decreased in amount, and even in number, as not a few of them are considered exhausted.

The State Comptroller's report for 1879 shows the public receipts and expenditures during that year to have been as follows:

Receipts from all the counties, \$225,888.82; from payments on State land, \$45,058.61; from miscellaneous sources, \$652,312.50; making a total of \$923,159.53.

Aggregate expenditures for all purposes, including the three departments of the State government, interest on the public debt, schools, charitable institutions, and State Prison, \$1,276,050.79.

Assets, after paying all State debts..... \$286,975 71
State and Territorial bonded debt..... 600,000 00

In the list of payments made to the public Treasury in 1879, the item from the proceeds of mines is \$34,969.53, exceeding but little the poll-tax item, \$31,841.73.

The amount of all State taxes collected from the fourteen counties in 1879, including \$54,456.28 of delinquent taxes, was \$766,288.47; of which sum the county of Storey alone contributed more than one fourth, \$195,404.26.

An additional statement embodied in the said report, exhibits the annual State expenditures of Nevada from its organization in 1865 to December 31, 1879. For the fifteen years together, these expenses amount to \$8,566,917.43, but vary considerably from year to year; the smallest among them belonging to 1868, \$288,463.58, the largest to 1879, \$1,276,050.79.

Pursuant to a call published by the Central Committee in February, the Republicans of Nevada held a State Convention at Austin on May 11th, for selecting delegates to the National Republican Convention that was to meet at Chicago on June 2d, to nominate its candidates for President and Vice-President of the United States. The following persons were appointed as such delegates: E. Strother and C. C. Stevenson, of Storey County; J. J. Meigs, of Elko; W. W. Bishop and M. D. Foley, of Eureka; and T. D. Edwards, of Ormsby.

By a resolution adopted in this Convention, the delegates were instructed to vote in the National Convention as a unit, and also to use all proper means in their power to secure the nomination of James G. Blaine, of Maine, for President, so long as his name should be before the National Convention as a candidate for that office.

The November election for State officers in Nevada being limited this year to a Supreme Judge in the place of William H. Beatty, the present Chief Justice, to a State Representative in the Lower House of Congress to succeed Rollin H. Daggett, whose official term is to expire on March 3, 1881, and to the Presidential electors, the Nevada Republicans met in State Convention at Carson, on August 11th, to nominate their candidates, with the following result:

For Congressman, Rollin H. Daggett was nominated by acclamation.

For the nomination of a candidate for Su-

preme Judge, a ballot was taken, William H. Beatty, R. H. Taylor, of Virginia City, and George M. Sabin, of Eureka County, being the competitors; and, after an animated struggle protracted to seventy-one ballots, William H. Beatty was declared the Republican nominee, the vote of the last ballot having stood: Beatty, 55; Sabin, 33; Taylor, 13; the entire number of the votes cast being 101.

For Presidential electors, were nominated: R. H. Taylor, by acclamation; A. E. Morton of Esmeralda County, and O. H. Grey, of White Pine County, by ballot.

The following platform was reported from the committee on resolutions, and unanimously adopted by the Convention:

Resolved, That the platform of principles adopted by the National Republican Convention at Chicago in June, deserves and receives the approval and hearty endorsement of all Republicans of Nevada.

Resolved, That the hordes of Chinese that are coming in upon our shores to eat out our substance are destroying our country, impoverishing our mines, miners, and laborers, debauching our youth, and making both men and women lower in the scale of humanity. This evil must and shall be stopped, and to this we pledge the entire strength of the Republican party. In the language of our great leader, we regard the immigration of Asiatics to the United States as little less than a servile invasion. Should the commissioners now in negotiation with the Chinese Government fail to secure by the 1st of next January such a modification of the Burlingame Treaty as will practically put an end to the influx of Chinese to this country, we demand that the treaty then be promptly annulled, and such laws enacted as will relieve us at once and for ever of the Asiatic scourge now menacing the well-being of the republic.

Resolved, That we most heartily endorse the general financial policy of the Republican party, which, in spite of every opposition on the part of the Democracy, has led to the resumption of specie payments, the raising of our national credit to a height never before known, and the restoration of national prosperity. But we also demand the complete restoration of silver coin to its former position by the side of gold, and, for the purpose of attaining that end, we hold it to be the duty of the General Government, through the authorization of Congress, to coin into standard dollars or other legal-tender currency, at the cost of coinage and for the benefit of the producer, the entire silver product of the country, and relieve the mining industry from the loss attending the shipment to, and sale of silver bullion in, foreign markets. As mining for the precious metals is the leading industry of Nevada, we are inflexibly opposed to the bill reported by the Committee on Mines and Mining, and now before the House of Representatives, prohibiting the following of fissure veins or deposits beyond vertical lines of surface boundaries, and we urge our Representatives in both Houses of Congress to continue their efforts for its defeat. Such a restriction would work disaster to the labors of the prospector, and seriously retard the development of the mineral riches of the West, and we cordially endorse the action of our Representative, the Hon. K. M. Daggett, in this behalf.

Resolved, That the Republican party claims it to be the right and duty of the State and Territorial Legislatures to regulate and restrict the charges of railroads exclusively within their respective boundaries, and that it is no less the constitutional right than positive duty of Congress to regulate tariffs and restrict the charges of inter-State railroads.

Resolved, That while we congratulate the country on the successful resumption of specie payments, and the splendid financial condition of the republic, we are in favor of restricting the issuance of national and

State legal-tender notes to denominations of not less than five dollars, thus creating an increased home demand as a circulating medium for the precious metals which our mines are annually yielding.

Resolved, That General James A. Garfield and Chester A. Arthur, by their services to the country, by their devotion to principles, and by their unspotted reputation as men and as citizens, are deserving of the united and earnest support of all the loyal people of the United States for President and Vice-President. We rejoice in their nomination, and pledge to them the electoral vote of Nevada at the ensuing election by an overwhelming majority.

The Democrats in their State Convention nominated for the above-mentioned offices the following ticket: For Supreme Court Judge, Charles H. Belknap; for Congressman, George W. Cassidy; for Presidential elector for the State at large, Ogden Hiles.

The result of the election on November 2d was most favorable to the Democratic party, its candidates for Supreme Court Judge, Congressman, Presidential electors, and nearly all the others, having been elected to the offices for which they had been nominated. The Republicans acknowledged in their newspapers this great defeat of their party, ascribing it to apathy or undue confidence of victory among its adherents, to want of organization, and to defective management of party interests during the campaign.

The charitable, reformatory, and penal institutions of Nevada appear to continue under good management, and answer the purposes intended. The insane patients are still kept at Stockton, in the neighboring State of California, in the private establishment of Drs. Langton and Clark. As this method costs the State a yearly sum of about fifty thousand dollars, the press in Nevada, with scarcely an exception, earnestly urge the building of an insane asylum within the State; which measure the small dissenting portion of the people admits to be desirable, but objects to it as inexpedient at this time, on account of the great outlay of money which the erection and first establishment of such an institution would necessarily entail on the State, and which the present unpropitious condition of her finances renders her unable to bear without greatly aggravating the burden of the already overburdened tax-payers.

The education of youth in Nevada seems to be healthy and prosperous.

The rate per capita allowed for children of school age, in 1879, was six dollars; about the same amount will be allowed for each of them in the following year.

A new railway line, entirely within the limits of the State, after many years' hard work and great expense, has been completed and put in operation in 1880. It goes under the name of "The Nevada Central Railroad," extending from Battle Mountain to the city of Austin, and passing through portions of Lander and Nye Counties. It is confidently predicted that its working will prove most beneficial to the people of the said counties, and chiefly to the city of Austin.

The business operations of the Central Pacific Railroad within the State of Nevada are very considerable in extent and amount. This railroad company is now consolidated with three other railroad companies outside of Nevada, upon terms and for purposes set forth in the following statement:

Certified copies of "Articles of association, amalgamation, and consolidation between the Central Pacific Railroad Company, California and Oregon Railroad Company, San Francisco, Oakland and Alameda Railroad Company, and the San Joaquin Valley Railroad Company," dated August 20, 1879, have been filed in the office of the County Recorder of Storey County. These articles, by whereas, etc., recite the building and operating by the Central Pacific of 1,000 miles of railroad and telegraph, the California and Oregon 313 miles, the San Francisco, Oakland and Alameda 25 miles, and the San Joaquin Valley 300 miles, and state that a consolidation of their capitals, debts, properties, assets, roads, telegraphs, lands, and franchises will be mutually advantageous; that more than three fourths of the stockholders of each road have consented thereto; therefore:

ARTICLE I. Said parties do hereby amalgamate.

ART. II. The object is to purchase, construct, own, maintain, and operate all and each of said lines.

ART. III. Directors of the new company: Leland Stanford, W. E. Brown, Mark Hopkins, C. P. Huntington, Charles Crocker, Edward H. Miller, Jr., and Charles H. Cummings.

ART. IV. Capital stock, \$100,000,000, in shares of \$100 each.

ART. V. Stockholders shall have the same number of shares now held by each.

ART. VI. The new company shall assume all the contracts, agreements, debts, etc., of the former companies.

The articles are accompanied by the certificate of officers, February 7, 1880: Directors—Leland Stanford, E. H. Miller, Jr., Charles Crocker, E. W. Hopkins, W. V. Huntington, C. F. Crocker, C. P. Huntington. Leland Stanford, President; C. P. Huntington, First Vice-President; Charles Crocker, Second Vice-President; E. W. Hopkins, Treasurer; E. H. Miller, Jr., Secretary.

NEW HAMPSHIRE. The members of the New Hampshire Temperance League held their second annual session at Concord on March 18, 1880, to see the progress of the work which they have undertaken, and deliberate on the best means that should be employed to insure success. The meeting was fully attended, and, at various times during its deliberations, prominent associates addressed it. The prosecuting committees, appointed in different sections of the State to sue before the courts and bring to punishment all offenders against the laws relating to the sale of intoxicating beverages, reported the success which the discharge of the duties imposed on them had met with in their respective localities. A new set of officers for the third year was chosen; and the following resolutions, as reported from the appropriate committee, were adopted:

Resolved, 1. That moral suasion is a great and important instrumentality for promoting the advancement of the temperance cause, to be constantly used and never abandoned.

2. That to the end there may be a full and complete triumph of the temperance cause, the places of temptation must be closed, the principles of prohibition recognized, and the prohibitory law fearlessly, impartially, and energetically enforced.

3. As a means to an end, we approve of a strictly moral detective system in the enforcement of the law and the suppression of the liquor-traffic, until such time as the law shall be enforced by the regularly constituted authorities.

4. That we are in favor of the instant repeal of the local-option beer law, and the enactment of a law making lager-beer, cider, and old malt-liquors intoxicating within the meaning of the statute.

5. That we condemn the practice of prosecuting officers in hanging up cases, and demand of such officers a rigid enforcement of the law against all offenders.

6. That we believe the temperance movement can not complete its work till the manufacture as well as the sale of intoxicants is prohibited by law.

7. That we are in favor of the enactment of a civil damage law making rum-sellers liable for all damages resulting from the unholy traffic.

8. That we regard the practice of suspending indictments as tampering with the ends of justice, temporizing with the law and its processes, and a practice fraught with danger to our institutions; and that we insist as a condition precedent, when these officers in 1880 ask our suffrages for reelection, that they show by their works the honesty of their profession, by pushing relentlessly to trial and verdict every indictment hereafter found against rum-sellers, and that no solicitor who compromises with rum-sellers should receive the suffrages of temperance voters.

9. That we recommend, as a measure to suppress the illegal traffic in intoxicating liquors, the prosecution of those persons who are renting their premises for this traffic.

10. That we respectfully request the Attorney-General, when a grand jury refuses to indict a rum-seller on positive evidence, to report the facts to the court, or instruct the solicitor so to do; and, if no new panel is ordered, to present on "information" for immediate trial all cases sustained by evidence furnished by the officers of the League, and not passed upon by the grand jury.

The Democrats of New Hampshire met in State Convention at Concord on April 29th, for selecting delegates to the Democratic National Convention, which was to assemble at Cincinnati on June 22d, for nominating the party's candidates for President and Vice-President of the Federal Government. As delegates for the State at large—five names having been proposed—Harry Bingham, Frank Jones, John H. George, and Martin Van Buren Edgerly, received the highest number of votes at the ballot, and were declared selected. As many alternates were also chosen. The district delegates were selected at meetings separately held by Democrats residing in the respective districts, with the following results: First district, George N. Proctor, of Exeter, and Charles A. Busick, of Laconia; second district, Alvah W. Sulloway, of Franklin, and Timothy B. Crowley, of Nashua; third district, Hosea W. Parker, of Claremont, and Irving W. Drew, of Lancaster.

The following platform was reported from the committee on resolutions and adopted by the Convention:

We, the Democracy of New Hampshire, reaffirm our devotion to the principles of democratic-republican government, as asserted by the founders of American liberty, embodied in the Constitution, and consistently maintained by the Democratic party of the Union.

We denounce the so-called Republican party—its

doctrines, its methods, and its controlling minds—as the persistent enemy of our free government; and we especially denounce that most infamous act of usurpation whereby the fairly-determined will of the American people, constitutionally expressed at the polls, was most outrageously defied, and the shameless creatures of conspiracy and fraud installed in the places of the lawfully chosen President and Vice-President of the United States.

We unite with our brethren throughout the land in asserting the sacred right of free elections—the right of every citizen to cast his ballot unintimidated by Federal bayonets or any instrumentality of force or fraud. We call upon the representatives of the people in Congress to persevere in the maintenance of that right, and the people everywhere to assert their determined purpose never again to be defrauded of the legitimate result of its exercise.

With full confidence in the judgment and patriotism of our delegates this day chosen, we believe in the exercise of wise discretion conjointly with the representatives of the Democracy from all the States, that they will select as the standard-bearers of the party at Cincinnati men who will command the hearty and enthusiastic support of every honest Democrat and sincere patriot in the land, to the end that the party of usurpation, corruption, and fraud shall be defeated, and honest constitutional government reestablished in our midst.

On motion, subsequently made by a member, the assembly voted “that it is the sense of this Convention that the National Convention adhere to the two-thirds vote.”

The Republicans assembled at Concord on the 6th of May, to choose their delegates to the Republican National Convention that would meet at Chicago on June 2d, to nominate the Republican candidates for President and Vice-President of the United States. Of the eight competitors balloted upon for delegates at large, William E. Chandler, David H. Buffum, Ruel Durkee, and Benjamin F. Prescott were announced chosen, the most numerous votes being cast for them. As their alternates, Benjamin A. Kimball, John H. Broughton, James A. Wood, and Augustus A. Woolson were, on motion, selected by acclamation.

For district delegates the following selections were made by Republicans of the several districts, who met among themselves for that purpose: First district, Charles M. Murphy and Joel Eastman, delegates; Charles B. Gaffney, of Rochester, and Stephen Girard Northross, of Conway, alternates. Second district, Charles Holman and James E. Sturgiss, delegates; Charles Williams, of Manchester, and David H. Goodell, of Antrim, alternates. Third district, S. W. Hale, of Keene, and A. L. Brown, of Whitefield, delegates; E. G. Gustine, of Keene, and H. L. Tilton, of Littleton, alternates.

The following preamble and series of resolutions were reported by the chairman of the appropriate committee, and unanimously adopted by the Convention:

Whereas, The Republicans of New Hampshire, in State Convention assembled, desire once more to attest their devotion to the cardinal principles of the party, and to place them upon record, that the whole world may see the very foundation of their belief and action; therefore

Resolved, That we are in favor—

1. Of a currency based upon gold, upon which the

prosperity of the country, individually and collectively, largely depends.

2. Of one free and untrammelled ballot for every legal voter, North and South—free from intimidation or control of every sort—as was contemplated by the founders of our Government.

3. Of equal rights for every citizen, everywhere, and the securing of those rights, if absolutely necessary, by the strong arm of the General Government, in accordance with the letter and the spirit of the constitutional amendments.

4. Of such conduct of the civil service as shall result in giving to the country a thoroughly honest and efficient administration of every department of the Government.

Resolved, That we arraign the Democratic party for its recreancy to the principles of free government, amply attested by its adherence to the doctrine of State supremacy; its connivance at the nullification of the laws for the protection of the rights of the freedmen in the South; its attempt to count out, by fraud and force, the fairly and legally elected Legislature of Maine; and its subserviency to the Southern oligarchy, now endeavoring to secure by legislative methods what it failed to achieve by a resort to arms in 1861-64.

Resolved, That we heartily approve of the present attitude of the Administration upon all the great principles of the Republican party, and most especially and emphatically of its conduct of the national finances, by that great financier, Hon. John Sherman, of Ohio.

Resolved, That we congratulate Ulysses S. Grant, the most renowned and illustrious citizen of the republic, on his safe return from a tour of the world; and we fervently wish that the afternoon of his remarkable life may be made serene by exemption from strife, and happy in the respect and affection of a grateful country, whose unity he did so much to preserve, and whose great destiny he did more than any of his compatriots to advance.

Resolved, That while we are in favor of sending an uninstructed delegation to Chicago, it is our earnest belief that the man for the times, above all others, embodying every element of a triumphant candidate and a successful Administration, is the Hon. James G. Blaine, of Maine.

Resolved, That any unit rule which seeks to compel a delegate to vote for a candidate not his choice, or the choice of his constituents, is tyrannous and un-republican, and we request our delegates to Chicago to so vote on all questions as to leave every delegate free to follow an unfettered and honest judgment.

Resolved, That our delegates to the Chicago Convention are requested to call the attention of that body to the propriety of a change in the existing basis of delegate representation in future National Republican Conventions, to the end that hereafter the number of delegates from the different States may be determined by the actual Republican vote cast therein at the last preceding State or national election.

Resolved, That the Republicans of New Hampshire pledge themselves to give the nominee at Chicago their hearty and enthusiastic support, and a rousing majority at the polls next November.

Preparatory to the general election of November, 1880, for State officers, the Republicans convened at Concord on September 7th to nominate their candidates, 545 delegates being in attendance. The nominations for the several State offices were as follows: For Governor, Charles H. Bell, of Exeter, was, on motion, declared the Republican nominee by acclamation; State Councilor, First District, Thomas G. Jameson, of Somersworth; Second District, Lyman D. Stevens, of Concord; Third District, John W. Wheeler, of Salem; Fourth District, George H. Stowell, of Claremont;

Fifth District, Albert S. Twitchell, of Gorham. For Railroad Commissioners, James E. French, of Moultonborough; Charles A. Smith, of Manchester; and Edward J. Tenney, of Claremont. For Congressmen—First District, Joshua G. Hall, of Dover; Second District, James F. Briggs, of Manchester; Third District, Everts W. Farr, of Littleton. For Presidential electors, Nathaniel White, of Concord; Ezra B. Winchester, of Portsmouth; Alfred L. Eastman, of Hampstead; John A. Spalding, of Nashua; and Henry L. Tilton, of Littleton.

The two first named in the foregoing list being intended to serve as Presidential electors for the State at large, the Convention nominated them together, on motion, by acclamation. Mr. White having suddenly died of apoplexy, or *angina pectoris*, on October 2d, the Republican State Committee, at a meeting held for the purpose in Concord on October 13th, filled the vacancy by choosing Aretas Blood, of Manchester, as such elector.

The committee on resolutions reported the following, which were received with loud applause by the Convention, and unanimously adopted:

The Republicans of New Hampshire, adhering to their party organization which prevented slavery extension, put down a slaveholders' rebellion, saved the Union of the States, abolished human bondage, decreed manhood suffrage, and established itself as the advocate and protector throughout the national domain of equal rights before the law to all citizens, and a free ballot to every voter; and opposing the Democratic party, which made itself the defender of slavery extension, encouraged secession and rebellion, opposed and prolonged the war for the Union, resisted emancipation and impartial suffrage, and made itself the ally of terrorism and murder as means for the suppression of all free suffrage at the South, hereby declare as appropriate to the opening of a new political campaign:

1. That we approve and endorse the platform adopted by the Republican National Convention at Chicago, and cordially support the candidates for President and Vice-President there nominated.

2. That the national Republican party is sacredly pledged to the complete protection of all its citizens in the free enjoyment of all their civil, political, and public rights, to be not only theoretically conceded, but actually and fully exercised in every part of the Union; and that, for securing the same, it is the solemn obligation of the legislative and executive departments of the Government to put into immediate and vigorous exercise all their constitutional powers, and that we imperatively demand a Congress and Chief Executive whose courage and fidelity to these duties shall not falter until those results are placed beyond dispute or recall.

3. That if any State shall attempt to limit or abridge directly or indirectly the freedom of the citizen, or his untrammelled right to the labor of his hands; shall oppose or neglect to provide for universal education; shall impede or destroy by legislation, intimidation, or fraud, the exercise of the right of suffrage, either for national or State offices; shall overcome lawful majorities by turbulent, armed, or rebellious minorities; shall adopt or tolerate oppression, terrorizing, whippings, or murder as election practices, or omit to enact and enforce laws for the punishment of such crimes—in any and all of these cases we demand the active interposition of the Federal Government to furnish the citizens of the States that protection and those benefits which State action fails to supply; and for these pur-

poses we advocate the vigorous enforcement of all existing laws of Congress, and, if found necessary, the enactment of new legislation, and the adoption of additional constitutional amendments.

4. That the party that has maintained the financial integrity of the republic by the resumption of specie payments, and the honest discharge of the national liabilities, thereby lifting the industries of the country from unparalleled depression to unprecedented prosperity, should not be supplanted by a party which has repudiated its financial obligations, and done all in its power to debase the national currency and throw a perpetual blight upon the industries and prosperities of the nation.

5. That we point with pride to the present Republican national Administration, and congratulate the country upon its financial success, and its faithful performance of its public duties, in spite of the systematic opposition of a Democratic Senate and House of Representatives.

6. That in the nomination of James A. Garfield for President, the Republican party presents for the suffrages of the American people a brave and successful Union general, a tried and experienced statesman, whose integrity and ability have won not only the admiration and confidence of his political associates, but also the respect and esteem of his opponents; that in Chester A. Arthur, our candidate for Vice-President, we have an eminent citizen of New York, whose patriotism, honesty, and business capacity are unsurpassed, and we pledge them our hearty and enthusiastic support.

7. That we recur to the administration of State affairs by the Republicans of New Hampshire for twenty-four years, against the ability and honesty of which no serious charge has ever been made by our bitterest opponents, as a reason for continuing State control in Republican hands; and we hereby commend Hon. Charles H. Bell, this day nominated for Governor, and James E. French, of Moultonborough, Charles A. Smith, of Manchester, and Edward J. Tenney, of Claremont, nominated for Railroad Commissioners, as candidates in every respect worthy the votes of the people of the State.

The Democratic party, in State Convention at Concord, on September 15th, nominated their candidates in competition with the Republican nominees for all the offices mentioned above. In the State Convention they also adopted a platform expressing their principles and rules of action in government.

As Democratic candidate for Governor was declared Frank Jones, of Portsmouth, for whom six hundred votes were cast.

For Congressmen from the three districts, in their numerical order, were nominated, Messrs. Sanborn, Sulloway, and George A. Bingham, one of the Judges of the State Supreme Court. On his being nominated for Congressman, Mr. Bingham sent to Governor Head his resignation of the office he held as Justice of the Supreme Court, which was accepted; and in order to fill the vacancy thereby created, the Governor subsequently appointed Isaac N. Blodgett as Justice of the Supreme Court, which appointment was confirmed at the meeting held by the Governor and State Councilors on November 30, 1880.

The adherents to the Liquor-Prohibition party of New Hampshire assembled also in State Convention in September, and adopted the following platform:

Whereas, We regard temperance as the most important issue in this State or nation, and more impor-

tant than any or all others, and the legal prohibition of the liquor-traffic as a most efficient means of promoting temperance; and whereas our independence was achieved and our Government founded through the privations, sufferings, and patriotism of our fathers, and is only to be maintained by emulating their patriotism and their virtues, and adhering to their time-honored and wise counsel: therefore,

Resolved, That we still hold fast upon the principles of the founders of this Government, that temperance, morality, and the impartial enforcement of our laws are the guardians of our civil and religious liberties.

Resolved, That we strongly commend and concur in the declaration of Washington that our laws, State and national, should be impartially sustained, and that all opposition to the executive and proper authorities in the discharge of their duties, coming from whatever pretext or from whatever source, should be frowned upon as unpatriotic and dangerous in its influence upon the perpetuity of a free government.

Resolved, That we desire that the laws of this State should be so amended as to prohibit the manufacture of all distilled and fermented liquors.

Resolved, That we demand the repeal of the local-option law in relation to lager-beer, and an enactment declaring lager-beer and all malt-liquors intoxicating.

Resolved, That having no evidence or belief that the leaders of either of the old parties have the desire or intention to enforce the prohibitory law, we therefore deem it necessary to make and support independent prohibitory nominations for State and other officers, while fully endorsing and supporting the nomination of Neal Dow and H. A. Thompson for President and Vice-President.

Resolved, That we pledge our hearty and uncompromising support to the nominees of this Convention.

Resolved, That we recommend and desire the pardon of Thomas E. Drake from the State Prison, as demanded in the interests of law, temperance, and justice.

The Greenbackers, so called, held their State Convention at Manchester, on October 6th, when they adopted a platform declaring their views, and nominated a full ticket for the several officers, as follows:

For Governor: Warren L. Brown, of Whitefield. State Councilors: First District, O. L. Giddings, of Exeter; Second District, D. M. Clough, of Canterbury; Third District, Peter Woodman, of Manchester; Fourth District, John Norwood, of Richmond; Fifth District, H. L. Colbath, of Barnstead. Railroad Commissioners: Nathaniel Wiggins, of Greenland; and John D. Emery, of Manchester.

Of the third candidate for Railroad Commissioner, the Convention intrusted the nomination to the Executive Committee.

For Congressmen: First District, Lafayette Chesley, of Chester; Second District, John D. Woodbury, of Manchester; Third District, Dudley F. Chase, of Claremont. Presidential electors: Lafayette Moore, of Northumberland; G. J. Greenleaf, of Portsmouth; P. B. Holmes, of Greenland; D. C. Whittemore, of Manchester; and E. M. Blodgett, of Wentworth.

The election, on November 2d, proved favorable to the Republicans, whose nominees for almost all the offices voted upon in State and local elections were elected by considerable majorities over their Democratic competitors. Besides the Governor, they had their candidates elected for Presidential electors; for the three

seats of New Hampshire in the Lower House of Congress; for the three Railroad Commissioners; and for four among the five State Councilors, one of the Council districts having returned a Democrat.

As to members of the State Legislature for the next session, the proportional numbers elected by the two parties in either House were as follows: In the Senate, 16 Republicans and 8 Democrats. In the House of Representatives, 179 Republicans and 114 Democrats; which gives the Republicans a majority of 73 on joint ballot.

The aggregate number of votes polled in the State for President this year exceeded by 193 that for Governor, which was 86,050. Of these, Mr. Bell had 44,376, Mr. Jones 40,796; the remaining 878 votes were reckoned as scattering.

Everts W. Farr, the member of Congress from New Hampshire's Third District, who was also elected on November 2d, to continue in his seat for the next term, having departed this life on November 30th, the Governor, on December 3d, issued a precept ordering a special election to be held in that district on December 28th, "for the choice, by ballot, first, of a representative for the unexpired term in the Forty-sixth Congress, to fill the vacancy occasioned by the death of the late member, Everts W. Farr," and "second, of a representative in the Forty-seventh Congress, for the term commencing on March 4, 1881." At this special election, the competing candidates, nominated by the opposite parties in the interval, were: Ray, of Lancaster, Republican, and J. D. Hosley, of West Lebanon, Democrat, with the result that Mr. Ray was elected by a majority of nearly 5,000 votes over Mr. Hosley.

From the tenth decennial census of New Hampshire, it appears that her aggregate population in 1880 is 347,311 (the tables of the United States census fix it at 347,784), showing an increase of 28,961 since 1870, when it was 318,350. Not a few of her towns have considerably lost in the number of their respective residents during the last decade, while many others have more considerably gained. Concord in 1870 had 12,241 inhabitants; their number in 1880 is 13,849—which increase, in the apportionment of town representation in the Legislature to be adjusted on the basis of the present census, entitles Concord to two representatives more than formerly. Manchester has gained enough in population during the ten years last past to add seven members to her representation in that body.

The Railroad Commissioners of New Hampshire, in their report for the year 1879-'80, which is the thirty-sixth annual report of that Board, state the business of her railways to have "improved during the year in proportion to the general prosperity." Besides the discussions and recommendations on other matters connected with railroad management, and their prudent regulation by legislative enactments,

the Commissioners point at the injustice resulting from the want of due proportion in the rates for *through* and *local* freight; an evil much complained of by local shippers, and greatly aggravated by the multitude of private freight-car companies everywhere established, whose business does also interfere with that of the regular railway companies; these being thereby deprived of the possibility of earning a fair income on the capital invested, and the amount of current expenses necessary to operate their roads.

Twenty-two railway lines are in actual operation in New Hampshire, some of them having both their termini at different places within its limits, others passing through various portions of it from, and into, other States. Their names, and the amount of State tax assessed on each for the present year, appear from the following table, prepared by the State Board of Equalization:

NAMES OF RAILROADS.	Amount of tax assessed on each road.
1. Eastern.....	\$4,085 12
2. Boston and Maine.....	17,600 00
3. Ashuelot.....	1,715 00
4. Boston, Concord and Montreal.....	25,424 73
5. Fitchburg.....	217 50
6. Nashua and Lowell.....	4,688 75
7. Wilton.....	8,111 50
8. Cheshire.....	11,421 25
9. Grand Trunk, lessee of the Atlantic and St. Lawrence.....	5,000 00
10. Northern.....	28,258 32
11. Concord.....	30,455 62
12. Manchester and North Weare.....	975 00
13. Concord and Portsmouth.....	5,558 12
14. Dover and Winnepesaukee.....	4,168 75
15. Portsmouth, Great Falls, and Conway.....	2,036 87
16. Manchester and Lawrence.....	17,458 42
17. Concord and Claremont, New Hampshire.....	4,375 00
18. Sullivan County.....	6,250 00
19. Worcester and Nashua.....	2,372 50
20. Mount Washington.....	1,750 50
21. Monadnock.....	1,865 00
22. Suncook.....	1,593 75

The total of the taxes here set down is nearly forty thousand dollars less than it was in the preceding year; which reduction is caused "by a general undervaluation of property for taxation throughout the State, the undervaluation in some places amounting to about fifty per centum."

*The fish-culture appears to succeed well in New Hampshire. The Fish Commissioners, in their report for the year ending June 30, 1880, refer to the 100,000 eggs of Atlantic salmon, which they collected from mature fish, and planted in the Pemigewasset River, between five and eight years ago; the 60,000 eggs of landlocked salmon, received from the Penobscot River, having also been placed in the Pemigewasset. They anticipate a fully stocked river by June 14, 1882, the last day of the period during which the fishing of salmon is prohibited by law. From the "Grand Lake Stream" enterprise, the Commissioners have received and planted 67,000 eggs of landlocked salmon. As to brook-trout, they have collected 150,000 eggs from spawners at the hatching-house, one half of which was sent to Massachusetts, the other half distributed into differ-

ent parts of New Hampshire to replenish exhausted streams. The Commissioners propose to stop the distribution of black bass after the present season, above a hundred brooks having been stocked already with this fish.

On November 30, 1880, the State prisoners under sentence in New Hampshire, numbering about one hundred and fifty, were safely removed from the old Penitentiary into the more capacious one erected and enlarged by acts of the Legislature within the last three years.

NEW JERSEY. The annual session of the Legislature began January 13th and ended March 12th. Sherman B. Oviatt was elected speaker of the Assembly, and William Sewell President of the Senate. There was a Republican majority in both Houses, the number of Republican Senators being fifteen; of Democratic Senators, six; of Republican Assemblymen, thirty-four; of Democratic Assemblymen, twenty-six.

The Legislature did not take action upon the important subjects of tax-reform and the regulation of municipalities, as was expected. A new bribery law was enacted, making bribery at any election, consisting in the promise or gift of money, preferment, or other consideration for giving or withholding any vote, a misdemeanor, punishable with a fine not to exceed one thousand dollars, or imprisonment for not more than one year, or both, and working the disfranchisement of the person convicted, and, if a candidate, his disqualification for office if elected; subjecting to the same punishment any person marking a ballot-ticket for the purpose of corruptly identifying it; and requiring a party to bribery to give evidence against the other party by depriving him of the immunity from giving testimony which may be self-criminating. The latter provision is the novel feature of the bill. A new judiciary salary bill was passed, which prevents the bill enacted in 1879 from going into operation. That bill curtailed the salaries of the judges to such an extent that the eight Associate Judges, the Chief-Justice, and the Chancellor would receive together \$31,000, instead of \$50,400, the amount of their pay in 1880 under the old law. The new law requires the fees to be paid into the Treasury, and fixes the salary of the Chancellor at \$10,000, that of the Chief-Justice at the minimum rate of \$7,500, and those of the other justices at the minimum of \$7,000, with additions proportionate to the excess of the population of their judicial districts over eighty thousand. The aggregate salaries, computed on the basis of the census of 1875, will amount to \$79,777. A bill was passed in 1879, the object of which was to break up the store-order system, but it was so loosely drawn that the law was easily evaded. A Senate bill for the same purpose was introduced in the session of 1880. A proviso, which was added by amendment, is sufficient to defeat the intention of the law. This is to the effect that debts due to employers may be off-

set in the payment of workmen's wages. The practice of giving pass-books to employees of glass-works and other factories, who are constrained, from want of cash, to trade at the company stores, in which excessive prices are charged, is said to prevail extensively, particularly in the southern part of the State. A bill to modify and relax the Sunday laws, favored by German and other citizens, of Essex and Hudson Counties particularly, which was introduced by Krueger, of Newark, was, after much debating, lost by a heavy majority.

The proposed amendment to the Constitution, providing for biennial sessions of the Legislature, was passed just before adjournment. The amendment will have to be ratified by another Legislature before it can be submitted to the popular vote. The Senate, after hesitating for some time to approve the appointment of a Judge belonging to the opposite party in politics, confirmed, before adjournment, the nomination by the Governor of ex-Governor Joel Parker as a Justice of the Supreme Court. Before acting upon the nomination, the Senate passed a resolution to address a communication to the Governor, requesting him to withdraw the nomination, on the ground that the appointment of another Judge from the political party of ex-Governor Parker would be impolitic, quoting a passage from one of the Governor's messages which said that "something more is necessary than that the judiciary should be really pure, impartial, and just; it is also requisite that the people believe them to be so." The Governor replied that he had appointed three Judges from the opposite party before making this one from his own; that none of the nominations were made on political grounds, and none were likely to bring the bench into discredit.

The special tax commission, appointed in accordance with an act of the Legislature passed in 1879, after examining the operation of the existing tax laws, and the way in which they affect the property and industries of the State, recommended modifications of the laws such as seemed necessary to them to equalize the burdens of taxation; which recommendations, however, were not acted upon by the Legislature during the session. They divide property into five classes: real estate; visible and material personal property; bonds, shares, etc., issued by corporations of the State; those issued by outside corporations; and franchises, as represented by express, telegraph, and other companies. They recommend that real property and tangible and visible personalty be taxed wherever found; and bonds, stocks, etc., in all cases, at the place of issue. The principle of allowing deductions for debt is considered wrong. They propose that the tax upon mortgaged real estate be collected from the mortgagor, who can obtain a special receipt if desired for the portion of the tax representing the mortgage, and must make a special contract with the mortgagee with regard to offsetting the tax against

the interest. The creation of a State Board of Equalization is counseled. The commission approve the exemption of the property of religious and charitable institutions from taxation, and state that their inquiries elicited the fact that the preponderance of public opinion in the State is in favor of such exemption. Machinery used for manufacturing purposes, and agricultural implements, they recommend should also be exempted; likewise household goods to the amount of one hundred dollars. They recommend that a valuation of real estate take place every three years, with a provision for revaluation in case of the loss or addition of improvements, to facilitate which improvements should be valued separately.

Another special commission was appointed in 1879 for the purpose of framing for the consideration of the Legislature general laws to govern all municipalities. This commission also reported a bill late in the session. It was not acted upon, but was referred, as was also the bill proposed by the tax commission, to a special committee of members of both Houses, to be reported with amendments to the next Legislature. Since the amendment of the Constitution prohibiting special local laws as well as private bills went into force, in 1876, many laws affecting municipalities, general in form, but special in their intention, have been enacted. Such laws have been usually decided by the courts to be void, as evading the spirit of the Constitution. Governor Ludlow, in his inaugural address, referred to the evils which made the amendment necessary, and to the inconveniences which have attended its operation. Before the adoption of the amendment each Senator or member of the Assembly was allowed by a kind of common courtesy to prescribe to the Legislature acts for his own constituency. Individual demands rather than public claims were the bases of municipal legislation; all sorts of schemes were passed for localities whose representatives asked for them, and public debts were piled up to colossal heights. The constant intermeddling of the Legislature in the affairs of the municipalities was felt to be a serious injury. The establishment of legislative commissions for the government of cities was a course which was subversive of the principles underlying the republic, and productive of the greatest mischief. Such a commission governed one of the largest cities of the State many years against the wishes of its citizens, and in spite of the protests of its representatives in the Legislature. The evils of special legislation have not been prevented, but the attempts to conform to the amendments have led to much legal confusion, which is scarcely less disastrous than the former license in local enactments.

The whole effort seems to have been to avoid rather than conform to their spirit and meaning; not to adopt general principles for the government of all, but to legislate for single localities by laws under a general title and context, from the operation of which

all the rest of the State is sought to be absolved by a proviso often grotesque in its complications.

By this method not only have all the old evils been retained, but there have been added to them the doubts as to what localities the laws are intended to and do apply; and, further, whether they are themselves constitutional.

As it is now, after the lapse of but a very few years, neither a common council, a town committee, nor their legal advisers can possibly tell what they are authorized and what they are forbidden to do until the whole mass of seemingly general legislation shall be carefully gone over, and the applying acts culled from the chaos which fills the books of the past five years.

When that has been done, there still remains the by no means trivial question as to how many of them have been either directly or by implication abrogated by the courts as evasions of the Constitution.

Were this the result of accident, it would not be so bad, but the practice has been of general adoption; and it has more than once happened that acts have been passed which had, previous to their enactment, been declared by the legal adviser of the Legislature to be unconstitutional.

It is proper to say that there was at first a desire to comply with the Constitution, but, as difficulties arose, the policy of evasion was inaugurated. One success paved the way for others, and each succeeding session has gone a step further than its predecessor, until the above culmination has been reached.

There seems to be but one way out of this labyrinth of doubt and uncertainty, so long as the requirement of the Constitution remains as at present; and that is, by the passage of a general law or laws under which municipalities can act, and then compelling them to do so.

Much of the difficulty of the position will disappear on the mere resolution to overcome it, and to abide by the law. If it is known that a city can not get authority to spend money for a Fourth-of-July celebration, or to open some particular street in some peculiar way, or to take away from or give power to some particular officer unexpectedly elected, by a special act of the Legislature, the act will not be applied for; much time and money will be saved both to the city and to the State, and nobody will really be the loser. And yet it will be found that much of the special legislation for which the directions of the Constitution have been disregarded, has been of a character and grade no more important than these.

The report of the commission on prison-labor approves the employment of convicts in productive labor and in skilled trades in order that they may be self-supporting while in prison and as well qualified as possible for earning their living when released. In the New Jersey Prison 368 convicts were employed in manufacturing shoes, in which trade over 6,000 free laborers are employed. The recommendations of the commission were as follows:

1. That the Supervisor and Inspectors be instructed to employ the convicts in the State Prison in as many different industries as the facilities at their disposal and a due regard for the proper maintenance and support of the prison and prisoners will admit.

2. To enable this to be done, and for the urgent needs of the State Prison in other respects, hereinbefore mentioned, that the present State Arsenal, and the grounds pertaining to it, be added to the prison and fitted for its uses.

3. That in order to prevent the labor of the convicts in our State Prison from becoming injurious to free labor in future periods of depression—for it is only in periods of financial and industrial depression that the competitive labor of convicts can be injurious, or sensibly felt—the Legislature should empower the Governor to confer with the Executives of the other

States, proposing the appointment of a commission, to consist of two or more members from each State, to devise a plan by which the convict-labor of all the States may be so distributed and employed among the various productive industries as to be just and fair to each one; and that the Governor be also empowered to appoint commissioners to represent the State in such commissions whenever the proposal shall have been accepted by a majority of the States in which convict-labor is an important competing element.

4. That the Legislature provide for the establishment of an *Intermediate Prison*, where convicts between the ages of sixteen and thirty years, sentenced to imprisonment for the first time, may be kept separate from old and hardened offenders, trained to useful occupations and regular habits, and, so far as possible, reformed.

The number of persons of school age in 1880 was 330,685, an increase of 2,867. The aggregate enrollment was 204,961, an increase of 1,393. The average attendance was 115,194, an increase of 3,124. There were 3,477 teachers employed, 991 males and 2,486 females. The total number of schoolhouses was 1,585, of which 26 were newly erected and 65 rebuilt. The average time that the schools were open was nine months and twelve days, a decrease of two days. The percentage of attendance to the school population is as follows: Attending public schools, 62 per cent.; private schools, 13 per cent.; attending no schools, 25 per cent.; attending ten months, 8 per cent.; between eight and ten months, 21 per cent.; between six and eight months, 19 per cent.; between four and six months, 18 per cent.; less than four months, 34 per cent.; percentage of average attendance, 56; percentage of the school census that the schools will accommodate, 57; in the cities, 41. The proceeds of the two-mill school-tax have decreased steadily, and will show a further decrease in 1881; but in 1882 and thereafter there will probably be an increase. The increase of the school census in 1881 counterbalances the increase in rates, and leaves the per capita apportionment about the same. The total value of school property is \$6,244,139; the average value of school-buildings, \$4,108. The average cost of education per pupil, based on the total school census, was \$4.66, a decrease of five cents. The average cost on the average attendance was \$13.39, an increase of fifty-two cents.

Although the total amount of money raised for school purposes was greater than in 1879, in the majority of districts the revenue was smaller. The cities and towns raise a considerable local tax, while the rural schools depend solely on the State funds, which have decreased from \$4.49 per capita in 1875 to \$3.41 for 1880. In most of the districts the salaries of the teachers were cut down in 1880. The average monthly salary of male teachers was \$55.82, a decrease of \$1.12; the salaries of female teachers averaged \$32.90, a decrease of eighty-three cents. Governor McClellan's annual message contained the following references to the subject of keeping up the standard of the efficiency of public-school teachers, and raising the rates of remuneration in order to at-

tract to the profession those who possess the suitable talents and attainments:

It may be doubted whether there is any profession in regard to which the theory of the world at large has differed so much from its practice. The accepted theory is, that there is nothing nobler than the work of educating the young, nothing more important than the training of the future citizens and rulers of a free country. The necessary inferences from this theory are, that teaching should be a profession, not a trade; that teachers should, as far as possible, possess a high order of intellect, tact, adaptability, and patience; broad, general views and information united with mastery of detail; the power of teaching children to think for themselves, as well as that of impressing facts upon their minds; self-command and kindness of heart united with a strict sense of justice and firmness of purpose; knowledge of human nature and the ability to grasp and deal with the individual characteristics of every pupil; entire devotion to the work; large experience—especially for the higher positions—and, in addition to other self-evident qualifications, the true spirit of Christianity; in other words, that teachers should possess, in a high degree, all those qualities which insure success in the best-paid and most alluring walks of life, and that they should make teaching their life's work.

The practice, too generally, is to commence all measures of economy by reducing the small salaries of the teachers, and to regulate the quality of the teachers by the amount set aside for the salary, instead of the reverse operation.

The consequence is, that there is seldom any inducement for highly qualified persons to devote their lives to the profession, so that such persons either adopt teaching as a temporary resource, until something better offers itself, or they are obliged to submit to the anxieties of poverty, while they see their inferiors in intellect and acquirements gaining all the advantages of worldly prosperity, or the places must be filled by incompetent persons, who can find nothing better to do.

There can be no question that the general results of public education would be far greater were those intrusted with the direction of such matters to adopt the principle that they would first select the most competent teachers available, and then assign them salaries sufficient to content them and make them regard teaching as their permanent occupation, and that the last measure taken in the interest of economy should be the decrease of the teacher's salary below a proper point.

If education is worth doing at all, it is worth doing well; and the quality of the teachers is at the foundation of the whole system.

The subject of public education has been so widely discussed that there is no necessity for its being entered upon in any detail here. It is generally conceded that in a republic it is the right and duty of the Government to require that each future citizen shall possess and use the means of obtaining an education which will enable him to understand his rights, duties, and responsibilities.

Many able and experienced men, as well in our own country as in others, have reached the conclusion that where public instruction is general its purpose should be to fit young people for that position in life which from their surroundings they are probably destined to occupy; that for the great majority of the schools there should be established a plain and useful course of studies, not only to afford the necessary information upon essential points, but also to train the pupils' minds and give them habits of thought and study to enable, and, if possible, induce them to continue their studies when the obligatory course has been completed; that for those exceptional cases of intelligence and vigor, which are sure to force themselves upward, exceptional facilities should be afforded, surrounded by just enough difficulty and sacrifice to make sure that the aspirants possess sufficient intelligence and earnest-

ness of purpose to prove them worthy of the advantages they seek.

A question of such magnitude as that of public instruction can seldom be solved by theory alone; careful inquiry and thought, comparison of theory with practice, and the best energies of able men devoted to the subject, are required to reach satisfactory results. It may prove to be the case that a Board of Education, less numerous than our existing one, clothed with a good deal more power than it now possesses, and empowered to determine the course of studies and methods pursued, could facilitate the solution of this vital problem, which perhaps may be concisely stated thus: to afford all young persons in the State that foundation of knowledge and habit of correct thought which will enable them to do their duty as citizens and to become useful members of a thriving and progressive community; to do this fully without undue waste of time, while avoiding that superficial over-education of the many which really unfits them for the everyday work of their lives, without enabling them to enter upon a successful competition for the higher prizes of life.

It would be well if all in this land could be taught to realize that for those who perform their allotted life-work honestly and manfully all pursuits are alike honorable, and that he who spends his life in hard manual toil, if he is worthy and industrious, is just as deserving of respect as he who devotes himself to purely intellectual labor; and, more than this, that it may be doubted whether at the close of a busy life the sum of content is greater in the latter than in the former case.

State Superintendent Apgar instituted inquiries with regard to the length of time which is passed in the schools by city children, for the object of arranging a proper course of study for the city schools. The school age in New Jersey is between the ages of five and eighteen years. Of the total school population in the cities, 53 per cent. is enrolled in the public schools, 18 per cent. attends private schools, and 29 per cent. does not attend school. Less than half of the children between five and six years old attend the public schools, and about one sixth private schools, more than one third being kept out of school. The numbers attending both public and private schools increase, and attain their maximum between the ages of seven and ten years, only one per cent. being out of school at those ages, 75 per cent. attending the public and 24 per cent. the private schools. Many attend only a small portion of the year. At the age of thirteen the children begin to drop out of the schools at a rapid rate; at the age of fifteen more than one half have ceased going to school, only 13 per cent. of the persons between fifteen and sixteen years of age attending the public and five per cent. the private schools. Between sixteen and eighteen years seven per cent. are remaining in the public and three per cent. in the private schools, while 90 per cent. are out of school.

In 1878 the Legislature passed a law to provide for the establishment of industrial schools. Through the imperfections of this act, and by reason of other difficulties, the system of public technical instruction has not yet been introduced. Governor McClellan strongly recommends the plan of supplementing the common-school system with a scheme of technical and artistic education. He deems it an experiment

of moment and of great promise, and points out the vital importance to a manufacturing State of improving the efficiency of its industries, and of promoting technical knowledge and proficiency for that object. The example of other countries proves the wisdom of such a course, for the establishment and encouragement of technical schools by governments has been found to act directly and beneficially on the welfare of the community.

The Governor cited some statistics of the Bureau of Labor and Industries to show how greatly the interests of New Jersey are involved in this question. In 1880 the products of twenty-six branches of industry were of the value of \$110,000,000. In the manufacturing establishments in which these trades were carried on, there were paid about \$28,500,000 for wages to nearly 75,500 employees. Of the branches enumerated, there are twelve which especially require technical or artistic skill. Of these, the products amounted to \$75,000,000; while they paid more than \$18,000,000 in wages to about 47,000 employees. For example, under the head of steam-engines and machinery, the value of the products is over \$19,750,000, and more than \$3,800,000 are paid in wages to 7,852 employees; the silk-manufactories produce goods to the value of nearly \$16,000,000, and pay more than \$4,000,000 in wages to 12,680 employees; manufactories of other textile fabrics produce more than \$10,700,000, and pay more than \$2,500,000 in wages to 8,593 employees; the potteries produce nearly \$3,000,000, and pay nearly \$1,250,000 to 3,195 employees; in jewelry the products amount to nearly \$4,000,000, and there are paid more than \$1,250,000 as wages to 2,393 employees.

Governor McClellan makes the following comments on the subject of industrial training:

In very many cases skilled labor and a considerable amount of technical and artistic knowledge are indispensable for the preservation and development of these industries, which do so much to insure the general prosperity of the State.

Never before in the history of industrial enterprises has there existed so great a demand for skilled labor, while the practical abolition of the system of apprenticeship and the lack of technical schools render it impossible to supply the demand to the requisite extent. Unskilled labor is superabundant—the professions are overstocked. The necessity of the hour is to convert unskilled into skilled labor, and also to open avenues for remunerative employment in the arts and industries to those who otherwise would only add to the already excessive number striving for existence in the professional or mercantile walks of life.

The total receipts of the Treasury in 1880 were \$2,467,697.15, from the following sources: Two-mill school-tax, \$1,063,703.70; income of school fund and securities paid off during the year, \$321,612.35; income of Agricultural College fund, \$6,960; State fund, \$1,075,421.10. This, with the balance on hand from the preceding year, made the amount available during the year \$2,967,985.59. The receipts for the year on account of the State fund were \$255,-

404 from the proceeds of the State tax, and \$820,017 from the regular sources of revenue; altogether \$1,075,421. The balance in the Treasury at the beginning of the year made the total available sum for the expenses of government \$1,392,109. The expenditures for the year were \$1,007,379, a decrease of \$59,980 as compared with the preceding year. The balance on hand, October 31st, was \$384,730. With this balance, the decrease in the expenses, and the increased receipts from the regular sources of revenue, the removal of the State tax by the Legislature is warranted, and would not entail any financial embarrassment. If the same economy continues to be practiced by the Legislature in making appropriations and regulating expenses, there will be no necessity of reimposing the State tax. There was a total balance in the Treasury at the end of the year of \$544,067.55. Of this, \$384,730.45 stands to the credit of the State fund, and \$159,337.10 to that of the school fund. There was a decrease of \$68,797.68 in the receipts from the two-mill school-tax as compared with 1879, and of \$276,754.02 from State taxes—the latter caused by a reduction in the rate of taxation. The whole of the balance credited to the State fund was not immediately available, there having been included in the balance from 1879 the sums of \$33,990 deposited in the State Bank of New Brunswick and of \$6,000 in a Newark bank, both of which institutions have passed into the hands of receivers. Partial payments have been made, but there is still due \$22,443.75, and, until that amount is paid, the available State fund must be reduced by that amount.

The detailed account of disbursements for the year ending October 31, 1880, is as follows:

For account of public debt..... \$90,000 00

CHARITABLE AND REFORMATORY.

Support of State Lunatic Asylums..	\$73,240 79
Support of County Lunatic Asylums	22,204 83
Special appropriation to Morristown	
Asylum.....	15,000 00
Deaf and Dumb, Blind and Feeble-minded.....	66,156 83
Reform School at Jamesburg.....	18,900 00
Home for Disabled Soldiers at Newark.....	17,799 71
Pensions.....	7,550 08
Girls' Industrial School at Trenton.....	7,500 00
Soldiers' Children's Home at Trenton.....	467 04
Soldiers' State bounty.....	233 51
	<hr/>
	280,511 74

STATE GOVERNMENT.

Legislature.....	\$6,285 21
Salaries and fees.....	29,023 61
State-House expenses.....	14,486 06
Clerical service.....	12,061 88
Stationery and postage.....	5,937 58
State Library.....	1,465 99
	<hr/>
	132,259 83

SCIENTIFIC, SANITARY, ETC.

Inspection of cattle.....	\$12,228 64
Geological Survey.....	8,370 00
Inspection of fisheries.....	6,486 39
Propagation of food-fishes.....	5,000 00
Vital statistics.....	2,598 84
Agriculture.....	1,035 75
Agricultural experiment stations.....	2,938 44
Bureau of Statistics.....	2,566 40
State Board of Health.....	2,258 06
Pleuro-pneumonia.....	951 04
Bounties on fibrous plants.....	50 75
	<hr/>
	44,540 11

Total.....		\$1,007,379 34

The estimates of expenditures for 1881 are for charitable and reformatory, \$251,200.29; courts, crimes, etc., \$270,000; State government, \$131,878.30; scientific, sanitary, etc., \$45,058.05; military, \$65,000; education, \$38,000; publication, \$103,500; miscellaneous, \$25,363.36. Total, \$1,020,000. The estimated revenue for the year is, including available balance on hand, \$1,304,860.90. So that, if no appropriations outside the ordinary expenditures are made, there will probably be a balance at the close of the year of \$284,860.90.

New Jersey has contracted no floating debt during the year. The only funded debt is the remaining portion of the war loan, amounting at the close of the year to \$1,996,300, and at the date of the Governor's message to \$1,896,300. Under the present arrangements for the redemption of these bonds, they will cease in about ten years to be a charge upon the State fund, after which time at the latest the sinking fund will be sufficient to extinguish the debt. A number of lots, thirty-two in all, of valuable real estate, have come into possession of the State through the foreclosure of mortgages which secured loans, made as an investment of the moneys of the sinking fund during the speculative period preceding the crisis of 1873. In order that the loss to the fund should be as

little as possible, the Commissioners of the Sinking Fund have not yet sold the foreclosed property, anticipating a rise in its market value after the return of general prosperity. This policy has received the approval of the Senate committee appointed to examine into the condition of that fund.

The Senate passed a resolution requesting the State Treasurer, George M. Wright, to give information as to his conduct in connection with the matter of the State Bank of New Brunswick, which failed in 1877 with \$33,990 of State funds in its hands. The Treasurer made the required statement of the dates and amounts of the deposits and drafts, and the legal steps taken to recover for the State. A petition was filed in the Court of Chancery after the closure of the bank, praying that the State's claim should be satisfied before any other one could be allowed. The Chancellor decided in the May term of 1878 that the State did not possess the prerogative which the common law gives to the Crown, of a preference before all other creditors, which decision was affirmed by the Court of Errors and Appeals in November of the same year. A draft was made by the Treasurer against the balance in the bank before the failure, which was deposited with the Trenton Banking Company for collection. The question whether the latter rendered itself liable for the amount of the check, \$7,990, through negligence, is in litigation. The allegation of the interlocutors against the Treasurer was that the bank, which had once before suspended payments, was known by him to be infirm, and that he had kept a balance of the public moneys in the bank, and had increased it with new deposits, while the State was borrowing money at interest to meet current obligations, from partisan motives, in order to influence local elections.

The State Agricultural College is incorporated with Rutgers Scientific School. Of the forty free scholarships, all but five were filled in 1880. The graduates are fitted to engage in engineering, manufacturing, farming, and other occupations requiring a high degree of knowledge and training. The farm carried on in connection with the school serves as a model for farmers; and the experiments to be made there promise to be of considerable practical value to the farming interests. The Agricultural Experiment Station was established by the Legislature of 1879. It has done a creditable amount of work already in the analysis of fertilizers, of samples of milk, feed, fodders, and soils, and the investigation of some questions of practical importance in agriculture. The results of the researches are regularly disseminated in bulletins.

The Adjutant-General, W. S. Stryker, reports 3,147 men and 260 officers as the force of the National Guard, an increase of 182. They have greatly improved in proficiency in the use of the rifle. The same uniform has been provided for the entire body—nearly the

same as that used in the United States Army. The dress hat has been changed for the helmet. The reserve militia force of the State is estimated approximately at 223,914 men.

In the State Lunatic Asylum, at Trenton, 550 patients were under treatment at the close of the year—303 males and 247 females. The whole number of cases treated during the year was 672; 49 were discharged cured, 26 improved, 9 incurable, and 38 died. The total number treated since 1848 has been 5,661, of whom 3,491 have been returned recovered or improved. The practice of confining insane convicts with the other patients is deprecated by the managers. The messages of the Governors have expressed disapproval of this policy at different times. There were thirty-six of these in the asylum at the end of the year. The branch asylum at Morris Plains makes an equally favorable showing. The indigent, mute, feeble-minded, and blind children receive instruction in institutions outside of the State, and the establishment of State institutions for the purpose is not advised.

The Boys' Reform School, at Jamesburg, is organized on the cottage, or family, system, and has a very thorough and successful method of discipline, instruction, and encouragement for the reformation of juvenile offenders. There were 270 in the school at the beginning of the year and 258 at its close. The total number of commitments since 1867 has been 1,051—970 white and 81 colored. The daily net cost for maintenance per capita, including clothing, is twenty-one cents. The school is under the superintendence of James H. Eastman. The buildings and grounds are pleasant, and are made as free from the suggestion of restraint as ordinary boarding-schools. The principal occupation of the boys is making and laundrying shirts, at which they work seven hours a day. A good number are employed also on the farm, and others in brickmaking, blacksmithing, baking, tailoring, etc. The means of the school do not admit of instructing all the boys in trades. In the shirt-factory the boys become very skillful, and their earnings are enough to greatly reduce the cost of the institution. The shop-building cost \$13,000, and the receipts for the work done in it in the first four years amounted to \$33,800. The school has been in existence fifteen years, and is considered one of the most successful of its kind. There is also an Industrial School for Girls at Jamesburg. It is on a much smaller scale, and in the last report is stated to be overcrowded.

From the report of the State Board of Health, it appears that the year has been unusually free from fatal disease, and that the number of deaths was about 1,000 less than in 1879. There has, however, been more disease of a remittent or malarial type. The local boards of health are increasing in number, and improving in activity and efficiency. The investigation of diseases of animals indicates that the danger from that source has not been appreciated;

that pleuro-pneumonia has not been extirpated, but still occurs in some localities, and requires close watching lest it become endemic in the State.

The Geological Survey has, with its topographical and other labors, made an examination of the fire-clays found in New Jersey, and their respective degrees of infusibility. They have also given attention to the question of water-supply for cities and seaside resorts. There have been a number of new iron-mines opened during the year. The survey advises caution in risking capital in mining for other metals than iron and zinc in the State.

The returns of the assessors show a total valuation of the property of the State of \$518,617,518, against \$508,892,338 in 1879. Until 1880 the valuation of taxable property showed a steady decline since 1874, the decrease from that year's valuation to that of 1879 amounting to over \$110,000,000. This variance is attributed only partly to the general decline in values. The defects in the system of assessment are supposed to account in a large measure for the decrease.

The report of Secretary of State Kelsey on the savings-banks shows that the assets of the thirty-four savings-banks in the State on January 1, 1880, were \$18,361,011; their total liabilities, \$17,533,055; the total number of depositors, 68,457. The increase in the amount of assets over that of the previous year was \$1,771,120; in the liabilities, \$1,721,008; in the surplus of assets over liabilities, \$53,111; in the number of depositors, 5,467. The increase in assets was mainly in Government bonds.

The Bureau of Labor and Statistics is very active in collecting information regarding the material welfare of the Commonwealth. Its report contains a chapter on the condition of the public highways. The roads of the United States are declared by Governor McClellan to be inferior in proportion to the amounts expended upon them to those of any other country. The bureau recommends the encouragement of silk-culture by the State. It appears that New Jersey already manufactures sixteen million dollars (\$16,000,000) of the thirty million dollars (\$30,000,000) produced in the United States, and consumes more than sixty (60) per cent. of the raw silk imported into the United States. The Legislature in 1879 authorized the payment of bounties for the cultivation of certain fibrous plants. A beginning has been made in flax-culture. A number of Irish spinners to whom specimens of flax raised in New Jersey were shown have expressed their intention, if the hopes of the bureau regarding flax-culture are realized, of establishing factories in the State. The culture of jute, it is believed, can be profitably carried on in south New Jersey, as indicated by experiments in Virginia.

The Commission of Fisheries has seen to the regular though judicious enforcement of the

fish laws, and as the result of its activity the supply of food-fishes has largely increased.

The census returns make the population of New Jersey, in 1880, 1,130,892, as against 906,096 in 1870, an increase of 24·8 per cent. Of the different counties Camden shows the highest ratio of increase, 46·7 per cent., and Sussex the smallest, 1·65 per cent.; the largest numerical increase was in the counties of Hudson, 58,883, and Essex, 45,980.

The Republican Convention which chose delegates to the National Convention met at Trenton, May 12th. The following resolutions were adopted:

1. *Resolved*, That, as American citizens, we hold the welfare of the entire Union to be above any and all sectional interests; that, as New Jersey men, proud of our State and loyal to her in all things, we believe that her prosperity and advancement are best to be served by steadfast advocacy of and devotion to the principles of the Republican party, and unswerving loyalty to and love for the national Union.

2. *Resolved*, That we insist upon perfect protection to every American citizen of whatsoever color, native or naturalized, in all his political and civil rights; that we are in favor of the extension of the public-school system throughout the Union, free from sectarian influence, believing, as we do, that the common schools are to do the work of preparing the millions of this country for the responsibilities that come with universal suffrage.

3. *Resolved*, That we congratulate the country upon the fact that such has been the financial policy of the Republican party that no man, foreign or native, has ever lost one dollar by the promises of the United States. We congratulate the country that we have returned to specie payments, and that resumption is now certain and permanent.

4. *Resolved*, That we favor a sound currency—the foundation of which shall be coin, or notes redeemable in coin, and that we regard any man or party as a most dangerous enemy who in any way seeks to impair the national credit.

5. *Resolved*, That it is the duty of the national Government to secure free and fair elections everywhere throughout the Union within the scope of the powers conferred upon it by the Constitution of the United States.

6. *Resolved*, That we will cordially support the nominee for President to be selected at Chicago, for the honor and welfare of our country and our State.

The Democratic State Convention for the selection of delegates to the Presidential Convention met at Trenton, May 20th. The platform adopted was as follows:

Resolved, That the Democracy of New Jersey reassert the principles of constitutional government, civil and religious liberty, and the equal rights of the people, to preserve which the Democratic party was founded by the men who founded the republic, and to perpetuate which is the aim, the mission, and the sacred duty of Democracy.

Resolved, That the preservation of the States and the maintenance of their governments are as much within the design and care of the Constitution as the preservation of the Union and the maintenance of the national Government; that the Constitution in all its provisions looks to an indissoluble Union composed of indestructible States; that the Government created by the Constitution was not designed for the regulation of matters of purely local concern; that the States are fully competent to provide for the due administration of justice between their own citizens in their own courts, as well as the regulation of highways, schools, hospitals, and charitable institutions; that the inter-

ference by Congress with the States in the administration of their governments and the enforcement of their laws with respect to matters over which jurisdiction was not surrendered to the United States, is not authorized by the Constitution or any of the amendments, and the attempt to enforce such legislation by a partisan judiciary is a dangerous usurpation, destructive of the liberties of the people, and, if persisted in, will result in reducing the States to mere municipal corporations, thus effectually destroying the government of our fathers.

Resolved, That a free and fair ballot is the right preservative of all rights. We denounce all pleas and subterfuges for surrounding the polls with troops, in imitation of imperial usurpers, and with petty officials clothed with the arbitrary power of arresting citizens without warrant, as pretenses of the enemies of free elections, whose aim it is to prevent an untrammelled expression of the popular will by a terrorizing and tyrannical system. We demand a free ballot as the inalienable right of free men.

Resolved, That the widespread disasters that followed the temporizing financial policy of the Republican party, and its legalized repudiation, have served to vindicate the Democratic doctrine that a sound currency, with a specie basis, is the best means of securing business stability and permanent prosperity; and to this doctrine we adhere. We favor economy in administration as the best means of strengthening the Government credit and lightening the burdens of the people; and we are opposed to all monopolies, class legislation and subsidies, which disturb the equal operation of the laws of trade, create unequal privileges, or interfere with the legitimate opportunities of honest labor and private enterprise.

Resolved, That we look to the Democratic National Convention for a Presidential candidate who will represent the foregoing principles, and whose election will secure their renewed ascendancy in the administration, believing that, through their observance alone, the Government, long perverted from its original and true purpose, can be restored to the purity, simplicity, and justice which should distinguish our republican institutions.

Resolved, That we favor the continuance of the two-thirds rule by the National Convention in the nomination of candidates.

Resolved, That we can not too often reiterate our abhorrence of the monstrous fraud by which the sovereign will of the American people in the choice of their Chief Magistrate was defeated in the last Presidential contest, and through which the United States has since presented the shameful spectacle of a republic with an Executive not elected by its people. To the execration in which the men and the party guilty of this crowning iniquity of the nineteenth century must be held, should be added their condemnation and defeat at the coming election as a warning that this people are resolved to maintain their priceless heritage of self-government.

The Republican Convention for the nomination of Governor and Presidential electors met at Trenton, August 18th. Frederick A. Potts was nominated for Governor.

In the Democratic State Convention, held at Trenton, September 1st, George C. Ludlow was nominated for Governor. The following resolutions were adopted:

Resolved, That the platform adopted by the National Democratic Convention at Cincinnati meets our hearty approval.

Resolved, That we cordially endorse and ratify the nominations for President and Vice-President made by said Convention.

Resolved, That the Democratic party in this State is in favor of such a tariff as will best protect our home industries.

Resolved, That the Democratic party will in the fu-

ture, as in the past, so act as to protect the best interests of the laboring-man.

Resolved, That we arraign and condemn successive Republican Legislatures, especially the last, for their inconsiderate passage of acts affecting the public Treasury, by which, had they not been defeated by the wise action of the Democratic Executive, the continuance of an onerous State tax would have been a necessity; and we approve and commend Governor McClellan for withholding his approval of such acts.

Resolved, That we emphatically condemn the Republican system of management of the State finances, by which a loss of more than fifty thousand dollars occurred by the defalcation of a Republican State Treasurer, covering a period of several years, and of a further loss of more than forty thousand dollars by the failure of two banks, in which a Republican Treasurer had, in his own discretion, deposited the public funds.

In the State election Ludlow received 121,666 votes; Potts, 121,015; Hoxsey, Greenback candidate, 2,759; and Ramson, Prohibition candidate, 195—electing Ludlow Governor by a plurality vote over the Republican candidate of 651. The Presidential vote was 122,565 for the Hancock electors, 120,555 for the Garfield electors, 2,617 for the Weaver electors, and 191 for the Dow electors—giving Hancock's electors the plurality of 2,010.

NEW YORK. The annual session of the Legislature of New York began on the 6th of January, and came to a close on the 27th of May. Among the minor incidents of the session was the appointment by the Governor and the confirmation by the Senate of Silas B. Dutcher as Superintendent of Public Works; and the election, in joint session of the two Houses, of Neil Gilmour as Superintendent of Public Instruction. The reappointment by Governor Cornell of John F. Smyth to be Superintendent of the Insurance Department excited a lively spirit of opposition in the Senate. Mr. Smyth's official course had been the subject of serious criticism and accusation, and an unsuccessful attempt to remove him from office had been made. His course as the leader of the Republican organization in the city of Albany had also occasioned some division in the party. The character of the opposition evoked by his reappointment led to the withdrawal of his name, and the substitution of that of Charles G. Fairman, who was promptly confirmed.

The death of Chief-Justice Sanford E. Church, of the Court of Appeals, which took place at Albion on the 14th of May, was announced to the Legislature by an Executive message on the 17th. In communicating the intelligence of this event, the Governor said:

For nearly forty years Judge Church has been a conspicuous figure in the public affairs of the State. Possessing superior ability and untiring devotion to duty, combined with high character and unquestioned integrity, he early secured the confidence of the people, and maintained it throughout his long and eventful career. Positive, fearless, and consistent in his political course, and faithful to those who shared his views, he merited and enjoyed the favor of his party in a remarkable degree. In official service his record is an enviable one. As member of the Assembly, District Attorney, Lieutenant-Governor, Comptroller, member

of the Constitutional Convention, and Chief Judge of the Court of Appeals, he acquitted himself with unusual credit. In every capacity or association he uniformly proved himself to be a leader of men. At the bar, in the councils of his party, and in all deliberative bodies, he occupied a place in the front rank, wielding an influence inferior to none, and equaled by few. In social life, his genial manners made him always a welcome guest, while the purity of his private life and the happiness of his domestic relations present a symmetry of character and an example worthy of emulation.

Called by the people to preside over our highest court just ten years ago to-day, Judge Church discharged his great trust with eminent success and fidelity. His former partisanship caused him, perhaps, in the beginning to be distrusted by many of opposite political opinions, but his impartiality and patriotic bearing soon dispelled every doubt; and it can now be truthfully said that never in the history of our State has the Appellate Court enjoyed the confidence of the people in a higher degree than during the period of his service as the presiding Judge.

The following commemorative record was unanimously adopted, after eulogistic remarks by several members, in the Assembly:

We, the representatives of the people of this State, bow with submission, but with deep sorrow, to the sad and sudden bereavement occasioned by the death of Sanford E. Church. A profound and able jurist as Chief Judge of the Court of Appeals, his decisions challenge and receive the approbation of all men. As a statesman his record as legislator, Lieutenant Governor, Comptroller, and head of the Finance Committee of the last Constitutional Convention is a bright and enduring monument to his skill, energy, foresight, unquestioned ability, and above all, to his great purity of thought and action. In his daily contact with his fellow-men, dignity was not lowered by his unrestrained intercourse with the humblest, nor was it elevated by his acknowledged equality in all things with the most refined and intelligent in the land. Socially he was loved by all, and in that nearer and closer intimacy of his family circle his example as a loving husband, a kind, indulgent, but judicious father, can well be followed by all. In his conduct and character we can mark this phase of life not the least of his many virtues.

We tender to his stricken family the only sympathy in our power. The State and the nation are with you mourners at the bier of this great and good man.

Our Speaker will name on the part of our body five of our number, who will represent us at the funeral, and we request the Clerk to cause this memorial to be properly engrossed and presented to the family of our departed friend.

Eulogies were also pronounced in the Senate, and that body appointed a committee of three to act with that designated by the Assembly. In the Court of Appeals, at the first meeting after the death of the Chief-Justice, the session of the day was devoted to tributes to his character and worth by his former associates, and an adjournment of one week was taken out of respect for his memory.

Two important subjects of legislation occupied a large share of attention during the session, though with unsatisfactory results. These were the revision of the laws relating to assessment and taxation, and the regulation of railroads. There had long been great dissatisfaction with the inequalities of taxation in the State, the small share of the burden borne by corporations, the escape of personal property

under the provision for deduction on account of debt, and general irregularity and uncertainty in the operation of the laws. The Governor, in his annual message, recommended the appointment of a commission to make a careful revision of the statutes relating to this subject, and to report at the next session; but this method had been tried more than once with unprofitable results, and the suggestion was not acted upon. Resolutions declaratory of the principles on which a revision of the tax laws should be made were introduced, and after some delay a joint special committee of the two Houses was appointed to deal with the whole subject. This committee set out with an avowed determination to make the needed revision of the laws, and adopted as an outline of their work the taxation of all corporations on their capital stock or receipts, from which source the entire revenue for State purposes was to be derived, the abolition of all exemptions except in the case of property used for public purposes, a strict assessment of all forms of wealth, including credits and certificates of shares, and a rigid enforcement of all provisions for a thorough and equal assessment and collection of taxes. It encountered a good deal of opposition in its work, and was forced back from some of its plans, while the bills prepared were largely modified after they left the hands of the committee, and some of them wholly defeated. The consequence was, some material changes in the laws, but no systematic revision. A bill defining lands was drawn which was intended to bring under assessment railroad tracks, telegraph wires, underground pipes, private docks, etc., but it was amended so as to exempt horse-railway tracks, and as passed was vetoed by the Governor, on the ground that on account of its loose wording it would fail of much of its purpose. The effort to restrict exemptions was wholly defeated. A bill to tax the deposits in savings-banks encountered so much opposition that it had to be abandoned, and the scope of that taxing the premiums received by life-insurance companies had to be materially limited. The latter passed, however, in such a form as to levy eight tenths of one per cent. on the premiums derived from business within the State during the year for which the assessment was made. This tax was to be levied and collected for the use of the State under the authority and direction of the Comptroller. A more general act for obtaining revenue for the State from corporations was passed, after some modification from the form given to it by the committee. It provides for a State tax on capital, to be collected under the authority of the Comptroller, the companies themselves being required to make reports of the amount and value of the capital, manufacturing corporations not being included. The tax, in the case of corporations paying dividends of six per cent. or more, is one fourth of a mill for each one per cent. of the dividend on every dollar of the par value

of the stock, and where smaller dividends or none at all are paid, one and a half mill on each dollar of an appraised value of the stock. A tax of eight tenths of one per cent. was also levied on the gross receipts of fire and marine insurance companies, and five tenths of one per cent. on the gross receipts of transportation companies. Street surface-railroads were exempted from the operation of the tax on gross receipts. The real estate of corporations was left subject to assessment for local purposes, but it was declared that their capital and personal property should be exempt from taxation except as in this act provided. The operation of this law did not prove altogether satisfactory, and the experience of the year failed to justify the anticipations of its supporters. Some difficulty was experienced in obtaining a list of all the corporations in the State, and in securing the reports required by the law. Then the provision exempting the capital and personal property of corporations from other taxation gave rise to doubt which resulted in litigation. A transportation company belonging to Richmond County claimed exemption from local assessment, but Judge Gilbert held that the exemption applied only to taxes for State purposes, and left the property subject to taxation for local purposes. The State Comptroller reported a collection of only \$141,127.03 in taxes under this law up to October 1st, but he anticipated that, when its meaning was clearly settled, and it could be effectively enforced, there would be a revenue of \$2,000,000 annually from this source. He suggested, however, a number of important amendments to be made to the law.

The matter of taxing shares in the stock of national banks not only occupied much attention in the Legislature, but in the courts as well. The statute of the United States relating to national banks, which forbids the taxing of their capital by State authority, declares that their shares may be included in the assessment of the personal property of the holders, but must not be assessed at a "higher rate" than "other moneyed capital in the hands of individual citizens of the State." The Legislature passed an act in 1866 for the assessment of bank-shares, providing that the tax should be paid by the banks, and by them held back from the payment of dividends on the stock. The question was raised whether deductions for debt were to be allowed. The Attorney-General gave it as his opinion that such was not the intent of the act, and the assessor proceeded on this interpretation of the law. The Exchange Bank in Albany resisted the collection of the tax, and the matter was carried through a protracted litigation which culminated in a decision of the Supreme Court of the United States in March of this year. The State Court of Appeals had sustained the interpretation of the act of 1866, which had been acted upon in the assessment of bank-shares, and the Federal tribunal accepted its construc-

tion of the State law as correct, but declared that the assessment of bank-shares under it, without allowing deduction for debts as in the case of other personal property, was in violation of the restriction of the act of Congress. The points decided by the State Court of Appeals were as follows:

1. That it was not the duty of the defendants, as assessors of the city of Albany, to comply with the demand made by said relator, and reduce his assessments to the sum of one dollar, and answer the first question submitted in the negative.

2. That under the law of the State of New York, referred to in the second question, and passed April 23, 1866, the defendants, as such assessors, were justified in refusing to reduce the relator's assessment on his shares of bank-stock mentioned in said submission to the sum of one dollar, and answers the second question in the affirmative.

3. That the said law of the State of New York, passed April 23, 1866, is not in violation of any law of the United States relating to the amount of taxes on shares of national banking associations, and answers the third question submitted in the negative.

In regard to these the United States Supreme Court says:

Of the second of these propositions this Court has no jurisdiction, but must accept the decision of the highest court of the State that the act of 1866 took the money invested in bank-shares out of the general provision of the law of 1850, which allowed a deduction of the debts owing by the shareholder from the value of the personal property, as a basis for laying the tax. In that respect we are bound by the decision of the Court of Appeals as the true construction of the State statute. The first proposition is but the necessary result of the case, if the other two are decided in favor of defendants by that Court. We have thus left for our consideration the third proposition, which being decided against a right asserted by plaintiff under the act of Congress establishing the national banking system, presents a question reviewable by this Court. We proceed to consider it.

The conclusion was adverse to the position of the State authorities, and was in effect that the refusal to allow the deduction for debt resulted in the assessment of bank-shares at a "higher rate" than other moneyed capital within the meaning of the Federal statute. On this point the Court used the following language:

"Taxation shall not be at a greater rate than is assessed upon other moneyed capital in the hands of individuals." Seizing upon the word *rate* in this sentence as if disconnected from the word *assessment*, and construing it to mean percentage on *any* valuation that might be made, the Court of Appeals arrive at the conclusion that, since that percentage is the same in all cases, the act of Congress is not infringed. If this philological criticism were perfectly just, we still think the manifest purpose of Congress in passing this law should prevail. We have already shown what that was. But the criticism is not sound. The section to be construed begins by declaring that these shares "may be included in the valuation of the personal property of the owner, in assessing taxes imposed by authority of the State within which the association is located." This *valuation*, then, is part of the *assessment* of taxes. It is a necessary part of every assessment of taxes which is governed by a ratio or percentage. There can be no rate or percentage without a valuation. This taxation, says the act, shall not be at a greater rate than is assessed on other moneyed capital. What is it that shall not be greater? The answer is, taxation. In what respect shall it not be

greater than *the rate assessed* upon other capital? We see that Congress had in its mind an *assessment*, a *rate* of assessment and a *valuation*; and taking all these together, the taxation on these shares was not to be greater than on other moneyed capital.

The concluding words of the opinion, which was delivered by Mr. Justice Miller, were as follows:

We are, therefore, of opinion that the statute of New York, as construed by the Court of Appeals, in refusing to plaintiff the same deduction for debts due by him, from the valuation of his shares of national bank stock, that it allows to those who have moneyed capital otherwise invested, is in conflict with the act of Congress, and the judgment of that Court is reversed and the case remanded for further proceedings in conformity to this opinion.

It was still assumed that the assessment of bank-shares might be made under the act of 1866, provided deductions for debt were allowed. This was the opinion of the Attorney-General of the State and the corporation counsel of the city of New York, and assessments were made under it, where the law required these to be made in the early part of the year. But before the end of the session the Legislature passed an act declaring that the capital of national banks was exempt from taxation, but that the shares might be included in the assessment of the personal property of holders, and specifically providing that the rate of assessment should not be higher than that imposed on other moneyed capital, and that deductions should be allowed for debt as in the case of other personal property. A separate act placed the shares of State banks on the same footing with those of national banks, and another provided for a tax of one half of one per cent. on the "average of all sums of money used or employed" in the State by foreign banks or bankers. Later in the year the United States Circuit Court at Syracuse decided, in the case of the Albany Exchange Bank, that the act of 1866 was wholly invalid for conflict with the Federal statute, and that assessments under it were of no effect. An injunction was granted restraining the collection of the tax, although deductions for debt were allowed. The decision was rendered in November by District Judge Wallace. Still later, in the early part of 1881, it was further decided at Albany by Judge Wallace that the bank could recover the taxes paid under protest in previous years. Even the new act of 1880 has been called in question. Judge Wallace sustained its validity in one of the Albany cases in 1881, but other suits are pending which involve the question of its validity.

The effort to abolish deductions for debt from the assessment of personal property was defeated, as was that which aimed at a "listing system," requiring citizens to fill out and swear to a full schedule of their property subject to taxation. Dissatisfaction with the tax laws was hardly mitigated by the action of the Legislature, and the subject continued to enter largely into public discussions. It was destined

to occupy a still larger share of attention in the Legislature of 1881 than in that of 1880.

The subject of regulating railroad traffic was brought before the Legislature by the report of the Assembly investigating committee, of which A. B. Hepburn was the chairman. This committee had been appointed in 1879, and had conducted its inquiries during a large part of that year. The report, including all the evidence taken, filled four bulky volumes. The investigation had taken a wide range, and exhausted all questions of abuses and irregularities in management. The conclusions of the committee were that charges in regard to discriminations, special rates, secret rebates, "stock-watering," etc., were fully proved; that the necessity existed for restrictive legislation, and that the State had the requisite authority for bringing the corporations under the regulation of law. A series of six acts was submitted to the Legislature for its approval, as affording the measure of relief deemed of immediate importance. The first of these was an amendment of the general law of 1850 restricting the increase of their capital by railroad companies. It provides that an increase shall be made only when necessary to effect the legitimate purpose of raising new capital for construction or operation, and then only with the concurrence of two thirds of the stockholders and the approval of the State Engineer. The second provided that when two or more companies were consolidated, the stock capital of the resulting corporation should not be greater than the sum of the capitals of the companies of which it was formed. The agreement for a consolidation was also required to be subject to the approval of two thirds in interest of the stockholders. The third measure regulated voting at meetings of stockholders, and prohibited voting on proxies furnished by persons to whom stock had been pledged. The fourth was known as the "Anti-discrimination Bill," and required equal facilities under the same circumstances to be furnished to all customers on equal terms. It forbade discriminations between persons and all secret or special rates, and prohibited a higher charge for a shorter than for a longer distance. The fifth, known as the "Commission Bill," provided for three railroad commissioners, to have supervision over the operations of railroad companies, and to see that all laws in regard to them were enforced. The commissioners were required to make investigation of accidents and of complaints against the companies, and to make annual reports to the Legislature. The sixth of the bills submitted by the committee provided for fuller reports to be made by the railroad companies, specifying all the various items to be included. A supplementary report was afterward made in regard to the leasing of the elevated railroads in New York City, and a bill was submitted with it, intended to prevent a virtual "watering" of stock by the lease of the property of one or more companies

to another having no property of its own, but issuing and disposing of stock representing no outlay of capital.

Four of the six original bills were passed without material change, and with no very strenuous opposition, but the "Anti-discrimination" and "Commission" Bills were strongly opposed by the railroad interest, especially the former of the two. This opposition had much effect, particularly in the Senate. The Commission Bill, after being favorably dealt with in the Assembly in the first stages of its progress, was unaccountably defeated on the third reading, and a motion to reconsider, of which notice was given, never came to a vote. So this measure did not reach the Senate. The Anti-discrimination Bill passed the Assembly, but in the Senate was so far modified as to make it unacceptable to the former body. It was finally sent to a conference committee which failed to agree, and it was therefore lost at the close of the session. The supplementary bill in regard to leases passed the Assembly, but in the Senate was sent to a committee which never reported it.

The question of railroad regulation continued to be a prominent topic of public discussion throughout the year, the Chamber of Commerce of New York City taking an energetic part in support of the policy of regulation.

The other legislation of the session was unimportant. The resolution proposing an amendment of the Constitution for biennial sessions of the Legislature failed in the Senate. There were some minor changes made in the election laws. Among these were the requirement of separate ballots for "county" and "judicial" officers, and a provision for uniformity in the ballots, requiring them to be of plain white paper, without distinguishing marks, and printed in plain type and black ink, with a caption "in one straight line, in black ink, with plain type of the size now generally known and designated as 'great primer Roman condensed capitals.'"

The State Comptroller addressed to the Governor the following charges regarding the management of the Binghamton Asylum:

STATE OF NEW YORK, COMPTROLLER'S OFFICE, }
ALBANY, April 23, 1880. }

To his Excellency A. B. Cornell, Governor, &c.

SIR: The very large appropriation asked for by the Trustees of the Binghamton Asylum for the Chronic Insane, greatly in excess of the sum originally thought sufficient to make the necessary alterations in the Inebriate Asylum building to fit it for its new uses, having attracted my attention, I requested Mr. Letchworth, President of the State Board of Charities, and Mr. Gallien, the Deputy-Comptroller, to proceed to Binghamton and make an examination of the expenditures of the said board. I have the honor to submit their report.

I have carefully considered the facts therein mentioned, and have arrived at the following conclusions:

1. The Trustees have violated the law, in that they have departed materially from the plans approved by the State Board of Charities, and have neglected to submit for approval other plans, specifications, and estimates involving large expenditures.

2. They have violated the law in that they did not do the work by contract, but by day's work.

3. They have violated the law, in that they have expended largely in excess of the original appropriation, and have contracted for work in excess of the appropriation.

4. They have violated the law in that they have agreed by resolution to pay the architect and building superintendent in excess of the six dollars per day provided by the statute.

5. The entire management has been careless, reckless, and of an exceedingly extravagant nature, an economical disbursement of the State's moneys seemingly being lost sight of entirely. It is intended gradually to enlarge the asylum to the capacity of 1,500 inmates. Large amounts of money must annually be expended to accomplish that end. An economical and judicious application of these sums rests entirely upon the management of the Trustees. In fact, the whole financial success of the institution depends upon them.

In view of the facts brought out in the joint report of Mr. Letchworth and Mr. Gallien, I do not see how the future success of the institution can be attained under the present management. I therefore recommend the removal of the Trustees appointed by virtue of chapter 208, laws of 1879.

With great respect,

J. W. WADSWORTH, Comptroller.

The matter was submitted to the Senate by the Governor in the following communication, but no action was taken:

STATE OF NEW YORK, EXECUTIVE CHAMBER, }
April 23, 1880. }

To the Senate:

Your attention is respectfully called to the accompanying letter of the Comptroller, charging Alvin Devereux, William S. Smith, Edward D. Van Slyck, Garvis Pierce, William E. Knight, Samuel I. Halliday, Rodney C. Ford, Erastus Root, and Frederick O. Cable, as Trustees of the Binghamton Asylum for the Chronic Insane, appointed pursuant to chapter 208 of the laws of 1879, with violations of law and extravagance in the management of the official trust confided to them, in the manner and instances set forth and specified therein. The report of the Deputy-Comptroller and President of the State Board of Charities in reference to the same subject is herewith submitted.

Assuming from the official reports above mentioned that the charges referred to are true, you are hereby recommended to remove the said Trustees.

ALONZO B. CORNELL.

The Republican party of the State opened the political campaign early, with an apparent purpose of giving direction and impetus to the Presidential canvass. The State Committee, after consultation, called the Convention for the appointment of delegates to the national nominating assembly, to be held at Utica, on the 25th of February. The following resolutions were adopted at the opening of the proceedings on that occasion:

Resolved, That the delegates from the several Congressional districts be empowered to nominate and report for the action of the Convention Presidential electors for their respective districts, and that the State Committee be empowered to fill any vacancies which may hereafter occur in the electoral ticket, and that the committee be appointed by the Chair for the purpose of reporting the names of delegates at large also report the names of two electors at large.

Before any nominations or appointments were made, the following was submitted by the committee on resolutions:

The Republicans of the State of New York, assem-

bled to appoint delegates to represent them in the National Convention, reaffirm the principles and patriotic purposes of the Republican party, heretofore declared and faithfully acted upon, and deeply impressed with the responsibility now devolved upon them, declare the safety of the nation is again imperiled by the virulent and unlawful efforts of the Democratic party to overawe State governments, as represented by the conduct of its leaders in Maine, and in several of the Southern States, thereby intending to secure control of the General Government by deeds of violence and fraud and in defiance of the carefully constituted judicial authorities. In the presence of these graver and threatening dangers, it is the duty of the Republican party, in its united strength, to meet and prevent them; and to this end, mindful of their great responsibility in the coming Presidential contest, and of the fact that it must be determined by the electoral vote of this State, the Republicans of New York hereby solemnly pledge to the Republicans of other States their ability to cast it for Ulysses S. Grant. We declare that in him we repose absolute trust for his honesty, his fidelity to duty, his serene judgment and solid intelligence, his varied experiences, and for the uniform success that has ever attended his efforts in securing the integrity, perpetuity, grandeur, and prosperity of our common country. For these reasons and because we are satisfied with him, the nation North and South decidedly greet the candidate deserving its confidence. We present him as entitled to the suffrages of every patriotic citizen. We also declare the objection to a third Presidential term applies only to a third consecutive term and is utterly inapplicable to the reelection of General Grant, who is and has been a private citizen, absent from the country, destitute of all Presidential or official influence or patronage, and whose election must be by the free choice of the people, unaided by those influences which alone give force, if any there be, to that objection: therefore,

Resolved, That the Republicans of New York believe the renomination of Ulysses S. Grant, as a Presidential candidate, is of urgent importance, and the delegates this day appointed are called upon and instructed to use their most earnest and united efforts to secure his nomination.

An amendment was offered, substituting the name of James G. Blaine for that of General Grant, and striking out the reference to the third term. This was afterward modified so as to leave the delegates to the National Convention unpledged, and, after a lively discussion, was in that form rejected by a vote of 180 yeas to 217 nays. The resolution was then adopted with the preamble as reported. The list of delegates at large, submitted by the committee appointed for that purpose, and of district delegates as selected by the representatives from the districts, was adopted by the Convention as a whole. The delegates at large were Roscoe Conkling, Alonzo B. Cornell, Chester A. Arthur, and James D. Warren. The candidates for electors and members of the State Committee were also approved as reported, and the State Committee was empowered to fill vacancies in its own membership.

The Democratic Convention was held at Syracuse, on the 20th of April. An attempt had previously been made in the city of New York to secure a united delegation from the "regular" and "Tammany" organizations to a proposition emanating from a body called the "Democratic Union." The General Committee of the regular organization sent a reply inclosing the following resolution:

Whereas, In the judgment of this committee, every honorable means should be adopted to promote the union and consolidation of the Democracy; but the unconditional support of candidates nominated by National and State Conventions, convened in accordance with the time-honored usages of the Democratic party, is a cardinal principle and obligation imposed upon every Democratic organization; and

Whereas, To recognize and negotiate with any faction that arrogates to itself the privilege of violating this essential rule of political action would be a dangerous precedent and a fatal concession: therefore,

Resolved, That we disapprove of any arrangement that necessarily involves the responsibility of introducing into the National or State Conventions delegates from any organization which threatens to dispute their authority and repudiate their candidates. Whenever such organization consents to unite with the regular Democracy in the unreserved support of national and State candidates, this committee will be prepared cordially to arrange the terms and conditions upon which Democratic coöperation and harmony can be secured and perpetuated.

The Tammany organization took no part in the State Convention, but, at a gathering of its own, appointed delegates to the Democratic National Convention. At the regular Convention, delegates to Cincinnati were appointed, candidates for Presidential electors were nominated, and the following platform was adopted:

The Democratic party of New York renew their fidelity to the principles set forth by the National Democratic Convention at St. Louis, and approved by decisive popular majorities in the Presidential election of 1876. The victory then won was in the name and for the sake of reform. The people were defrauded of the fruits of that victory by a false count of the electoral votes. Reform throughout the Federal Administration is still an imperative necessity. It yet remains for a truly national party to restore the national Government to the fraternal spirit, the constitutional principles, the frugal expenditure, and the administrative purity of the fathers of the republic. But the Democratic party of New York also declare their settled conviction that the success of that conspiracy against the people's constitutional sovereignty, which by perjuries, forgeries, bribes, and violence, in effect, disfranchised 4,300,316 voting citizens—a large majority of all—and which, by a false count of the electoral votes, reversed the result of the last Presidential election, compels the next to turn upon a single commanding issue. That issue precedes and dwarfs every other. It imposes a more sacred duty upon the people of this Union than ever addressed the consciences of a nation of freemen. That duty is to vindicate the right of the people to elective self-government; that is, whether this generation shall condemn or sanction the wrong-doing of those Republican party leaders who four years ago frustrated the people's deliberate will and cheated them of their choice in the supreme act of their sovereignty; whether we shall preserve and transmit to coming generations our own glorious political heritage, or paralyze the cause of popular sovereignty here and throughout the world. Despite a century of broadening precedents, despite the guarantees of the Declaration of Independence, of every Bill of Rights, of the Federal Constitution, and of every State constitution, establishing the right of the people to govern themselves and to change their rulers at will, those party leaders nevertheless foisted a defeated candidate into the chair of the Chief Magistracy, there to administer the government according to a policy condemned by the people, through ministers repudiated by the people, every one of whom, contrivers, abettors, advocates, and apologists, all were straightway rewarded for their several shares in the conspiracy of fraud by the foremost beneficiary of that unexampled political crime. Republics can not shirk the care of their own

destinies. A government of the people, for the people, must be a government by the people. The lawful exercise and orderly transfer of the people's power, through successive administrations of government preserved by the people's choice, is the fundamental condition of a representative Democratic republic. It is the political object for which constitutions and laws are framed. It is the first of popular rights, for, besides being the greatest of them, it is the one without which the others can not exist. It is that for which a republic is anywhere preferred above a monarchy, where the transfer is by hereditary succession, as an escape from usurped magistracies and civil wars. It is the substance of civil liberty. As for democracy (the people's rule), the people's right to rule, it is the very breath of its life.

This, then, is the momentous issue, the right of the people to exercise and enjoy an elective self-government, without impediment by force or fraud from any quarter, least of all by fraud and force from their temporary but discarded servants. Shall the conspiracy of 1876 be sanctioned as a precedent by the impunity of its authors and the submission of its victims? Its victims are the honest citizens of all political parties. To destroy and stigmatize that corrupting precedent, by inflicting a fatal blow upon the Republican party, whose recognized and rewarded leaders were guilty of it, is the supreme duty of the American people. Neglected now, in the nature of the case, it is lost for ever. Not now to make that crime odious, is to invite its repetition. The polluting infamy, unpunished, sanctioned, must go on demoralizing all political parties, putting their leadership at the mercy of brigands, and infecting their healthful contentions with disease and death. The character, the future, of this republic are all at stake in the next Presidential election.

The Democratic party of New York add to their condemnation of the electoral conspiracy of 1876 an emphatic declaration of their continued confidence in the character, ability, and fitness of that distinguished citizen of New York who was then elected to the highest office in the people's gift, and who was, in his own person, the object of their joint attack on his party, his fellow-citizens, and the cause of free government. The blow which deprived the country of its chosen ruler was not aimed so much at him as at the Democratic millions who stood behind him. While making no instructions as to candidates, and committing to our delegates, as heretofore, the duty of joining in the deliberations of the National Convention, we respectfully suggest to our brethren of other States that the dignity and welfare of the party and nation demand of them that they take such action as shall best present this great issue to the people. Higher than all other party duties is the solemn obligation to give to the free voters of the land an opportunity to pass their judgment upon this monstrous crime against popular rights. On any such issue the State of New York will speak with no doubtful voice.

The Democratic party of New York hereby readopt their resolutions adopted in the State Conventions of 1864, 1868, 1872, and 1876, as follows:

Resolved, That the delegates to the Democratic National Convention, to be appointed, are hereby instructed to enter that Convention as a unit, and to act and vote as a unit, in accordance with the will of a majority of the members thereof; and, in case any of its members shall be appointed a delegate by any other organization, and shall not forthwith, in writing, decline such appointment, his seat shall be regarded as vacated, and the delegates shall proceed to fill the same; and it is hereby also empowered to supply all vacancies by death, absence, resignation, or otherwise.

And whereas, the Democratic party of this State has, in the last four national contests, instructed its delegations to the Democratic National Conventions to enter the Convention as a unit for the purpose of protecting itself thereby against fictitious and fraudulent contests of the seats of the regularly-appointed delegates; therefore,

Resolved, That in case any attempt should be made

to dismember or divide the delegation by contesting the seats of a portion of the delegates, and any of the delegates appointed by this Convention should countenance such attempt by assuming to act separately from the majority of the delegation appointed by this Convention, or to enter the National Convention separately from such majority, or should fail to cooperate with such majority, the seats of such delegates shall be deemed to be vacated.

Before the time for holding the Republican National Convention arrived, there were indications of a revolt of several of the State delegates against the instructions of the Convention at Utica. Their position and claims are sufficiently indicated by the following statement of one of their number, which was communicated in the form of a letter to the editor of the Albany "Journal":

ALBANY, May 6, 1880.

To the Editor of the Albany Evening Journal:

May I avail myself of the columns of the "Journal" for reply to inquiries of friends from various parts of the State in regard to my course as a delegate to the Chicago Convention? The last Republican National Convention held that where a State Convention had instructed its delegation to vote as a unit, each delegate had the right to vote for his individual preference. With Republicans that decision is final, and the Utica Convention had no power to overrule it. As well might the General Term of the Supreme Court reverse the judgment of the Court of Appeals.

The delegates at large are bound by the instructions of the State Convention. The district delegates are under no such obligation. A district delegate should represent the wishes of the Republicans of his district.

The Republicans of my district, with great unanimity, prefer James G. Blaine as the Republican candidate for the Presidency, and with them, in this respect, I am in full accord.

On the first roll-call at Chicago, and on each subsequent one till a nomination shall be made, I shall vote for James G. Blaine.

I shall vote for him because he is the choice of the Republicans of the district which I represent.

I shall vote for him because to-day he is, in my judgment, the strongest and most popular Republican living, and these qualities it will be well for the Convention to consider in making its choice, as on the election of the nominee will depend, to a great extent, the nation's welfare.

I shall vote for him because, if elected, he will make a safe and wise ruler. Under his Administration all rebellion will begin and continue to respect the Government, and the country will enter upon a career of prosperity and greatness hitherto unknown.

Yours, truly, W. H. ROBERTSON.

Judge Robertson's lead was followed by three of his colleagues in the State Senate, who made oral statement of their purposes in that body under the guise of "personal explanations."

The Democratic State Committee, at a meeting held in New York on July 21st, adopted the following resolution:

Resolved, That this committee, while disclaiming any right to interfere in any purely local differences, if such exist among Democrats in any part of the State, particularly where such differences are due to strenuous rivalry in support of State and national candidates of the party, yet hopes that in all parts of the State the voice of dissension may be hushed, and impulses to cordial cooperation encouraged, to the end that, irrespective of past differences, the undivided strength of the party may contribute to success against the common enemy of administrative reform, better

government, and the restoration of fraternal love among our countrymen.

The death of Chief-Judge Church, of the Court of Appeals, occasioned the necessity of choosing his successor at the election in November, and the parties were called upon to nominate candidates for the office. The Republican State Committee, at a meeting held in New York on August 24th, decided not to call a convention for this purpose, but to put in nomination on its own responsibility Charles J. Folger, who had already been appointed by the Governor as Judge Church's successor. The proposition to hold a convention was negated by a vote of five to twenty-six, and then the following resolution was adopted unanimously:

Whereas, The general sense of the Republican party is opposed to a State Convention, for the reasons, among others, that the time occupied in the selection of delegates to a State Convention would disturb and retard the work of the campaign, already auspiciously begun, and that the character of Charles J. Folger dictates his nomination for the high place he now occupies, and no other name would be acceptable to the Republican party; therefore be it

Resolved, That, in compliance with the sentiment of the Republican party, the State Committee places in nomination for Chief Judge of the Court of Appeals Charles J. Folger, of Ontario.

The Democratic State Committee, after some consideration of the matter, concluded to call a State Convention, being somewhat moved thereto by the determination of Mr. John Kelly, of New York, and the committee of the Tammany organization, to hold a convention if the regular party organization did not. The Convention was held at Saratoga on September 28th, and represented a union of the two factions. Charles A. Rapallo was nominated for Chief Judge of the Court of Appeals, and the following was adopted as a platform:

The Democrats of the State of New York, in convention assembled, reaffirm the declaration of principles made at the late Convention of 1879, and ratify the resolutions adopted by the Democratic National Convention at Cincinnati. The Democrats of New York hereby pledge the thirty-five electoral votes of this State to Hancock for President and English for Vice-President, and we hereby express the confidence that the next Federal Administration will be conducted by constitutional methods; that the right of local self-government in the States will be respected; that industry will be relieved from the weight of unequal taxation; that American commerce will again be carried forward under the American flag; and that the union of these States will once more find its perfect and sure defense in the affection of all the people.

The Democrats of New York congratulate their brethren upon the prospect which now exists of success throughout the whole country, and we think ourselves justified in claiming that the result is in part due to the manner in which we have maintained and applied democratic principles and methods of administration in our own State.

Resolved, That the death of Sanford E. Church, Chief Judge of the Court of Appeals, has caused a grave loss to the court over which he presided, and has deprived the Democratic party of one of its most trusted and wisest counselors. We express our admiration for his great talents and exalted character, and will cherish his memory as a priceless heritage to the people of the State.

The union of the two Democratic factions

was maintained until after the election, their differences being reconciled in New York City, where they chiefly existed, by an agreement upon a division of the local nominations between the Tammany Hall and Irving Hall organizations. The candidate for Mayor of the city, Mr. William R. Grace, was selected by the Tammany Committee from a list of names submitted by that of the Irving Hall Democrats. The selection proved far more satisfactory to the Tammany faction than to the other, and many of the latter, together with the great body of independent voters, joined with the Republicans in support of William Dowd for Mayor. The local contest turned largely on the public-school question and the fact that Mr. Grace was a Roman Catholic, and it was probably not without effect on the State and national elections.

The total vote cast for Presidential electors on November 2d was 1,105,226. Of these, 555,544 were for the Republican, 534,511 for the Democratic, 12,373 for the "Greenback," and 1,517 for the Prohibitory ticket. There were 80 votes for the Antimasonic candidates, and 1,201 returned as "scattering." The Republican plurality over the Democratic vote was 21,033; majority over all, 5,862. The vote for Chief Judge of the Court of Appeals was 1,094,134, of which Folger received 562,821, Rapallo 517,661, Armstrong, Greenback candidate, 13,183, and 469 were "scattering." Folger's plurality was 44,160. An amendment of the Constitution was voted upon and ratified by a majority of 110,678 out of a total vote of 333,128. The vote for Mayor in New York City was 101,760 for Grace, and 98,715 for Dowd, making the plurality of the former 3,045.

The constitutional amendment which was ratified provided for detailing Judges of the Superior and Common Pleas Courts of New York and the City Court of Brooklyn to hold special terms of the Supreme Court in their districts, and for the continuation of the salaries of Judges of the Supreme Court and Court of Appeals who are forced to retire by reason of being seventy years of age before the expiration of the term for which they were elected, provided they have served on the bench ten years, such continuation to be only for the unexpired term.

CHARLES J. FOLGER, who was elected Chief Judge of the Court of Appeals, was born in Massachusetts, April 16, 1818. At the age of fourteen years he removed with his parents from Nantucket to Geneva, New York, where he entered Hobart College, graduating in 1836. He studied law at Canandaigua, and was admitted to the bar by the Supreme Court at Albany in 1839. After practicing a short time at Lyons, he finally settled down at Geneva in 1840. In 1844 he was chosen Judge of the Court of Common Pleas in Ontario County, and Master and Examiner in Chancery, positions which were abolished by the remodeling

of the judiciary by the Constitution of 1846. In 1851 he was elected County Judge in Ontario, and held the position four years. He was elected to the State Senate in 1861, and served in that body continuously until 1869, taking a prominent part in the important legislation of that period. In 1869 he accepted the position of Assistant Treasurer of the United States at New York. In 1871 he was elected to the bench of the Court of Appeals as one of the Associate Judges for the full term of fourteen years. On the death of Chief-Judge Church, he was appointed by Governor Cornell to fill the vacancy until the election which confirmed him in the position.

About two weeks before the election considerable excitement was produced by the publication in New York City of the following letter, alleged to have been written by the Republican candidate for the Presidency:

[PERSONAL AND CONFIDENTIAL.]

HOUSE OF REPRESENTATIVES,
WASHINGTON, D. C., January 23, 1880. }

DEAR SIR: Yours in relation to the Chinese problem came duly to hand.

I take it that the question of employees is only a question of private and corporate economy, and individuals or companies have the right to buy labor where they can get it cheapest.

We have a treaty with the Chinese Government which should be religiously kept until its provisions are abrogated by the action of the General Government, and I am not prepared to say that it should be abrogated until our great manufacturing and corporate interests are conserved in the matter of labor.

Very truly yours, J. A. GARFIELD.

H. L. MOREY, Employers' Union, Lynn, Massachusetts.

General Garfield at once denounced this as a forgery, but a *fac-simile* of the manuscript having been printed, a prominent member of the Democratic National Committee, who was familiar with General Garfield's handwriting, publicly expressed the opinion that it was genuine. It was widely circulated by the committee and the press, and occasioned much bitter controversy. Shortly before the election, an *attaché* of the newspaper in which the letter first appeared was arrested on a charge of forging it, and an investigation was begun by the Court of Oyer and Terminer in New York. Evidence was produced to the effect that there was no such person as H. L. Morey, of Lynn, and tending plainly to show that this letter had been concocted and a forgery committed for political effect. The accused was held for trial, but a *nolle prosequi* was subsequently entered in the case. One of the witnesses who testified to the genuineness of the letter was, however, convicted of perjury and sentenced to eight years' imprisonment.

Controversy in regard to the power of the Mayor of the city of New York to remove the heads of executive departments, which began in 1879, continued during a greater part of this year. The charter of the city provides for such removals by the Mayor, on charges and after a hearing, subject to the approval of the Gov-

error of the State. Mayor Cooper had removed certain of the police commissioners, and, while giving them an opportunity to answer the charges against them in person, had refused to hear counsel or to make a judicial investigation of his charges. In the case of one of the commissioners, Mr. Sidney P. Nichols, whose removal had received the approval of the Governor in April, 1879, the matter was carried into the courts by an application for a writ of *certiorari* for his reinstatement. This and other cases involving the Mayor's power of removal were in litigation for several months, and there was much conflict of judicial opinion and decision; but the Court of Appeals decided that the Mayor was bound to conduct a judicial inquiry, hearing evidence and argument, before he could remove the officials against whom his charges were directed. This virtually determined the controversy in favor of the commissioners and against the Mayor.

The financial condition of the State is declared by the Governor to be "eminently satisfactory." The following statement exhibits the transactions of the financial department for the fiscal year, and the general condition of the State Treasury on the 30th of September:

Aggregate balances in the Treasury of all the funds, October 1, 1879.....	\$4,518,356 41
Aggregate receipts during the fiscal year ending September 30.....	11,835,570 93
Total.....	\$16,353,927 34
Payments during the year.....	12,905,711 96
Balance in the Treasury September 30....	\$3,448,215 38
Amount of receipts into the Treasury on account of the general fund revenue during the year.....	\$5,859,566 20
Payments.....	6,290,418 91
Apparent deficiency, September 30.....	\$430,852 71
Balances due from county Treasurers, September 30, on State tax of 1879.....	\$222,606 92
Add amount paid on account of 1880 appropriations, included in tax levy, payable into the State Treasury in April and May, 1881, of which \$590,000 are for New Capitol....	1,069,065 39
Total.....	\$1,231,672 31
Deduct apparent deficiency of the revenue, September 30, as shown in preceding statement.....	\$430,852 71
Also balances of 1879 appropriations unpaid, and in force September 30.....	208,059 99
	638,912 70
Actual surplus September 30, 1880.....	\$652,759 61

On the 30th of September, 1879, the total funded debt was \$9,122,054.87, classified as follows:

General fund (representing Indian annuities).....	\$122,694 87
Canal.....	8,958,360 00
Bounty.....	11,000 00
Total.....	\$9,122,054 87

On the 30th of September, 1880, the total funded debt was \$9,114,085.87, classified as follows:

General fund (representing Indian annuities).....	\$122,694 87
Canal.....	8,958,360 00
Bounty.....	3,000 00
Total.....	\$9,114,054 87

The general fund State debt is all paid, and the item of \$122,694.87 represents the amount required to yield at the rate of six per cent. the sum necessary to pay the Indian annuities. The balance of \$3,000, bounty debt, for which funds are provided, had not been presented for redemption at the close of the fiscal year. A balance of \$2,051,480.17 in the canal sinking fund leaves the amount of that debt, unprovided for, September 30, 1880, at \$6,936,879.83.

The State debt on September 30, 1879, after deducting the unapplied balances of the sinking fund, amounted to.....	\$7,659,426 89
On September 30, 1880 (including \$122,694 87), to.....	7,050,574 70

Showing net contributions to sinking fund of The actual reduction of the debt during the same period by cancellation being.....	\$599,851 69
	8,000 00

The total valuation of property in the State for purposes of taxation is \$2,637,869,235, and the State tax levy for 1880-'81 is three and a half mills on the dollar.

The revenues of the canals for the year ending September 30, 1880, were as follows:

Tolls.....	\$1,188,852 74
Rent of surplus water.....	2,177 03
Miscellaneous.....	14,604 81
Total.....	\$1,200,134 63
Total expenses for ordinary repairs, superintendence, and collection of tolls.....	889,015 84

Surplus revenues of the canals for the fiscal year ending September 30, 1880.....	\$311,118 79
---	--------------

A comparison with the previous year shows the following results:

A gain in revenue of.....	\$278,881 82
Increase in expenses.....	137,241 02
Gain in net revenue.....	\$141,640 80

The amount necessary to meet the constitutional requirements in regard to the canal debt for the year is as follows:

For interest on canal debt.....	\$538,902 00
For the sinking fund.....	450,000 00
Total.....	\$988,902 00
Surplus revenue realized.....	311,118 79

Deficiency for year ending September 30, 1880.....	\$677,783 21
Add deficiency in tax in 1879.....	24,507 46
Add for interest on these deficiencies until the same can be realized from taxes.....	56,207 25

Total amount to be supplied by tax.....	\$758,797 92
---	--------------

The canals were suddenly closed by ice in November, and more than one thousand boats were arrested in their passage. Of these, 746 were loaded with grain for tidewater, containing approximately six million bushels.

The record of the calendar year showed an increase of 20½ per cent. in the tonnage of canal traffic, and 22½ per cent. in tolls. The following shows the tolls and tonnage for the last four years:

CANALS.	1877.	1878.	1879.	1880.
Tolls.....	\$880,896	\$993,348	\$941,574	\$1,155,257
Tonnage.....	4,955,953	5,171,320	5,362,372	6,402,220

The total number of miles of railroad in the State is 9,186, of which 477 miles are horse-

railways. This includes the elevated railroads in the city of New York. The steam surface-roads have cost \$695,525,828.48, the horse-railways \$40,686,946.64, and the elevated roads \$33,038,332.12, a total of \$770,251,107.24. The steam surface-roads carried 47,197,385 passengers during the year, the horse-roads 244,900,717, and the elevated roads 60,831,757. The steam surface-roads also carried 57,356,128 tons of freight. Their aggregate earnings were \$108,965,556.04, operating expenses \$64,996,989.54, leaving as net earnings \$43,968,566.50, or 64 per cent. on the cost. The earnings of horse-railroads amounted to \$13,449,121.87; cost of operating, \$9,157,457.28; net earnings, \$4,291,664.59, or 10½ per cent. of cost. Earnings of elevated roads, \$4,612,975.56; expense of operating, \$2,644,525.24; surplus, \$1,968,650.32, or about six per cent. on the cost. It is a noteworthy fact that, notwithstanding the large number of passengers carried by the elevated railways in New York City, the horse-railways carried a larger number, and showed a larger aggregate of receipts, than in 1877, when these structures were not yet in operation, with the exception of the unimportant line on the extreme west side of the city. The total paid-up capital of all the steam-railroad companies of the State is \$516,934,587.91; of the horse-railroad companies, \$211,702,857.94; total funded debt of steam-roads, \$361,270,474.59; of horse-roads, \$16,706,708.08; floating debt of steam-roads, \$27,302,156.22; of horse-roads, \$1,584,638.19. The aggregate of stock and debts is \$905,507,218.72 for steam and \$42,990,204.21 for horse-roads, but of the former only \$662,871,488.93 represents roads within the limits of the State.

There were 68 banks of discount and deposit doing business under the laws of the State on the 1st of October, at which date their condition was as follows:

Resources.....	\$99,850,755
Capital.....	18,738,200
Surplus profits.....	8,058,280
Due depositors.....	61,795,773
Other liabilities.....	11,258,502

During the year deposits increased \$9,536,184; profits, \$821,715; loans and discounts, \$12,328,180. The net aggregate increase in assets was \$13,157,573. Six banks closed during the year, four of which went into voluntary liquidation, one was converted into a national bank, and one failed. One new banking association was formed during the year.

One hundred and twenty-eight savings-banks reported July 1, 1880, eleven of which do not receive deposits and have only a nominal existence. Three went into voluntary liquidation, paying depositors in full.

The aggregate resources of these institutions amounted, on the 1st of January, 1881, to \$400,944,380. This includes a surplus of \$47,099,094, the deposits amounting to \$353,625,657. This is an increase for the year of \$34,371,156, and is larger by many millions than ever before known in the history of these in-

stitutions. The increase of surplus for the year is \$12,317,142, and of number of depositors, 89,237. The whole number of depositors was 953,707, which is greater by more than seventy thousand than in any previous year.

Of trust, loan, and mortgage companies, twelve institutions are in operation, having \$11,377,375 capital and \$96,713,717 of resources. Also eight corporations for the safe keeping and guarantee of personal property, with aggregate capital of \$1,376,900.

There are 167 fire-insurance companies doing business in the State, of which 87 are organized under its laws, 58 belong to other States, and 22 are foreign. Their total assets are \$143,248,869; liabilities, including capital stock, \$94,107,073; surplus, \$49,146,966; gross income for the year, \$60,548,160; gross expenses, \$58,822,513. Of life-insurance companies, there are twelve organized under the laws of the State, with \$202,562,831 of assets and \$169,675,366 of liabilities, and nineteen belonging to other States, whose assets are \$198,952,961, and liabilities, \$166,562,705. There are eighteen marine insurance companies, seven of which are organized under the laws of the State, and their assets are \$20,147,902, the surplus over liabilities amounting to \$3,565,707; and four casualty insurance companies, with \$1,800,000 of assets and a net surplus of \$271,000.

The amount expended on the new Capitol at Albany during the year was \$1,251,989.02, and \$421,180.60 of funds remained in the hands of the commissioners.

The public-school statistics for the year ending with September 30th are as follows:

Total receipts, including balance on hand September 30, 1879.....	\$11,390,888 16
Total expenditures.....	10,296,977 26
Amount paid for teachers' wages.....	7,638,921 88
Amount paid for schoolhouses, repairs, furniture, etc.....	1,145,881 15
Estimated value of schoolhouses and sites.....	80,747,509 00
Number of schoolhouses.....	11,899
Number of school districts, exclusive of cities.....	11,263
Number of teachers employed for the legal term of school.....	20,596
Number of teachers employed during any portion of the year.....	80,780
Number of children attending public schools.....	1,081,598
Number of persons attending normal schools.....	5,753
Number of children of school age in private schools.....	108,567
Number of volumes in school-district libraries.....	735,653
Number of persons in the State between the ages of five and twenty-one years.....	1,641,173

The property, real and personal, held for charitable purposes in the State, may be set down in round numbers as follows:

By State institutions.....	\$6,900,000 00
By cities and counties.....	6,200,000 00
By incorporated associations.....	21,900,000 00
Total.....	\$35,000,000 00

The total expenditure during the year for the support of the several charitable institutions, public and private, reached about eight million dollars. The average number of beneficiaries was approximately as follows:

In State institutions.....	4,800
In city and county institutions.....	15,700
In incorporated benevolent institutions.....	24,200
Total.....	44,700

The total number of insane persons in the several State and local asylums, poor-houses, and private asylums, for the years stated, was as follows:

October 1, 1880.....	9,548
October 1, 1879.....	9,015
October 1, 1878.....	8,771
October 1, 1877.....	7,921

The average annual increase of insane for the four years was 400 persons. The Buffalo asylum, which has been so far completed as to accommodate 300 patients, cost about \$1,250,000, or more than \$4,000 for each inmate.

The average number of prisoners in the Clinton, Auburn, and Sing Sing Prisons for the last three years is as follows:

1878-'79.....	8,379
1879-'80.....	8,062
1880-'81.....	2,970

The earnings and expenditures of the several State Prisons for the fiscal year ending September 30, 1880, were as follows:

SING SING.	
Earnings.....	\$217,028 69
Expenses.....	184,277 69
Surplus.....	\$32,751 00
AUBURN.	
Earnings.....	\$114,925 00
Expenses.....	130,103 75
Deficiency.....	\$15,183 75
CLINTON.	
Earnings.....	\$54,952 46
Expenses.....	90,606 69
Deficiency.....	\$35,654 23
	50,837 98
Total deficiency.....	\$18,086 98

There were about 500 inmates at the Elmira Reformatory during the year. The cost of maintenance was \$81,338, while the earnings amounted to \$62,657, leaving a deficiency of \$18,681.

The organized militia or "National Guard" of the State comprises six divisions, eleven brigades, twenty-one regiments, five battalions, and thirty-six separate companies of infantry, eight troops of cavalry, and ten batteries of artillery; in all, 18,102 officers and enlisted men.

The number of passengers arriving at the port of New York from foreign ports during the year was 372,880. Of these, 327,371 were aliens, and 320,607 were steerage-passengers. The increase of arrivals over 1879 was 186,611. Of the total immigrant arrivals, 112,119 went to the Western States and 63,368 to the Eastern States, while 137,561 remained in New York State. The Southern States drew but 6,497, and Canada 1,627. The distribution of immigrants in some other States was as follows: Illinois, 32,641; Wisconsin, 9,847; Ohio, 18,869; Iowa, 7,649; Minnesota, 12,640; Ne-

braska, 4,237; Michigan, 11,303; Kansas, 3,546. The monthly arrivals of immigrants for the year were as follows: January, 5,677; February, 7,904; March, 21,094; April, 45,578; May, 55,084; June, 42,027; July, 25,382; August, 25,321; September, 26,942; October, 30,702; November, 18,904; December, 15,992. Their nationalities were as follows:

Germany.....	104,264	Hungary.....	6,672
Ireland.....	66,399	Denmark.....	5,577
England.....	33,768	Austria.....	4,461
Sweden.....	85,217	France.....	4,087
Italy.....	11,190	Wales.....	8,583
Norway.....	9,937	Netherlands.....	3,259
Scotland.....	9,625	Belgium.....	1,309
Switzerland.....	8,223	West Indies.....	1,293
Russia.....	7,693	Spain.....	991
Bohemia.....	7,606		

It costs the State about \$200,000 a year to attend to the needs of arriving immigrants. The Board of Commissioners aid them in reaching their destination and in obtaining employment and care for the sick and temporarily helpless at the institutions on Ward's Island, where 3,933 persons were received during the year. There were remaining on the 1st of December 337 sick inmates in the hospital, 115 insane in the asylum, 85 cripples and 42 children at the Refuge. The Castle Garden Labor Bureau found employment for 39,942 applicants during the year. The Board of Commissioners has incurred a debt of \$353,575.88 in consequence of insufficient appropriations. The United States Government has been persistently urged for several years to relieve the State of the expense of caring for immigrants whose destination is the country at large rather than New York.

According to the Federal census, the State has 5,082,844 inhabitants, but the table of population by counties and classification has not been completed in time for insertion here. The cities of the State having more than 20,000 inhabitants are the following: New York, 1,206,590; Brooklyn, 566,689; Buffalo, 155,137; Albany, 90,903; Rochester, 89,747; Troy, 56,747; Syracuse, 51,791; Utica, 38,913; Watervliet, 22,220; Auburn, 21,924; Oswego, 21,117; Elmira, 20,541; Poughkeepsie, 20,207. According to a report of the Census Bureau, prepared by Robert Porter, the total valuation of property in the State is \$2,679,139,133, of which \$2,326,669,813 is for real estate, and \$352,469,320 for personal property. The same authority gives the aggregate of the bonded debt of counties as \$11,601,675.09; floating debt of counties, \$786,634.71; bonded debt of cities of 7,500 inhabitants and more, \$208,787,710.33; floating debt of the same, \$7,075,868.59; bonded debt of cities, villages, etc., of less than 7,500 inhabitants, \$1,781,950.95; floating debt of the same, \$29,771.55; bonded debt of towns, \$18,601,930.93; floating debt of towns, \$100,576.72; grand total of local indebtedness exclusive of school districts, \$248,766,118.87. The amount of taxation is presented as follows: State, \$4,940,600.18; county, \$6,204,517.24; cities of 7,500 inhabitants

and more, \$29,253,003.47; cities and villages of less than 7,500 inhabitants, \$843,238.54; town or townships, \$4,722,648.21; total, \$45,973,007.64, exclusive of a State school-tax of \$2,945,199.55, and not including school-district taxation. The statistics given for the city of New York in these matters are: valuation of real estate, \$1,049,340,336; personal property, \$197,532,075; total valuation, \$1,246,872,411; bonded debt, \$136,406,733.66; floating debt, \$6,039,966.41; total indebtedness, \$142,446,700.07; share of State tax, \$2,368,906.28; city tax, \$20,935,926.65; total taxation, exclusive of school, \$23,304,832.93; school-tax, \$1,382,155.91.

There were during the summer several disasters of an unusual character, closely connected with New York. On the night of June 11th the steamers Narragansett and Stonington, plying between New York City and Stonington, Connecticut, and connecting with railroad for Boston, came into collision in a fog near the mouth of the Connecticut River on Long Island Sound. The Narragansett took fire, and about fifty passengers lost their lives. In the afternoon of June 28th the steamer Seawanhaka, plying between New York and several towns on the north shore of Long Island, took fire on its way from the city when off College Point, and was run aground and burned to the water's edge. In this case also about fifty lives were lost, mostly by drowning. On the morning of July 21st a portion of the tunnel in course of construction under the Hudson River from Jersey City to New York caved in, and twenty workmen were suffocated and buried in the ruins. Several weeks were occupied in recovering the bodies and restoring the work to the condition it was in previous to the disaster.

The Hudson River Tunnel is intended to furnish the means of extending the railways which now terminate on the New Jersey side of the river to the heart of the city of New York. It is in process of construction by a company with \$10,000,000 capital, and consists of two shafts about twenty-five feet in diameter side by side and penetrating below the bed of the river. The excavation is carried on with the aid of compressed air, which keeps the soil and silt in position until a casing of iron is put in, within which the masonry of the tunnel is built. The beginning is made on either side of the river from an upright circular shaft which is connected with the horizontal shafts by an air-lock. The tunnel has been extended some hundreds of feet from the New Jersey side, and work has been begun on the New York side. The entire length will be about 12,000 feet; or one mile beneath the river, and nearly three quarters of a mile underground on either side.

NORTHBROOK, THOMAS GEORGE BARING, Earl of, first Lord of the Admiralty in the new English Ministry, was born in 1826, and received his education at Christ Church, Oxford, where he graduated (second class in classics)

in 1846. He is the eldest son of the first Baron Northbrook, who was long known as Sir Francis Baring. He was successively private secretary to Mr. Labouchere at the Board of Trade, to Sir George Grey at the Home Office, to Sir Charles Wood at the India Board, and at the Admiralty till 1857, when he was returned to the House of Commons for Penryn and Falmouth, which constituency he continued to represent in the Liberal interest till he became a peer on the death of his father in 1866. He was a Lord of the Admiralty from May, 1857, to February, 1858. He has since held the following offices: Under-Secretary of State for India, from June, 1859, to January, 1861; Under-Secretary for War, from the latter date till June, 1866; and again under Mr. Gladstone, from December, 1868, until February, 1872, when he succeeded the late Lord Mayo as Viceroy and Governor-General of India. He resigned the viceroyalty in 1876, and was then advanced to the dignities of Viscount Baring and Earl of Northbrook.

NORTH CAROLINA. Governor Jarvis called the General Assembly together on the 21st of February to take action on a proposition of W. J. Best, of New York, and others, for the purchase of the State's interest in the Western North Carolina Railroad, and the speedy completion of the road. Of this railroad, the section running from Salisbury westward to Asheville, 148 miles in length, was practically completed. The other portions, consisting of two branches, forking at Asheville, about 200 miles in total length, had not been constructed. One of these runs from Asheville northward along the French Broad River to Paint Rock, near the Tennessee line, 45 miles. The other, or main line, known as the Ducktown line, runs southwestward for 135 miles to Murphy, the county-seat of Cherokee County, and thence across the State line to Ducktown, eighteen or twenty miles distant in the direction of Chattanooga. The proposition, as modified and perfected after extended conferences between the Governor and the contracting parties, was that the State should make a deed of its entire interest in the railroad property to the syndicate, consisting of W. J. Best, J. N. Tappan, W. R. Grace, and J. D. Fish, which instrument should be held in trust, and not be delivered until the completion of the railroad and the other stipulations of the contract are performed. The purchasers agree to construct the road to Paint Rock and the Ducktown line to Pigeon River before July 1, 1881, and to complete the line to Ducktown by January 1, 1885. They assume the \$850,000 first-mortgage bonds on which the State is paying interest from the date of the ratification of the act authorizing the sale. They are to be authorized to issue bonds for \$15,000 on every mile completed, deducting the \$850,000 already issued, on the guarantee of a conditional mortgage which can not be foreclosed until the railroad is completed

to Paint Rock and to Murphy. The State is to receive \$550,000 of these bonds to reimburse it for expenditures made since its purchase of the road in 1875. In case of failure to perform the requirements of the contract, if the State can not or does not choose to enforce specific performance, the entire division from Salisbury to Paint Rock is forfeited to the State, subject only to the lien resting upon it already, and a conditional mortgage which is not due until the road is completed to Murphy. The railroad when completed to Paint Rock will be worth, it is estimated, \$3,000,000. The purchasers agree not to discriminate against the cities and towns of North Carolina in the matter of transportation charges, nor favor any towns to the detriment of others. The State agrees to furnish 500 convicts to be employed in the construction of the railroad, for whose labor the syndicate is to pay to the State \$125 each, or \$62,500 altogether, per annum for five years. The Governor had been advised not to call a special session of the Legislature by a majority of the Board of Directors of the Western North Carolina Railroad, and by a majority of the Board of Internal Improvements. The representatives of the State in Congress favored the acceptance of the proposition of the New York capitalists. It was the first offer ever made to take the railroad out of the hands of the State and to complete it with private capital. The probable cost of the extra session, which need not last over ten days, was estimated at \$13,387. The advantages offered to the State by the proposition were the relief of the people from \$183,000 annual taxation, \$59,500 interest on the railroad bonds, \$70,000 for material used in the extension of the road, \$45,000 for the support of convicts, and \$8,500 or more for the expenses of collection, and the rapid completion by the investment of about \$4,000,000 of foreign capital of the railroad which was projected nearly thirty years ago, the discharge of the duty and engagements of the State to the inhabitants of the western counties, and the development of that valuable mineral region.

The charter for this railroad was first granted in the session of 1854-'55, and work was begun soon after. It was from the beginning the subject-matter of political discussion, and pledges for its speedy completion have been made by rival political parties in nearly every campaign. Prior to 1868 the State issued bonds for this work to the amount of \$4,000,000; \$1,300,000 were paid by counties and private parties; and the company issued mortgage bonds for nearly \$1,500,000. Before the purchase of the road by the State in 1875 as much as \$7,000,000 in cash, including the proceeds of the sale of \$6,640,000 of special tax-bonds, had passed through the hands of the officers of the company; and yet the construction had not advanced beyond Old Fort, in McDowell County. In 1875 the road was sold off at auction, the State bidding it in for \$850,-

000, for which amount 7 per cent. mortgage bonds payable in 1890 were issued, the interest being guaranteed and the coupons made receivable for taxes. The road was placed in the hands of a company in 1877, and considerable work has been done since the reorganization, the State providing the materials and a force of convict laborers averaging about 500. The cost to the State up to March 1, 1880, was as follows: for iron, etc., \$150,173; for interest, \$266,175; for support of convicts, \$140,031; total, \$556,379. From estimates prepared by the president of the company, there would be required within two years \$220,000 to repair the road between Salisbury and Asheville; \$650,000 would be needed to build and equip the road from Asheville to Painted Post, and \$5,330,000 to construct the Ducktown line; and the time required to complete both branches under existing laws would be thirty years. The net earnings of the completed portion in 1879 were \$22,157, not enough to keep the road in repair.

The General Assembly convened on the 15th of March, and adjourned on the 29th, after a session of thirteen days. The proposition of William J. Best had been submitted before the Governor convened the Assembly in the form of an engrossed bill. A redraft of the proposition was prepared and laid before the Legislature. In the new bill, besides a clearer statement of the terms of the contract, the principal change was a provision that in the case of default on the part of Best and his associates the State may take possession of and build and complete the roads as "by law may be directed," instead of the matter being subject to an arrangement between the State and Best. The bill passed both Houses on the eleventh day of the session. The principal amendment was one making the \$550,000 bonds issued to the State a prior and unconditional lien of the same standing with the existing bonds. Another change was a proviso that the existing laws regarding the construction of the roads with convict-labor should continue in force if the grantees should not commence work within the stipulated two months. Not much general legislation was transacted in the extra session. The tax paid by liquor-dealers was reduced, the road law was amended, and a number of special acts were passed.

The completion of the contract with the purchasers of the Western North Carolina Railroad depended upon the validity of the act of 1879 repealing the charter of the Western Division of the railroad, which was alleged to be legislation of such nature "as impairs the obligation of contracts" and deprives a person "of his property without due process of law." The question was brought before the United States Supreme Court for adjudication by W. W. Rollins, President of the Western Division. The decision was against the latter, the effect being to vest the franchises and property of the Western Division, including cash and bonds in the

hands of the officers of the extinct corporation, in the new company, subject to the claims of creditors of the Western Division, the remainder to be administered as a trust for the stockholders of the Western Division. The purchasers of the State's interest had fulfilled their obligations up to the close of the year, paying off the floating debt according to a later amendment of the bill authorizing the sale, the limit of the obligation being \$30,000, paying cash for the hire of the convicts, etc. The Paint Rock branch, when completed, will be, it is reported, a link in an extensive combination of railroads lately effected by capitalists of Richmond and other cities, taking in all the important lines of connection east of the Alleghany Mountains.

The Atlantic and North Carolina Railroad, which is under the control of the State, is in a prosperous condition, having been able to pay the interest on its bonded debt of \$195,500 and a judgment debt of \$37,474, and having in the two years paid cash for all purchases, and spent considerable sums in repairing its roadway and keeping up its rolling-stock. Several offers have been made for the lease of the road, of which that of the Wilmington and Weldon Railroad Company is favored by the stockholders. Of the stock of the Albemarle and Chesapeake Canal held by the State, in all \$350,000, \$100,000 has been exchanged for State bonds. The law authorizing the exchange expired January 1, 1880. The Cape Fear and Yadkin Railroad has been graded fifty miles beyond Greensboro. The sale of first-mortgage bonds, authorized in 1879, will probably be sufficient to equip the road to Greensboro; \$30,000 out of \$50,000 appropriated was paid out in adjusting the indebtedness of this road. For the hire of convicts employed in the construction, the State receives first-mortgage bonds.

Pursuant to an act ratified March 14, 1879, George Davis, Montford McGehee, and Donald W. Bain were appointed commissioners to settle the portion of the State debt represented by the construction bonds of the North Carolina Railroad. The compromise effected by them involves the issue of \$2,750,000 of new bonds in settlement, the authorization of which is dependent on the action of the Legislature. The State owns \$3,000,000 of the \$4,000,000 of stock of this railroad. The dividends on this stock were pledged for the payment of interest on the bonds. In 1868 the interest on the bonds remaining after the exchange of a portion for Raleigh and Gaston stock was funded. There were \$2,795,000 of these bonds then outstanding. In 1871 the road was leased to the Richmond and Danville Company, and by order of the Federal Court in the Swasey suit, the rental was applied to pay the interest on the bonds. The bonds fall due in 1883, 1884, and 1885. If the adjustment proposed is accepted and the lease continues, the State will derive a surplus income from the road of

\$12,000. If the road ceases to be paying, the amount of taxes to be raised for the payment of the interest will amount to \$170,000 annually.

The summary of the total receipts and expenditures of the Treasury for the fiscal year ending September 30, 1880, is as follows:

Total receipts.....	\$546,996 04
Total disbursements.....	492,720 33
Balance in favor of receipts.....	\$54,275 71

If all the expenses incurred in the quarter ending September 30th had been paid in that quarter, the balance in hand would not have been so great. It is likely, however, that as great an amount will not be paid in the quarter ending September 30, 1881, so that this need not alter any estimate. Among the items in the receipts were the following: Drummers' licenses, \$42,300; fertilizer licenses, \$24,000; general tax, including tax on banks, \$208,220.80; income-tax, \$2,602.48; Insane Asylum, special tax, \$94,241.15; Penitentiary, special tax, \$92,860.48; insurance companies, \$15,181.04; merchants' tax, \$18,256.21; sewing-machines, \$2,400; three fourths tax on purchases of liquors, \$12,329.49; Western North Carolina Railroad, \$10,041.67. The principal disbursements were as follows: Agricultural department, \$24,697.07; Cape Fear and Yadkin Valley Railroad, \$30,000; commutation for loss of eyesight, etc., \$1,370; fugitives from justice, \$1,315; convict account, \$9,083.62; General Assembly, \$17,695.70; Insane Asylum at Raleigh, support account, \$40,000; Western Insane Asylum at Morganton, \$30,000; Colored Insane Asylum at Goldsborough, \$22,500; Deaf, Dumb, and Blind Institution, \$24,375; interest on mortgage bonds of the Western North Carolina Railroad, \$58,485; judiciary, \$38,213.83; outside lunatics, \$115; Oxford Orphan Asylum, \$3,000; Penitentiary, \$103,000; public printing, \$7,900.86; Western North Carolina Railroad, \$30,747.06. The gross amount of State taxes collected was \$431,687.92; school-taxes, \$342,290.68; county taxes, \$1,309,714.66.

The following is a statement showing the amount of receipts and disbursements of the public funds of the State for each fiscal year from 1868 to 1880, inclusive:

YEARS.	Receipts.	Disbursements.
1868.....	\$1,925,564 98	\$2,019,909 41
1869.....	8,550,877 62	8,687,428 97
1870.....	8,557,867 43	8,454,214 10
1871.....	568,147 88	645,579 97
1872.....	654,476 21	628,532 70
1873.....	481,224 91	524,163 47
1874.....	667,114 49	448,539 68
1875.....	508,817 67	551,816 78
1876.....	524,039 17	628,055 22
1877.....	538,635 55	613,264 59
1878.....	538,322 04	534,157 07
1879.....	563,389 95	577,658 41
1880.....	546,796 04	492,720 33

The total assessed value of all kinds of property in the State, according to the returns of 1880, is \$166,268,241. Of this amount, \$101,-

799,424 represents real estate; \$38,531,897 personal property in farming-utensils, money, solvent credit, shares, railroad franchises, and other classes; and \$15,936,920 the value of horses, mules, cattle, hogs, sheep, and other live-stock.

The number of acres of land returned was 26,823,511; value, \$83,034,885; the value of town lots, \$18,764,539; compared with the report of 1872, there has been an advance in the aggregate value of land of \$13,500,000, or 20 per cent., and in the value of town lots of \$6,000,000, or 50 per cent. The value of farming-implements has increased from about \$2,500,000 to \$10,124,553. The amount of money on hand was returned as \$3,106,076; solvent credits, \$13,518,809; stock in incorporated companies, \$893,819; other personal property, \$892,582. The counties giving the highest personalty valuations are Wake, \$2,703,991; Mecklenburg, \$1,696,611; New Hanover, \$1,381,162; Edgecombe, \$1,316,234; Forsyth, \$1,192,900; Guilford, \$1,143,550. The number of horses was 137,133, value \$5,871,006; mules 81,021, value \$3,850,285; cattle 678,311, value \$3,844,964; hogs 1,530,403, value \$1,703,245; sheep 582,468, value \$521,345; goats, 25,772. The number of horses and mules has increased 46,000, or 25 per cent., since 1870. Sheep have increased only 10 per cent. in number. Then only 82,000 whites paid a poll-tax, now 118,610 list themselves for taxation. Then 39,500 negroes listed, now 56,028 of them pay their taxes. The entire amount collected by way of taxes reaches \$2,082,700, of which the counties spend two thirds, the schools one sixth, and the State about one fifth. The following school-taxes were collected: Tax on licensed retailers, \$25,844.59; on white polls, \$120,068.76; on colored polls, \$57,232.42; 8½ cents on total valuation of real and personal property, \$133,576.87.

Dr. Worth, the State Treasurer, has labored persistently for ten years to have a scheme adopted for the adjustment of the State debt, and with final success. Under the act to compromise and commute the debt, passed at the session of 1879, he has taken up the old bonds of the State to January 1, 1881, as follows:

Forty per cent. class.....	\$3,579,500
Twenty-five per cent. class.....	1,962,045
Fifteen per cent. class.....	1,923,700

Total.....\$7,470,245

He has issued in lieu of these new four per cent. bonds of the State, to the amount of \$2,211,816, upon which the interest was promptly paid on the 1st day of January. The old bonds taken up were recorded, as required by law, and burned. The total amount outstanding and to be funded of the several classes was as follows before refunding:

Forty per cent. class.....	\$5,577,400
Twenty-five per cent. class.....	4,700,045
Fifteen per cent. class.....	3,888,600

Total.....\$14,166,045

The first class, being the old State bonds, are

refunded at 40 per cent. of the face value. The second class were to be funded at 25, and the third at 15 per cent. of their face value. Of the entire debt it is possible that a considerable percentage is lost and will never be presented. The new bonds taken in lieu of the old bear 4 per cent. interest. The funded debt will not amount to more than \$4,000,000. The special tax-bonds which are repudiated by the people as unconstitutional and void, amounting to about \$18,000,000, have never been declared invalid by the courts. The amendment to the Constitution prohibiting their payment was ratified by the popular vote in the November election. Suits have been brought for a recommendatory judgment against the State, and by the advice of the Council of State the Governor engaged extra counsel in order to defend the State's interests as completely as possible. Two former cases involving this question were not decided finally. The first suit, brought in 1869 by August Belmont, of New York, was dismissed by the United States Court because the order to the auditor to include the special tax in the tax-levy, for which he sued, was anticipated by the Legislature, who had passed an act prohibiting it. The second suit was decided in favor of the State in the first instance, but dismissed on appeal by the State Supreme Court.

The earnings of the Penitentiary approximated the cost, as seen in the following exhibit for the two years ending November 1st. The expenditures for the two years were as follows:

At the State Prison.....	\$160,083 47
On Western North Carolina Railroad.....	82,478 97
On Cape Fear and Yadkin Valley Railroad.....	45,087 76

The receipts from convict-labor are reported as follows:

Work, etc., at Raleigh.....	\$47,525 88
Work on Western North Carolina Railroad.....	103,096 00
Cash for convict-labor.....	21,946 56
Work on Yadkin Valley Railroad.....	56,438 25
Shoe department.....	46,320 94
Oxford Railroad.....	9,849 00
Other work, about.....	6,000 00

Total.....\$291,328 98

From this statement it appears that, if the earnings of the Penitentiary were paid for in cash, the receipts would exceed the expenditures. The number of convicts is gradually decreasing. The entire number in 1880 was 841, of whom 400 were received during the year. There were 48 discharged, and 15 pardoned; 41 died; and 12 escaped. About 300 are confined at the Penitentiary. The entire number received since the opening of the Penitentiary, in 1870, is 3,822. Of those in prison about three fourths are unable to read and write, and comparatively few are over thirty years of age, the negroes who have grown up since the war furnishing a larger proportion of criminals than those who were reared in slavery. The care of the convicts who work on the railroads is said to be insufficient, and in the Penitentiary better sanitary regulations are needed, as shown

by the large ratio of deaths. The intention of the directors is to make the Penitentiary self-sustaining by employing the convicts, such as must be kept within the walls, at useful trades, for which suitable buildings are needed. The receipts from the hire of convicts on the Western North Carolina Railroad have been applied to the completion of the walls and buildings of the Penitentiary. The entire number of convicts on October 30th was 993, which was less than the number in confinement in any of the three years previous.

For the year 1879 there were reported 271,000 white persons of school age, and 154 colored persons. Of the former, 153,000 attended school during the year, and of the latter, 85,000. The State is divided into 4,000 school districts, about four in each township. There are 2,500 schoolhouses for the white children, and 1,000 for the colored children. There were taught during the year 3,600 white and nearly 2,000 colored schools. The teachers were paid on the average \$22 a month, \$183,000 having been paid to the teachers of white schools and \$110,000 to the teachers of the colored schools during the year. There was received from the poll-tax \$156,000, from the property-tax \$132,000, and from other sources about \$60,000.

The inadequacy of the means for the support of public instruction afforded by the present tax laws is dwelt upon in the message of the Governor, who recommends that the school-tax should be trebled, or raised from 8½ cents on the \$100 of property to 25 cents, and from 25 to 75 cents on the poll. The salary of the Superintendent of Public Instruction is notably deficient, being only \$1,500 per annum, with no allowance for his necessary traveling expenses. The Board of Education holds a fund of \$91,500, invested in four per cent. United States consols, which, it is recommended, should be placed in the new State four per cents, as they can be obtained below par some ten per cent., while the former command a high premium.

The Governor recommends that the swamp-lands, the title of which is vested in the Board of Education, should be made subject to entry and sale, in the same way as other vacant lands. Some of these lands, if cleared and drained, would be valuable. As it is, they are liable to be pillaged by the public. They have lain idle in the hands of the Board of Education for half a century. By the change in the law suggested they could be made to add to the taxable property of the State, and to yield a fund to aid the educational at a time when it would be of great service. The two normal schools established by the Legislature of 1876-'77 have been very successful in their work of preparing teachers.

The university is intended to furnish its benefits gratuitously to as many students of the State as possible. At present one student is received free of tuition from each county. In addition to this the University has been ac-

customed to receive all indigent students of good character. The Governor recommends that two beneficiary students from each county be received, and that the appropriation be increased by \$7,500 for this purpose. The State is indebted to the university fund derived from land-scrip donated by the United States in the sum of \$125,000, which was invested in special tax-bonds and lost. The State now pays the interest on this amount, for which it is responsible. In the normal school department of the university 800 teachers have received instruction. There were in attendance in the university 166 students at the end of the school year, of whom 89 paid no tuition. Contributions received after the reorganization of the university in 1875, to the amount of about \$20,000, were spent in repairs. With the \$7,500 paid by the State under the Land-Scrip Act of 1862, the university has done something toward establishing the industrial and agricultural department required. For normal teaching the State allows \$2,000 per annum.

The policy with regard to immigration adopted by the Department of Agriculture is to register lands for sale or to let, and through an agent in Europe to inform intending immigrants of the opportunities for settlement or employment. The agent in England has already brought many desirable tenants, purchasers, and laborers into the State. The registry fee for each tract of land, divided into any number of smaller tracts, is one dollar. For every sale effected through the agency of the department, a commission of 2½ per cent. of the purchase-money is charged. Every settler is enabled to select his location from all the pieces of land on the register, and receives all the information and advice in making his choice that can be given. The Agricultural Department of North Carolina has been the model upon which South Carolina and other States have framed their laws constituting such a department. Bulletins of the results of experiments and tests at the experimental station are published monthly.

The Insane Asylum at Raleigh is overcrowded, and 190 or more applicants are waiting for admission. For the extensions which are projected \$80,000 will be required. The Colored Asylum at Goldsboro has been opened, and contained 91 patients at the close of the year.

The Supreme Court Judges are overworked since the abolition of the fees for taking an appeal, and it is felt to be necessary either to increase the number of Judges or to regulate the appeals so as to diminish the work to be done. The imposition of a tax-fee of ten dollars in civil cases, and five dollars in criminal cases, is advised; and also the restoration of the twenty dollar attorney's fee. The costs now in a case in the Supreme Court are about nine dollars. They are less than they frequently are in the court of a justice of the peace. Fifty dollars (twenty for the library, twenty for attorney's fee, and ten for other costs) would not be

unreasonable, with the law still in force that allows the poor to sue in *forma pauperis*. The dockets of the Superior Courts are also overcrowded. It is necessary either to increase the number of circuits and Judges, or to establish separate courts for the trial of criminal cases. The Judges should hold three courts a year in each county; but no court should be held, as is now done, in the month of June, the busiest month for agriculturists. A codification of the statutes is demanded. This labor has not been done since the preparation of Battle's revision. The Governor calls for the establishment of a Board of Pardons. He granted sixteen pardons in 1879, and forty-six in 1880.

There have been held for two years past colored industrial fairs, in which much interest has been shown by public-spirited citizens of both races. At the fair held at Raleigh in September, Frederick Douglass, United States Marshal in Washington, who had been the most prominent colored champion of abolition, was present to deliver the oration. Introduced by Governor Jarvis, he expressed surprise and gratification at the evidences he saw of the amicable relations of the two races, and the material progress of the negro race:

It was well worth coming all the way from Washington, nay, from a much greater distance north, to see what he had seen to-day, to witness the presence in North Carolina of the Chief Executive of your great State coming here and meeting with you, men of the colored race, and holding forth to you in words of truth and soberness; encouraging and uplifting you from the dust; giving you a glorious send-off in the direction of knowledge and virtuous and excellence. There was no eloquence equal to that which he had just listened to from the lips of the noble Governor. He should go home and in the North and West would tell what he had seen and heard to day. He would speak it from the platform, spread it from the press. He could not tell how much he had been affected by his experience here to-day. He never expected to hear what he had heard or see what he had seen. Abroad it was supposed that there is a state of warfare between the races—aggression on the one hand, oppression on the other. What he saw and heard contradicted the idea plainly, unless he did not possess the ability to see, hear, or comprehend aright. He said that the colored race was emancipated under peculiar conditions, not under the action of cool, deliberate judgment, but in a moment, in the heat of war and passion. The development of the race since was little less than a miracle. Its labor had saved it, and its labor was to save it further on. He saw in North Carolina not the slightest evidence of anything but the kindest treatment of the colored people. He then spoke of the "exodus" in plain words, saying that a colored man had a right, no doubt, to go where and when he pleased, provided he did so at his own expense, without a stampede or calls for help; but it was folly for a people to leave a land to which they are suited, and where they are at home, to go to a strange place. Here they could often elect a man of their own color to office, but in Indiana or in other Northern and Western States they would be but a drop in a bucket, and voiceless. He declared that a flea in a tar-barrel without claws was far better off than a Southern darkey up North without money. The exodus the colored people want is the exodus from ignorance, vice, and lack of thrift.

Governor Jarvis comments upon the mutual relations between the white and colored races,

in referring to these industrial exhibitions, in the following terms:

The two races are working together in peace and harmony, with increasing respect for each other. The colored population, I am glad to say, are becoming more industrious and thrifty. Many of them are property-owners and tax-payers. They seem to be learning the important lesson that they have nothing to rely upon but their own labor. I have tried, on every important occasion, to impress this lesson upon them, and to assure them of the sympathy and hearty coöperation of the white race in their efforts to make themselves good and useful citizens.

I regard it as an imperative duty, from which the whites can not escape if they would, to see that in all things full and exact justice is done the blacks, and that they are not left alone to work out their own destiny. They are entitled, by many binding considerations, to receive aid and encouragement from the whites in their effort to be better men and women, and I have no doubt will receive it.

Of the history of the Swepson embezzlement case, which is still pending in the courts, Governor Jarvis gives the following account in his biennial message:

During the administration of Governor Caldwell, an indictment was found in Wake Superior Court against George W. Swepson and M. S. Littlefield for obtaining the bonds of the State under false pretenses. A farce of a trial was had before Judge Watts, and, in the absence of the defendants, he ordered a verdict of "not guilty" to be entered, and the State appealed. The appeal, after being in the Supreme Court a long time, was finally decided against the defendants, during the administration of Governor Vance, who employed counsel to prosecute the case. This case has twice since been to the Supreme Court on collateral questions, and both times the decisions have been in favor of the State.

He reviews the extradition proceedings in the case of Littlefield, as follows:

The defendant, Littlefield, has not been in the State since the indictment. In May, 1879, I heard he was in Florida, and having procured a certified copy of the indictment, I sent a messenger, with my requisition on the Governor of that State, for his arrest and delivery to my agent. The Governor issued his warrant promptly and Littlefield was arrested, but he was at once released upon a writ of *habeas corpus*, issued by a Judge Archibald, of that State. I then procured a copy of a bill of indictment, which had been found against him in Buncombe, and made a requisition upon that bill; but upon this the Governor refused to issue his warrant, holding that it was substantially the same offense. I was then powerless to do more.

Precedents have lately been established in some of the States which strip the clause in the United States Constitution, requiring the extradition between the States of persons charged with crime, of its compulsory character. This was notably the case in the refusal of the Massachusetts Executive to deliver up upon the requisition of the Governor of South Carolina a fugitive charged with a felony, who had been a prominent political character, it claiming the right to inquire into the merits of the case. A case involving the interpretation of the constitutional requirement, and the duty it imposes upon the Executives of the several States, has recently been decided in the Supreme Court of the District of Columbia. The case came up on a requisition from the

Governor of North Carolina for the rendition of a fugitive from that State.

The ground is taken in the opinion rendered by Chief-Justice Carter that the Executive can go no further than inquire whether a crime has been substantially charged. Extracts from the opinion are given below:

These jurisdictions stand upon equal plane. That being the status of the power appealing, and of the power appealed to, what becomes the duty of the Executive in requisition and in response to requisitions? That duty is verily clearly and simply manifested in the Constitution of the United States, and in the law giving effect to it. Where a crime has been committed, treason, felony, or other crime, and the party has been duly accused under the law of the jurisdiction, it becomes the privilege, and is made the duty of the Executive against whose laws the offense is perpetrated, where the party has fled from justice, to demand of the authority of the coordinate jurisdiction, in which he has taken refuge, his person to answer for the offense.

The Constitution further provides that where a party is charged with crime, and has fled before the process of justice from the jurisdiction in which the crime was committed, and taken refuge in another jurisdiction, the jurisdiction where refuge is sought shall render him up.

It is said, on one side, that this is a discretionary duty, and the meaning of that is, according to the Executive will so should he act. Now, that is so if the proposition means the exercise of a discretion within authority—within right as well as within power; for I am aware I have the physical power to discharge this man or to hold him, and I am aware the public would be remedied by the act, temporarily, not ultimately, I hope, in the exercise of such a judgment or determination as that. But the power to do a thing when enlightened by constitutional and legal duty signifies the power to do it within the limitations of that duty, and no higher power, no capricious, no arbitrary power, the exercise of no mere physical power. It is a discretion revolving within the enlightenment of law, a discretion which considers the constitutional and legal proprieties of the subject that is being acted upon; that is, power under the Constitution and the law, as it is before the Executive charged with the duty of rendition or with the duty of requisition. How is the Executive to know whether a party is charged with a crime? He can not learn it by looking at the great seal of the State. He is to be informed by the indictment or the affidavit which is to be part and parcel of the record and transmitted under due authentication to the jurisdiction of which the party is demanded. The question is, when advised of the crime, how far you may go into details in pronouncing whether a crime is charged or not. Does it predicate in the Executive the right to inspect the technical requisites of the pleadings or to inquire into matters of defense under it? I think not; and at this point you do come to the grave proposition in the discharge of Executive duty of entering into a coordinate jurisdiction in one sense, a forum in the details of administrative justice. The Constitution never contemplated this. The Constitution never contemplated the transfer of the trial from the venue laid in the indictment.

The case was that of one Perry, who was accused of the forgery of a school order in the county of Lenoir. Of the proceedings in the lower court the Governor says, in his message, that "the trial assumed the aspect of a political inquisition against the State of North Carolina. Instead of trying the case upon the papers before him, the Judge proceeded to try the State upon the testimony of the defendant, his wife, and mother, as to whether the man

could get a fair trial if he should deliver him up to the State's agent."

Two propositions for the amendment of the Constitution, which were passed by the Assembly of 1879, were submitted to the people at the general election. One of these removes the constitutional obligation to provide for indigent mutes, blind, and insane, at the expense of the State, and makes it optional with the Legislature whether the State shall care for these classes or not. The other amendment forbids the Legislature to make any appropriation or authorize the collection of any tax to pay any debt or bond authorized by the Convention of 1868, or issued by the Legislatures of 1868-'69 and 1869-'70, except the bonds issued for funding the interest on the old State debt, unless in accordance with a proposition for such payment, which shall have been ratified by a vote of the people at a special election. The design of this measure is to forbid the State through its officers to make any provision for the payment of the special tax bonds and other bonds, which are held to be unconstitutional, unless it shall be ordered by the people, and to render fruitless the suits which have been brought against the State for bonds and coupons of this class, aggregating, as above stated, altogether \$18,000,000.

The Democratic State Convention met at Raleigh, June 17th. An exciting canvass had preceded the Convention, owing to the rival efforts of the friends of Governor Jarvis and those of Judge Daniel G. Fowle to secure the gubernatorial nomination. The former candidate receiving the largest number of votes on the first ballot, he was nominated, without a second formal ballot, by acclamation. The State ticket was composed as follows: For Governor, Thomas J. Jarvis; Lieutenant-Governor, James L. Robinson; Secretary of State, William L. Saunders; Treasurer, J. M. Worth; Attorney-General, Thomas S. Kenan; Auditor, W. P. Roberts; Superintendent of Public Instruction, John C. Scarborough. The Convention adopted the following resolution:

That the Democratic party of North Carolina are in favor of an honest and economical administration of the Government, national and State, under the Constitution and laws of the United States and of the State of North Carolina, and rely for their success upon the exercise of a free ballot, untrammelled by military interference.

The Republican Convention assembled at Raleigh in July. The nominations were as follows: For Governor, R. P. Buxton; Lieutenant-Governor, Rufus Barringer; Secretary of State, R. M. Norment; Treasurer, A. D. Jenkins; Auditor, R. H. Cannon; Attorney-General, Augustus M. Moore; Superintendent of Public Instruction, A. R. Black. Portions of the platform are given below:

That they have seen, with great apprehension and alarm, the rapid consolidation and engrossment of our railroad systems by and under the control and ownership of foreign monopolists.

That they view with anxiety the condition of the

Western North Carolina Railroad, which, through the hot haste and ill-considered contracts of the Democratic State administration, is surrounded by legal troubles which afford no relief from taxation, and threaten to delay for a long time, if not altogether defeat, the completion of that work, so necessary for the welfare and development of the State, and especially the western counties.

That the Republican party has always been the friend of education.

That they recognize the mechanic and laborer as the bone and sinew of the land, and pledge themselves to protect their rights and promote their political, educational, and material interests.

That the recent constitutional amendments were passed by a convention which was not composed of a majority of elected delegates, and the control of which was stolen from the Republican majority by an infamous and admitted fraud on the voters of Robeson County.

That the present system of county government in North Carolina is utterly subversive of the rights of the citizens; is the grossest political robbery ever practiced in this or any civilized country; is the most damnable fraud ever devised or sanctioned by any political party, and calls for the unqualified condemnation of all who have the name of freemen without regard to party affiliation. We claim the right of the people to elect every officer in the State from the Chief Executive down to the humblest official, and demand that this right shall not be denied nor abridged; that

an honest count shall follow a free ballot, and the majority shall determine who shall enact and administer its laws.

They denounce the Democratic party as an oligarchy, controlled by railroad corporations and aristocratic influences, and, if not arrested in its course, it will overthrow the most cherished rights of the people.

That they denounce the laws known as the landlord and tenant acts, as devised for the benefit of a few and to oppress the humble and defenseless citizen.

That they denounce the present road laws of the State as oppressive to the laborer, and demand their amendment so that the building and repairing them shall be borne more equally by all classes of the people.

All the Democratic candidates for State offices were elected by large majorities. The Presidential election returns were 124,204 votes for the Hancock electors, 115,616 for the Garfield electors, and 1,136 for the Weaver electors. There were cast 117,388 votes in favor of the amendment prohibiting the payment of the special tax bonds to 5,458 against, and in favor of the amendment relieving the State from the obligation to support the defective paupers 87,163 to 70,459 against, both amendments being adopted by a majority of the qualified voters of the State.

O

OBITUARIES, AMERICAN. ADAIR, WILLIAM P., assistant chief of the Cherokee nation, died in Washington, October 28d, aged fifty-two. He was at the capital representing the interests of that tribe. During the war he commanded a brigade of Indians in the army of the Confederacy.

ADAMS, REV. WILLIAM, D. D., LL. D., was born in Colchester, Connecticut, in 1807, and died at Orange Mountain, New Jersey, August 31st. He was the son of John Adams, the teacher and philanthropist, who superintended his education and prepared him for Yale College. He graduated in 1827, and under the influence of his friend and tutor, Woolsey, he went to Andover Theological Seminary to study for the ministry of the Presbyterian Church. In 1834 he took charge of the Central Presbyterian Church in Broome Street. This small congregation increased in numbers and in wealth, and in 1853-'54 they erected and occupied the building called the Madison Square Presbyterian Church. During thirty-nine years he remained the beloved pastor of this congregation. He refused calls to Europe, and professorships, peculiarly tempting to one of his literary tastes, so strong was the tie that bound him to his people. But in 1873 an endowment of three hundred thousand dollars was proffered to the New York Union Theological Seminary, on condition that he would accept its presidency, to which he had been thrice elected. Dr. Adams had been a founder of this institution, and he was induced to change to this sphere of usefulness. In 1852 Dr. Adams act-

ed as Moderator of the New-School General Assembly. In 1870-'71 he was active in promoting the reuniting of the Old and New School Churches. He was an industrious writer of sermons, lectures, and magazine articles. He published "The Two Gardens—Eden and Gethsemane"; "Isaac Taylor's Spirit of Hebrew Poetry," with a biographical sketch; "Thanksgiving, Memories of the Day and Helps to the Habit." Dr. Adams was the first who correctly translated the Greek and Latin inscriptions in the Catacombs of Rome, and he delivered in New York a striking lecture on those monuments of the primitive Church.

AKERMAN, AMOS TAPPAN, ex-Attorney-General of the United States, was born in New Hampshire in 1823. He graduated from Dartmouth College in 1842. For four years he taught school at Murfreesboro, Tennessee, and Richmond, Virginia. He then went to Peoria, Illinois, but removed to Georgia and supported himself by teaching until his admission to the bar. He acquired a competence by the practice of the law. He was not a secessionist, but after the passage of the act he "went with his State." He served the Confederacy in the quartermaster's department. After the resignation of Judge Hoar, in June, 1870, General Grant offered the attorney-generalship to Mr. Akerman. He joined the Republican party just after the war, and an article on reconstruction, published by him in the "New Era," made such an impression on General Grant that when on a visit to Washington he was invited to the White House. He held the post

of State Attorney under Governor Bullock. General Grant appointed him United States District Attorney for Georgia. When he tendered him a position in his Cabinet it was a surprise both North and South. He held it, however, without incurring much odium, resigned it in December, 1871, and was succeeded by ex-Senator George H. Williams, of Oregon. In 1873 Mr. Akerman received the votes of the Republican members of the Georgia Legislature for United States Senator. He died at Cartersville, Georgia, December 21st.

ALBERT, JOHN S., Chief-Engineer United States Navy, was born in 1835, and died in Philadelphia July 3d. He entered the navy in 1855, from New York. He was appointed Chief-Engineer in 1861, and served meritoriously throughout the war.

AUDENRIED, JOSEPH CRAIN, Colonel United States Army, was born at Pottsville, Pennsylvania, November 6, 1839. He entered West Point Academy in 1857, and graduated in 1861. Brevetted second-lieutenant Fourth Cavalry, he assisted in organizing and drilling the troops then assembled in Washington. He took part in the first campaign as aide-de-camp to General Daniel Tyler. He served with the Second Artillery to March, 1862. During the Peninsular campaign he was acting assistant adjutant-general to General Emory's cavalry command. In July, 1862, he became aide-de-camp to General Sumner, commanding Second Army Corps, and acted in this capacity until the death of General Sumner in March, 1863. He was wounded at Antietam and brevetted captain. He reported as aide-de-camp to General U. S. Grant in June, 1863, and witnessed the surrender of Vicksburg on July 4th. He joined the staff of General Sherman at Memphis on October 1, 1863. He shared every battle and campaign of this General after that period, embracing the Chattanooga and Knoxville campaigns, that to Meridian, the Atlanta campaign, the march to the sea, and that of the Carolinas. He accompanied General Sherman during his several tours through the Great West, among the Indians, and through Europe. He continued to discharge the duties of aide-de-camp to the General of the Army until his death, which occurred in Washington, on June 3d.

BALL, Dr. IRWIN W., was born in Livingston Parish, Louisiana, in 1828. He studied medicine and practiced his profession in Pointe Coupée before the war. He owned a plantation in West Feliciana, on which he carried out scientific methods of planting. He was deeply interested in silk-culture; he was successful in raising mulberry-trees and in growing silkworms. He believed that Louisiana was adapted to this branch of industry. To carry a bill through the Legislature organizing a silk company, he accepted a nomination as member. While superintending its passage through the Legislature he died in New Orleans, January 29th.

BARRETT, Commodore, was born in New Orleans, in 1828. He entered the navy at the age of thirteen, and was on the Macedonian under Commodore Nicholson. After some years' service in the West Indies, the Mediterranean, and the Brazilian waters, he was ordered to the United States Naval Academy at Annapolis in February, 1846, and graduated thence in the succeeding August. He was assigned to duty with the Gulf Squadron. During the siege of Vera Cruz he was on the blockading-ship John Adams. He relieved Passed-Midshipman Nelson in command of the Ambulance Corps operating with the naval battery in 1847, and participated in the battle of Alvarado. He commanded the bark Coosa, and brought her to New Orleans. She was the best prize taken during the Mexican War. In 1848 he was sent to the African coast in command of the Jamestown. In 1854 he was appointed flag-lieutenant to Commodore Breese. After his return to the United States in 1858, he was again ordered to the African coast, and subsequently to the East Indies. In 1861 he was appointed instructor of gunnery, and he organized the school-ship Savannah. In 1862 he was tried by court-martial for disloyalty, but was fully acquitted, and complimented on his patriotic and professional services. He commanded the Massasoit in 1863. In 1864, while in command of the ironclad Catskill, off Charleston, South Carolina, the advance of the picket of monitors, he captured the Deer, the only prize taken by a monitor, and the last taken off Charleston. He was in the first expedition that ascended the Yang-tse-Kiang as far as Hankow. He commanded the Government ship at the close of the International Exhibition. His was the first naval ship to test and pass the jetties at the South Pass of the Mississippi. He died in March, at the age of fifty-two.

BEDFORD, Dr. HENRY MOORE, died at Richfield Springs, on August 20th. He was the eldest son of Dr. Gunning Bedford, who was the nephew and namesake of one of the framers and signers of the Constitution of the United States. Like his eminent father, Dr. Henry Bedford was a zealous student of medical science. He was chief of staff to him when he was Professor of Obstetrics in the New York University Medical College. The obstetrical clinic was first established by them in spite of determined opposition. From first to last over thirty thousand cases passed through the hands of father and son, and afforded an incomparable field of study to the profession.

BENNET, Captain ORLANDO, son of the inventor Phineas Bennet, died on Long Island, on July 10th, aged sixty-two. He was remarkably successful in the recovery of indestructible goods from wrecks. He raised two steamers sunk in sixty feet of water in the North River, and recovered a cargo of quicksilver from a wreck covered by many feet of sand. He was employed by the Government to clear the harbors of Charleston and Savannah from moni-

tors, torpedoes, and other obstructions, and thus opened the sea-way to supply Sherman's army after its "march to the sea."

BIGLER, WILLIAM, ex-Governor of Pennsylvania, and Senator from that State, was born at Shermansburg, Cumberland County, Pennsylvania, in 1814. His elder brother, John Bigler, became Minister to Mexico and Governor of California. The family was of Dutch origin, and German was the tongue of his childhood. William Bigler had few advantages for education, brought up in what was then the backwoods, and forced to labor on a farm for his share in the support of an orphaned family. In 1829 he began to aid his brother John as a printer in the office of the "Center Democrat," published at Bellefonte. In 1833, anxious to push his own fortunes, he removed to Clearfield, and, with a capital of twenty dollars and some second-hand material, all borrowed, he began the printing, publishing, and editing of what he often described as a "ten-by-twelve Jackson paper." His heart failed him when he arrived, friendless and alone, in a village where he was an entire stranger. But he was received with a kindness that he never forgot. He managed his affairs with so much ability that the "Clearfield Democrat" became a prosperous and notable paper. He sold it in 1836, married, and entered the lumber business. But his editorial career had so extended his reputation that he was already regarded as a political leader, and he was soon called into the public service. In 1841 he was elected to the State Senate by a majority of over three thousand. He received every vote, save one, in Clearfield County, an unprecedented result. He was Speaker of the Senate in 1843-'44. In the latter year he was reelected to the Senate. In 1849 he was appointed one of the Revenue Commissioners. In 1851 he was nominated for Governor, and elected. In this same year his brother John was made Governor of California. He received the gubernatorial nomination a second time, in 1854, but he was defeated by the Native American party. In 1855 he was sent to the United States Senate for a term of six years. He was a member of the Charleston Convention in 1860, and strongly opposed the nomination of Judge Douglas. He was temporary chairman of the Democratic Convention of 1864, and voted for General McClellan. He was a member of the Convention of 1868 held in New York. In 1873 he was delegate-at-large of the Constitutional Convention at Erie. In 1874 he was a member of the Board of Finance of the Centennial Exhibition, and his management was in great part the cause of its success. Of all the public and private labors of Governor Bigler, that which best shows his patriotism and statesmanship is the position he took in 1860. After the election of Mr. Lincoln, when secession was imminent, Mr. Bigler, then a member of the United States Senate, strove with all the powers of his head and heart to prevent that catastrophe. He

maintained that the Southern States were bound to exhaust peaceable means for the redress of grievances before resorting to extreme measures. Appointed on the Committee of Thirteen to whom the Crittenden Compromise was referred, he strenuously urged its adoption. He drew up a bill, and advocated it before the Senate, for submitting this compromise proposition to a vote of the people of the several States. In the heat of sectional strife the bill was lost, but it is now admitted that it was the one measure that might have preserved the country from the horrors of civil war. After sixty-six years of life spent in usefulness and honor, Governor Bigler died at his home in Clearfield, Pennsylvania, on the 9th of August.

BLAIR, BARNARD, born in Salem, New York, in 1801; died there, May 1st. In 1841 he was elected to Congress, and served until March, 1843. He held several political offices in his own township.

BOARDMAN, REV. HENRY AUGUSTUS, D. D., died in Philadelphia, on June 15th, aged seventy-two. He was during forty-three years the pastor of the Tenth Presbyterian Church in that city. He was born at Troy, New York, in 1808, graduated at Yale College, and studied at the Princeton Theological Seminary. He was an active member of various societies of the Presbyterian organization. He was also a manager of the Deaf and Dumb Institution. His writings were voluminous. In 1839 he published "The Scripture Doctrine of Original Sin," followed in 1855 by "The Great Question," and in 1857 by "The Society of Friends and the Two Sacraments." Among his other publications were "Correspondence with Bishop Doane on the Oxford Tracts," "The Christian Ministry not a Priesthood," "The Apostolical Succession," and "The Doctrine of Election."

BOLL, Professor JACOB, a native of Switzerland, and a distinguished pupil of Agassiz, died in Wilbarger County, Texas, September 29th. He had been engaged for six years previously in a scientific exploration of Texas. There being no State geologist, Professor Copes, of Philadelphia, had induced him to go thither and examine the mineral resources of the State, with a view to introducing capital for their development. He was much esteemed in Texas, and his reputation as a geologist and naturalist is extensive.

BOND, RICHARD C., was born in Louisiana, in 1833. He was educated at the University of Saint Louis, and adopted the legal profession. He was Clerk of the District Court of Ascension, and represented that parish in the Legislature. During the war, Colonel Bond was an officer of the First Louisiana Regulars, Heavy Artillery. For some time he was commandant of Fort St. Philip. He was in Vicksburg during the siege. Afterward he was chief of artillery of General Mouton's army in the trans-Mississippi Department. On September 14, 1874, he commanded a company of citizen-sol-

diers in the White League. He died in the Northwest, in October, at the age of forty-six.

BORIE, Hon. ADOLPH E., ex-Secretary of the Navy of the United States, was born in Philadelphia in 1809. He was a descendant, on the mother's side, of a family of refugees from St. Domingo, of whom a large number settled in Philadelphia. In 1826 Mr. Borie graduated from the Pennsylvania University, and went to Paris to complete his education. After spending several years abroad he returned to America and entered upon mercantile pursuits. In the outset of the civil war the first Union League of the country was formed in Philadelphia, and Mr. Borie was one of its founders and its vice-president. He gave large sums toward the enlistment and care of the soldiers during the war, but otherwise he had taken no part in politics. In 1869 he became a member of the Cabinet appointed by General Grant, as Secretary of the Navy. He held the office during a few months, and instituted many reforms. He died in Philadelphia, February 5th, at the age of seventy-one.

BRAYTON, Judge GEORGE A., at one time Chief-Justice of the Supreme Court of Rhode Island, died at East Greenwich, Rhode Island, April 19th.

BRENT, HENRY J., descended from a Roman Catholic family, early settlers of Maryland, and grand-nephew of Archbishop Carroll, was born in Washington, D. C., in 1811. He contributed to Porter's "Spirit of the Times," over the well-known signature of "Stirrup." He was the associate of Lewis Gaylord Clark in founding and editing the "Knickerbocker." He died in New York City, August 3d.

BRINKERHOFF, Judge JACOB, born in New York, in 1810, removed early to Plymouth, Ohio. He was twice elected to Congress by the Democrats, and served from 1843 to 1847. He was Judge of the Supreme Court of Ohio from 1856 to 1871. He was the author of the original draft of the Wilmot Proviso. He died at Mansfield, Ohio, July 19th.

BROPHEY, GEORGE, was born near the city of Kilkenny, Ireland, in August, 1775, contemporaneously with Daniel O'Connell, and died at Davenport, Iowa, October 16, 1880, in the one hundred and fifth year of his age. He was the son of an ardent Irish patriot who, after the battle of Vinegar Hill, in the great rebellion of 1798, was captured and executed by the British. Young Brophey was, from his earliest age, intended for the priesthood. After graduating at Carlow College, he went to Paris to pursue his theological studies, and was ordained priest in 1798. He was proficient in the French, Spanish, Italian, and English languages. Danton, Robespierre, and Marat were his personal acquaintances, and were by him considered human fiends, without their parallels in history. He saw and conversed with Napoleon I many times, and in 1815, when the dethroned Emperor was about to leave France for his St. Helena prison, Father Brophey was among the

vast concourse who listened to the last address delivered by the "Man of Destiny" on the soil of France. In 1833, when the remains of the Emperor were brought back to his beloved land for interment, Father Brophey assisted at the most august obsequies ever celebrated by this people, devoted to magnificent pageants. A week after this imposing event, Father Brophey witnessed the attempt made upon the life of King Louis Philippe by Fieschi. From the boulevard where he stood, the priest beheld the passage of the immense procession headed by the King, and saw the terrible discharge of the infernal machine prepared and concealed in a certain building by which the monarch's way led. The murderous attack killed not the King, but one of his Ministers who rode beside him. Father Brophey, with Archbishop Dupont, were the last spiritual attendants of Lafayette, the former watching night after night by the death-bed of the statesman until his soul was released. In 1843 Father Brophey left France and came to America. He settled in New York as pastor of St. Paul's Church. Nine churches were built through his efforts, and he was honorably identified with the development of that great metropolis. Under his spiritual guidance the renowned and well-beloved Archbishop Bailey was converted from Protestantism to Catholicity, and at his instance repaired to Rome to be received into the Holy Church. Father Brophey was a ripe scholar, and a man of wide and prominent acquaintance. Presidents Tyler, Polk, Fillmore, Buchanan, Pierce, and Lincoln, were his personal friends. He settled in Iowa in 1865. With a view to establishing an Irish college, he purchased a large tract of land near Boone, but the project was never executed. At a later day he repaired to Mercy Hospital to spend the residue of his days, and there, tenderly cared for by the Sisters, passed to his rest—not ravaged by disease, but worn out with age and faithful service in his Master's cause.

BUDD, Dr. CHARLES HENRY, a native of New Jersey, died in Philadelphia, October 22d. He was a surgeon during the war between the States, after which he became Professor of Chemistry and Natural History in Franklin and Marshall College at Lancaster, Pennsylvania. He was subsequently selected to fill the chair of Natural History at Girard College, which professorship he held at the time of his death.

BUTLER, Major THOMAS LANGFORD, eldest son of General Percival Butler, was born in 1789, at Lexington, Kentucky. In 1796 he moved to Carrollton, then Port William, Kentucky. In 1809 he entered the army as lieutenant, and was stationed at Fort Massac. Having resigned in 1811, he was appointed in 1812 by General Harrison, Quartermaster for the Territories of Indiana and Illinois, with headquarters at Vincennes. In 1813 he was promoted captain, and served through the Northwestern campaign under Harrison. In 1814, as aide-de-camp to

General Jackson, he was at the siege of Pensacola, and in 1815 at the battle of New Orleans, and was brevetted major for gallantry. After the close of the war he left the army and received from President Madison the appointment of Surveyor and Inspector of the Port of New Orleans. He resigned this post in a short time and returned to his home in Kentucky. From 1819 to 1825 he was Sheriff of Gallatin County. In 1826 he represented that county in the Legislature. The old and new court question was the prominent issue of that day. He was a member of the Old Court party, according to whose principles the State reached a satisfactory decision. In 1847 he again represented Carroll and Gallatin in the Legislature. He died in Louisville, Kentucky, on the 21st of October.

CAMPBELL, JOHN A., died in Washington, on July 14th. He was at one time Governor of Wyoming. Afterward, he was Third Assistant Secretary of State. He fought through the war of the rebellion, and received the grade of lieutenant-colonel. He was brevetted colonel and brigadier-general on the recommendations of General G. H. Thomas and of General Schofield, on whose staff he held the position of adjutant-general. After the war he moved to Ohio, and was one of the editors of the Cleveland "Leader." He received a commission in the army and accompanied General Schofield to Washington, when that General was appointed Secretary of War. General Campbell was on duty there at the time of his death.

CANADA, CLEM, died in Loudon County, Virginia, November 3d, at the great age of one hundred and twenty-one. He was a negro slave of the family of Lee, of Loudon. By the will of his master he was manumitted sixty years ago. He removed to Pennsylvania, but, rather than live out of Virginia, he preferred to remain the slave of the Lees. He enjoyed and deserved their confidence. According to a record preserved in that family, he was born in January, 1759, when George II was still reigning over Great Britain and America.

CHAMBERS, Dr. MONTGOMERY, died in Philadelphia, October 10th, aged eighty-five. He wrote many valuable medical treatises, and practiced his profession during more than sixty years.

CHANDLER, JOSEPH R., born in 1792; died in Philadelphia. From 1849 to 1855 he was a member of Congress from Pennsylvania, and long the editor of the "United States Gazette."

CLINCH, CHARLES POWELL, was born in New York, in 1797. His father was a ship-chandler, who acquired wealth. His sister married A. T. Stewart. In the early part of his life Mr. Clinch belonged to the same literary circle as Drake, Halleck, and Paulding. He wrote for the press; and one of his dramas, "The First of May," was produced at the Broadway Theatre. In 1835 Mr. Clinch was elected to the State Assembly. In that year occurred the

great fire, which melted away his property, which had been invested in insurance stocks. In 1838 he obtained an appointment in the Custom-House. He showed such aptitude for his work that he was promoted to be deputy, and then assistant collector, which position he held through all changes until 1876, when old age led him to resign after forty years of service. He died on December 16th, in the eighty-fourth year of his age.

CORWINE, AMOS BRECKINRIDGE, was born in 1815, at Maysville, Kentucky. His early years were spent on his father's plantation in Mississippi. He published the Yazoo "Banner" from 1840 to 1864. He served during the Mexican War, being a lieutenant in the Mississippi regiment commanded by Jefferson Davis. He was severely wounded at Buena Vista. After that war, in partnership with his brother Samuel, he edited the Cincinnati "Daily Chronicle." During the Administrations of Tyler and Fillmore he was United States Consul at Panama. In 1856 he was sent by President Pierce to investigate the Panama massacres. His report was the basis of the treaty and adjustment of damages between the United States and Granada. He was reappointed consul, and remained in Panama until 1861, when he was removed by President Lincoln. The command of an Ohio regiment was offered to him, but he declined it. In 1862 he settled in New Rochelle, where he died, on June 22d.

COX, Dr. SAMUEL H., theologian, was born at Rahway, New Jersey, in 1792. He served as a volunteer during the War of 1812; after the war he studied theology, and was ordained by the New Jersey Presbytery. He received his degree of D. D. from Williams College and that of A. M. from Princeton. He was for a long time pastor of the Lighthouse Church, New York. In 1833 he visited Europe, and made a remarkable speech before the English and Foreign Bible Society. He was an abolitionist, and frequently preached on that subject. He was one of the founders of the University of New York. He was pastor of the first Presbyterian Church in Brooklyn. He was also professor at the Auburn, and later in the Union Theological Seminary. He died at Bronxville, October 2d.

CRITTENDEN, General GEORGE B., Confederate States Army, was born in Kentucky, in 1811, and graduated at West Point with the class of 1832. He did duty in the Black Hawk War, was stationed at Augusta, Georgia, and in Alabama, and resigned the following year. Having volunteered in the Texan cause, he was captured, and with difficulty released through the intervention of Daniel Webster. He practiced law until the Mexican War, when he was reappointed to the army. He again resigned from the army in June, 1861, and joined the Confederate cause. He was commissioned major-general and sent to Kentucky, where he was defeated by General Thomas at Mill Spring. This important battle, resulting in the death of

General Zollicoffer, occasioned such sharp censure that he resigned his command, but served in some capacity throughout the war. He died at Danville, Kentucky, November 27th.

DAFT, Miss OLIVIA, born in Liberty Street, New York, in 1778; died in Newark, New Jersey, on June 10th, at the age of one hundred and two.

DAGGETT, Rev. Dr. OLIVER ELLSWORTH, born at New Haven, Connecticut, in 1810; died in Hartford, September 1st. He graduated from Yale College in 1828. He was Professor of Divinity at Yale for several years. The "Connecticut Hymn-Book," issued in 1845, was in part compiled by Dr. Daggett.

DENISON, Rev. Dr. SAMUEL D., died at White Plains, New York, September 3d, at the age of seventy. He was the descendant of Major-General Daniel Denison, commander-in-chief of Massachusetts Colony during King Philip's War. In 1842 he became Secretary of the Episcopal Mission in New York. He was ordained in 1845. His long life was devoted to missionary work. He received his degree of D. D. from Hobart College in 1867. At the time of his death he was Honorary Secretary for Foreign Missions of the Protestant Episcopal Church.

DERBY, LAVANCHIE FITCH, died October 12, 1880, in Brooklyn, New York. She was a native of Cooperstown, and became the wife of James C. Derby, the well-known publisher. Mrs. Derby was conspicuous in society for the generous and graceful hospitality which she dispensed to a large circle of literary people, whom her husband attracted to their home in Auburn, New York, and Brooklyn. Some of the late years of her life were passed in the South, on a plantation bought by her husband to gratify her, near Aiken, South Carolina, where she left a vivid impression of herself upon the minds of her Southern friends. Her remains are interred in Fort Hill Cemetery, at Auburn.

DOGGETT, DANIEL S., Bishop of the Methodist Episcopal Church, South, was born in Virginia, in 1810. His father was a prominent member of the bar, and the son began the study of that profession, but changed to the ministry. He was made Chaplain of Randolph Macon College, a Methodist institution. After preaching throughout the Southern States, in 1873 he was made a bishop. He was about to preside over the California Conference, when he was seized with the illness which resulted in his death, at Richmond, Virginia, on the 27th of October.

EMANUEL, Dr. MAULEY, born in England; graduated from St. George's Hospital, London, and was a Fellow of the Royal College of Surgeons. He emigrated to Pennsylvania, and was for many years President of the Delaware County Medical Society. He was also justice of the peace, and at one time United States examining-surgeon for pensioners. The last ten years of his life he spent in Philadelphia,

where he died, in July, at the age of eighty-six.

ESTORGE, Dr. JOSEPH LEONARD, was born in Opelousas, Louisiana, in 1830, and died there, August 21st. He studied at the Royal College of Cahors, France, where he was a classmate of Gambetta. Having graduated in medicine, he was pursuing scientific studies in Paris when the war between the States recalled him to America. He was appointed a surgeon in the Confederate army in the trans-Mississippi Department. He was captured at Fort de Russey. After the war, he practiced his profession in St. Landry, and endeared himself to the people by his skill and devotion during the epidemic of 1878.

FARR, EVARTS W., was born at Littleton, New Hampshire, in 1840. He was educated at Dartmouth College. During the war between the States he entered the army as a private, and was promoted to the rank of major. In 1867 he was admitted to the bar. In 1876 he was a member of the Executive Council of New Hampshire. He was elected as Representative of the Third District of New Hampshire to the Forty-sixth and Forty-seventh Congresses of the United States. He died in Littleton, on November 30th.

FARRELL, Rev. THOMAS, born in Ireland, in 1823; came to America in his youth; was educated at Mount St. Mary's, and ordained by Archbishop Hughes. He was a Greek and Latin scholar of high attainments. During the war his great pastoral influence was all employed in behalf of the Government, as he was a staunch Union man. He died July 19th.

FISH, BENJAMIN, was born near Trenton, New Jersey, in 1785. In 1812, during the war with England, he was employed in transporting commissary and ordnance stores for the Government. When the first railroads were being constructed in the United States, he undertook to connect New York and Philadelphia by rail. His management was conservative. His rule was to wait one hour for a train, and then send out a locomotive to look for it. When asked by a conductor how long he should wait, his answer was, "Wait, sir, till you learn something." Mr. Fish was largely connected with various railroad and canal enterprises. He represented Nottingham in the State Legislature in 1833. He died on June 22d, in Trenton, New Jersey, aged ninety-five.

FORD, EDWARD LLOYD, publisher, died in New Jersey, December 16th, at the age of thirty-six. He was in the army during the late war, and came out as captain on the staff of General Birney. In 1867 the publishing firm of J. B. Ford & Co., of which he was a partner, was begun. Many notable books were published by this house and its successor. Captain Ford had a strong mechanical bent, and introduced many improvements. It was at his suggestion that the present mode of uniting a folding and pasting arrangement with the ordinary printing-press was first adopted. He in-

vented a machine for folding, which was connected with a Hoe rotary, and several other appliances, which have been patented. The "Christian Union," a weekly paper, then edited by Mr. Beecher, reached a circulation of 136,000 copies while his firm was its publisher.

FULLER, JEROME, died September 2d, 1880, at Brockport, in the seventy-fourth year of his age. Formerly a leading Whig of western New York, he represented Monroe County successively in the Assembly, 1843; in the Senate, 1848-'49; and in the Constitutional Convention of 1867. After Mr. Fuller left the Senate, President Fillmore appointed him (1851) Federal Judge of the Territory of Minnesota. When Minnesota was admitted as a State, Judge Fuller returned home, and in 1867 was elected County Judge of Monroe County during a succession of terms.

GITTINGS, Major ERSKINE, of the Third United States Artillery, was born in Maryland, in 1839. He graduated from the Military Academy, West Point, in May, 1861. After drilling troops for some time in Washington, he was promoted first-lieutenant, and served on the staff of General Runyon at Alexandria, Virginia, in the Port Royal Expedition, and the Department of the South. In the attack on Secessionville, South Carolina, October, 1862, he was wounded, and was promoted, for gallant and distinguished services, to brevet captain. He was at the fall of Vicksburg. He was again brevetted major for meritorious services at the siege of Knoxville, December, 1863. He was ordered to West Point after the close of the war, as Assistant Professor of Natural and Experimental Philosophy. He was appointed captain, February 5, 1867, and ordered to Fort Hamilton, where he died, September 20th.

HOLMES, THEOPHILUS HUNTER, Lieutenant-General in the Confederate Army, was born in North Carolina, in 1804. Appointed a cadet at West Point in 1825, he graduated in 1829, and, as brevet second-lieutenant, was assigned to the Seventh Infantry Regiment. He declined a second-lieutenancy of dragoons in 1833. In 1835 he was made first-lieutenant, and in 1838 he became a captain. For gallant and meritorious conduct at Monterey he was brevetted major. After the Mexican War, he was stationed in Missouri, New Mexico, and Texas. In 1860 he was ordered to Fort Columbus, New York, on recruiting service. He went on leave of absence to North Carolina, where he owned large estates. In 1861 he resigned his commission, and entered the Confederate army. He commanded at Aquia Creek, and engaged in the various campaigns of the Army of Northern Virginia, until he was appointed by President Davis to the command of the trans-Mississippi Department. He died at Fayetteville, North Carolina, on June 20th.

IRVING, Rev. THEODORE, LL. D., was born in New York, in 1809. In 1826 he joined his celebrated uncle, Washington Irving, in Europe,

and spent three years in Madrid, London, and Paris. In 1836 he was appointed Professor of Belles-lettres in Geneva College, New York. After twelve years he was transferred to a professorship in the Free Academy, now the College of the City of New York. In 1856 he was ordained a priest in the Episcopal Church, and was rector of Christ Church, Long Island, and of two parishes on Staten Island. He was also assistant rector of the Church of the Holy Trinity. Mr. Irving was the author of the "Conquest of Florida by Hernando de Soto" (1835); "The Fountain of Living Waters" (1854); "Tiny Fountains" (1869), and "More than Conqueror" (1873). He died December 20th, in New York.

JOHNSON, BUSHROD R., Confederate general, was born in Ohio, in 1817, graduated from West Point and served in the regular army until the close of the Mexican War, when he resigned and became Superintendent of the Western Military Institute, of Kentucky. He also acted as Professor of Engineering, Mechanics, and Natural Philosophy. This Institute was removed for sanitary reasons to Nashville. When Tennessee seceded he joined the Confederate side. At Fort Donelson he was captured with his command. He took part in many of the battles, and in 1863 attained the rank of major-general. After the surrender he resumed his professorship at Nashville. He died at his home in Illinois, on September 11th.

KINNEY, WILLIAM BURNET, was born at Morristown, New Jersey, in 1800. His grandfather, Sir Thomas Kinney, came on a scientific tour to America, and ended by settling in Morris County. His father, Colonel Abraham Kinney, was a gallant Revolutionary officer and quartermaster-general during the war of 1812. His mother was Miss Hannah Burnet, a descendant of the famous Bishop of Salisbury. William B. Kinney was educated at Princeton, and after having studied law, medicine, and theology, he finally chose the profession of literature and settled down to journalism. He founded the Newark "Daily Advertiser," which afterward passed into the hands of his son Thomas. In 1841 Mr. William B. Kinney contracted a second marriage with the authoress, Mrs. Elizabeth C. Stedman, mother of the poet, Edmund C. Stedman. In 1850 President Taylor sent Mr. Kinney to the court of Victor Emanuel, of Sardinia, as United States Minister. After three years' residence at Turin he removed to Florence for the purpose of collecting material for a history of Tuscany. This work, which he had long meditated, is still incomplete. In 1865 Mr. Kinney returned to his native country, and has lived in comparative retirement. He died in Morristown, October 21st.

LOGAN, Judge STEPHEN J., born in 1799; died at Springfield, Illinois, July 17th. He had been a resident of that State since 1833. He was the law partner of Abraham Lincoln, be-

fore his election as Judge, which office was twice conferred upon him. He was a delegate to the Constitutional Convention of 1847, and was a member of the State Legislature for four terms.

McCLOSKEY, Dr. JOHN, D. D., President of Mount St. Mary's College, Emmetsburg, Maryland, was born in Ireland, in 1817. Brought to America at an early age, he entered Mount St. Mary's in 1830, and pursued his theological as well as his classical studies there. He was ordained by Bishop Hughes, of New York, in 1840. He returned to his college, and in 1844 was made its vice-president. He was elected president in 1871. He resigned in favor of Dr. Watterson in 1877. Dr. McCloskey resumed the presidency in 1879. He died at his post of usefulness and honor December 24th.

MACWHORTER, Professor ALEXANDER, born in New York, in 1822, was the grandson of Dr. MacWhorter, chaplain of General Knox's brigade of artillery, of Revolutionary fame. Professor MacWhorter was a graduate of Yale College in 1842. He filled the chair of English Literature and Metaphysics at the Troy University. He was a profound Hebrew scholar, and published, in 1857, "Yahveh Christ, or the Memorial Name," in which he tried to prove that the word Jehovah should be Yahveh, "He who shall be," meaning Christ. His argument is ingenious. He wrote largely for reviews; his last article, "The Edemic Period of Man," is learned. He died in July, at New Haven.

MERRIAM, GEORGE, was born in 1803, in Worcester, Massachusetts, died June 22, 1880, in Springfield, where he was a member of the well-known Webster's Dictionary publishing firm of G. & C. Merriam. At the age of fifteen years he went into a printing-office, where he acquitted himself with such credit that when he became of age he was taken into partnership. In 1831 he removed to Springfield and established with his brother the firm that has since become famous, and in 1847 bought the plates and copyright of Webster's Dictionary, which was, at that time, a drug on the market. This work they carefully reedited, having secured a series of scholarly revisions of it.

NEALE, Professor SAMUEL A., one of the most prominent colored men in the country, died at Frederick, Maryland, on August 16th, at the age of fifty-five. He was one of the Faculty of Avery College, Allegheny City, Pennsylvania. He took an active part in the political campaign of 1876, and was a member of the Republican State Central Committee of Pennsylvania.

NICHOLS, Rev. SAMUEL, D. D., was born November, 1787. He graduated from Yale College in 1811, and studied for the ministry of the Protestant Episcopal Church. He was probably the oldest presbyter of that Church in America at the time of his death, which occurred July 17th at Bridgeport, Connecticut. He was the friend of Chief-Justice Jay, and

officiated at his funeral. Williams College conferred his degree of Doctor of Divinity.

NOYES, Amos C., was born in Massachusetts, in 1818. He removed to Pennsylvania in 1848. In 1869 he was a member of the Legislature of that State. In 1877 he received the Democratic nomination for Governor, and was subsequently elected State Treasurer. He died September 4th, in Westport, Pennsylvania.

O'CALLAGHAN, Dr. EDMUND BAILEY, M. D., LL. D., was born in Mallow, County Cork, Ireland, in 1799. After completing his collegiate course, he spent two years in Paris. In 1823 he emigrated to Quebec. He was admitted to the practice of medicine in 1827. In 1834 he was editor of "The Vindicator." In 1836 he was elected a member of the Assembly of Lower Canada. After the insurrection, he removed to New York. He was a laborious student of the history of Canada and of the Colonial Annals of New York. He published treatises and essays on that subject, translating French and Dutch documents, and preserving many curious political and family anecdotes. His "History of the New Netherlands, or New York under the Dutch," appeared in 1846, and has passed through several editions. In the office of the Secretary of State at Albany he collated and edited for the State the records embodied in the fourteen volumes of the "Documentary History of the State of New York," and eleven volumes containing "Documents relating to the Colonial History of New York." This work required the devotion of twenty-two years. Afterward, in 1870, he removed to New York City. His long labors in behalf of American history ended only with his life. He died in New York, May 27th.

O'KEEFE, Rev. EUGENE, was born in Cork, Ireland, but came to America in his boyhood, and was educated at the College of St. Francis Xavier, and afterward at the Sulpician College, Montreal. After his ordination he began his labors in the house of the Bishop of Toronto, where he remained until 1864, when he took charge of a parish in New Jersey. He was a profound linguist and classical scholar. He is most widely known by his translations from the Italian and Greek languages. He died in New York, September 22d.

OMOHUNDRO, J. B., better known as "Texas Jack," was one of the most noted scouts of the Far West. In the Sioux campaign of 1876, under General Crook's command, he was employed by the Government. After the defeat of the Sioux he rode three hundred and twenty-five miles in six days through a hostile country, bringing the news twenty-four hours earlier than the military authorities. He died May 28th, at Leadville, Colorado, and was buried with military honors.

OPDYKE, GEORGE, ex-Mayor of New York, was born in Hunterdon County, New Jersey, in 1805. Though descended from Gysbert Opdyke, one of the early Knickerbocker settlers, the father of George Opdyke was a plain

farmer who could give his son no advantages for education except what he could gain from a winter night-school after farm-work was done. Yet he so improved his limited opportunities that at sixteen he himself took up the profession of a schoolmaster. At eighteen he went West to seek his fortune. He first stopped at Cleveland, Ohio, then a mere frontier town. From there he moved to New Orleans. In 1832 he returned, engaging in business in New York City while he continued to reside in New Jersey. He represented this State in the Buffalo Convention in 1848 as a Free-soil Democrat. In 1858 he was elected to the Legislature. He showed himself so zealous in protecting the valuable franchises of New York City from spoliation that, while he alienated some members of his own party, he received the nomination for Mayor in 1859. Defeated in that election, he was renominated and installed in 1860. His administration extended over the eventful years of 1863 and 1864, and was marked by firmness and vigor. The draft riots were repressed, and many important acts were passed. In 1851 Mr. Opdyke published a work on political economy. While a member of the Board of Currency he showed his mastery of the subject of finance, and carried through some measures to prevent the recurrence of commercial panics. He died in New York, on the 12th of June, in the seventy-fifth year of his age.

PEIRCE, Professor BENJAMIN, the mathematician, was born at Salem, Massachusetts, in 1809. He graduated at Harvard in 1829. He was for some time Tutor of Mathematics in his college. In 1833 he became Professor of Mathematics and Natural Philosophy, and in 1842 he was made Professor of Astronomy and Mathematics. In 1849 the Government appointed him Consulting Astronomer in the preparation of the "American Nautical Almanac." He was a member of the Scientific Council charged with the organization of the Dudley Observatory at Albany. From 1867 to 1874 he was Superintendent of the Coast Survey, in place of Professor Bache. He was the author of the mathematical text-books used in Harvard. He supervised the "Cambridge Miscellany of Mathematics, Physics, and Astronomy." He was the writer of many widely known papers on "Potential Physics," "Celestial Mechanics," "The Discovery of Neptune," and other kindred topics. He died October 6th, at the age of seventy-one.

PELLICIER, Right Rev. A. D., Bishop of San Antonio, Texas, was born in Florida, in 1824; educated at Spring Hill College, Mobile, and ordained in that city in 1850 by Bishop Portier. He was consecrated Bishop of San Antonio on December 8, 1874. He died there, April 14th.

PHELPS, Rev. ELISHA, D. D., was born at Belchertown, Massachusetts, in 1790, and died at Weehawken, New Jersey, December 29th. He was ordained a minister of the Presbyterian Church in 1815. After a pastorate at

Brookfield, Massachusetts, and another at Geneva, New York, in 1835 he was elected Secretary of the American Education Society in Philadelphia. In 1850 he retired from active service. He was one of the earliest advocates of the temperance cause. He was father of Professor Phelps, of Andover, and grandfather of the authoress Elizabeth Stuart Phelps.

PILLOT, ANDREW P., was born in France in 1796. He served under Napoleon in his last two campaigns. He afterward removed to America and engaged in commerce, first in Charleston, and later as a banker in New York. His firm, Pillot & La Barlié, first established the cotton-trade between New York, Liverpool, and Havre. His large fortune was swept away by the sudden fall in prices at the close of the war. He died at Orange, New Jersey, on July 10th, in the eighty-fourth year of his age.

READ, Mrs. SOPHIA HOWARD, died in Baltimore, on November 21st, at the age of eighty. She was the last surviving child of Colonel John Eager Howard, the hero of the Cowpens, who, after passing with distinction through the Revolutionary War, was four times elected Governor of Maryland, and finally represented his State in the United States Senate. His ancestral estates occupied a portion of the land on which Baltimore stands. Out of it he donated the land for the Washington Monument. He was appointed a brigadier-general in the regular army organized by General Washington. Sophia Howard was born in 1800, at her father's Belvidere estate. Born and reared in luxury, she wished to marry a penniless young lawyer, George Channing Read, of South Carolina. Her father's consent being denied, they made a runaway match. The brilliant belle of a few weeks past began housekeeping on the narrowest scale, in her husband's back office. The father soon relented, and she inherited from him a large fortune. Her eldest daughter married an Englishman, a near relative of Cardinal Weld. Her second daughter was married first to Albert Carroll, great-grandson of Charles Carroll of Carrollton. Shortly after his marriage, Mr. Carroll, who joined the Confederates, was killed in battle in 1862. His widow remarried Mr. James Fenner Lee, a member of the Maryland Legislature. Mrs. Read was the friend of Mrs. Betsey Bonaparte, and up to a short period before her death was one of the most conspicuous figures in Baltimore society, and an historic link between the Revolutionary period and her own day.

SATTERLEE, RICHARD S., Brevet Brigadier-General, was born at Fairfield, Herkimer County, New York, December, 1798. He was the son of Major William Satterlee, who received his death-wound at the battle of Brandywine, shortly before the birth of his son Richard. He was commissioned in the army in 1822, and saw hard service against the Indians on the frontier. In 1837 he was at Tampa Bay, and was medical director on the staff of Gen-

eral Zachary Taylor. During the Cherokee campaign he was with General Scott. He was stationed on the frontier until the breaking out of the Mexican War, when he was made chief surgeon under General Worth. He was shipwrecked off Cape Horn on the transport San Francisco, while on the way to California. During the civil war he was Medical Purveyor of the army. He was retired by President Johnson. He died in New York, on November 10th.

SEARS, BARNAS, died July 6, 1880, at Saratoga, New York, in the seventy-seventh year of his age. Dr. Sears had long been prominent in educational affairs, was the author of several books on educational subjects, and for many years President of Brown University, at Providence. When George Peabody gave the fund for the promotion of education in the South, Dr. Sears was made manager, with an advisory Board of Trustees. He went to live in Staunton, Virginia, which was his residence at the time of his death.

SEDDEN, JAMES ALEXANDER, a descendant of William Alexander, Earl of Stirling, was born in Virginia, in 1815. He entered public life at an early age, and represented the Richmond district in the Twenty-ninth and Thirty-third Congresses, having defeated John Minor Botts, the Whig candidate. He was one of the Peace Commissioners in 1861. He was elected to the First Confederate Congress. In 1862 he was appointed Confederate Secretary of War. After the war he engaged in mercantile pursuits. He died in Goochland County, Virginia, August 19th.

SEGUIN, Dr. EDWARD, was born in France, in 1812, but removed to America in 1848, and established himself first in Ohio, and afterward in New York. His specialty was the treatment of idiocy, insanity, and nervous diseases. He was the first person who established in 1838 a school for the training of idiots. This has been the model of nearly a hundred institutions having this object. He has published many works treating the subject of idiocy and cognate matters. Since 1866 he has been engaged in researches on thermography, or the science of animal heat, in which department he made many notable discoveries. He was President of the American Association of Medical Officers having charge of Institutions for Idiots. His latest essay, "On the Training of the Idiotic Hand," was read at the last meeting of the American Medical Association. He died in New York, October 28th.

SIMONS, M. LAIRD, a journalist and literary man, died in Philadelphia, November 17th. He was born in that city, in 1843, and was a graduate of its Central High School. He was editor of "Stodart's Review." He condensed D'Aubigné's "History of the Reformation." He was the continuator of Duyckinck's "Cyclopedia of American Literature." He had just prepared a "History of the World" in many volumes, which was the last labor of his life.

He also published a series of books entitled "Half Hours with the Best Preachers."

SPOFFORD, HENRY M., was born in Massachusetts. His father was a clergyman, living then at Chilmark, on Cape Cod. He removed to Amherst to educate his sons. Henry M. Spofford graduated at the head of his class at Amherst College in 1840. He spent three years there as a tutor, and then removed to Louisiana, where he was principal of an academy in Bienville Parish. During this period he was studying law. After his admission to the bar in 1846, he settled in Shreveport, and became the partner of Judge Olcott, brother-in-law of Rufus Choate. His rise was rapid. He was elected Judge of the district in which Shreveport is situated in 1852. In 1854 he became Associate-Justice of the Supreme Court of Louisiana. In 1858 he resigned this position, and began practicing law in New Orleans. After the war he was taken as a partner by Hon. John A. Campbell, who had held the position of Associate-Justice of the United States Supreme Court until 1861, when he resigned it. Having amassed a fortune, Judge Spofford retired from the practice of the law, and lived chiefly on an estate in Tennessee. In 1877 he was nominated by the Democratic caucus for United States Senator, and was unanimously elected by the Louisiana Legislature to fill the term beginning March, 1877. The "Packard" Legislature, shortly before its disbanding, elected William Pitt Kellogg for the same term, and he took his seat. Judge Spofford made two contests against Mr. Kellogg, but was not admitted up to the time of his death, which occurred at the Red Sulphur Springs, West Virginia, August 20th.

STEVENS, Colonel AMBROSE, died in Lexington, Kentucky, December 10th, aged seventy-three. He commanded a regiment during the civil war. For the last four years of his life he was the editor of the "Live-Stock Journal." He was considered in England and America the highest authority on pedigrees and the raising of live-stock. He was a native of New York State.

THORNE, JOHN S., M. D., was born in New York in 1806, and graduated from Union College, Schenectady. He studied medicine, and settled in Brooklyn. During the prevalence of cholera, in 1832, he distinguished himself by his courage and successful practice. He was a founder of the Brooklyn City Hospital, and one of the Board of Regents of the Long Island College Hospital. For twenty-five years he was a member of the Brooklyn Board of Education, of which he was elected President. Dr. Thorne was also an associate of the King's County Medical Society, the Long Island Historical Society, and a trustee of the Packer Institute. He died, September 1st, in Brooklyn.

TILESTON, WILLIAM M., died in New York, April 22d, from injuries received at Madison Square Garden. He saw much travel in his youth, especially in China and Japan. In 1874

he became one of the editors and proprietors of the "Forest and Stream." His contributions were not confined to this one periodical; he wrote many stories and bits of travel which were published in Scribner's and other magazines.

WATSON, JAMES CRAIG, LL. D., was born of American parents in Elgin County, Ontario, in 1838. He graduated at the University of Michigan, in 1857. He became Instructor of Mathematics there, and assistant at the observatory. He was appointed Professor of Astronomy in 1859, Professor of Mathematics and Physics in 1860, and director of the observatory in 1863. In 1870 he was awarded the gold medal of the French Academy of Sciences for his discovery of eighteen asteroids. He went with the American expedition to Peking to watch the transit of Venus. While there he added a new asteroid to his list of discoveries. He gave it the name of Ne-wha, a Chinese goddess, who is said to have righted the heavens once when they had fallen into chaos. He observed the great solar eclipse of 1878 from Wyoming. His name is also connected with the discovery of a planet between Mercury and the sun. A fine observatory was built at Madison, Wisconsin, especially for his use. He is the author of "A Popular Treatise on Comets" (1860), and "Theoretical Astronomy" (1868). He died at Madison, Wisconsin, on November 23d, at the age of forty-two.

WINCHESTER, OLIVER F., ex-Lieutenant-Governor of Connecticut, was born in Boston, in 1810. He amassed great wealth, which he invested in a manufactory of rifles. He was President of the Winchester Repeating-Arms Company. In 1866 he was elected Lieutenant-Governor of Connecticut. He made many benefactions to Yale College, and was founder of the Winchester Conservatory at Yale. He died December 10th, at New Haven.

WOLFE, JOEL, a direct descendant of General Wolfe, was born in Richmond, Virginia. He died in New York, on November 25th. He studied medicine, but abandoned it for a mercantile life. In 1846 he retired with a competent fortune. He was the originator of many charitable enterprises, and devoted his time and means to philanthropic objects during the last thirty-five years of his life.

WOOD, JOHN, ex-Governor of Illinois, died at Quincy, Illinois, on June 4th. He was born on December 20, 1798, in Cayuga County, New York. He went to Illinois in 1819. He was the founder of the city of Quincy, having been its first and only settler in the year 1822. He was successively City Councilman, repeatedly reelected Mayor, State Senator, and Governor.

WOOLWORTH, SAMUEL BUELL, LL. D., died in Brooklyn, New York, on June 30th. For more than half a century his life was devoted to the cause of education. In 1852 his marked ability caused his appointment as Principal of the State Normal School at Albany. He was elected, in 1856, Secretary and Treasurer of the Board of

Regents. This office he resigned in January, and by unanimous vote was appointed Honorary Secretary of the Board on the acceptance of his resignation.

OBITUARIES, FOREIGN. ANSTED, DAVID THOMAS, an English physicist, born in London, in 1814; died May 20, 1880. He was appointed in 1840 Professor of King's College, London, in 1845 Lecturer on Geology, in the East India Military Seminary at Addiscombe, and in the same year Professor of Geology at the College of Civil Engineers, Putney. He is the author of a large number of works and essays chiefly on geology. Among his latest writings are "Physiography" (1877), and "Water, Physical, Descriptive, and Practical" (1878). In 1874 he was engaged in directing the works of the Laurian Lead-smelting Company in Greece.

APUZZO, FRANCESCO, cardinal, priest, and Archbishop of Capua, was born in Naples, April 7, 1807; died July 27, 1880. At the Vatican Council, he made a moderate opposition to the declaration of the dogma of papal infallibility, but accepted the doctrine after its promulgation. He was made a cardinal in 1877. In the same year he was appointed Archbishop of Naples upon the death of Cardinal Kiarlo Sforza, and took possession of the see without asking the royal exequatur, thus precipitating a conflict between the Government of Italy and the Papal Court. He was not recognized by the Government, and even nominally imprisoned. In November, 1878, however, when the assassination of the King was attempted by Passenante, he hastened to congratulate the King upon his escape, and also conveyed the congratulations of the Pope. The Government then sent the Cardinal his exequatur, and the latter submitted to the Italian ecclesiastical law.

ASSING, LUDMILLA, a German authoress, born at Hamburg, February 22, 1821; died March 25, 1880. She was a niece of the celebrated Varnhagen von Ense, in whose house at Berlin she received, after the death of her parents, an excellent education, and became intimately acquainted with Alexander von Humboldt, Prince von Pückler-Muskau, and other celebrated men. She created a great sensation in the political world by the posthumous publication of the diaries of her uncle. An action brought against her at Berlin for traducing the King and Queen resulted in her being sentenced to eight months' imprisonment, and some time later she was again sentenced to two years' imprisonment. As she had taken up her permanent residence in Italy, she never actually underwent these punishments. In Italy she became intimately acquainted with Mazzini and other leaders of the Republican party, and published a number of works in the Italian language. She translated Mazzini's works into German, and wrote a number of works and essays on prominent men and the condition of affairs in Italy. Some of her latest works are: "Ausgenählte Schriften von Varnhagen von

Ense" (14 vols., 1871-'74); "Briefwechsel und Tagebücher der Fürsten von Pückler-Muskau" (4 vols., 1873-'74); "Fürst Hermann von Pückler-Muskau" (1873-'74). Of Varnhagen's posthumous works she also published: "Fr. von Gentz. Tagebücher" (4 vols., 1873-'74); "Briefe zwischen Varnhagen und Rahel" (6 vols., 1874-'75). A marriage which she contracted in December, 1874, with Cino Grimelli, a colonel in the Italian army, proved unhappy and ended in divorce.

AUZOUX, THÉODORE LOUIS JÉRÔME, a French anatomist, was born at Saint-Aubin d'Ecroville, in the department of Eure, April 7, 1797; died at Paris, on March 6, 1880. He graduated in Paris as a physician in 1822, and soon became known in the medical world by his system of *anatomie élastique*, a method of taking casts of the dead subjects in a paste which when dry becomes as hard as wood and impervious to moisture, exhibiting with perfect distinctness every vein and fiber. He established at Saint-Aubin a manufactory of such molds and produced types of each of the great families of natural history, from the elephant down to the mollusk, each divided into several hundred pieces. His establishment was celebrated for the judicious management of the workmen employed, and the artistic education it afforded to large numbers of the people of the district. He was the author of "Leçons élémentaires d'anatomie et de physiologie" (1839, third edition, 1858), and of various other professional essays.

BARRY, EDWARD MIDDLETON, an English architect, born in 1830; died January 29, 1880. He was the third son of the late Sir Charles Barry, whom he succeeded in 1860 as architect of the Houses of Parliament, which were completed by him. He was also the architect of Covent Garden Theatre and numerous other buildings. In 1867 his design for the new National Gallery was deemed the best by the judges. He was a Fellow and at one time Vice-President of the Royal Institute of British Architects, and an honorary member of several foreign societies. In 1873 he was elected Professor of Architecture in the Royal Academy, and Treasurer in 1874.

BELL, THOMAS, an English naturalist, born at Poole, Dorsetshire, England, October 11, 1792; died March , 1880. He was Professor of Zoölogy at King's College, London, for more than forty years from 1832, President of the Ray Society from its foundation until 1859, and President of the Linnæan Society from 1853 to 1861. He was a member of many European and American scientific societies, the author of numerous works and monographs on natural history, and a contributor to the transactions of some societies. For many years before his death he resided in Gilbert White's former dwelling at Selborne.

BRODIE, SIR BENJAMIN COLLINS, baronet, the eldest surviving son of the late eminent surgeon of the same name, born February 5, 1817;

died November 26, 1880. He succeeded to the baronetcy at the death of his father in 1862, being the second baronet. He was appointed Professor of Chemistry in the University of Oxford, and was for several years President of the Chemical Society.

BUCKLAND, FRANCIS TREVELYAN, an English naturalist, son of the geologist William Buckland, D.D., Dean of Westminster, born December 17, 1826; died in London, December 19, 1880. Having graduated in 1848 from Christchurch, Oxford, he was from 1854 to 1863 assistant surgeon in the army. He retired in order to devote himself wholly to natural history. In 1867 he was appointed Inspector of Salmon-Fisheries for England and Wales, and in 1870 special commissioner to inquire into the effects of recent legislation on the salmon-fisheries of Scotland. He had previously established at his own expense the "Museum of Economic Fish-Culture" in the Royal Horticultural Garden, in which are illustrated the modes of propagating fresh and salt water fish and oysters. In 1877 he was one of a commission to inquire into the crab and lobster fisheries of England and Scotland, which resulted in an act of Parliament for the protection of those mollusks. He also served in 1877 on a commission of inquiry into the herring-fisheries, and in 1878 he was engaged upon a committee relative to the sea-fisheries around England and Wales. No one has done more than Mr. Buckland for popularizing the subject of fishery cultivation throughout the civilized world, and his advice was sought not only by his own Government, but by those of Russia, Germany, France, the United States, and many other countries. In 1866, with the late Mr. Pfennell, he projected and started "Land and Water," and he contributed to this periodical up to the very day before his death. His four series of "Curiosities of Natural History" were first published in 1857, and several additions have since appeared. A "Familiar History of British Fishes" appeared in 1873, the "Logbook of a Fisherman and Zoölogist" in 1876, and a magnificent edition of Gilbert White's classical "Natural History of Selborne" (first published in 1789), largely annotated, was published in 1879. Mr. Buckland was a very decided opponent of the views of Darwin, and frequently expressed his dissent from them.

BUSCHMANN, JOHANN KARL EDUARD, a German philologist, born in Magdeburg, February 14, 1805; died April 21, 1880. At the age of twenty-two years he went to Mexico, where he studied the Aztec and other native languages. On his return he was recommended by Boff to Alexander and Wilhelm von Humboldt, both of whom he assisted in the preparation of their standard works. He was the author of Wilhelm von Humboldt's larger work on the Kaoli language of Java, containing a comparative grammar of the South-Sea languages. Of Alexander von Humboldt's "Kosmos" he published in 1862 the fifth volume, with a general

index of the entire work. He did not publish anything of importance during the last eighteen years of his life.

CHARLES, MICHEL, a French mathematician, born at Epernon, November 15, 1793; died at Paris, December 19, 1880. He was a pupil of the Polytechnic School, and in 1841 was appointed Professor of Astronomy and Mechanics in the same institution. Subsequently a professorship of Higher Mathematics was specially established for him by the Faculty of Sciences. He was regarded as one of the best analysts and geometricians of his age, and his principal works were translated into German and other languages. He was the victim of a very remarkable literary fraud,* having purchased from M. Irene Lucas a very large number of forged autograph letters of distinguished persons.

CRAWFORD and BALCARRES, ALEXANDER WILLIAM CRAWFORD LINDSAY, Earl of, eldest son of James Crawford, the twenty-fourth Earl of Crawford and ninth Earl of Balcarres, was born October 16, 1812; died December 16, 1880. He succeeded to the earldom in 1869, up to which time he had borne the title of Lord Lindsay. He wrote works on the Church of England, on his travels in the East, and on Etruscan inscriptions, and in 1874 sent at his own expense an expedition to Mauritius to observe the transit of Venus.

DIGBY, KENELM HENRY, an English author, was born in 1800; died, March 22, 1880. He was the youngest son of the Very Rev. W. Digby, Dean of Clonfert, who belonged to the Irish branch of Lord Digby's family. Graduating at Trinity College, Cambridge, in 1823, he some time afterward joined the Roman Catholic Church. He wrote a number of theological and archaeological works, the last of which appeared in 1876 under the title of "The Epilogue to Previous Works in Prose and Verse." A son of Mr. Digby, Mr. Kenelm Thomas Digby, represented Queen's County in the House of Commons from 1868 to 1880, but was defeated at the election in 1880.

FLAUBERT, GUSTAVE, a French novelist, born in Rouen, in 1821; died at Croisset, near Rouen, May 8, 1880. He has sometimes been called the father of the realistic or naturalistic school, of which M. Zola is now the most celebrated representative. His first novel, "Madame de Bovary" (2 volumes, Paris, 1857), led to legal proceedings against him for immorality. The historical novel, *Salammbô*, which treats of life in ancient Carthage (1862), is considered his most important work. The next novel, "L'Education Sentimentale" (1869), did not meet with a favorable reception, but a fairy-play, written in the same year, "Le Château des Cœurs," met with a great success. His last great work, "Tentation de Saint-Antoine" (1874), was praised by many French critics as one of the master-works of French literature, but it found

only a small number of readers. Only a few weeks before his death he completed "Bouvard et Pécuchet" (1880), which has been styled a kind of cyclopædia of human folly.

FORTUNE, ROBERT, a Scottish botanist, born in Berwickshire, in 1813; died April 13, 1880. He became a horticulturist in the Botanical Gardens of Edinburgh, and, after acquiring a competent knowledge of botany by his own efforts, he was sent in 1842 as Commissioner of the Horticultural Society of London, to northern China; and on his return published a work, which was highly valued. In 1848 he was employed by the East India Tea Company to make investigations respecting the acclimatization of the tea-plant in India, and in 1857 by the United States Patent-Office to collect in China the seeds of the tea-shrub. He was a frequent contributor on botanical, geographical, and scientific subjects, to the "Athenæum" and other English periodicals.

FOURNIER, ÉDOUARD, a French author, born in Orleans, June 15, 1819; died in Paris, May 10, 1880. He early devoted himself to journalism and to writing for the theatre. His first dramatic work was published in 1851; his last, "Gutenberg," in 1865. Among journalists he was especially known as the dramatic critic of the "Patrie." With great perseverance he also pursued historical studies, among the fruits of which were a "History of Inventions," a "History of Hotels," a "History of the Art of Printing and of Libraries," and a "History of Bookbinding in France during the Past Centuries."

GALIMART, NICOLAS AUGUSTE, a French painter, born in Paris, March 25, 1813; died in Paris, January 19, 1880. A pupil of Ingres, he chose by preference sober and Scriptural themes, and for many years his name was never absent from the catalogue of the *Salon*. He also wrote on subjects connected with the fine arts.

GRAMONT, ANTOINE AGÉNOR ALFRED, Duke de, a French statesman, born in Paris, August 14, 1819; died January 16, 1880. After receiving an education at the Polytechnic School, he was sent in 1840 as Minister Plenipotentiary to Cassel. Subsequently he held similar posts at Stuttgart, Turin, Rome, and Vienna. From the latter city he was recalled in 1870, to be Minister of Foreign Affairs in the Ollivier Cabinet. He showed in this position a spirit of hostility to Prussia, and appeared to be anxious to bring on the war, which soon broke out, and ended so fatally for France. Though very popular at the time of his appointment, he soon fell from power when the French army suffered the first terrible disasters. Since the war the Duke had been almost forgotten. Under the pseudonym of "Andréas Memor," he published in the latter years of his life a series of articles in the "Revue de France," which attracted great attention.

GRANIER DE CASSAGNAC, ADOLPHE BERNARD, a French journalist and politician, born at

* For a full account of this fraud, see "American Cyclopædia," article CHARLES.

Bergelle-Averon, in the department of Gers, in 1806; died at the castle of Couloumé, in the same department, January 31, 1880. He came in 1832 to Paris, where he obtained, through Victor Hugo, employment on the "*Revue de Paris*," and later on the "*Journal des Débats*." Subsequently Girardin employed him on the "*Presse*," in which journal he defended negro slavery. His views on slavery endeared him to the planters of Martinique and Guadeloupe, and the last-named colony elected him as its delegate. As a supporter of M. Guizot, he made himself noted for the violence of his attacks upon the opposition journals. In 1848 he joined the Republicans; but two years later he started a journal, the "*Pouvoir*," in advocacy of "a strong man at the head of the Government." Since 1880 he has been one of the chiefs of the Bonapartist party, which he represented as deputy for the department of Gers in the Legislative Assemblies, both of the empire and, since 1876, of the republic. His attitude as a deputy was as violent and belligerent as in the press, and gave rise to many sensations. Of late he had taken but little part in journalism, being more than replaced by his son, Paul de Cassagnac. He was the author of numerous works, the last of which was entitled "*Souvenirs du Second Empire*" (1880), a reprint of a series of articles originally contributed to his son's paper.

HAHN-HAHN, IDA, Countess, a German authoress, born at Tressow, Mecklenburg-Schwerin, June 22, 1805; died at Mayence, January 12, 1880. She was married at the age of twenty-one to her cousin, Count Friedrich Wilhelm Adolf von Hahn-Hahn, but was divorced in 1829. In 1850 she joined the Roman Catholic Church, and in 1852 she entered the house of the Good Shepherd at Angers. Soon after, she took up her residence in a convent of the same order which was founded by her at Mayence. She had written a number of novels before she became a Roman Catholic, and she continued her literary activity as Superior of the convent, writing, besides several other works, twelve Catholic novels, the last of which, entitled "*Wahl und Führung*," was published in 1879.

HARTZENBUSCH, JUAN EUGENIO, a Spanish author, born in Madrid, September 6, 1806; died at Madrid, in August, 1880. His father was a German joiner, who had settled and married in Spain. He was educated by the Jesuits for the priesthood, but abandoned the Church for a literary career. The Revolution of 1823 having ruined the small fortune of his father, he learned a joiner's trade, and for several years supplemented his daily labors at the bench by his nightly pursuit of literature. His first efforts were translations or adaptations of French comedies. Subsequently he prepared some of Calderon's works for the modern stage, wrote lyric poems, learned short-hand writing, and became in 1835 stenographer for the official "*Gaceta de Madrid*." His first great dramatic

success was in 1835 with "*The Lovers of Zeruel*," which was followed by a number of other plays. He was elected to the Academy of Madrid in 1847, and became Director of the Royal Library in 1862. Of late years he had written little, but freely imparted his vast erudition to younger men.

HAGEN, ERNST AUGUST, a German art historian, novelist, and poet, born at Königsberg, April 12, 1797; died February 15, 1880. His first poem, "*Alfried and Lisena*" (Königsberg, 1820), which he published while a student at the university, was highly recommended by Goethe. He was a prolific author of works on the history of art.

JACOBS, JACQUES ALBERT MICHEL, otherwise known as Jacob Jacobs, a Belgian painter, born at Antwerp, in 1812; died in Antwerp, December 9, 1879. For many years he was professor at the Antwerp Academy, and painted chiefly landscapes and marines. He first exhibited when he was but twenty years of age, at Antwerp, Brussels, and Ghent, and quickly gained very favorable recognition. He received medals at Belgian exhibitions in 1836 and 1842, and one of gold in 1844; was made officer of the order of Leopold in 1864 and a member of the Academy of Antwerp in 1851. His funeral was of a semi-public character, being attended by the municipality of Antwerp, as well as the members of the Academy and a large gathering of citizens.

JONES, THOMAS RYMER, an English anatomist, born in 1810; died in London, in December, 1880. On the first establishment of King's College, London, he was appointed to the chair of Comparative Anatomy in that institution, and in 1840 he became Fullerian Professor of Physiology at the Royal Institution. The work by which he achieved the greatest reputation is "*The General Outline of the Animal Kingdom*," which was published in 1841, and is still regarded as a standard authority.

LANDSEER, THOMAS, an English engraver, born in 1794; died January 20, 1880. He was the eldest and last surviving of a celebrated trio of brothers, Charles Landseer having died in 1879, and Sir Edwin Landseer about six years ago. Thomas occupied for many years a distinguished place in the world of art, and especially excelled in mezzotint engravings. He executed among many other favorite subjects the "*Horse Fair*" of Rosa Bonheur, and he continued to practice his art with but scanty signs of failing power, down to 1879.

LEMAIRE, PHILIPPE, a French sculptor, born at Valenciennes, in 1798; died in August, 1880. He was a pupil of Cartellier, and obtained the grand prix de Rome in 1821. In 1836 he was charged with the task of decorating the Madeleine, and the gates of the Academy of Fine Arts were thereby opened to him. In 1862 he entered political life, in which he made a not inconsiderable figure, and from which he retired in 1869.

LESSING, KARL FRIEDRICH, a German painter,

born at Breslau, February 15, 1808; died June 6, 1880. His reputation as a great painter was fully established by his first picture, "Churchyard with Gravestones and Ruins" (1825). For a year or two he devoted himself to landscape; then he established himself at Düsseldorf, and came to be looked upon as the prominent pupil of the Düsseldorf school, of which Schadow was the master. Though for a time he sympathized with the sentimental romanticism of that school, he subsequently severed himself from the Catholic tendencies of Schadow, Veit, and other masters. This became especially apparent in a cyclis of pictures representing the history of Huss ("Huss before the Council of Constance," "The Seizure of Pope Paschal II," "The Martyrdom of Huss"), which gave him a world-wide celebration. In 1853 he painted the "Burning of the Papal Bull against Luther," which was purchased in New York. In 1858 he was appointed by the Grand Duke of Baden director of the gallery of paintings at Carlsruhe, which position he retained until his death. Since 1866 he was engaged on a large picture representing the disputation between Luther and Eck, but painted also a number of landscapes and portraits.

LIGNE, EUGÈNE, AMIRAL, PRINCE DE, a Belgian statesman, born January 23, 1804; died in June, 1880. In 1830 he was proposed as a suitable candidate for the new throne of Belgium, but he preferred to keep aloof from the national struggle. He subsequently accepted, however, the office of Belgian ambassador at several foreign courts. In 1851 he was elected President of the Belgian Senate, and in 1863 a Minister of State, positions which he continued to hold until his death.

MECHI, JOHN JOSEPH, a British agriculturist, born in London May 22, 1802; died in London December 26, 1880. His father was a native of Italy, but became a naturalized British subject, and was employed in the household of George III. The agricultural reform which he introduced on his farm at Tiptree Heath, Essex, and which he described in several works, attracted great attention. He was Sheriff of London, 1855-'56, Alderman, 1857-'65, a magistrate of Middlesex, a juror in the International Exhibition, of London and Paris, and a member of the Council of the Society of Arts. Shortly before his death his bankruptcy was announced.

MULDER, GERARDUS JOHANNES, a Dutch chemist, born December 27, 1802; died in April, 1880. He was from 1840 to 1868 Professor of Chemistry at Utrecht, and attracted great attention by asserting the existence in animals of a substance which he called "Proteine," and which according to his theory animals derive ready formed from plants. His theory involved him in a violent controversy with Liebig. He was for more than forty years adviser of the Colonial Ministry of the Netherlands, which position he retained seven years longer than his chair at the university,

until he became entirely blind. His last work, dictated after he had become blind, was a "Testimony in Behalf of Higher Instruction" (2 vols., 1876).

MUSSET, PAUL EDMÉ DE, a French author, born at Paris, November 7, 1804; died May 19, 1880. He was the eldest brother of the celebrated Alfred de Musset, and wrote a number of novels and two plays. He was a regular contributor to the "National," and the "Revue des Deux Mondes." His best-known work is "Femmes de la Régence" (1841).

NITZSCH, KARL WILHELM, a German historian, born December 22, 1818; died June 20, 1880. He was in succession Professor of History at the Universities of Kiel, Königsberg, and, since 1872, at Berlin. He was the author of a number of special works on topics of Grecian and Roman history.

OFFENBACH, JACQUES, a French composer, born at Cologne, June 21, 1819; died at Paris October 5, 1880. His parents were German Jews, but when sixteen years old he was entered at the Paris Conservatory, which was then under the direction of Cherubini, and after that his entire life was spent in Paris. In 1870, at the time of the Franco-German War, efforts were made to prejudice the Parisians against him as a Prussian, but he stoutly denied the charge of disloyalty, and published a declaration that, in spite of his birthplace, he was heart and soul a Frenchman. As a student at the Paris Conservatory he acquired a degree of proficiency in playing the violoncello, sufficient to warrant his seeking and securing a place in the orchestra of the Théâtre Français, of which he ultimately became the leader. His music to La Fontaine's "Fables" made him very popular, and his publisher encouraged him by liberal payments to direct his talent for composing bright and taking melodies, even if trivial in an artistic sense, to the embellishment of light comedies and vaudevilles. In 1855 he accepted the management of the Bouffes Parisiens, and in 1873 he became director of the Gaité Théâtre. Offenbach's career as manager and composer was eminently successful both in regard to the popular and the financial success which he achieved. Many of his compositions, as "Belle Hélène" (1864), "Barbe-bleue" (1866), "La Grande Duchesse" (1867), "La Périochole" and "Geneviève de Brabant" (1868), "Les Brigands" and "La Princesse de Trébizonde" (1869), "La Jolie Parfumeuse" (1873), and "Madame L'Archiduc" (1874), obtained a world-wide celebrity. Offenbach confined himself almost entirely to the limits of the *bouffe* stage; several efforts to compose a more serious style of music failed. In 1876 he came to the United States, and conducted the series of concerts with which Gilmore's garden in this city was opened. He published an amusing account of this journey under the title "Offenbach en Amérique." He returned to Paris late in the season very much broken in health, and re-

mained an invalid until the time of his death; still he continued at intervals to compose his merry music. His last published work was "La Fille du Tambour Major." At the time of his death the Opéra Comique was preparing to produce his new and most ambitious work, "Les Contes d'Hoffmann." Besides this, he left behind him a three-act opera, "La Belle Lurette."

ORENSE, JOSÉ MARIA D'ALBAIDA, Marquis, a Spanish statesman, born in 1802; died November, 1880. He took throughout his life an active part in all the republican movements in Spain. He headed the republican insurrection in Madrid in 1848. In 1868, after the overthrow of Isabella, he was the chief agitator for the establishment of a federal republic, and became chairman of the Liberal Committee, which demanded the abolition of slavery in the colonies. On the abdication of Amadeo in 1873, there was a general call for Orense to assume the Presidency of the Republic; but he declined, and absented himself from Madrid, though he subsequently accepted the Presidency of the Cortes for a brief period. Under Alfonso XII he took little part in public affairs.

PÉREIRE, ISAAC, a French financier, was born November 25, 1806; died July 12, 1880. He was, with his brother Émile, an ardent votary of St. Simonism, and he was the last survivor of the great representatives of that school. He originated the idea of publishing a daily report of the Bourse, which appeared at first in the "Journal des Débats." He had previously contributed financial articles to the "Globe" and the "Temps." With his brother Émile he was largely interested in the construction of French and Austrian railroads, and of a number of other public works. They were the founders and chief managers of the Crédit Mobilier. Ten years ago he became blind, but he never ceased to take the greatest interest in the financial schemes of his day, and the movements of the Bourse. He had bought the daily paper "La Liberté," and was himself its editor-in-chief. His contributions for charitable purposes were very large. Shortly before his death he offered 100,000 francs for the best essay on the distinction of pauperism. He was from 1863 to 1869 member of the Corps Législatif. He published in 1864 a brochure, entitled "Le Rôle de la Banque de France et l'Organisation du Crédit en France."

PETERS, CHRISTIAN AUGUST FRIEDRICH, a German astronomer, born September 7, 1806; died May 8, 1880. He was employed in the Observatory of Hamburg, and afterward of Pulkova, near St. Petersburg, and in 1839 became a director of the latter. He was appointed in 1849 Professor of Astronomy at Königsberg, in 1854 director of the Observatory of Altona, in 1872 director of the new Observatory of Kiel, and in 1873 professor of the university of the same city. He reported on his discoveries and observations in Schumacher's "Astronomische Nachrichten," in the mémoires

and bulletins of the Academy of St. Petersburg, and in the "Zeitschrift für Populäre Mittheilungen aus dem Gebiete der Astronomie," of which he himself was the editor.

PLANCHÉ, JAMES ROBINSON, an English author, born in London, February 27, 1796; died May 30, 1880. He produced more than two hundred plays for the theatre, of which "Charles XII" was considered one of the best. He also wrote a number of works on antiquarian subjects.

POUJOLAT, JEAN JOSEPH FRANÇOIS, a French author, born at La Fare, Bouches-du-Rhône, February 26, 1808; died at Paris, January 7, 1880. The first part of his life was mainly devoted to travel, the second to politics, and the third to essay-writing. He formed, when a very young man, the idea of illustrating the history of the Crusades, and for that purpose made extensive journeys in the East, the results of which he published conjointly with Michaud. He wrote a history of the French Revolution, biographies of St. Augustine (whose complete works he translated), Bossuet, Cardinal Maury, and many others. In the Constituent Assembly, to which he was elected in 1848, as well as in the Legislative Assembly, he constantly voted with the Right, the principles of which he defended in the brochure "La Droite et sa Mission."

RICASOLI, BETTINO, Baron, an Italian statesman, born at Florence, March 9, 1809; died at Rome, October 24, 1880. He was descended from an ancient noble family, and, after receiving an excellent education, devoted himself with great success to the cultivation of his extensive lands in the Maremma of Grosseto. He began to take an active part in Italian politics in 1847, when, conjointly with other Liberals, he demanded the introduction of constitutional institutions and of a liberal press law. In the same year he became *gonfaloniere* (mayor) of Florence. In 1848 he was elected member of the Tuscan Parliament, but in October of the same year he resigned, because he was opposed to the radical policy of Guerazzi and Montanelli, which was then in the ascendancy. After the battle of Novara, Ricasoli was in favor of recalling the Grand Duke; but when the latter invoked the invasion of Austria, and refused to restore the Constitution of 1848, he retired to private life, and did not reappear in politics until 1856. In 1859 he took a leading part in the overthrow of the Tuscan dynasty, and the union of the country with Sardinia. He was regarded as the principal coadjutor of Cavour in building the edifice of united Italy; and on the death of the latter, in 1861, became himself Prime Minister. In March, 1863, he was succeeded by Rattazzi, but he was recalled to the headship of the Ministry in 1866. He tried to regulate the relations between Italy and the Catholic Church by complete separation between church and state; but, being unable to secure a compact majority in Parliament, he resigned in April,

1867. He was out of sympathy with the Ultra-Liberal party, now in power, but continued to represent Florence in the Italian Parliament until his death.

RUGE, ARNOLD, a German author and philosopher, born at Bergen, on the island of Rügen, September 13, 1803; died December 31, 1880. At an early age he became a leader of German radicalism in politics, and of a new radical school of Hegelianism in philosophy. He was in succession editor of the "*Hallische Jahrbücher*," "*Deutsche Jahrbücher*," and "*Deutsch-französische Jahrbücher*." In the first German Parliament of Frankfurt he was the leader of the extreme Left. Being compelled, in consequence of his revolutionary activity, to leave Germany, and subsequently France, he formed in London, conjointly with Ledru-Rollin, Mazzini, Darac, and Bratiano, the "European Democratic Committee," from which he, however, soon withdrew. Since 1850 he resided in Brighton, as "visiting tutor" of several schools. The movements in 1866 and 1870 toward a union of the German states met with his warmest sympathy, and the German Government therefore gave him, in 1878, an annuity of three thousand marks.

STRATFORD DE REDCLIFFE, Viscount, better known as Sir Stratford Canning, born January 6, 1788; died in August, 1880. He was the son of Mr. Stratford Canning, a merchant of London, and received his education at Eton and at the University of Cambridge. In 1807, while still an undergraduate, he obtained an appointment as junior writer in the Foreign Office through the interest of his cousin, George Canning, who was then Secretary of State for Foreign Affairs in the Duke of Portland's Administration. For the light duty of copying the dockets of dispatches sent to and received from foreign courts into a register for the national archives, he received a salary of about \$1,500 a year. In 1808 he was appointed secretary to the special mission of Mr. (afterward Sir Robert) Adair to Constantinople, when the latter was sent to negotiate terms of peace between England and the Porte. In April, 1809, he was named secretary of the embassy at Constantinople, and on July 12, 1810—being then but twenty-two years of age—he became Minister Plenipotentiary. In 1812 he resigned the mission at Constantinople, to go back to college to complete his education, taking the degree of M. A. in 1813. He was ordered to attend the Congress of Vienna in 1814-'15, and at the same time accepted the duties of Minister to Berne. In 1820, Lord Castlereagh sent him as Minister to the United States to settle the question of the Northwest boundary. In this mission he was not successful, for the British Government declined to ratify the engagements he had made. In 1824, George Canning, who had once more become the director of the foreign policy of England, sent him on a special mission to Russia respecting Greece, and for the regulation of a bounda-

ry line between British and Russian America. Some slight abruptness of manner on his part offended the Grand Duke Nicholas, who subsequently became Emperor, and never forgot the slight he had received. A few years later, when Emperor, he refused to receive Stratford Canning as ambassador to his court, and the latter, during his long stay at Constantinople, remained a violent opponent of the Russian policy. In 1825 he was appointed by George Canning ambassador at Constantinople, where he attained to a position of unrivaled authority and prestige. When he did not succeed in obtaining from Sultan Mahmoud the concessions in behalf of the Greeks which he demanded, he went to England on leave, to be present during the conferences of London. He returned to his post in 1827, but when, after the battle of Navarino, diplomatic relations with Turkey were broken off, he again came to England and received the Grand Cross of the Bath in acknowledgment of his services. In 1830 he resigned the embassy at Constantinople, retiring again on a pension, and was elected a member of the House of Commons. In the next year he accepted from Lord Palmerston a special embassy to Constantinople to settle a dispute relating to the Greek frontier. In 1831 he was sent on a special mission to Spain and Portugal. The next few years he passed in comparative retirement, though he sat in the reformed Parliament for King's Lynn. On the second advent of Sir Robert Peel to power in 1841, the new Foreign Secretary, Lord Aberdeen, sent him back to his old post in Constantinople, where he was to remain for seventeen years, and through four changes of Ministry—a circumstance which greatly added to his ascendancy over the Sultan's advisers. He was the steadfast friend of Reshid Pasha and the supporter of all his reforms, and uniformly exercised his influence to improve the condition of the Christian population of Turkey. He returned to England in the early part of 1858. He had previously (1852) been raised to the peerage, by the title of Viscount Stratford de Redcliffe, and, after he took his seat in the House of Lords, he actively participated in the debates on questions of foreign policy. He was created Knight of the Garter, December 11, 1869. During the Russo-Turkish conflict from 1875 to 1878, he gave, in letters to the London "*Times*," several interesting contributions for a solution of the Eastern Question. A collection of poems, entitled "*Shadows of the Past*," reflecting upon the events of more than half a century, was published by him in 1865, and a summary of the evidences of Christianity, under the title of "*Why I am a Christian*," in 1873.

TAYLOR, TOM, an English author, born in Sunderland, in 1817; died July 12, 1880. He received his education at the Universities of Glasgow and Cambridge. He then went to London, where he was called to the bar, and was for two years Professor of English Lan-

guage and Literature at University College, London. In 1854 he became Secretary-in-Chief of the Board of Health. The functions of this body were eventually transferred to the Local Government Acts Office, which in its turn was merged in the Local Government Board. The office held by Mr. Taylor was thus abolished (1872), and, in recognition of the many services he had rendered in the way of sanitary improvement, a liberal pension was bestowed upon him. In the mean while he had gained a prominent place among men of letters as a dramatist, critic, biographer, and humorist. To the drama he devoted himself with particular ardor. From 1846 to 1875 he contributed in rapid succession more than one hundred pieces to the stage, the majority being adaptations of, or indirectly derived from, French plays or stories. His plays were generally distinguished by depth of interest, effective development of plot, and well-defined characters. Taking his *théâtre* in its entirety, the London "Times" pronounces him the first and most successful dramatist of his time. He wrote a "Life of Benjamin Robert Haydon" (3 vols., 1853), and completed the account begun by C. R. Leslie of the "Life and Times of Sir Joshua Reynolds." His early passion for acting continued unabated to the last, and in 1879, when "As You Like It" was played at Manchester in memory of Mr. Charles Calvert, he played *Adam* with unusual effect. From the time of his arrival in London he was associated with "Punch," and about seven years ago, at the death of Mr. Shirley Brooks, he became the editor of that periodical.

WAGNER, RUDOLF JOHANNES VON, a German chemist and technologist, born in Leipsic, February 13, 1823; died October 4, 1880. He became in 1851 Professor of Chemistry in Nuremberg; in 1856 extraordinary, and in 1858 ordinary Professor of Technology at the University of Würzburg, which position he retained until his death. In the same year he was appointed inspector of the technical schools in Bavaria. His authority as a technologist was generally recognized. He was a member of the juries at the International Exhibitions of London, Paris, and Amsterdam, and a member of German Imperial Commissions at the International Exhibitions of Vienna (1874) and Philadelphia (1876). For his work on the Exhibition of Vienna the King of Bavaria conferred upon him the Order of the Bavarian Crown, with which the personal nobility is connected. His chemical and technological works are very numerous. His "Handbuch der chemischen Technologie" (eleventh edition, 1879) has been translated into almost all living languages. He was the editor of the highly-valued "Jahresbericht über die Leistungen der chemischen Technologie" (vols. i-xxiv, 1856-1879). One of his last works was a "Report on the Chemical Products of the Centennial Exhibition of Philadelphia."

WIENIAWSKI, HENRY, a Polish violinist, born

July 10, 1835; died March 31, 1880. After receiving a musical education in Paris, he appeared in concerts at the early age of seventeen, and afterward achieved a reputation in both hemispheres as one of the greatest violinists of the age. In 1872 he came to the United States with Rubinstein.

OHIO. The debt of the State on November 15, 1880, was as follows:

Foreign debt, payable in New York:	
Loan payable July 1, 1868, not bearing interest.....	\$2,500 00
Loan payable after June 30, 1881, bearing 6 per cent. interest.....	4,072,640 80
Loan payable after December 31, 1886, bearing 6 per cent. interest.....	2,400,000 00
Total foreign debt.....	\$6,475,140 80
Domestic debt, payable at Columbus:	
Canal loan, not bearing interest.....	1,665 00
Total funded debt.....	\$6,476,805 80
Local indebtedness of the State:	
Debts of counties.....	\$2,858,856 99
Debts of cities.....	35,993,586 22
Debts of villages.....	964,593 56
Debts of townships.....	300,801 14
Debts of special school districts.....	1,188,997 77
Total local debts.....	\$41,297,745 68
Funded State debt.....	\$6,476,805 80
Irreducible State debt.....	4,323,005 60
	<hr/> 10,800,810 90

Aggregate public debts in the State. \$52,107,556 58

The following figures show the comparisons between the grand duplicate of taxes of 1879 and 1880:

Acres of land, 1879.....	25,376,264
In 1880.....	25,461,785
Increase.....	85,521
Value of lands, 1879.....	\$716,111,437
In 1880.....	705,821,074
Decrease.....	\$10,290,363
Value of real estate in cities, towns, and villages, 1879.....	
In 1880.....	\$377,657,467
	896,228,867
Increase.....	\$18,571,390
Personal property, 1879.....	\$442,979,885
In 1880.....	456,166,034
Increase.....	\$13,186,149
Total increase.....	\$31,757,589
Total decrease.....	10,290,363
Net increase.....	\$21,467,176

The total value of real property, as returned by the assessors and placed on the grand duplicate for 1880, was \$1,102,049,931. The decennial Board of Equalization subsequently reduced the amount to \$1,097,920,000.

The valuation of real property exempt from taxation in the State, as returned by the several county auditors to the Auditor of State for use of State Board of Equalization, is as follows: Total valuation exempted, \$77,068,743, classified as follows:

Colleges and academies:	
Number in State.....	227
Value of lands.....	\$866,651
Value of buildings.....	1,966,595
Total value.....	\$2,833,186
Public common school property:	
Number in State.....	11,763
Value of lands.....	\$2,153,950
Value of buildings.....	12,268,682
Total value.....	\$14,422,582

Churches:			
Number in State	7,488		
Value of lands		\$2,805,175	
Value of buildings		15,589,782	
Total value		\$18,394,957	
Public charitable institutions:			
Number in State	817		
Value of lands		\$1,820,624	
Value of buildings		9,862,970	
Total value		\$11,183,594	
All other buildings, etc., exempt from taxation:			
Number in State	957		
Value of lands		\$4,961,730	
Value of buildings		15,766,342	
Total value		\$20,728,072	
Valuation of cemeteries, public parks, etc.,			
\$6,006,402.			
The taxes levied for 1880 were as follows:			
State tax for 1880:			
Sinking fund		\$777,863 49	
General revenue fund		2,177,916 40	
State common school fund		1,557,460 84	
Total		\$4,513,240 73	
County general tax		\$2,476,795 48	
County poor-tax		715,259 43	
County bridge-tax		1,823,034 01	
County building-tax		606,548 47	
County debts		774,818 71	
Township general tax		850,077 80	
Township road-tax		898,457 88	
School-tax		5,958,310 80	
Special tax		1,198,941 81	
City tax		7,678,902 80	
Total		\$22,495,941 19	
State tax		4,513,240 73	
		\$27,009,181 92	
Delinquent tax		2,082,902 85	
		\$29,092,084 27	
Special dog-tax		253,875 00	
Grand total		\$29,345,959 27	

The report of the Board of Public Works for the year ending November 15, 1880, shows the canals to have done a successful business. The receipts from tolls and water rents were \$236,988.64, and the expenditures for repairs of an ordinary nature, and for work of an unusual character, were \$223,642.92, leaving a balance to the credit of canal fund of \$13,345.72. Balance brought forward from last year \$52,875.56, thus placing in the treasury, during the two and one half years under State management, \$66,221.28.

The report of the State Inspector of Mines shows that, since the mining law went into operation six years ago, new and approved systems of mining have been adopted in many cases. The ventilation and general security of the mines have improved, and, most important of all, the number of fatal and serious accidents have been greatly reduced. There are in the State over 600 mines reported.

The report of the Commissioner of Railroads and Telegraphs shows a large increase in the business of the railroads, a decided improvement in their condition, with a large increase of equipment, and a general degree of prosperity never before equalled.

The report of the Commissioner of Labor Statistics presents some facts of importance in the labor history of the State during the year.

The report notes the improved condition of mechanics and laborers engaged in the various industries of the State. Wages have increased, and, in the leading industries, the number of employees has been largely augmented. In the manufacture of pig-iron the number of employees has increased from 5,153, in 1878, to 9,796 in 1880, and in the rolling-mills the increase has been from 5,400, in 1878, to 10,746 in 1880. In the other industries the increase of employees has not been so marked, but the increase of employment to all connected with the industries is a matter for congratulation. Particular attention was paid by the Bureau to strikes during the year. There were in all 105 strikes, and of these 43 won, 34 lost, 23 compromised, and 5 remained undecided. On account of wages there were 73 strikes, as follows: At coal-mines, 22; Cincinnati, 14; Cleveland, 14; miscellaneous, 23. Of these 73 there were 27 won, 23 lost, 18 compromised, and 3 undecided. By occupation the strikes in the State were as follows: Coal-miners, 41; molders, 16; iron-workers, 7; coopers, 5; cigar-makers, 4; laborers, 4; printers, 3; boys, 3; machinists, 2; safe-makers, 2; freight and baggage handlers, 2; and one each of the following: Tanners, shoemakers, horse-shoers, hod-carriers, horse-collar makers, bricklayers, stonecutters, teamsters, iron-pipe makers, lamp-lighters, agricultural machine-makers, glass-workers, boiler-makers, paper-makers, tailors, and rope-makers. The report says that unsteady employment, with the accompaniment of its uncertain income, is a prime cause of labor strikes in Ohio. It is noticeable that strikes are more prevalent in those trades in which piece-work is the rule.

The following are some of the more important school statistics of the year, as reported by the State School Commissioner:

Amount of money received within the year:

Balance on hand September 1, 1879	\$3,549,422 51
State school-tax	1,558,207 32
Irreducible school fund	245,744 51
School-tax levied by local authorities	5,155,578 47
State school bonds by local authorities	340,804 75
From fines and licenses	225,589 41
Total receipts	\$11,075,646 97

Amount of expenditures for school purposes during the year:

Amount paid teachers in primary schools	\$4,530,183 46
Amount paid teachers in high-schools	442,358 18
Total amount paid teachers	4,972,541 64
Amount paid for managing and superintendency	141,681 30
Paid for sites and buildings	798,736 13
Interest on and redemption of bonds	537,455 99
Fuel and other contingent expenses	1,254,003 74

Total expenditures	\$7,704,448 05
Balance on hand September 1, 1880	3,371,198 12

Enumeration of children for school purposes in 1879:

White boys, school age	592,213
White girls, school age	496,582
Total whites, school age	1,018,795
Colored boys, school age	11,596
Colored girls, school age	12,019
Total colored, school age	24,525

Grand total, white and colored.....	1,043,320
Number between 16 and 21 years of age.....	273,250
Grand total high and primary school enrollment.....	747,133
Per cent. average daily attendance is of average monthly enrollment, townships.....	.77
Same as to separate districts.....	.83

Number and cost of school-houses erected within the year: Houses erected, 442; total cost, \$711,835.

The number of school-houses in the State is 12,143; value, \$21,851,718. The number of school-rooms is 16,247, and the number of teachers necessary to supply the schools is 16,627.

The statistics of the Ohio Penitentiary for the year show the number of convicts who can not read to be 111; number who can not write, 165; number who can not read or write, 955; number having common school education, 40; collegiate education, 3. Total number of convicts in the prison, October 31, 1880, 1,231; male, 1,214; female, 17; white, 1,057; colored, 180. Under twenty-one years of age, 267; between twenty-one and fifty years of age, 883; between fifty and sixty years of age, 63; over sixty years of age, 18. Terms: Under ten years, 1,043; over ten years, 113; for life, 75.

The annual cost per capita of each inmate in the different State institutions is figured out to be as follows:

INSTITUTIONS.	No. of patients.	Per capita.
Columbus Asylum.....	840	\$173 56
Cleveland Asylum.....	620	146 73
Athens Asylum.....	620	156 45
Dayton Asylum.....	620	185 48
Blind Asylum.....	173	289 08
Deaf and Dumb Asylum.....	433	172 55
Idiotic Asylum.....	466	165 41
Xenia Home.....	578	139 54
Boys' Reform School.....	512	150 40
Girls' Reform School.....	240	121 06

The State Board of Agriculture made, during the year, an endeavor to obtain more accurate returns of the crops of the State than had been obtainable through the township assessors, and at an earlier period. The result was satisfactory so far as regards wheat, the other crops being partly estimated. The returns showed 2,909,657 acres cut in 1880, yielding 52,673,083 bushels, or 18.1 bushels to the acre; 46,489 acres were reported winter-killed. The number of acres sowed for 1881 was 2,994,210. Nearly all the poor yields of wheat are found in the two tiers of counties nearest the Ohio River, which are largely mining regions, hilly, and more adapted to sheep than to wheat. In the twenty poorest counties the yield was a little over ten bushels to the acre, and in the remaining sixty-eight counties nearly twenty bushels to the acre. The other crops, partly estimated, were 115,321,472 bushels corn; 17,867,289 bushels oats; 1,396,098 bushels barley; 287,095 bushels rye; 1,129,425 gallons sorghum; 32,126,685 pounds tobacco; 17,722,626 bushels apples; 2,038,466 pounds maple sugar; 383,791 gallons maple-sirup. The amount of butter and cheese reported was

over 50,000,000 pounds of the former, and 26,000,000 pounds of the latter. The Board of Agriculture report pronounces these figures unreliable, being in some of the most important counties far below the facts. Of the agricultural products of the State, wheat ranks first in commercial importance; next corn; the wool and mutton crop was reported more in value than all the coal mined in the State, at net prices; during the year the number of hogs raised decreased twenty per cent., while the number of sheep materially increased; butter is of very uniform production throughout the State, and even at the insufficiently reported yield, ranked one fifth as much as wheat; cheese is mainly produced in about twenty northerly counties, though its production is gradually spreading over a wider area; hay was a large and valuable crop. Oats, barley, rye, and buckwheat are reported as not paying crops in Ohio, taking year by year.

The cultivated land of the State is reported at 8,770,402 acres; pasture-land, 5,852,185 acres. About one fourth the entire area of the State is woodland.

The Sixty-fourth General Assembly met January 5th, with a Republican majority in both Houses, the previous Legislature having been Democratic. In the Senate were twenty-two Republicans and fifteen Democrats, and in the House sixty-nine Republicans and forty-five Democrats. The organization of the House was effected by the election of Thomas A. Cowgill as Speaker. One of the members of the House, G. W. Williams, of Hamilton County, was colored, and, on entering a restaurant in Columbus just after the organization, he was refused to be served on account of his color. The matter was brought to the attention of the House, and a committee of investigation reported the proceeding to be an insult to the House in the person of one of its members. On the 12th of January Charles Foster was inaugurated Governor, succeeding, as a Republican, the Democratic Governor, Richard W. Bishop, Lieutenant-Governor Hickenlooper at the same time succeeding Lieutenant-Governor Fitch as presiding officer of the Senate. On the 14th James A. Garfield was elected United States Senator. He subsequently resigned his seat in Congress as Representative from the Nineteenth District, and Ezra B. Taylor was elected to fill the balance of the term, receiving 11,791 votes against 1,395 votes cast for all others.

The previous (Democratic) Legislature had redistricted the State for Congressional purposes, it being the first instance of change in the districts between the regular decennial apportionments. This had formed one of the issues in the State election of 1879, and, in accordance with the apparent verdict at the polls, the new Legislature passed, among its first laws, an act restoring the districts as they stood before the change made by the Sixty-third General Assembly. Another proceeding

by the previous Legislature was the passage of laws for the reorganization of the several State, venal, reformatory, and charitable institutions, so that the Democratic Governor could appoint new Trustees. It was expected that the new Legislature would undo this work, but there was a disagreement among the majority as to the best manner of accomplishing the purpose, and the bill was not passed until near the close of the session. In the form in which it finally became a law it gave the Governor discretionary power, providing that he "may" appoint trustees, by and with the consent of the Senate, instead of directing that he "shall" do so. Immediately after being notified of the passage of the bill Governor Foster commenced the work of reorganizing the institutions by sending in to the Senate batches of nominations. The names sent in were selected according to a defined plan, and the additional nominations made afterward were selected upon the same principle. The full term of service of the trustees is five years, and the term of one trustee expires every year. The first appointments being for unequal terms of years, Governor Foster chose Republicans for the two short terms and the longest term, and Democrats for the three- and four-years' terms. The object was to remove the inducement for any further reorganization for purely political reasons. The board of each institution is formed at the start of three Republicans and two Democrats, the Executive and Legislature being Republican. A change of power in the State would reverse those proportions, but no more, and it would be impracticable for either party to do more, for some time, than secure the bare majority on each board.

Several attempts were made during the session to free legislation on the liquor question, but most of them without practical result. A bill to regulate the sale of liquors by compelling retail dealers to give heavy bonds as security for any actionable damage under the personal injury liquor law failed for lack of a constitutional majority, as did a local option bill after a very severe struggle. There were repeated endeavors to pass an act regulating the publication and use of school-books in the State, but without success. A bill passed the Senate, but remained unacted on in the House during the session of 1880, preventing the selling of pools upon the result of horse-races, walking-matches, or any other trial of speed or endurance on the part of either horse or man. The punishment to be inflicted upon violators of the law is a fine of no more than five hundred dollars or less than five dollars, or imprisonment not more than six months or less than ten days, or both if the Court deems it necessary.

An endeavor was made to establish a precedent for the admission of women to school boards by so amending a bill for the election of school trustees in Cincinnati as to permit women to be chosen. The Senate passed the measure, but the House rejected it.

The Legislature adjourned April 17th, until January 4, 1881, after passing over two hundred laws of a general nature, and a number of local laws. Among the acts passed, in addition to those mentioned, were laws increasing the penalty for violation of liquor laws from fifty dollars to one hundred dollars for selling to minors or habitual drunkards; prohibiting the sale of intoxicating liquors within four miles of harvest-home festivals; making the penalty for grave-robbing imprisonment in the Penitentiary from one to five years; and a number of acts authorizing counties and towns to build railroads within their limits.

The Prohibition State Convention met in Columbus March 5th, and commenced proceedings by the adoption of the following platform of principles, reported from the committee:

1. That we reaffirm the principles and measures heretofore declared by the Prohibition Reform party, in our State and National Conventions.

2. That, asserting our rights as electors, we demand from the law-making power prompt and adequate protection of the people against the enormous wrongs inflicted upon them by the liquor crime, and this demand we call upon all good citizens to aid us in enforcing at the ballot-box.

3. That, as a step in that direction, we recommend the enactment of a law combining State with local option against the liquor-traffic on the plan proposed in the bill from the majority of its Committee on Bills, submitted by the Local Option State Convention of last January to the Legislature.

4. That this Convention hereby tenders to that worthy and distinguished daughter of Ohio, Mrs. R. B. Hayes, its thankful honors for the moral courage she has evinced and the high example she has placed before the world in her efforts to exclude from her table and from the public banquets and receptions at the White House all intoxicating beverages.

5. That, duly estimating the value and importance of all preventive agencies against the liquor crime, we cordially second the present movement among the friends of the cause for practically uniting temperance with education by the introduction of temperance textbooks in the public schools.

6. That we urge on all temperance citizens the duty of immediate and thorough local organization; and we recommend that they meet in their several places on the last Monday evening of this month, where such action is not before had, and where party lines are drawn, nominate full Prohibition Reform corporation and township tickets for the April election; and that they maintain at all elections hereafter total separation from all parties and politicians who are in complicity with the liquor crime.

The following additional resolutions were also adopted:

Whereas, In the hour of peril when the life of this Nation was threatened by secession and rebellion the citizen became the soldier and went forth to battle for his country's life; and

Whereas, To the soldier and the children of the soldier this nation owes a debt of gratitude; therefore

Resolved, That the fostering of the liquor-traffic by the General Government for a revenue, and the protection of it by State legislation, whereby the soldier and his family are deep sufferers, are not only acts of great ingratitude, but are wrongs unparalleled in any heathen nation.

Resolved, That the proposition, whether coming from a conference or a Legislature, to defer action on the liquor question until after the Presidential election in order to get the liquor vote, implies that that vote is deemed essential and useful in determining the issues

of that election, and on account of such just and necessary implication is therefore dishonest, hypothetical, and disloyal to American institutions.

The following ticket was nominated: For Secretary of State, William H. Doan, of Cuyahoga County; for Judge of the Supreme Court, William Mungen, of Hancock County; for Clerk of the Supreme Court, George Calderwood; for Member of the Board of Public Works, J. H. Lorimer, of Clarke County; for State School Commissioner, James A. Brush, of Stark County. Mr. Mungen declined the nomination, and William F. Ross was selected to fill the vacancy on the ticket.

The Republican Convention for the nomination of a State and Presidential electors ticket, and for choosing delegates to the Republican National Convention, met in Columbus April 28th. The delegates were first chosen, those for the State at large being ex-Governor William Dennison, Hon. James A. Garfield, Governor Charles Foster, and Warner M. Bateman. A State ticket was then nominated as follows: For Secretary of State, Charles Townsend, of Athens County; for Judge of the Supreme Court, George W. McIlvaine (renominated); for Clerk of the Supreme Court, Dwight Crowell, of Ashtabula County; for Member of the Board of Public Works, S. R. Hosmer, of Muskingum County; for State School Commissioner, D. F. De Wolf, of Lucas County; for Presidential electors at large, Charles H. Grosvenor, of Athens County; S. S. Warner, of Lorain County. The following platform was adopted:

Resolved, That we reaffirm the principles enunciated in the resolutions adopted by the last Republican National Convention.

Resolved, That we are in favor of the extension of the system of free public schools throughout the whole country, supported by general taxation, exempt from sectarian influences, and open to every child of proper age; and to that end we are in favor of all appropriate and constitutional legislation.

Resolved, That we are in favor of a full protection by the national Government of every citizen of the United States, native or naturalized, as well within as without our territorial limits, in the exercise of every right conferred upon him by its Constitution and laws, and against every infraction of such right, in whatever way or by whomsoever committed; and for the purpose of affording such protection the whole power of the Government should be used.

Resolved, That it is the duty of the national Government to protect the election of representatives in Congress from fraud and violence, and we condemn the attempts of the Democratic party to nullify or repeal existing laws on this subject as unpatriotic and calculated to encourage and foster fraud.

Resolved, That we are in favor of the maintenance of a sound currency based upon coin, or upon notes redeemable in coin, and the sacred observance of the public faith against all taint or suspicion of evasion or repudiation.

Resolved, That we congratulate the country upon the resumption of specie payments, now assured and permanent, as the fruits of Republican policy and the splendid achievement of Republican administration; and we likewise congratulate the country upon the general revival of business and industry, secured as they are by the soundest and most convenient currency and the wisest financial policy the country ever enjoyed.

Resolved, That the great ability, invaluable services,

long experience, pure and exalted character, and unwavering fidelity to Republican principles of our distinguished fellow-citizen, John Sherman, entitle him to the highest honors and confidence of the Republican party of Ohio and of the country. His matchless skill and capacity as a financier have mainly contributed to accomplish the invaluable and difficult work of resumption and refunding the public debt, and made him the trusted representative in public life of the business interests of all classes of the American people. He has been trained from the beginning of his public life in the advocacy of the rights of man, and no man has been more unfaltering in his demand that the whole power of the Government should be used to protect the colored people of the South from unlawful violence and unfriendly local legislation; and in view of his services to his country and his eminent ability as a statesman, we, the Republican party of Ohio, present him to the Republican party of the country as a fit candidate for President, and respectfully urge upon the Republican Convention at Chicago his nomination.

Resolved, That the delegates at large chosen by this Convention are hereby instructed to vote for and to use all honorable means to secure the nomination of John Sherman by the National Republican Convention at Chicago for President, and the district delegates are respectfully requested to vote for him.

Resolved, That we cordially endorse the Administration of President Hayes in maintaining the legislation, principles, and purposes of the Republican party, designed as they are to maintain the existence of the Government, to protect all citizens in the enjoyment of all rights given or guaranteed by the Constitution and laws, and to secure prosperity to the industries of the country.

Resolved, That we pledge the united and earnest efforts of the Republicans of Ohio for the election of the nominees of the National Republican Convention.

The Democratic State Convention to select delegates to the Democratic National Convention was held at Columbus May 6th. The Democratic Convention for the nomination of a State ticket met in Cleveland July 22d. The platform was adopted before the nominations were made, and was confined to the following two resolutions:

Resolved, That the Democracy of Ohio heartily endorse the candidates of the National Democratic Convention, and that we will zealously labor for the election of Hancock and English, and for the candidates for State offices this day nominated.

Resolved, That the Democracy of Ohio adopt as their own the National platform. (See UNITED STATES.)

The ticket nominated was as follows: For Secretary of State, William Lang, of Crawford County; for Judge of the Supreme Court, Martin D. Follett, of Washington County; for Clerk of the Supreme Court, Richard J. Fanning, of Franklin County; for Member of the Board of Public Works, William J. Jackson, of Miami County; for State School Commissioner, J. J. Burns, of Belmont County; for Presidential Electors at Large, R. P. Ranney, of Cuyahoga County; John F. Follett, of Hamilton County.

The Greenback Labor Convention was held at Columbus July 28th, and put in nomination the following ticket: For Secretary of State, Charles A. Lloyd, of Huron County; for Judge of the Supreme Court, D. W. C. Louden, of Brown County; for Clerk of the Supreme Court, Charles Bonsell, of Columbiana County; for Member of Board of Public Works, Amos Roberts, of Knox County; for State School

Commissioner, R. B. Smart, of Ross County; for Presidential Electors at Large, Harry Kellogg, of Lucas County; L. T. Foster, of Mahoning County.

The platform endorsed the Chicago resolutions, favored a woman suffrage amendment to the Constitution, called for reduction of the fees of public officials, denounced payment of employees by corporations in scrip or store goods, and demanded a law for its punishment as a crime. The last resolution said that land, light, air, and water are free gifts of Nature, and any law or custom of society that allows any person to monopolize more of these gifts than he has a right to, to the detriment of the rights of others, they condemn and will seek to abolish. A resolution was also adopted denouncing any coalition of Greenbackers with Democrats in other States.

The election was held October 12th, with the following result, the total vote on the State ticket being 718,186:

SECRETARY OF STATE.

C. Townsend, Republican.....	362,021
William Lang, Democrat.....	343,016
Charles A. Lloyd, Greenback.....	6,786
William H. Doan, Prohibitionist.....	2,515

JUDGE OF THE SUPREME COURT.

G. W. McIlvaine, Republican.....	364,045
M. D. Follett, Democrat.....	340,998
De Witt C. Loudon, Greenback.....	6,859
William F. Ross, Prohibitionist.....	2,353

CLERK OF THE SUPREME COURT.

D. Crowell, Republican.....	364,225
R. J. Fanning, Democrat.....	340,870
George Bonsall, Greenback.....	6,865
George Calderwood, Prohibitionist.....	2,575

MEMBER OF BOARD OF PUBLIC WORKS.

Stephen R. Hosmer, Republican.....	364,053
William J. Jackson, Democrat.....	341,001
Amos Roberts, Greenback.....	6,844
John H. Lorimer, Prohibitionist.....	2,577

STATE SCHOOL COMMISSIONER.

D. DeWolf, Republican.....	363,887
James J. Burns, Democrat.....	341,204
R. B. Smart, Greenback.....	6,800
James A. Brush, Prohibitionist.....	2,816

The result of the Congressional election was the choice of fifteen Republicans and five Democrats. The members chosen and the majority of each over the next highest candidate are as follows: I, Benjamin Butterworth, R., 1,298; II, Thomas L. Young, R., 1,004; III, Henry L. Morey, R., 968; IV, Emanuel Schultz, R., 328; V, Benjamin Le Fevre, D., 8,110; VI, James M. Ritchie, R., 685; VII, John P. Leedom, D., 1,712; VIII, J. Warren Keifer, R., 5,918; IX, James S. Robinson, R., 1,139; X, John R. Rice, R., 1,368; XI, Henry S. Neal, R., 2,138; XII, George L. Converse, D., 4,189; XIII, Gibson Atherton, D., 2,475; XIV, Geo. W. Geddes, D., 6,467; XV, Rufus R. Dawes, R., 502; XVI, Jonathan T. Updegraff, R., 2,848; XVII, William McKenley, Jr., R., 3,571; XVIII, Addison S. McClure, R., 5,096; XIX, Ezra B. Taylor, R., 12,678; XX, Amos Townsend, R., 5,327.

OLD CATHOLICS. No synod of the Old Catholic Church of Germany was held in 1880, as it had been resolved in 1879 that, thereafter, there should be only biennial sessions. In the years in which the Synod does not meet, it is

intended to hold a Church Congress, which, like the assemblies of the same name in the Church of England, and the Protestant Episcopal Church of the United States, is an unofficial gathering of members for the discussion of important questions. The seventh Old Catholic Congress was held at Baden-Baden, the famous watering-place, from September 12 to 14, 1880. Like its predecessors, the Congresses held at Munich, Cologne, Constance, Freiburg, Breslau, and Mayence, it was well attended, but some of the most prominent representatives of the Old Catholic movement, the theological professors of the Universities of Bonn and Munich, still kept aloof from the meetings. A number of bishops of the Church of England, the Protestant Episcopal Church of the United States, and the Old Catholic (Jansenist) Church of Holland, sent greetings, and assured the German Church of their abiding interest in its prosperity and progress. Bishop Reinkens, who was present, made a favorable report on the progress of the Church during the preceding year. The figures showed a slight advance all through the Church, a result which was received with great satisfaction, because in the years from 1876 to 1878 there had been a considerable falling off. The views entertained by the Church at present with regard to its relations to the Papacy found expression in the following resolutions: 1. An actual and effective contradiction between faith in the fundamental truths of Christianity founded upon the testamentary proof of history, and science founded upon the immediate facts of nature and mind, is not possible. Each protects, carries on, and supplements the other. 2. The independent character of national churches is just as much in accordance with the universal character of the Church as are the national peculiarities in the state, art, and science, with the general object of culture. 3. It is a mischievous error of many Protestants to regard the Church, which the adherents of the Vatican are bound to recognize as the only rightful one, as the shield of faith, a rallying-point for authority in civil and social affairs, and a protection against destructive socialistic tendencies, and therefore to adopt it as a conservative ally. 4. History, the task and duty of self-preservation, compels the German Empire to oppose the Vatican system. 5. Negotiations with the infallible Pope or his organs, upon all matters which concern the promulgation of laws and the authority of the state, are objectionable. Transactions of this kind lead to the dissolution of the national state. The relations of the Old Catholics of Prussia were, on the whole, less friendly than in former years, because the latter was all the time meditating upon the expediency of making its peace with Rome. The Minister of Public Worship, Herr von Puttkammer, defended, however, the continuance of the provision made in the Prussian budget for the Old Catholic bishop, as a part of the law of the land, and declared that the Gov-

ernment would carry out the ecclesiastical laws as long as they remained on the statute-books.

The Synod of the Christian Catholic Church of Switzerland met at Geneva on May 20th. From the annual report of Bishop Herzog, it appeared that the Church, in the course of the past year, had suffered a loss of twelve parishes and ten priests. The principal cause of these losses was the recurrence in the canton of Berne of the six years' period of the election of the parish priests by the people. On the occasion of the previous elections, the Roman Catholic party had refused to take any part in them, and thus the property of many parishes had passed into the hands of the Old Catholics, although they formed only the minority of the inhabitants. The Bishop states that other losses were in prospect for the coming year from the same reason. The losses of the Church were, however, confined to the cantons of Berne and Geneva. An annual accession to the ranks of the priesthood is now obtained, and expected for the future, from the Old Catholic Faculty of Theology at the University of Berne. In 1880 the Church numbered fifty-nine priests and forty-eight parishes. As the churches are not yet accustomed to self-support, the aid of the Anglican churches in England and the United States was solicited and obtained. Bishop Herzog strongly advocates the establishment of the closest intercommunion between the Anglican and the Old Catholic Churches. A new prayer-book, prepared by him for the use of the Swiss churches, after the model of the Anglican manual, was adopted by the Synod as the official manual of the Church, and it was ordered that the office of the mass contained therein should be used universally.

In Austria, the first legally acknowledged Synod of Old Catholics was held in Vienna, on June 29th. It had been summoned by Dr. K. Lindner, the President of the Synodal Council, and was attended by five priests and a number of lay delegates. The synodal and parochial regulation, which hitherto had been provisional, was definitely adopted. The Synod also decreed the introduction of divine services in the language of the people, the abrogation of compulsory celibacy and fasts, as also of surplice-fees, and the removal of the observance of holy days (with the exception of the high festivals) to the next Sunday.

In France, the congregation of M. Hyacinthe Loyson reported in June, 1880, a membership of about one thousand. It did not yet own a church-building, and was about one thousand dollars in debt. It has three priests. On August 27th, M. Loyson solemnized the marriage of a regular priest, Abbé Laine.

In Russia, the province of Volhynia has several communities of Bohemians who have attached themselves to the Old Catholic movement. They have three priests who are recognized and supported by the state. In a memorandum addressed to the Minister of the Interior,

the priests requested permission to hold a conference with some of the most influential of the Bohemian laymen, to formulate a statement of their fundamental doctrines and organic constitution. This conference was to serve as a permanent organization and constitute a synodal council.

OREGON. The Legislature opened its session September 13th, and closed October 23d. Solomon Hirsch was elected President of the Senate, and Z. F. Moody Speaker of the House. The more important general laws which were enacted are enumerated below.

An act to establish and protect the rights of married women repeals all laws imposing civil disabilities upon a wife which do not rest upon the husband; gives the wife the right to sue alone in the courts for the redress of personal wrongs; provides that both parents shall have equal rights and responsibilities regarding their children; and that the wife shall succeed after the husband's death to the same control of the estate and of the children as the father now does after the death of the mother. The judiciary laws were amended, and provision made for the times and places for holding supreme, circuit, and county courts, and for the regular session of a circuit court in each district, and the enforcement of its orders in all the districts. A singular bill was introduced and received strong support, but failed of enactment, the provisions of which would require every railroad to pass over its line the cars of another railroad connecting with it at the rates charged on the same.

An act requires county clerks, sheriffs, and district attorneys to make semi-annual returns to the Secretary of State of all fees and emoluments earned by them, and of the expenses of their offices. The object of this act is to obtain the information necessary for the regulation of the compensation of those officers. Another act provides for the pay of sheriffs and clerks for the different counties. The law regulating the salaries of county treasurers was also changed. Authority was given to let out the labor of convicts in the Penitentiary at thirty cents a day. The salary of the Superintendent of the Penitentiary was reduced, and the regulations relating to the purchase of supplies altered in the interest of economy. The construction of an insane-asylum building was provided for and a tax-levy for the purpose prescribed. It was also voted to establish a school for deaf-mutes. An act was passed providing for the refunding of the war debt, and for the appropriation of money and the levy of taxes for that purpose. The assessment and tax laws received some modifications. A special act, called the "Levee Bill," which was carried through the Legislature amid earnest protests, then vetoed by the Governor, and finally passed over the veto, aroused much excitement and suspicion. The bill grants to the Oregonian Railway Company the levee in the city of Portland and the right of way and ter-

minal and wharfage facilities within the limits of the city. The Governor declared that it was vesting corporate powers in the company, which could not be done by a special act under the Constitution. The contest was described by the supporters of the bill as an opposition on the part of the citizens of Portland to the interests of the rural population.

The only temperance legislation was an act to prevent the sale of malt or other intoxicating liquors within four miles of any premises upon which the General Government may be engaged in constructing canals or locks, or works of a similar nature.

A bill prohibiting the sale of liquors by the glass was lost by a tie-vote in the Senate. The amendment to the Constitution providing that regular sessions of the Legislature shall last sixty days, and special sessions thirty days, and fixing the per diem of members at four dollars, passed the Legislature a second time, as required, previous to being submitted to the people. A proposed constitutional amendment granting full rights of suffrage to women passed both branches of the Legislature, and was approved by the Governor. The proposition, which must be concurred in by the next Legislature before presentation to the people, is as follows:

The elective franchise in this State shall not hereafter be prohibited to any citizen on account of sex.

Notwithstanding the Executive approval of the act, it is thought that the action of the Legislature was invalid, and that the amendment must be deferred, on account of an article in the Constitution providing that, "while an amendment or amendments which shall have been agreed upon by one legislative assembly shall be awaiting the action of a legislative assembly or the electors, no additional amendment or amendments shall be proposed." The article is loosely expressed, and may have been intended to prevent the alteration of the amendments under consideration; but the above clause seems subject only to a construction which precludes action on this amendment while another proposition is before the people.

The following summary shows the transactions and condition of the Treasury for the years 1879 and 1880—

RECEIPTS.

From four-mill tax in 1878.....	\$184,961 80
From same in 1879.....	186,691 24
Penitentiary, care of private insane, sale of stamps, sale of State property, trial fees, and miscellaneous.....	28,821 55
Total.....	398,974 09
From the three-mill tax, levied to meet the special indebtedness of the State in 1878.....	138,720 99
In 1879.....	139,268 45
Total.....	\$277,989 44

EXPENDITURES.

Current expenses and interest on the bonded debt.....	\$332,758 88
Deficiencies on account of inadequacy of appropriations.....	28,002 97
Interest due on Modoc-war bonds.....	6,200 07
Total.....	\$366,961 42
Balance September 30, 1880.....	32,012 67

There should be added to the receipts the amount received from the former Treasurer, and the amount collected on account of delinquent taxes prior to 1878, and to the expenses the various appropriations for purposes other than current expenses. The latter exceeded the former by \$21,970.20, reducing the balance in favor of the State to \$10,042.47. The three-mill tax was levied to pay off the debt arising from the excess of disbursements over receipts for several years prior to 1876, in consequence of a decision made by the Supreme Court in that year, to the effect that the revenue of each year is applicable only to the expenses of the same year. The principal of that accumulated indebtedness amounted at the close of 1878 to \$192,975. The interest on the warrants issued on account of this debt amounts to about \$115,000. The proceeds of the special tax for the two do not therefore entirely extinguish the debt, but leave about \$30,000 unliquidated; but the September levy of 1880 is sufficient to pay off this balance and leave about \$100,000 over. The four-mill tax is understood by the Governor to be applicable only to the current expenses of the State, according to a section in the Constitution prescribing that "every law imposing a tax shall state distinctly the object of the same, to which only it shall be applied." This requirement has not heretofore been observed. A large portion of the revenues for 1879 and 1880 has been appropriated for other objects besides the expenses of the State government proper.

The bonded indebtedness of the State includes the Soldiers' Bounty bonds, Soldiers' Relief bonds, Modoc-war bonds, and the bonded debt arising out of the Indian difficulties of 1878. The soldiers' bounty bonds and the soldiers' relief bonds were issued in 1864, and were to run twenty years. A tax of one mill was provided in each act for the redemption of the bonds issued under it. Respective funds were thereby raised, more than sufficient to pay them off. At the close of the fiscal year 1878, according to the Treasurer's report, there was in the soldiers' bounty fund, \$30,496.67, and in the soldiers' relief fund, \$27,496.50; while the liability upon the former fund was but \$26,400, and upon the latter only \$761. The money in the former fund was applied to the current expenses of the State by the Legislature in 1878. The Governor remarks that such an appropriation could only be a temporary loan under the Constitution. The Modoc-war debt was contracted in 1874. It amounted to \$132,858, and was payable January 1, 1880, with seven per cent. interest. The interest was paid regularly, but no provision had been made for paying off the principal upon maturing. It has been thought that the United States ought to pay this debt, but no measures have been taken by Congress for that object. The indebtedness arising from the Indian disturbances of 1878 has been funded at seven per cent., and amounts to about \$44,000, payable

in 1890. For these expenses also the State claims indemnity from the General Government. There is a bonded debt due the Willamette Falls Canal and Lock Company out of the proceeds of the sales of United States lands, five per cent. of which go to this fund, and from the sale of 500,000 acres donated by the Federal Government for internal improvements. This debt amounted to \$200,000, and the interest at the close of 1878 to \$160,000, since which time \$8,500 of the interest has been paid. The State holds notes for \$40,000 for lands sold; and 260,000 acres yet remain to be sold. Besides the bonded indebtedness there were at the close of 1880 \$133,604 of outstanding warrants. They are payable out of specific funds, mainly from the swamp-land fund. These and the lock bonds are not a general indebtedness of the State, but the latter merely administers upon certain property and funds for their payment.

The value of taxable property as assessed in 1879 was \$46,422,817. The valuation is probably less than half the actual value of all property in the State. The amount of indebtedness returned in 1879 to offset assessments aggregated the surprising sum of \$19,690,878, over \$7,000,000 more than the total assessment of notes, accounts, and shares of stock. The Governor recommends that the law allowing the deduction of debts from assessments be repealed or changed, so as to prevent fraud. He counsels also the taxation of the capital of foreign corporations employed in business in the State, and the imposition of a license-tax for conducting business through agents and solicitors from without the State. He thinks also that the law allowing interest upon State or county warrants, presented and not paid, ought to be changed.

A special tax has been levied for the establishment of an insane asylum. Heretofore the insane and the imbecile have been cared for under a special contract. They have increased to over 290 in number, and the expense to over \$75,000 a year. The Governor thinks that the expense of sending insane persons to the asylum should be borne by the counties, and that the feeble-minded should not be received at all, but should be cared for by the local authorities. The schools for the blind and the deaf and dumb, which were conducted by the Board of Education, were discontinued in 1879, because the trouble and the cost were greater than the benefits afforded. The latter school was reopened in that year under a special arrangement. The Legislature has provided for the reorganization of these institutions under the supervision of a separate commission.

At the request of the Governor the General Land-Office has sent an agent, R. V. Ankeny, to Oregon to select, in coöperation with an agent of the State, the lands which have been granted to the State by the swamp-land act, the State authorities having forwarded to Washington a claim for 106,826 acres of such

lands, which they had caused to be surveyed. Other grants to the State were as follows: For the use of the State University, seventy-two sections; for public buildings, ten sections; the salt springs, twelve in number, with six sections of land adjoining; 90,000 acres for a college for instruction in agriculture and the mechanic arts; and 500,000 acres for internal improvement purposes. The State University grant has been almost all selected, and of the lands 17,000 acres remain unsold. It has yielded a fund amounting at present to about \$40,000, with accrued interest, making it about \$60,000, invested in numerous private loans. The fund has been seriously impaired by the default of interest, and it is recommended that it be re-invested in State bonds; or, if this is impracticable, that the back interest be made by law to bear interest. The grant for the purpose of constructing public buildings has all been located and sold. The salt-spring grant has lapsed, by reason of a proviso that the lands should be selected within a year after the admission of the State. The Agricultural College grant has been selected, and 23,000 acres sold, the proceeds amounting to \$50,000. The internal improvement grant has been spoken of above. The La Grande Land-Office, which has had charge of them heretofore, the Governor recommends should be abolished.

A claim of the Willamette Valley and Cascade Mountain Military Wagon-Road Company for land, alleged to have been earned by the construction of a military road, was investigated by a special land agent. The documentary evidence presented in support of the claim, although apparently conclusive and bearing the seal of the State's officers, was discovered to have been fabricated and the claim fraudulent. The road was alleged to have been built from Albany, through the mountains, to the eastern boundary of the State. The company did some work at the western end, and then obtained the enactment of a law granting lands to the State of Oregon for the construction of such a road. The road was made for 150 miles of the distance; and then, fearing the lapse of the grant, the company simply made a wagon-track to the Idaho line, 350 miles long, without bridging or grading, and then claimed patents on 440,000 acres, having already patented 100,000 acres upon the basis of fictitious representations.

In the annual report of the Portland Board of Trade it is stated that, while formerly nine tenths of the immigrants to the Pacific coast over the Pacific Railroads settled in California, now nearly one half of such immigrants make their way to Oregon and Washington Territory, together with other settlers from California itself. Notwithstanding the short wheat-crop in the Willamette Valley in 1879, money was more plentiful. Interest rates are lowering, and capital seeking borrowers. About \$3,000,000 was invested in new buildings in Portland in 1880. The exports of wheat for the year

ending August 1, 1880, amounted to 177,790 tons, of which over two thirds came from western Oregon. The exports of wheat to Great Britain were of the value of \$4,164,212; the exports of flour to the same country amounted to \$622,465. There was also exported to other ports, including San Francisco, wheat of the value of \$811,550, and San Francisco took flour to the amount of \$553,613, while \$258,310 worth remained in warehouse; making the total receipts for the year's crop \$6,609,150, exclusive of home consumption. The shipments to San Francisco were destined also for Great Britain.

The wheat-crop of 1880 was estimated to be at least 200,000 tons over and above the home

requirements. Of this, over three quarters was still held for lower freight-rates at the close of the year, while ocean-carrying facilities were offered for only about one quarter of this quantity. The salmon exports during the year ending August 1st were 451,363 cases, the greater portion of which brought the lowest prices ever realized. The spring and summer catch of 1880 was unprecedented, and 530,000 cases were packed. In 1875 the quantity put up was 231,500 cases; in 1877, 400,000 cases; in 1879, 435,000 cases. The prices in 1880 were better than in the preceding year. The value of the salmon exports for the last four years, computed for the crop year, ending July 31st, were as follows:

SALMON EXPORTS.	1879-'80.	1878-'79.	1877-'78.	1876-'77.
Via San Francisco.....	\$1,570,610	\$1,246,672	\$1,750,350	\$989,956
To England, direct.....	1,199,205	616,397	787,836	1,376,056
Total.....	\$2,769,815	\$1,863,069	\$2,438,186	\$2,357,012

The value of the direct wheat exports to Great Britain was \$3,785,060 in 1878-'79, \$3,552,000 in 1877-'78, and \$4,872,027 in 1876-'77. The exports of wheat, flour, and other products to China, the Sandwich Islands, British America, Alaska, and elsewhere, except to Europe and San Francisco, amounted to \$443,376 in 1879-'80 against \$423,432 in 1878-'79, \$386,600 in 1877-'78, and \$637,636 in 1876-'77. The beef and mutton exports, which amounted to \$365,733 in 1876-'77, have ceased. There is an annual trade in coal from Coos Bay and in lumber with San Francisco, amounting in 1879-'80 to \$233,763. The overland trade, principally in cattle sent to the East, and wool from southeastern Oregon shipped through California, was estimated for 1879-'80 to be \$534,000, nearly double the estimate for the preceding year. The wool production of the State has developed with remarkable rapidity. The shipments *via* San Francisco, which amounted in 1876-'77 to \$998,305 and in 1877-'78 to \$756,000, were in 1878-'79 \$1,567,202 and in 1879-'80 \$2,155,147. The bullion product of the State is estimated at \$900,000 a year, twenty-five per cent. less than a couple of years ago. The Director of the Mint reports deposits of gold from Oregon for the fiscal year 1879-'80 of \$583,365, the total amount deposited having been \$15,414,509 up to the end of that year. The total shipments to San Francisco of all commodities were \$6,861,993 in 1879-'80, against \$6,057,685 in 1878-'79, \$5,329,192 in 1877-'78, and \$6,124,491 in 1876-'77. The aggregate values of Oregon exports for the same years were as follows: In 1879-'80, \$15,045,521; in 1878-'79, \$12,282,047; in 1877-'78, \$11,571,361; in 1876-'77, \$14,644,973. The wool-clip of Oregon and Washington Territory in 1879 was over 8,000,000 pounds, and it realized \$2,363,276. The local mills consumed about 747,000 pounds. It is said that recent clips do not sustain the high reputation which Oregon wool has en-

joyed. This may be owing to deficient forage during a part of the year, and the consequent stunting of the wool and inequality of the staple. The wool-clip of 1880 was estimated at not less than 10,000,000 pounds. Oregon beef stands very high in all the markets, and the business of cattle-raising is extending fast in eastern Oregon. The extension of the Northern Pacific Railroad must give a great impetus to stock-raising in eastern Oregon and Washington.

The railroad projected by the Oregon Railway and Navigation Company, which was founded by Henry Villard, of New York, who brought out the Oregon Steam Navigation Company, is to run from Portland to Umatilla, on the Columbia River, about two hundred and fifty miles distant, and there divide into two main branches. One will run northeastward through the counties of Walla Walla, Columbia, and Whitman, to within a few miles of the Idaho boundary-line, whence an extension thirty miles in length will connect it with the Northern Pacific Railroad at the great falls of the Spokan River. The other branch is to follow a southerly direction over the Blue Mountains through La Gránd, Union, Baker, and Boise City, and eventually connect with the Central Pacific, and with the Utah Northern and Central Railroad at Ogden. The immediate and more important object of this enterprise is to provide an outlet for the products of the eastern portions of Oregon and Washington Territory, in connection with the steamboats navigating the Willamette, Columbia, and Snake Rivers. This country contains about four million acres of wheat-lands of the first quality. Besides the steamers and barges, the transfer included the locks at Oregon City, and forty-four miles of railroad. The Northern Pacific Railroad has a prospect of being speedily completed, and thus furnishing the settlers of the extreme Northwest with the direct connection

with the Mississippi Valley and the Atlantic seaboard to which they have long looked forward with impatient expectancy. The Oregon Central, the Western Oregon, and the Oregon and California Railroads, which have been of great service in developing the western parts of the State, though unprofitable to their original owners, have been consolidated under one management. The Oregonian Railway Company, limited, is constructing a series of narrow-gauge roads through some of the richest sections of the Willamette Valley.

A new channel was made through the bar of the Columbia River by scraping. It was opened to the depth of eighteen feet in August, and in a couple of months the scouring action of the tides deepened it about three feet more. The need of a deep channel from Portland to the sea is strongly felt. The cost and delay of lighterage, and the impossibility of large ships ascending the Columbia, occasion a constant dearth of tonnage and excessive charter rates. There are four bars, consisting of sand or clay, to be dredged away. The Board of Engineers appointed by authority of Congress to select a harbor of refuge, have decided upon Port Orford, in southern Oregon. This project, like the locks at the Cascades of the Columbia, for which improvement the chief of engineers presented an estimate of \$500,000 for the work to be done in 1881, is considered unprofitable; whereas there are pressing demands made on the Government for needed improvements in the navigation of the rivers.

The Republican State Convention assembled at Portland, April 21st. The Convention declared Blaine its choice for Presidential candidate, and nominated M. C. George for Congress. The platform contained the following resolutions:

That we are in favor of regulating and equalizing the salaries of county and State officers so that they shall receive such compensations as are usually paid to private persons under like circumstances of service and responsibility.

That we favor a thorough revision and equalization of our system of taxation, to the end that every species of property within its limits, whether owned or possessed by citizens of this or of foreign states, shall bear its equal proportion of the burdens of the Government which protects it.

That the recent action of the Democratic party in State Convention assembled, in denouncing the Supreme Court of the United States of America, and imputing the most unworthy and unpatriotic motives to that high and honorable Court, is unworthy of law-abiding, intelligent, and patriotic American citizens, and directly tends to the loosening of the foundation of our Government, the subversion of all law, and the overthrow of the sanctity of a system of judicature, venerable with age and perfected by wisdom.

That the attempt by the leaders of the Democratic party to defraud the people of the State out of an electoral vote, was an outrage unparalleled in the political history of the State, which, together with the Maine infamy and the attempt to unseat members in the halls of Congress for base partisan advantage, deserves the condemnation of all fair-minded men.

That we condemn the outrageous conduct of our Democratic State administrations from 1870 to 1878, their extravagance, their corruption, and their peculations.

That while we are in favor of a revenue for the support of the General Government by duties upon imports, sound policy requires such adjustment of import duties as to encourage the development of the industrial interests of the whole country, and we commend that policy of national exchange which secures to the workingman liberal wages, to agriculture remunerative prices, to mechanics and manufacturers an adequate reward for their skill, labor, and enterprise, and to the nation commercial prosperity and independence.

That we are in favor of judicious appropriations by the General Government for the improvement of our rivers and seaports, as well as for the construction of such lines of railway communication as will develop the resources of the country and connect our State with other parts of the Union, under such restrictions as will amply protect the rights of the people from unjust discrimination and extortionate charges; and that in the grants of lands to railroads we favor the sale of the same by the Government to the people at the lowest price for public lands, giving the proceeds only to the corporations.

That we demand of our representation in Congress their best endeavors to secure just and judicious appropriations and favorable legislation by the General Government for the free navigation of the Columbia and the rivers of the State, the improvement of the mouth of the Columbia and the harbors at Yaquina and Coos Bays, the location of a harbor of refuge at the point along our coast most available to the interests of commerce, the extension of the public surveys to meet the wants of our increasing population, and aid and assistance to railroads, and the opening up for settlement such of our Indian reservations as the interest of civilization demands and necessitates.

That we demand a modification of the treaty with China so as to restrict Chinese immigration to America.

The election returns showed 20,618 votes cast in the State for the Garfield electors, 19,950 votes for the Hancock electors, and 226 votes for the Weaver electors.

OSGOOD, Rev. SAMUEL, D. D., LL. D., was born at Charlestown, Massachusetts, August 30, 1812, of an old Puritan family, which has produced more than one eminent divine. He was a pupil of Dr. Willard Parker before entering Harvard College. He graduated in 1832, at the time when Ware and Channing were exercising their strong influence. He studied divinity at the Harvard School, and in 1835 entered the Unitarian ministry. In 1836 he moved to Louisville, Kentucky, and edited the "Western Messenger." In 1838 he returned to New England, and employed himself in pastoral duty there until 1849, when he was called to take charge of the Church of the Messiah, the leading Unitarian congregation of New York City. He filled this pastorate until 1869, when a change in his religious convictions required him to resign it. On his return from Europe in the following year, he was admitted to holy orders in the Protestant Episcopal Church. He sought no preferment in the church of his adoption. He was an erudite theologian and a fervent orator. He married Miss Murdock, daughter of the authoress of "Charlotte Temple." In early life Dr. Osgood was somewhat tinged by the novel social and religious ideas which permeated New England. He was versed in German philosophy. His first publications were translations of Olshau-

sen's "History of the Passion" (1839), and De Wette's "Human Life" (1842). In 1850 he became the editor of the "Christian Inquirer," and wrote largely for its columns, and for those of the "Christian Examiner," the "Bibliotheca Sacra," and the "North American Review." Some of these essays were republished as "Studies of Christian Biography" (1851). He was the author of "The Hearthstone" (1854), "God with Men" (1854), "Milestones in our Life Journey" (1855), "Student Life" (1860), "American Leaves" (1867), "Essay on the Ethics of Art" (1876), besides many orations and memorial discourses. He received his degree of doctor of divinity from Harvard in 1857, and that of LL. D. from Hobart College in 1860. He died in New York, April 14th.

OURAY, Chief, was born in Colorado about sixty years ago. The tribe of Utes to which he belonged, and which gave its name to Utah, was numerous, and subdivided into various bands. He was chief of the Uncompahgre Utes, whose specific title is probably a corruption of the Spanish term *un compadre*. Ouray's only son was captured by the Sioux, and is supposed to be still living among that hostile

tribe. He made many appeals to the Great Father at Washington in behalf of this boy. He was several times a visitor at the Federal capital to represent the grievances of his people. His dignity and eloquence were remarkable. He knew the Spanish language, and signed the letters he caused to be written to the President or to the Indian Department. His services were indispensable to the Government in conducting negotiations with the Utes, who kept in good faith all agreements made through him. He was known as the white man's friend among his tribe; but it is likewise true that he protected their interests so far as he could. They remained savage, but he accepted a certain degree of civilization. He built a comfortable house, owned and cultivated a farm, and used a carriage presented to him by the Governor of Colorado. He was a famous warrior in his youth, but in his old age he became a lover of peace. At the time of the Meeker murder his personal influence alone restrained the breaking out of hostilities. His last visit to Washington was to effect the sale of the Ute reservation in Colorado, which will now be difficult of accomplishment. He died, August 27th, at Los Pinos Agency, Colorado.

P

PARNELL, CHARLES STEWART, the head of the Irish Land League, was born in 1846. He is the son of the late John Henry Parnell, of Avondale, County Wicklow, who was at one time High Sheriff for the County of Meath. His grandfather was the last Chancellor of the Exchequer of the Irish Parliament, and a bitter opponent of the Union. His mother was the daughter of an admiral of the United States Navy. Soon after finishing his education at Magdalene College, Cambridge, he was elected in 1875, at the early age of twenty-nine years, member of Parliament for Meath, and he represented this constituency until 1880. He was elected as a candidate of the party of Home Rulers, and soon became a prominent member of the party. In 1877 he was one of the seven members of the party who tried to extort concessions from the Government by systematically obstructing the business of the House (see "Annual Cyclopædia" for 1877, article GREAT BRITAIN), and who were therefore called Obstructionists. By most of the leading men of the party he was, however, greatly disliked. He was never on any but bare speaking terms with Mr. Butt, and the relations between him and Mr. Shaw, the subsequent leader of the Home Rule party, were very similar. The breach between him and the party generally was considerably widened by an incident which took place in 1879. At a meeting of the Home Rule Committee he urged that, unless the Government granted a substantial University Bill to Ireland, the whole of the votes for the

Queen's College should be opposed. The proposal was rejected, and Mr. Parnell, who is a Protestant, is said, while smarting under defeat, to have used the words, "You are a cowardly lot of Papist rats!" A fierce controversy on the subject raged for some time in the Irish papers. It was asserted by some members of Parliament, and denied by others, that the words had been used. The report, at all events, gave rise to a great deal of bad blood, and alienated a great portion of the Home Rulers from Mr. Parnell and his projects. An attempt made by Mr. Parnell in 1879 to call a national convention, in which he intended to reconstruct the Home Rule party, failed through the opposition of the more conservative members of the party. On the other hand, he succeeded in October of the same year in organizing a "National Irish Land League," of which he was chosen president. (See IRELAND.) He was the principal and most popular speaker in the many meetings which preceded and followed the organization of the League, and his influence rapidly rose with the increasing power of the League. It was repeatedly said in 1880 that Ireland was no longer ruled by the Viceroy but by Parnell and the Land League. In January, 1880, he paid a visit to the United States to collect contributions for the poor in Ireland, and the House of Representatives in Washington allowed him the use of its hall for holding a meeting. At the new elections in 1880 he was simultaneously returned for Meath, Mayo, and Cork City, but elected to sit for the

last named. The influence which he had shown during these elections was so great that on May 17th he was chosen President of the Home Rule party in the place of Mr. Shaw. As the law advisers of the Irish Government conceived that Mr. Parnell and some other leaders of the Land League had brought themselves by the incendiary speeches within the grasp of the law, an information for seditious conspiracy was applied for by the Crown against Mr. Parnell, some other Home Rule members of Parliament, and several of the officials of the Land League. The state trial began on December 28, 1880, and it ended on January 25, 1881, in a non-agreement of the jury. On December 27th, Mr. Parnell had been reelected as the leader of the Irish Parliamentary party.

PENNSYLVANIA. The State Convention of the Republican party of Pennsylvania was held at Harrisburg on the 4th of February. It was called thus early for the apparent purpose of opening a vigorous campaign for the nomination of General Grant for the Presidency, his candidacy being favored by those prominent in the councils of the party in this State. The acknowledged leader of this faction was Senator J. D. Cameron, but there was also a strong element of the party which preferred Senator Blaine, of Maine, as the Presidential candidate. The contest in the Convention was opened by the following resolution offered by the Hon. John Cessna in the interest of the Grant movement and a united delegation:

Resolved, That a committee of nine members be appointed to report, subject to the approval of the Convention, a list of delegates and alternates to the National Convention and a list of Presidential electors, after consulting with the delegates from the different Congressional districts.

The following was immediately offered as an amendment in the Blaine interest:

Resolved, That a committee of one from each Congressional district be selected by the delegates from each Congressional district, whose duty it will be to report to the committee the names of four delegates-at-large to the National Convention and two electors-at-large; that it shall also be the duty of the Convention to report also a list of the district delegates to the National Convention, who are to be chosen by the delegates from the respective districts, including in their report the names of those persons who have already been chosen as delegates from their respective districts by the action of the people therein.

After some discussion the amendment was lost by a vote of 100 yeas and 150 nays, and the Cessna resolution was agreed to. The following was then offered:

Resolved, That the delegates elected to the Republican National Convention from this State are hereby instructed to support General U. S. Grant for the Presidential nomination, and to vote as a unit on that and all questions that may come before the Convention.

This produced considerable excitement, and the following was proposed on the other side:

Resolved, That, while we pledge ourselves to support the nomination of the Republican party, we see

no good reason for abandoning the position taken by the party in our own and other States in 1876 of opposition to a third Presidential term, and we hereby indorse and reaffirm the resolutions passed by our own State Convention, held in this city in 1876, upon this question.

After a warm debate the latter was withdrawn, and a motion made to substitute the name of James G. Blaine for that of General Grant in the former. This was defeated by a vote of 95 to 154, and separate votes were taken on the two clauses of the original resolution. That instructing the delegates to support General Grant was agreed to by a vote of 183 to 113, and the clause in favor of the unit rule was adopted by a *viva voce* vote. The following is the platform adopted:

Resolved, 1. That rejoicing, as we do, over the steady growth of the national prosperity, which began in 1876 with the change of the balance of trade in our favor, and over the successful resumption and maintenance of specie payments, we may reasonably claim the financial soundness and prosperity of the country as the natural result of the financial policy we, as a party, have sustained.

2. The resumption of specie payments having been accomplished, at the time appointed by law, and the finances of the country being in a thoroughly healthy condition, we regard it as unwise to engage in any new attempts at financial legislation. The country is prosperous under our financial system as it is, and we know of no good reason why that system should be now disturbed.

3. The persistent efforts of the free-traders to destroy our tariff, piecemeal, by legislation to repeal the duties on special articles, admonish us of the necessity of adhering more strongly than ever to the tariff policy of the past twenty years, which has built up our grand system of manufactures, fostered the revenues of the Government, and promoted our national prosperity. The business of the country will not bear this tinkering of the tariff; and if any revision of that tariff is to be made at all, it should be done through a commission of capable men, after a patient and thorough hearing of all parties to the interests involved.

4. We object most decidedly to all attempts to enact a new tariff through the agency of commercial treaties. A treaty framed, negotiated, discussed, and ratified in secret, is not a proper method of regulating the revenues of the Government.

5. In view of recent events in Congress and in the Southern States, and latterly in the State of Maine, we deem this a fitting opportunity to reaffirm our adherence to the following principles, viz.:

(1.) The union of the States—with equal rights—indestructible by any constitutional means.

(2.) Protection to the person, liberty, and property of the citizens of the United States, in each and every portion of our common country, wherever he may choose to move, demanding of him only obedience to the laws and proper respect for the rights of others.

(3.) Strict integrity in fulfilling all our obligations, State or national.

(4.) The perfect security of free thought, free speech, and a free press, and of equal rights and privileges to all men, everywhere, irrespective of nationality, color, or religion.

(5.) A pure and free ballot, thoroughly protected, so that every man entitled to cast a vote may do so, just once, at each election, without fear of molestation, moral or physical, on account of his political faith, nativity, or the hue of his skin.

(6.) Honesty in elections. The people having the virtue and the patriotism to govern themselves, our Government must depend for its stability upon honest elections. Until a man is considered infamous who

casts an illegal vote, our Government will not be safe, and whoever deprives a citizen of his right to vote, or of the legal effect of his vote, is a traitor to our Government.

(7.) An honest count of all votes legally cast, and an honest return of whoever is elected, free from all attempts to defraud the people of their choice through technicalities or by an arbitrary rejection of their votes.

6. We extend to the Republicans of Maine our congratulations over the peaceful and successful resistance to an effort to defraud the people of that State of the right to choose their own representatives, and to the attempt to steal the government of that State. Our Republican form of government will be a signal failure when any political party can succeed in defying the public will as shown by the people at the ballot-box.

7. We deeply regret the growing tendency to throw elections aside on mere technicalities and informalities. The right of the people to choose their public servants is too sacred to be subverted upon any pretext that the returns of election are deficient in some trivial matters of form.

8. We thank our Senators and Representatives at Washington, in the last Congress and in this, for their firm adhesion to Republican principles and policy, and for their opposition to Democratic schemes to renew the obsolete doctrine of State rights, and to cripple the Government by withholding needed appropriations in order to coerce legislation repealing all national laws that protect the purity of the ballot-box.

Resolved, That the chairman of the Republican State Committee is hereby instructed and required to carefully examine whether any person to-day placed on the electoral ticket be legally disqualified, from any cause, from serving as an elector; and, in case any such legal disability be found, the State Committee shall substitute another name from the same Congressional district.

The list of delegates and of candidates for electors was accepted as reported by the committee, and the membership of the State Central Committee was agreed to. The only State offices to be filled were those of Judge of the Supreme Court and Auditor-General. For the former, Henry Green, of Northampton County, was nominated; and for the latter, John A. Lennon, of Blair County.

The Democratic Convention was held at Harrisburg, on the 28th and 29th of April. There had been symptoms of division among the leaders of the party on the question of maintaining what is known as the "unit rule." Senator Wallace was at the head of those in favor of maintaining the rule, while Speaker Randall, of the national House of Representatives, led those who favored its abrogation. The latter was also understood to be in favor of the nomination of Samuel J. Tilden as the candidate for President, and the former to be opposed to it. On the meeting of the Convention there were contesting delegations from Philadelphia and from Alleghany County. A conference of the leaders took place, and it was agreed to refer all matters of differences to a special committee, to which all contests should also be referred without debate. The report of the committee threw out the Alleghany contest and admitted both delegations from Philadelphia, giving to each delegate half a vote. It also agreed upon an equal division of the delegates to the National Convention

and the members of the State Central Committee for the Philadelphia districts. This plan for compromise and harmony was accepted, and the Convention proceeded to appoint delegates to the National Convention, and to nominate candidates for electors. The Committee on Resolutions reported the following:

Resolved, That we, the Democratic party of Pennsylvania, in convention assembled, renew our vows of fidelity to the fundamental principles proclaimed and practiced by the illustrious men who settled our free institutions and founded the Democratic party to protect and preserve them.

Resolved, That the just powers of the Federal Union, the rights of States, and the liberties of the people, are vital parts of one harmonious system, and to save each part in its whole constitutional vigor is to save the life of the nation.

Resolved, That the Democratic party maintains, as it ever has maintained, that the military are and ought to be in all things subordinate to civil authorities. It denies, as it has denied, the right of the Federal Administration to keep on foot, at the general expense, a standing army to invade the States for political purposes, without regard to constitutional restrictions, to control the people at the polls, to protect and encourage fraudulent counts of votes, or to inaugurate candidates rejected by the majority.

Resolved, That the right to a free ballot is a right preservative of all rights, the only means of peacefully redressing grievances and reforming abuses. The presence at the polls of a regular military force, and of a host claiming power to arrest and imprison citizens without warrant or a hearing, destroys all freedom of elections, and ruptures the very foundation of self-government. We call upon all good citizens to aid us in preserving our institutions from destruction by these imperial methods of supervising the right of suffrage and coercing the popular will in keeping the way to the ballot-box open and free, as it was to our fathers, in removing the army to a safe distance from the people assembled to express their sovereign pleasure at the polls, and insuring obedience to their will when legally expressed by their votes.

Resolved, That Rutherford B. Hayes, having been placed in power against the well-known and legally expressed will of the people, is the representative of a conspiracy only, and his claim of right to surround the ballot-boxes with troops and deputy-marshals to intimidate and obstruct electors, and his unprecedented use of the veto to maintain this, is an insult and menace to the country.

Resolved, That the Democratic party, as of old, favors a constitutional currency of gold and silver, and of paper convertible into coin.

Resolved, That we are opposed to a system of subsidies by the General Government, under which during the period of Republican ascendancy, political rings and corporations profited at the people's expense, and to any appropriations of public moneys or public credit to any object but public service. The reforms and economies enforced by the Democratic party since its advent to power in Congress have saved to the people many millions of dollars, and we believe that a like result would follow its restoration to power in the State of Pennsylvania.

Resolved, That the Democratic party, being the natural friend of the workingman, and having throughout its history stood between him and oppression, renews its expression of sympathy with labor and its promise of protection to its rights.

Resolved, That we look with alarm and apprehension upon the pretensions of the great transportation companies to be above the fundamental laws of this Commonwealth, which governs all else within our borders, and, until they accept the Constitution of 1873 in good faith, they should remain objects of the utmost vigilance and jealousy of both the Legislature and the people.

Resolved, That the recent attempt, under the personal direction of ruling Republican leaders, to debauch the Legislature by wholesale bribery and corruption, and to take from the Commonwealth four million dollars, for which its liability had never been ascertained, is fresh and alarming evidence of the aggressiveness of the political ring, and should receive the signal condemnation of the people at the polls.

Resolved, That the great fraud of 1876-'77, by which, upon a false count of the electoral votes of three States, the candidate defeated at the polls was seated in the Presidential chair, and, for the first time in American history, the will of the people was set aside under a threat of military force, was the most deadly blow ever aimed at our system of representative government. To preserve our country from the horrors of a second civil war, the Democratic party submitted for the time, in the firm and patriotic faith that the people would peacefully redress the great wrong and signally rebuke the dark crime when they should come to vote in 1880. That issue precedes and dwarfs every other. It imposed a more sacred duty upon the people of the Union than ever addressed the consciences of a nation of freemen.

Resolved, That in conformity with the time-honored custom of the Pennsylvania Democracy, and to the end that our great Commonwealth shall not be deprived of her legitimate influence, her delegates to the National Convention are instructed to vote as a unit upon all questions, and they are further instructed to oppose the abrogation of the two-thirds rule.

The unit rule controversy was introduced by the last resolution, and the following was proposed as a substitute for the entire declaration: "That delegates to the National Convention be and they are hereby instructed to oppose the abrogation of the two-thirds rule." After a sharp debate, this was adopted by a vote of 125 to 122, which was a success for the Randall faction. The candidate selected for Judge of the Supreme Court was George A. Jenks, of Jefferson County; for Auditor-General, R. P. Dechart, of Philadelphia.

At the election in November the total vote for Presidential electors was 874,783, of which 444,704 were for the Republican, 407,428 for the Democratic, and 20,668 for the Greenback ticket. There were also 1,939 votes for the Prohibitory, and 44 for the "American" candidates. The Republican plurality over the Democratic vote was 37,276; majority over all, 14,625. The vote for Supreme Court Judge was 444,934 for Green, 406,904 for Jenks, 12,643 for Samuel Calvin, Greenback candidate, and 827 "scattering." The Legislature elected at the same time consists of 31 Republicans, 16 Democrats, and 2 Greenbackers in the Senate, and 123 Republicans, 77 Democrats, and 2 Greenbackers in the House.

The proper legislation has not yet been secured in Pennsylvania for the effectual execution of the provisions of the Constitution forbidding discriminations by railroad companies. Section 3, Article XVII, of the Constitution provides that "all individuals, associations, and corporations shall have equal right to have persons and property transported over railroads and canals, and no undue or unreasonable discrimination shall be made in charges for, or in facilities for, transportation of freight or passengers within the State, or coming from,

or going to, any other State. Persons and property transported over any railroad shall be delivered at any station at charges not exceeding the charges for transportation of persons and property of the same class in the same direction to any more distant station, but excursion and commutation tickets may be issued at special rates." Section 7, of the same article, provides that "no discrimination in charges or facilities for transportation shall be made between transportation companies and individuals, or in favor of either, by abatement, drawback, or otherwise, and no railroad or canal company, or any lessee, manager, or employee thereof, shall make any preferences in furnishing cars or motive power." Section 12, Article XVII, prescribes that "the General Assembly shall enforce, by appropriate legislation, the provisions of this article." While these requirements and prohibitions exist in the organic law, the "appropriate legislation" for their enforcement has not been obtained.

A litigation, begun by the State for the purpose of enforcing the rights of shippers as against the transportation companies, under existing laws, has been terminated by compromise and without any final adjudication upon the principles involved. During the year 1878, upon the petition of a large number of citizens engaged in the production of oil, charging that they were subjected to injustice by reason of discriminations in freights, the result of illegal confederated action between certain railroads and oil-shippers, suits in equity were instituted in the name of the Commonwealth by the Attorney-General, in the Supreme Court of the States, against the Pennsylvania Railroad Company, the Atlantic and Great Western Railroad Company, Dunkirk, Allegheny and Pittsburg Railroad Company, and the Lake Shore and Michigan Southern Railway Company. Separate bills were filed against each corporation, charging unlawful conspiracy with all the others, and the appropriate relief prayed for. The object of the Commonwealth was to procure a judicial declaration of the common law duty of carriers, in the absence of a statute, to the effect that charges must be the same for all persons similarly situated, and for all freights of a like kind and quality for a given service. After the testimony had been taken as against the Pennsylvania Railroad Company, it was proposed to compel that corporation to put in its evidence in answer. But, as there were allegations of conspiracy in which all were alike engaged, the Attorney-General decided not to put that company on its defense until the case against the others was also completed. There was delay on the part of the petitioners in placing their testimony in the hands of the Attorney-General, which indicated a disposition not to press the cases against the other companies. In the mean time indictments had been found, at the instance and in the interests of the same petitioners, in Clarion County against a

number of defendants for a conspiracy in the matter of procuring freight discrimination, in connection with other alleged offenses. Some of the defendants were residents in the State, within the jurisdiction of the court, and caused appearances to be entered for themselves; others were non-residents. For these demand was made upon the Executive for requisitions. Before a decision was reached, and while the equity suits were resting upon the determination that the Commonwealth should close its testimony against all the defendants, before any one defendant should be ruled to open its case and go on with its evidence, negotiations were entered upon between the petitioners and the railroad companies to settle by agreement their controversy. In referring to the final result, the Governor, in his message to the Legislature of 1881, says:

Finding that the highest process of the Commonwealth was being used simply as leverage for and against the parties to these negotiations between contending litigants, and that, however entire and perfect had been the good faith in which the criminal proceedings in Clarion County might have been commenced, they were being regarded and treated as a mere make-weight in the stages of private diplomacy, I deemed it my duty, in the exercise of a sound discretion, to suspend action on the requisitions. It resulted that an amicable conclusion between the litigants was reached; all suits were discontinued at the request of the original petitioners, and the litigation terminated without cost to the Commonwealth. It is believed that all the railroads over which the courts of Pennsylvania have jurisdiction are now prosecuting their business with oil-producers according to the spirit of the Constitution.

A decision was rendered by the Supreme Court of the State, in June, affecting the question of the valuation of the capital stock of corporations for purposes of taxation. The law provides, in case a corporation does not pay a dividend of six per cent. or more, that the assessment shall be made on an appraised value of the stock, which shall not be "less, however, than the average price which said stock sold for during said year." The officers of the corporation submit an appraisal, but the Auditor-General and State Treasurer, if not satisfied with this, may make one of their own. The Pennsylvania Railroad having paid less than six per cent. in dividends during the year ending in November, 1879, its secretary and treasurer reported as the appraised value of its stock capital \$51,652,650, the par value being \$65,870,200. The appraisal was based on the average market price during the year. The State officers appraised it at \$66,804,094, taking as the basis of their valuation the selling prices in the public market from the 1st to the 15th of November. The difference in the amount of tax due on the two valuations was \$45,454.32, and suit was brought for its recovery. The Court of Common Pleas of Dauphin County gave judgment for the State, and this was sustained by the Supreme Court on appeal. In rendering the final decision, Justice Paxson said:

The contention on the part of the company is, that the stock should have been appraised at its average selling value during the year for which the tax is laid, and not at its value from the 1st to the 15th of November succeeding; in other words, that the stock must be appraised at the average price for which it sold during the year. The act of Assembly does not say so. It requires an appraisal to be made between the 1st and 15th days of November of the stock of non-dividend-paying corporations, or those paying less than six per cent. Said stock is to be appraised at its cash value—"not less, however, than the average price which said stock sold for during said year." If the Legislature intended to have the stock appraised at its average price during the year, it was very easy to have said so. We find nothing in the act from which such intent can be gathered with any reasonable certainty. On the contrary, the use of the words "not less, however, than the average price which said stock sold for during said year," necessarily implies the power to appraise the stock at more than the average price during the year. The construction of the act contended for by the company would expunge the words above quoted, or render them nugatory. It is our duty to give them effect, if consistent with other portions of the statute. They mean just this: that if the stock of the company is lower when the appraisal is made in November than it was during the previous year, it shall be appraised at not less than the average selling price for the year. On the other hand, if it is higher in November, it may be appraised at its increased value. If it be objected to this view that the advantage is all on the side of the State, we may safely concede it to be so. The object of the act was to raise revenue, and it appears to have been drawn with care, and in the interest of the State.

We are of opinion that the learned Judge of the Court below rules the law correctly, and his judgment is accordingly affirmed.

The subject of revising tax laws, which is a trouble to so many States, is of pressing importance in Pennsylvania. The Attorney-General, in his report to the Legislature of 1881, says:

That taxes are grossly unequal has been a standing complaint for a generation. As, for instance, the land of the State owned by individuals is exempt from taxation for State purposes, together with the product or profit thereof, whether coal, oil, iron, timber, or farm produce. If owned by an association of individuals, combining their capital to promote an enterprise too great for a single-handed endeavor, the money that buys the land—viz., the capital—must, 1. Pay a bonus tax for a charter. 2. A tax on capital stock, measured by the amount of dividend paid, if equal to six per cent., and, if less, then by the actual value of the stock at a given time in the year. 3. If coal-land, until lately, to a tax of three cents per ton on coal mined, though every ton represents a portion of the capital stock already twice taxed. 4. The land itself, with all the buildings, machinery, improvements, bought and paid for by the thrice-taxed capital, is again liable to the onerous and excessive demands of local authorities for county, school, poor, road, and special tax. The adjoining tract, equally valuable, equally productive, owned by an individual, escapes with the payment of the local tax only, or one of the four paid by an association of citizens engaged in the laudable and necessary enterprise of developing the resources of the State. The owner of personal property, in a majority of cases, escapes assessment entirely, or, if his personal property be assessed, it is at one fourth its actual value. The owner of money at interest, if he makes an honest return, or if returned by the assessor, pays on the entire value thereof. The owner of a mortgaged farm pays taxes thereon equally with his unincumbered neighbor, and, in addition, the tax on mortgages, or, if not so stipulated in the bond, then the

mortgagee pays for him and adds to the rate per cent.

These instances will suffice to indicate, in some degree, the inequality and injustice of these laws.

As to their administration, the assessors are required to make oath to return the real and personal property at its actual value in cash. They deliberately and openly return the property at one third or one fourth its cash value. Mortgages and money at interest are neither returned by the owner or assessor or by a sort of tacit general understanding, and all, except a small fraction, escape taxation altogether. Such evasions of the law are the rule and not the exception. Assessors who attempted to perform their plain, sworn duty, would be visited with stormy indignation. Because the laws are felt to be grossly inequitable, unequal, and unjust, the people agree together to disregard and disobey them. Great diversity of practice exists in the different counties as to enforcement of the tax laws, and wide difference of opinion as to their proper interpretation. Persistent effort on the part of the Auditor-General to secure uniformity has not been rewarded with success. With such a heterogeneous mass of ill-assorted, mismatched patches, there is cause for wonder that county officials are enabled to perform their duty at all.

The following is the first official report of the population of Pennsylvania by counties, according to the Federal census of 1880:

Adams.....	32,454	Lackawanna.....	89,268
Allegheny.....	355,759	Lancaster.....	139,448
Armstrong.....	47,638	Lawrence.....	38,811
Beaver.....	39,603	Lebanon.....	38,476
Bedford.....	34,932	Lehigh.....	65,969

The population of the cities having more than 10,000 inhabitants is as follows: Philadelphia, 846,984; Pittsburg, 156,381; Allegheny, 78,681; Scranton, 45,850; Reading, 43,280; Harrisburg, 30,762; Erie, 27,730; Lancaster, 25,769; Wilkesbarre, 23,339; Altoona, 19,716; Williamsport, 18,934; Allentown, 18,063; Chester, 14,996; York, 13,940; Pottsville, 13,255; Norristown, 13,064; Easton, 11,924; Shenandoah, 10,148.

The receipts of the State Treasury for the fiscal year ending with November 30th were \$6,720,334.17; expenditures, \$6,820,119.49. For the year ending November 30, 1881, the estimated revenues are—

The general fund.....	\$3,244,000 00
The sinking fund.....	2,160,000 00
	\$5,404,000 00

The estimated expenses for the same period are—

From the general fund.....	\$4,015,000 00
From the sinking fund.....	1,844,988 50
	\$5,899,988 50

This will leave a deficit in the general fund of.....	\$771,000 50
There was at the beginning of the year a deficit in appropriations unpaid of.....	1,043,000 50

Deficiency to be provided for in 1881..... \$1,514,000 50

During the year 1882 over \$10,000,000 of the State loans will become payable by the terms of the acts creating them as follows:

Six per cents.....	\$9,271,850
Five per cents.....	1,209,350
Four and a half per cents.....	87,000
	\$10,568,200

The whole number of graded schools in the State is 7,037; schools not graded, 11,618. The whole number of pupils on the rolls of the public schools for the year was 937,310, and the average attendance was 77 per cent. of the number. The expenditures for the year ending with June, not including those of normal or orphan schools, were \$7,482,577.75. The value of school property is \$25,467,097. The total indebtedness of school districts throughout the State at the close of the last year was \$2,648,495.84, while the unexpended balances in their treasuries amounted to \$1,425,213.16. There are ten of the normal schools, and there were 2,900 pupils in attendance during the year. The value of their property is estimated at \$1,366,395.17. In their establishment \$400,000 was contributed by private subscription, and up to 1878 the State had contributed \$645,000 for grounds, buildings, and apparatus. They have debts amounting to \$250,000. The State has for several years appropriated \$100,000 annually for these institutions, which sum has been equally divided among the ten. The orphan schools contained 2,580 pupils during the year, and cost \$351,431.59 for their support. Children admitted under existing laws must belong to one of three classes: 1. Those whose fathers were either killed or died of disease while in the army. Only one hundred of this class remain. 2. Those whose fathers have died since the close of the war of wounds or disease contracted while in the service. 3. Those whose fathers are living, but are so disabled by wounds or disease contracted while in the army that they are unable to support their families; and, in all cases, the children must be under sixteen years of age, and in destitute circumstances.

The superintendent, in his annual report, says: "In making the usual appropriations for the orphan schools the Legislature of 1878 provided that no more children should be admitted into them after the first day of June, 1882, and that they should be finally closed on the first day of June, 1885. Should this law stand, the system can be made to come to an end in a

way both creditable to it and to the State. The record it will leave will form the brightest page in our history. It will have supported, educated, and prepared for usefulness twelve thousand of the sons and daughters of dead and disabled soldiers, and will have expended in this noble work the magnificent sum of \$8,000,000. The whole world may be searched in vain for another such example of patriotic benevolence."

W. H. Kemble, Charles B. Salter, W. F. Rumberger, Jesse R. Crawford, and Emile J. Petroff, charged with corrupt solicitation of members of the Legislature to secure the passage of the act providing for payment by the State of losses occasioned by the railroad riots in Pittsburgh in 1877, were indicted and brought up for trial in the Court of Quarter Sessions of Dauphin County early in the year. The law under which they were to be tried was passed in 1874, and provided as follows:

1. That any person or persons who shall directly or indirectly, by offer or promise of money, office, appointment, employment, testimonial, or other thing of value, or who shall by threats or intimidation, endeavor to influence any member of the General Assembly, State, county, election, municipal, or other public officer, in the discharge, performance, or non-performance of any act, duty, or obligation pertaining to such office, shall be guilty of the offense of corrupt solicitation and liable to an indictment for a misdemeanor, and on conviction thereof shall be sentenced to pay a fine not exceeding one thousand dollars, and to undergo imprisonment not exceeding two years, at the discretion of the Court.

2. That any occupation or practice of solicitation of members of either House of the General Assembly, or of public officers of the State or of any municipal division thereof, to influence their official action, shall be deemed a misdemeanor, and any person convicted thereof shall be punished as provided by the preceding section. *Provided*, That any open address upon, or explanation of, any measure or question before either House of the General Assembly, or any committee or member thereof, or before any municipal council or board or committee thereof, or before any public officer, shall not be held to be solicitation within the meaning of this section.

When the accused appeared before the Court for trial at Harrisburg, on the 8th of March, general surprise was occasioned by pleas of guilty on the part of Kemble, Salter, Rumberger, and Crawford. Kemble attempted to qualify his plea by a declaration that he did not "corruptly offer any money or thing of value unto any or either of the persons named in the indictment." This was not admitted as part of the plea, but by leave of the Court it was filed in a protest. Petroff was tried and convicted by a jury, and March 29th was appointed for passing sentence on all the accused persons. An appeal was made to the Board of Pardons, which consented to a special session on March 27th to consider the petitions. The petition of William H. Kemble, after recalling the circumstances attending the effort to pass the Riot Indemnity Bill, stated that the "petitioner had no personal interest in the measure, but desired its passage in common with many of the best citizens of the State. The excitement referred to culminated in a committee of investigation, before which he appeared and frankly stated his participation in the matter. On consultation with his counsel he ascertained for the first time that his statements and facts, as given in his examination before the committee, rendered him guilty of a technical violation of the act of 1874, and subjected him to the charge of corrupt solicitation. With no disposition to withhold the truth, he could only reaffirm his testimony before the committee, and, therefore, he pleaded guilty to such charge, but protested, at the time of filing said plea, that he had not promised or offered to either or any of the persons named in the bill of indictment any money or thing of value to influence him in his vote or official action in relation to said bill, and that said plea should not be construed as an admission on his part that he had corruptly offered or promised any money or thing of value to said person or persons mentioned in said indictments."

The Board of Pardons gave a hearing to counsel and listened to letters and statements, and a remonstrance was entered by the counsel of the Commonwealth. The result was a refusal to recommend a pardon of the offenders by an equal division of the board, Secretary of State Quay and Secretary of Internal Affairs Dunkel favoring the pardon, and Lieutenant-Governor Stone and Attorney-General Palmer opposing it. The board also refused to hold another session, after sentence should be passed, to consider the question again. When, on the 29th of March, the five convicted men were called in court to receive sentence, none of them appeared, and it was speedily noised abroad that they had fled. It proved that Kemble had left the State, but he subsequently returned of his own accord, and on the 26th of April sentence was passed on the five prisoners. Judge Pearson said, in pronouncing the sentence:

"You are each charged with corruptly soliciting members of the General Assembly, and endeavoring to induce them, under promise of money, to vote for the passage of a bill under consideration. Four of you have pleaded guilty, and one has been convicted, after an impartial trial. It is greatly to be regretted that for years the practice has been carried on in the Legislature. It was charged throughout the whole country that bribery in the Legislature was the great evil of the day. So crying was this that, when the Convention met to revise the Constitution of the State, it was decided to make the most stringent laws and enact heavy penalties to meet the case of a legislator withholding or giving his vote on any measure for a consideration." The Judge then referred to the law of 1860, which provided that the punishment should be five years and one thousand dollars fine, and then he said: "To this has been added the disqualification of the defendant from holding any office of honor, profit, or trust in the Commonwealth. Even the occupation of soliciting members' votes is prohibited by fine and imprisonment, and this meets that large class of men who hang about legislative halls who are known as 'borers.' However trivial you may have considered your offense is not looked upon by this Court in such a manner. The public treasury has been plundered, and others made great gains by this practice. What was particularly noticeable in this case is that two of

you were members of the Legislature. Individually, I feel a pity for your situation, but as Judge of the Court I must carry out the law. The beggar in rags who steals a loaf of bread, or the millionaire in broad-cloth, is treated the same. It can not be pleaded that the bill was highly meritorious, for if it had been it would have passed the Legislature. You are not like some who come here. You can not be excused on the ground of ignorance, because you are all intelligent men. You went into this thing with your eyes open, because you knew many members of the Legislature were corrupt. The sentence of the Court is that each of you pay a fine of one thousand dollars, the costs of prosecution, and that you serve a term of imprisonment of one year in the Eastern Penitentiary."

Considerable excitement was occasioned by the sentence, and new efforts were made to save the offenders from the punishment of the law. These resulted in a new intervention of the Board of Pardons and the adoption of the following recommendation:

To his Excellency HENRY M. HOYT, Governor of Pennsylvania:

The Board of Pardons recommend that so much of the sentence of the Court of Quarter Sessions of Dauphin County imposing imprisonment by separate and solitary confinement at hard labor in the Eastern Penitentiary on William H. Kemble, Jesse R. Crawford, William F. Rumberger, Emile J. Petroff, and Charles B. Salter, for the crime of corrupt solicitation of members of the Legislature, be remitted, and that the remainder thereof, imposing payment of fine and costs and disqualification to hold any office of trust or profit under the commonwealth, be executed, for the following reasons:

The act of 1874 defining the crime of corrupt solicitation provides for simple imprisonment. No power is lodged in the courts by the Constitution or laws to add to or impose conditions not contained in the statute. The sentence in these cases superadds to the statutory punishment the conditions that the imprisonment shall be by separate and solitary confinement at labor in the Penitentiary, and that the prisoners shall be fed and clothed as provided by law. In numerous analogous cases the Supreme Court of the State have decided such enlarged sentence unlawful, and by the common law imprisonment in the Penitentiary has always been regarded as infamous. In view of the foregoing facts and of the severity of the punishment remaining to be executed for an offense recently made punishable, and for which these are the first convictions, we make the foregoing recommendation.

HENRY W. PALMER,
Attorney-General.
M. S. QUAY,
Secretary of Commonwealth.
AARON K. DUNKEL,
Secretary of Internal Affairs.
CHARLES W. STONE,
Lieutenant-Governor.

This was promptly acted upon by the Governor, the pardons were signed, the fines paid, and the prisoners discharged early in the month of May.

The General Assembly, in 1879, by joint resolution, directed the Attorney-General to institute proceedings against the American University of Philadelphia for abuse of its franchises "in the unlawful sale of diplomas to persons who had not pursued the prescribed course of study, and who were unfitted, by reason of ignorance, to practice medicine." Writs of *quo warranto* were sued out against the American University of Philadelphia, and

the Eclectic Medical College of Pennsylvania, an institution of the same character and controlled by the same persons, and the result was the forfeiture of their charters, and the conviction and imprisonment of the manager and official head, known as "Dr." John Buchanan, for violating the laws relative to the sale of diplomas, and for other crimes. When evidence was first obtained against Buchanan of dealing in bogus diplomas, he endeavored to escape arrest by a ruse, pretending to jump overboard from a ferry-boat and drown himself. This was discovered to be a trick, and it was found that Buchanan had fled to Canada. He was arrested at St. Clair, Michigan, in September, and speedily brought to justice.

PERSIA, a country of Asia. Reigning sovereign, the Shah Nasred-Din. Born April 24, 1831; succeeded his father, Mohammed, in September, 1848. The heir-apparent to the throne, Muzaffer-ed-Din, was born in 1854, and has two sons.

The area of Persia is about 1,647,070 square kilometres, or 637,000 square miles. The population is given by the "Gotha Almanac," according to a correspondence from Teheran, as 7,000,000,* among whom there are about 80,000 Armenians (and Nestorians), 20,000 Israelites, and 8,500 Parsees. The population of the principal cities is as follows: Teheran, 200,000; Tabreez, 120,000; Ispahan, 60,000; Meshhed, 60,000; Resht, 60,000.

The first regular postal service was opened in January, 1877. The number of letters sent in that year was 366,000; the number of postal stations, 43. The number of telegraph-offices was 71; the aggregate length of the lines was 5,432 kilometres, of wires 9,113 kilometres; the number of dispatches sent in 1878, 500,000; the receipts, 350,000 francs.

The close connection existing between Persia and western Afghanistan, where the Persian language is almost exclusively spoken, naturally involved the Persian Government in the negotiation concerning a final solution of the Afghan question. The British Government offered to release Persia from the engagement to which it had long been held not to occupy Herat, in return for which Persia was expected to concede to English companies certain rights within its territory, and to consider England rather than Russia as its friend and ally. An announcement, which was made on the subject in the British Parliament, created a great deal of uneasiness in Russia. Before availing itself of the English offer, the Persian Government desired to obtain some guarantee on the part of England that it would be eventually assisted by that power in maintaining its position at Herat, and a suggestion was made by the Persians that a convention should be concluded between England and Persia similar to that

* "The Statesman's Manual" for 1881 gives Persia only 4,400,000 inhabitants, composed of about 1,000,000 inhabitants of cities, 1,700,000 belonging to wandering tribes, and 1,700,000 inhabitants of villages and country districts.

† See "Annual Cyclopædia" for 1879, p. 7.

which had been concluded between England and Turkey for the protection of Asia Minor. The Shah had begun to prepare an expedition for the occupation of Afghan Seistan, and eventually of Herat, even before receiving the British proposals. The expedition was, however, abandoned about the first of March, on the ground of the expense, and because political difficulties, which the country was not prepared to face, would be likely to result if it were persevered in. In April the Persian Government decided not to accept the English offer. Several tribes of Kurds rose in insurrection early in September, and were immediately joined by bodies of men from Turkish Kurdistan. The reinforcements were sent by the Turkish Kurdish Sheik Abdullah, and were commanded by his sons; and the whole movement appears to have been inspired by that chief, and under his direction. The Sheik Abdullah was regarded by the Kurds as a kind of national saint or great prophet, and was held in exalted esteem by the Sunni Moslems of Turkey and Arabia, and even in Africa, as the third dignitary of the Faith, being next in rank to the Shereef of Mecca. He was really a man of much ability and tact. He had in the previous year resisted the collection of taxes in the Kurdish district by the Governor of Ooroomiah, and had compelled him to agree to a compromise in the matter. In the present year he had endeavored by negotiations to have those districts placed under his own control on condition of his guaranteeing their revenues to the Persian Government, but having failed, had decided to make war. A force of eight or ten thousand men under Sheik Abdel-Kadir entered Persian territory, swept through the districts of Sooldooz, Foshnoo, and Sonj Boolak without interruption, being furnished with provisions by the populations on the route, and marched toward Tabreez. A second division was collected near Ooroomiah, with the view of operating against that position, and a third division was assembled north of Ooroomiah, to proceed to Tabreez by the northern shores of Lake Ooroomiah. The Persian Government ordered the dispatch from different places of twelve battalions of infantry, two thousand cavalry, and twelve guns, under the command of Hishmet-ed-Dowleh, uncle of the Shah. The nearest of the points at which troops could be got was, however, ten days' march from the scene of the rebellion, and it was not easy to collect troops. The inhabitants of South Bulak, the governor of which place had fled on the approach of the insurrectionists, submitted to the Kurds. The town of Mirandoab and four large villages were pillaged by them, and their inhabitants massacred; and more than one hundred villages, it was said, were ravaged. The Sheik Abdullah issued a proclamation calling upon the Turkish and Persian Kurds to unite as an independent nation, with himself as their sovereign, and he made overtures to the Nestorian Chris-

tians to join with him in an effort to expel the Turkish and Persian rulers from the country. He also professed to entertain a high regard for the English, and sought to cultivate friendly relations with the American missionaries for the sake of their influence with the British Consuls, assuring them that he would rule impartially as between Moslems and Christians. The Christians, who lived near his stronghold, testified that his recent treatment of them had been good. Abdullah, it was said, also sent messengers to the brother of the Shah, who was supposed to be hostile to his Majesty, with an invitation to him to put himself at the head of the movement and establish a separate sovereignty. The prince immediately took the letter of invitation and the messengers to the Shah. The Persian Government appealed to Russia for help against the Kurds, and the Government of St. Petersburg, in response, instructed the Russian commanders on the frontier to furnish aid under certain limitations, but strictly forbade any violation of Turkish territory. A besieging army of Kurds assaulted Ooroomiah in October, but was repulsed by the garrison with heavy loss. It then raised the siege and retired, and the forces on the opposite side of the lake surrendered to the officer commanding the Persian troops. The principal body of Kurds twice attacked the Persians at Beenab, and was repulsed, after which it retreated. The British consul started from Ooroomiah for Tabreez through a district which had been occupied by the Kurds in force, and the insurrection was then pronounced at an end.

The famine which prevailed in Turkish Armenia during the spring and early summer extended also into Persia, and became severe in the Province of Azerbajan. Six hundred deaths from starvation were reported in the district of Ooroomiah from January to May, and twelve hundred Christians were compelled to leave the country. The British consul-general at Tabreez wrote in June that "the condition of the people was desperate, that deaths were occurring daily at a frightful rate," and gave a graphic picture of intense suffering among all the people of the poorer classes.

The cultivation of opium has been greatly developed in Persia within a few years. Formerly the Persian opium was much adulterated and held in low esteem in the Chinese market. It has more recently been prepared pure, and the price at which it is sold has been nearly doubled. Before 1875 the annual product of opium was only about two thousand cases of one hundred and forty pounds each. The product for 1878-'79 rose to 6,700 cases, and that for 1879-'80 was estimated at the same amount.

PERU (REPÚBLICA DEL PERÚ). Statements of the territorial division, area, population, etc., have been given in the "Annual Cyclopædia" for 1873, 1875, 1878, and in the article BOLIVIA in the volume for 1879.

During the past year the country was governed by Colonel Nicolás de Piérola, with the title of Supreme Chief (*Jefe Supremo*). The Cabinet was composed of the following Ministers: Interior, Señor Orbegoso; Foreign Affairs, Señor Pedro José Calderon; Finance, Señor Manuel A. Barinaga; War, Señor Miguel Iglesias; Navy, Señor Manuel Villar; Justice and Public Instruction, Señor Federico Pánizo; Commerce, Public Worship, etc., Señor Mariano Echegaray. The staff Major-General of the Army and Navy was P. Silva; and the Commandant-General of the Navy, J. M. García. The Postmaster-General was Señor F. de P. Muñoz. The Archbishop of Lima is the Rt. Rev. Orueta y Castrillon. The Peruvian *chargé d'affaires* in the United States is Señor José Carlos Tracy (resident in New York); and the United States Minister Plenipotentiary to Peru, Mr. J. P. Christiancy.

For the respective strength of the army and navy, up to the commencement of last year, reference may be made to the "Annual Cyclopædia" for 1879. It may here be stated that by the end of 1880 the Peruvian fleet had been almost completely annihilated by the uniformly successful Chileans.

Of the present condition of the national finances nothing definite can be said, nor have any returns of an official character been made on which to base an approximate statement. Previous to the war, the revenue, for the most part derived from the sale of guano and nitrate, and to a certain extent from the customs department, fluctuated between 30,000,000 and 50,000,000 soles,* and the expenditure between 40,000,000 and 60,000,000. Vast outlays, regarded abroad as unwarranted, were made on railways, iron-clad vessels, etc., giving rise to large annual deficits; and, even without the additional expenses of war, hopeless bankruptcy for the republic was predicted as the inevitable issue.

Peru's onerous national debt comprises the home liabilities, estimated at 20,000,000 soles, exclusive of a floating debt of unknown amount, greatly increased by extensive issues † of paper money in 1879 and 1880 to carry on the war; and the foreign liabilities, amounting, in July, 1879, to £45,268,103.40, or 226,340,516 soles, at five soles to the pound sterling. ‡ There is now, however, a fair prospect of ultimate liquidation of this debt, the Chilean Government having generously consented to the shipment, for the benefit of the Peruvian bondholders, of guano from the deposits secured by conquest. The conditions to which the shipments are subject may be briefly stated as follows: 1. A royalty of £1.10 per ton of guano so exported to be paid to the Chilean Government, in drafts on London at ninety days'

sight, before the cargoes leave Valparaiso; 2. The intervention of the Chilean Government in the appointment of a responsible firm that will undertake to pay the royalty, defray the expenses of removal and shipment of the guano, and receive and sell the stuff in foreign markets. (See also the article CHILE in the present volume, and that of PERU in the volume for 1879.)

The foreign commerce of Peru was, previous to 1879, of an average value of 80,000,000 soles, the exports representing about 50,000,000. The total values of the exports to and imports from Great Britain for each year of the decade 1870-79 are exhibited in the following table:

YEARS.	Exports.	Imports.
	Soles.	Soles.
1870.....	24,405,375	8,505,865
1871.....	19,859,840	10,798,850
1872.....	21,058,615	14,351,190
1873.....	26,097,860	12,623,110
1874.....	22,506,065	7,966,905
1875.....	24,420,905	7,972,495
1876.....	28,153,350	4,956,520
1877.....	28,452,510	6,381,970
1878.....	26,161,825	6,849,155
1879.....	16,942,660	3,787,135

The principal commodities imported from Great Britain were cotton and woolen fabrics. Among the minor exports from Peru to that destination were raw sugar, which in 1879 was of the value of 6,903,110 soles; sheep's and alpaca wool, 1,643,840 soles; and copper, unwrought or partly wrought, 506,420 soles. But by far the most important staples of export to Great Britain were guano and cubic niter, the total values of each of which for each of the ten years 1870-79 were as follows, in pounds sterling:

YEARS.	GUANO.		NITER.	
	Tons.	Values.	Tons.	Values.
1870...	243,434	£3,243,998	1,068,972	£2820,353
1871...	142,865	1,711,176	1,293,905	1,013,415
1872...	74,401	875,582	1,365,195	1,045,383
1873...	138,895	1,732,554	2,176,239	1,604,040
1874...	94,346	1,207,679	1,894,018	1,134,008
1875...	86,342	1,068,570	2,979,876	1,793,110
1876...	156,564	1,966,063	3,064,707	1,761,450
1877...	111,835	1,375,023	1,247,909	841,074
1878...	127,813	1,469,405	1,667,521	1,238,625
1879...	44,325	480,927	879,103	602,872

At the end of 1877 there were in the republic twenty-two railway lines (open to traffic or in process of completion), of a total length of 2,030 miles, and representing a total cost of £35,994,920, or 179,974,600 soles. Eleven of these lines were the property of the Government; eight belonged to private companies or individuals, and these are partly government and partly private property. "Of the railways belonging to private individuals," writes the British Minister to Peru, in 1878, "only the double line from Callao to Lima and Chorillos (17 miles in length) is reported to be a commercial success; and 232 miles of difficult railway have been made, at a cost of £6,000,000,

* The sol is equivalent to about 90 cents of United States money.

† The total amount of these issues, up to October 31, 1880, was estimated at 35,000,000 soles.

‡ For further particulars relating to the debt, see "Annual Cyclopædia" for 1873 and 1879.

in order to have three or four freight-trains weekly."

On quitting Peru, December 18, 1879, President Prado left the executive power in the hands of the Vice-President, General La Puerta, than whom, it would appear, none more ill-suited could have been chosen for such a charge at that critical juncture. Popular discontent at once became visible, and, the sentiment spreading to the troops at Lima, a violent revolutionary movement ensued, in favor of Don Nicolás de Piérola, which ended in the establishment of the latter at the head of the Government, with the self-bestowed title of Supreme Chief. We here transcribe the proclamation issued by Piérola at Callao on the 22d of the same month:

TO THE PEOPLE AND THE ARMY: Silent and sorrowful before the exigent demands of the people and the army, I resigned myself to circumstances during the days which followed the shameful flight of Prado and the advent of the superannuated General La Puerta, hoping that the army would decide at last to overcome the scruples of a misunderstood loyalty which stayed a part of it from acting according to its convictions, which are those of the nation, and desirous of avoiding any collision between brothers and the loss of a part of our forces.

The headlong and impatient ambition of General La Cotera, after brutally stifling the unanimous voice of the people of Lima and Callao, provoked a conflict yesterday, employing the forces under his command to disarm the patriots of the army, whose only aim was the salvation of the country and the defeat of the foreign foe.

In Lima but a few moments sufficed to show how irresistible was the patriotic desire of the people and the army, and it would have sufficed for me to remain a few hours more in the capital to end all resistance.

Yielding, nevertheless, to the motives I have already expressed, I preferred to retire to this city, which has received me without any manner of resistance, to the end of making impossible all chance of strife between brethren and of favoring the tranquil adhesion of those remaining in Lima to the political *régime* proclaimed months ago by the whole nation.

Thus all conflict is made utterly inexcusable, and throws in its true light the responsibility for its evils upon its sole authors.

That portion of the army still under their orders in Lima will not, I am confident, permit this responsibility to become a fact, to the immeasurable injury of all. The hour of national reparation has come. In the series of disasters which have marked the history of our foreign war, Peru has no part. In shaking off, as she now does, the old rule, she raises the most eloquent protests against that deplorable history, and presents herself worthy of her name and her destinies before the other peoples of the earth.

For us there is, as there can only be, but one aspiration—a swift and full triumph over the foreign enemy. To achieve this work, we are now all brothers, without the memory even of our past divisions, and drawn one to another by the indissoluble tie of love for Peru.

Whatever may retard for an instant the complete national unity is an act of treason to our country. Unity is the one condition of the power and triumph of Peru. To that end has ever consecrated and now consecrates his most zealous efforts, your fellow-citizen and comrade in arms, N. DE PIÉROLA.

Thus the constitutional government was, in the short space of four days, overthrown, and replaced by a dictatorship, as indicated by the following decree:

NICOLÁS DE PIÉROLA, Supreme Head of the Republic: Considering—

I. That the inhabitants of Lima and Callao, by their respective acts, have spontaneously invested me with supreme authority in the state, with full and complete powers;

II. That the army and navy of the republic have adhered to this step, which has been long the general aspiration of the country, and that it is confirmed by the army in the south and by all the towns in telegraphic communication with the capital:

I decree:

SOLE ARTICLE. With the title of Supreme Head of the Republic I accept the position and powers with which I have been invested.

The Chief Clerk of the Ministry of Foreign Affairs is intrusted with the publication and communication to the proper persons of this decree.

Given in the Government-House in Lima, this 23d day of the month of December, 1879.

NICOLÁS DE PIÉROLA.

By order of his Excellency:

The Chief Clerk of Foreign Affairs,
E. LARRABURE Y UNÁNUE.

Piérola, by some called the evil genius of Peru, and to whose influence may be traced much of the disaster that has befallen that republic, has been spoken of by United States Minister Christiancy as a man of great mental capacity, of boldness and decision, and one whose inclinations are generally believed to be kind and humane. "Yet he most thoroughly believes," adds Mr. Christiancy, "that in time of war, or any great national crisis, the law of self-preservation is superior to any written constitution. He is now to be tested, and so much is expected of him that it will be hard to meet all these expectations; and it is quite possible he may fail, and, in the course of a year, become as unpopular as Prado is to-day." Piérola displayed, during the first weeks of his dictatorship, no common energy in levying troops, forming new regiments, issuing decrees, and adopting vigorous measures of reform in many branches of public administration in which they were urgently needed. The war in the mean time was progressing on the coast. The slight check sustained by the Chilians in Tarapacá on November 26, 1879, far from discouraging them, seemed but to stimulate their ardor, and the Peruvian columns were almost immediately forced to retreat upon Arica. Before the end of March, 1880, the Chilian divisions commanded by General Baquedano invested the town of Moquegua, and on the 23d of the same month took possession of Torata. This last victory, at a cost of but eight killed and twenty-seven wounded, made the Chilians masters of the roads leading to Arequipa. On May 26th the important town of Tacna, which had long been the objective of Baquedano's efforts, was taken, after a fiercely-contested battle, in which the allied troops, commanded by Admiral Montero, Prado's successor, and the new President of Bolivia, General Campero, were completely routed and dispersed. In this encounter the allies, numbering in all 8,320 (5,120 Peruvians and 3,200 Bolivians), were divided into two wings, the left under Colonel Camacho and the right under Cam-

pero. The Chilians, instead of attacking in front, as had been expected, hurled their whole force on the left wing, which was repeatedly reinforced from the reserves under Montero's command. But no reserves could avail against the impetuous attack of an enemy of superior strength and flushed with former successes. Camacho was killed in this disastrous fight, and it was now seen that Arica must fall, as it did early in June, after a desperate struggle against the united efforts of the Chilian land and sea forces. Meanwhile the Chilian squadron, after destroying Mollendo, blockaded Callao and the other Peruvian ports southward, and prepared for the bombardment of Callao, and an expedition under the command of Bagedano to invest the Peruvian capital itself. Ever since the wreck of the Independencia and the subsequent capture of the Huáscar, under circumstances so honorable to the courage of both contestants, the fortunes of war seemed to have become steadily adverse to the Peruvian arms. By the good offices of the United States Government, endeavors had been made to bring the war to a termination, but the conditions of peace presented by the Chilian Plenipotentiary to those of Peru and Bolivia on October 22, 1881, were rejected by the latter. These conditions were as follows:

1. Cession to Chili of the Peruvian and Bolivian territories extending south of the Quebrada de Camarones and east of the line which, in the Cordillera of the Andes, separates Peru from Bolivia as far as the Quebrada de la Chacarilla, and to the west also of a line stretching from this point to the Argentine frontier, passing through the center of the lake Ascotan.

2. Payment to Chili by Peru and Bolivia, in coin, of the sum of \$20,000,000, of which amount \$4,000,000 to be paid forthwith.

3. Restitution of the property of which Chilian enterprises and individual citizens have been divested by Peru and Bolivia.

4. Restoration of the transport Rimac.

5. Abrogation of the secret treaty entered into between Peru and Bolivia in the year 1873, at the same time remaining without value or effect whatsoever the steps taken with the object of establishing a confederation between the two nations.

6. Retention by Chili of the territories of Moquegua, Taena, and Arica, occupied by the Chilian forces, until such time as the preceding conditions shall have been fulfilled.

7. Peru to be under obligation not to fortify the port of Arica when handed over to her, nor at any period, and to undertake that it will subsequently be a commercial port exclusively.

At the end of 1880, then, Peru had, with the exception of her capital and a few minor towns, lost everything but her courage, and the obstinate determination not to surrender or give up the struggle until utterly incapacitated to continue it. (See articles BOLIVIA and CHILI in this volume.)

PLUMER, WILLIAM SWAN, was born in Darlington, Pennsylvania, July 25, 1802; died October 22, 1880, in the seventy-ninth year of his age. He was a graduate of Washington College, Virginia, in 1825; studied theology at Princeton, New Jersey; was licensed to preach in 1826, and, a year later, organized the Presbyterian Church in Danville, Virginia. He afterward removed to Warrenton, North Carolina, where he also organized a church, and later he preached in Raleigh, Washington, and Newbern, North Carolina. In 1834 he became pastor in Richmond, and in 1847 in Baltimore. In 1837 he founded "The Watchman of the South," which he edited for eight years. In 1854 he became professor in the Western Theological Seminary at Allegheny City, Pennsylvania, and from there he went to the seminary at Columbia, where he remained until a short time before his death, which took place at the Union Protestant Infirmary, in Baltimore. Dr. Plumer was the author of voluminous works, some of which became standard among students of the evangelical denominations. His ancestors were among the first settlers of Newburyport, Massachusetts.

POLAR REGION. The well-known statistical periodical, "Die Bevölkerung der Erde," edited by Behm and Wagner, gives in vol. vi (Gotha, 1880) an estimate of the extent of all the polar regions, inclusive of all the recent discoveries. It gives the following tables:

I. NORTH POLAR TERRITORIES.

TERRITORIES.	Area in sq. kilometres.	Population.
1. Arctic America.....	1,801,080	unknown
2. Greenland.....	2,169,750	10,000
3. Iceland.....	104,785	72,000
Jan Mayen.....	418	not inhabited
Spitzbergen, with the Bear Island.....	79,963	"
Francis Joseph Land.....	29,850	"
Nova Zembla.....	91,813	"
New Siberian Islands.....	25,585	"
Wrangel Land.....	66,100	"
Total.....	3,859,400	82,000

Arctic America is subdivided as follows:

	Area in sq. kilometres.
1. <i>Southern Group:</i>	
(1) Baffin Land as far as Lancaster Sound, with Cocksburn Island, about.....	606,000
Resolution Island.....	2,580
Islands of the Hudson Strait.....	2,640
(2) North Somerset.....	24,680
Prince of Wales Island.....	235,800
Russell Island.....	825
(3) King William Land.....	15,150
Adjacent islets.....	1,100
(4) Wollaston, Victoria, and Prince Albert Land.....	198,000
Banks Land.....	63,200
Total Southern Group.....	954,900
2. <i>Northern Group (Parry Archipelago):</i>	
(1) Prince Patrick Island.....	18,550
Esmeralda Island.....	380
Eglinton Island.....	1,700
(2) Melville Island.....	42,500
Byam Martin.....	990
(3) Bathurst Island.....	19,100
Berkeley Group, north of the preceding.....	500
Lowther Island.....	148
(4) Cornwallis Island.....	5,506
Islands in Queens Canal, north of the preceding.....	770

	Area in sq. kilometres.
Brought forward.....	90,089
(5). North Cornwall.....	1,650
(6) Grinnell Land.....	5,650
Victoria Islands.....	440
(7). North Devon.....	53,400
North Kent.....	940
Philpot's Island.....	660
Coburg Island.....	530
Total Northern Group.....	153,359
3. Land west of Smith Sound:	
Between 78° and 83° north latitude (Lincoln Grant Land).....	192,700
Grand total.....	1,301,100

II. SOUTH POLAR TERRITORIES.

	Area in sq. kilometres.
1. South of America:	
South Georgia.....	4,075
South Orkney Islands.....	1,650
South Shetland Islands.....	2,200
Graham Land.....	100,000
Alexandra Land.....	33,000
Total South of America.....	237,925
2. South of Australia:	
Victoria Land.....	330,000
Wilkes Land.....	165,000
Kemp Island and Enderby Land.....	28,000
Total South of Australia.....	523,000
Total Polar Territories.....	660,935

PORTUGAL, a kingdom in Southwestern Europe. King, Luis I, born October 31, 1838; succeeded his brother, Pedro V, November 11, 1861; married October 6, 1862, to Pia, youngest daughter of King Victor Emanuel, of Italy. Issue of the union are two sons: Charles, Duke of Braganza, born September 28, 1863; and Alfons, Duke of Oporto, born July 31, 1865.

The area and population (according to the census of 1878) are given in the following table:

PROVINCES.	Area in sq. kilometres.	Population in 1878.
Continental Portugal (embracing the provinces of Minho, Tras os Montes, Beira, Estremadura, Alentejo, Algarve).....	89,625.29	4,948,551
The Azores.....	2,388.30	264,852
Madeira.....	815.00	132,221
Total.....	92,828.59	4,745,124

Portugal has extensive possessions in Africa and Asia, but the limits of some of the most important possessions being not defined, only estimates can be given of both area and populations. The "Gotha Almanac" for 1881 gives the following table:

POSSESSIONS.	Square kilometres.	Population.
Africa.....	1,805,556	2,454,030
Asia.....	19,666	822,217
Total.....	1,825,252	3,306,247

Portugal has only two cities with more than 100,000 inhabitants (according to the census of 1878): Lisbon with 233,389, and Oporto with 108,346.

The following were the gross sums of the budget estimates for the financial year 1880-'81,

in contos and milreis (1 conto=1,000 milreis; 1 milreis=\$1.08; 5,624:448 means 5,624 contos and 448 milreis):

REVENUE.	
1. Direct taxes.....	5,624:448
2. Register.....	2,749:600
3. Indirect taxes.....	14,222:066
4. National domain.....	2,801:808
5. Other receipts.....	1,153:368
6. Extraordinary loan of 1878.....	2,438:000
Total.....	28,989:340

EXPENDITURE.	
1. Public debt.....	11,852:807
2. Ministry of Finance.....	6,024:413
3. " of the Interior.....	2,193:910
4. " of Worship and Justice.....	629:423
5. " of War.....	4,836:127
6. " of Navy and Colonies.....	1,629:666
7. " of Foreign Affairs.....	277:941
8. " of Public Works.....	3,940:047
9. Extraordinary expenditures.....	2,815:212
Total.....	38,199:046

The public debt on June 30, 1879, amounted to 387,659:575 milreis, against 374,122:000 in 1878. There has been no budget for the last thirty years without a deficit. The Minister of Finance, in the budget speech of 1880, ascribed the unsatisfactory state of the finances to the following causes: That no effective control over the public purse can be exercised by the Cortes in the absence of any authoritative statement of the actual as compared with the estimated expenditure of each completed financial year; that for the last six years the balances, as represented in the budget, have been fictitious, the sums voted at the beginning of each session having always been exceeded, sometimes even without the authorization of a special law; that from 1874 to 1879, inclusive, over 9,000,000 milreis had been obtained from loans.

The actual strength of the army on July 15, 1880, was 1,817 officers and 28,088 men. The strength of the army on the war footing is 2,688 officers and 75,336 men. The army in the colonies consists of 447 officers and 7,526 men.

The navy in 1880 consisted of 27 steamers of an aggregate of 4,460 horse-power and 139 guns, and 14 sailing-vessels of 39 guns.

The trade of Portugal in 1877 was as follows (in contos):

COUNTRIES.	Imports.	Exports.
England.....	13,748	12,456
France.....	5,160	2,065
Spain.....	2,890	1,612
Sweden and Norway.....	1,215	23
Germany.....	1,122	899
Belgium.....	812	87
Russia.....	509	8
Netherlands.....	249	125
Italy.....	245	160
United States.....	2,147	762
Brazil.....	2,665	5,286
Portuguese colonies.....	771	733
Other countries.....	445	291
Total, 1877.....	31,978	24,587
Total, 1876.....	34,548	22,674
Transit and reexport.....	2,967

The most important articles of export are wine (in 1877, 11,409 contos), animals and

animal food (3,159 contos), seeds and fruit (2,177), and minerals (2,074).

The movement of shipping in 1877 was as follows:

FLAG.	ENTERED.		CLEARED.	
	Sailing-vessels.	Steamers.	Sailing-vessels.	Steamers.
Portuguese:				
Sea-going vessels....	688	89	806	96
Coast.....	4,797	612	4,633	621
Foreign.....	2,481	1,970	2,420	1,963
Total.....	7,966	2,671	7,859	2,630

The commercial navy in 1879 consisted of 554 vessels, of which 42 were steamers. The total length of railways in operation in September, 1880, was 1,248 kilometres, besides which 450 kilometres were in course of construction. The length of telegraph-lines in September, 1878, was 3,711 kilometres, of wires 8,042 kilometres; the number of stations (in 1880), 185; the number of dispatches (in 1878), 662,708. The number of post-offices in September, 1880, was 863, of which 47 were on the islands.

The Cortes were opened January 4th by the King, who in his speech from the throne stated that his relations with all foreign powers were friendly. His Majesty announced the intention of the Government to introduce a bill for decentralizing, in a large measure, the administration of the colonial possessions of the kingdom, and to bring in measures relating to the principle of ministerial responsibility, regulating the employment of children in factories, and insuring freedom of election and the due representation of minorities. The late loan, it was stated, had been completely subscribed by home and foreign capital. A convention with England concerning trade-marks was approved. A convention regulating literary property between Portugal and Spain was signed in September. Three royal decrees concerning political and economical reforms to be introduced in the Portuguese Indies were published in September. A decree was published in November citing the provisions of the law of the Marquis of Pombal prohibiting Jesuit communities and establishments in the kingdom, which was declared to be still in force, and ordering the civil governors and public functionaries throughout the nation to use all vigilance in order to prevent any infringements of it. A provisional contract was signed in November for a loan of £4,000,000 sterling (\$19,400,000).

The Archbishop of Goa, the Roman Catholic Primate of the East, died in Lisbon, November 28th.

News was received from Loanda in September that Senhor Lino, captain of the steamer Andrade, had steamed up the Congo River as far as Noki, two hours' sail from Bibi, where Mr. Stanley had established his headquarters. This was the first time that a Portuguese had ventured so far up the Congo.

The "Diario de Noticias" announced in November that the Portuguese Government intended to construct the projected railway between Delagoa Bay and the Transvaal on its own account.

Tercentenary festivities in memory of the poet Camoens and of Vasco de Gama were celebrated in Lisbon and throughout the kingdom in June. The remains of the poet and of the great navigator were deposited in the Church of the Jeronimites at Belem on the 7th with great pomp. The royal galleys carrying the remains were accompanied by a war-ship, steamers, and boats, in an imposing river procession, and the banks of the Tagus were lined with people. A solemn ceremony took place in the church, which was attended by the King, the Queen, the Ministers, and the nobility. Salutes were fired from the ships and the castle, the streets were brilliantly illuminated at night, and the day was marked by general rejoicings. The ceremonies were closed on the 10th with a procession of triumphal cars, in which the King and Queen and the other members of the royal family, the high dignitaries of state, the civic authorities, the foreign diplomatic body, the trade and friendly societies, the members of the various scientific institutions, and deputations from the army and navy took part.

PRESBYTERIANS. I. PRESBYTERIAN CHURCH IN THE UNITED STATES OF AMERICA.—The following is a summary of the statistics of this Church by synods, as they were reported to the General Assembly in May, 1880:

SYNODS.	Ministers.	Churches.	Communicants.

The receipts of the *Board of Foreign Missions* had been \$585,844, and its expenditures \$579,746. The board had paid the debt of \$62,532 with which it had begun the year, and now returned a balance of \$6,098. The women had contributed \$176,000, or thirty per cent. of the whole receipts of the board. The following is a summary of the statistics of the missions:

Indian Tribes (Senecas, Chippewas, Omahas, Dakotas, Creeks, Seminoles, Nez-Percés), 11 American, 14 native ministers, 30 lay agents, 1,048 communicants, 506 scholars; *Mexico* (4 stations and several out-stations), 7 American, 17 native ministers, 17 lay agents, 3,907 communicants, 586 scholars; *South America* (United States of Colombia, Brazil, Chili, 14 stations and several out-stations), 11 American, 5 native ministers, 31 lay agents, 1,089 communicants, 511 scholars; *Africa* (12 stations, 7 out-stations), 7 American, 5 native ministers, 38 lay agents, 601 communicants, 244 scholars; *India* (19 stations and 17 out-stations), 30 American, 15 native ministers, 204 lay agents, 971 communicants, 7,798 scholars; *Siam* and *Laos* (4 stations and 3 out-stations), 7 American, 2 native ministers, 27 lay agents, 206 communicants, 346 scholars; *China* (10 stations and several out-stations), 22 American, 51 native ministers, 101 lay agents, 1,784 communicants, 1,096 scholars; *Chinese in California* (2 stations), 2 American, 1 native, ministers, 8 lay agents, 131 communicants, 190 scholars; *Japan* (3 stations), 6 American, 12 native ministers, 14 lay agents, 739 communicants, 345

scholars; *Persia* (4 stations, 81 out-stations), 8 American, 87 native ministers, 116 lay agents, 1,321 communicants, 1,909 scholars; *Syria* (5 stations, 43 out-stations), 14 American, 21 native ministers, 144 lay agents, 810 communicants, 4,260 scholars: total, 125 American, 230 native ministers, 736 lay agents, 12,607 communicants, 17,791 scholars.

The *Woman's Foreign Missionary Society* returned its receipts for the year at \$127,352. It had 94 missionaries in service, of whom 29 were in India, 17 in China, 5 in Japan, 7 in Persia, 5 in Syria, 6 in Africa, 3 in Siam, 3 in Mexico, 7 in Brazil and the United States of Colombia, 9 among the Indians in North America, and 4 among the Chinese in California, and conducted in India fifty day-schools and six boarding schools, in connection with which one hundred scholarships had been founded.

The *General Assembly* of the Presbyterian Church in the United States of America met at Madison, Wisconsin, May 20th. The Rev. William M. Paxton, D. D., of New York, was chosen moderator. Attention was given chiefly to hearing and considering the reports of the boards, and little legislation of importance was enacted. A reform was directed in the administration of the ministerial relief fund by ordering that appropriations shall not be made, in ordinary cases, to ministers merely because they are poor, unless they are disabled so that they can not sustain themselves by suitable employment, nor to widows who have children able to give them support; and that ministers who voluntarily and in health leave the ministry for some secular employment and after years fail in business and become poor, shall be held to have voluntarily relinquished by the course they have pursued all claims upon the funds of the Board. The Board of Publication was admonished in the report of the committee on its affairs to be vigilant against the issue from its press of publications casting the slightest doubt upon the Divine authority and plenary inspiration of the Bible, or upon the divinity and atoning death of Jesus Christ, or on the fact of man's utter ruin by sin and his need of redemption. The subject of considering a plan to alleviate the evils arising from the presence of so many unemployed ministers in the Church while yet so many vacant churches existed, was referred to a special committee to report to the next General Assembly. The professors in the theological seminaries were urged not to commend to the young men those religious teachers in Europe who are "disseminating doctrines calculated to undermine the authority of the Holy Scriptures," but to expose their fallacies, denounce their heresies, and fully and emphatically insist in their instructions on the integrity, inspiration, and authority of the Word of God. Resolutions were adopted against reading secular papers on Sunday, against the investment of money in enterprises to be carried out on Sunday, against the sale of intoxicating li-

quors, and against the transmission of lottery-tickets by the United States mails; also resolutions urging the eradication of Mormonism. The Presbyteries were enjoined, when dealing with applications for admission from other denominations, to see that they had received as thorough a course in collegiate and theological instruction as is required of regular Presbyterian candidates.

II. PRESBYTERIAN CHURCH IN THE UNITED STATES.—The following is a summary of the statistics of this Church for the last year, as they were reported to the General Assembly in May, 1880:

Synods.....	12
Presbyteries.....	67
Candidates.....	145
Licentiates.....	79
Ministers.....	1,060
Churches.....	1,923
Licensures.....	53
Ordinations.....	83
Installations.....	82
Ministers deceased.....	19
Pastoral dissolutions.....	40
Ministers received.....	3
Ministers dismissed.....	4
Churches organized.....	47
Churches dissolved.....	18
Ruling elders.....	5,721
Deacons.....	3,511
Added on examination.....	5,920
Added on certificate.....	3,614
Total communicants.....	120,025
Adults baptized.....	1,892
Infants baptized.....	4,705
Number of baptisms of non-communicants.....	29,397
In Sabbath-school and Bible-classes.....	74,902

CONTRIBUTIONS.

Sustentation.....	\$32,123
Evangelistic.....	15,233
Invalid fund.....	10,384

Publication.....	8,796
Presbyterial.....	12,945
Pastors' salaries.....	532,869
Congregational.....	396,692
Miscellaneous.....	47,693
Total.....	\$1,062,338

The *Committee on Foreign Missions* returned its receipts at \$48,485, or \$2,251 more than the receipts of the previous year. The principal part of the increase had come from the Women's Missionary Associations. The general debt of the committee had been reduced from \$9,524 to \$4,378. The foreign missionary force consisted of 83 persons, of whom 15 were missionaries, 21 assistants from the United States, 10 native preachers, 5 licentiates, and 32 teachers. Six churches had been organized in Brazil, and four young men were studying for the ministry. Four or five churches had been organized in Mexico, and a new station had been opened. Ten missionaries and 9 native preachers and licentiates were employed in China, with 34 communicants at Hangchow, 9 mission-schools, and 171 pupils. The native members of this mission had contributed \$23. Five members had been received in the Greek mission. Seventeen missionaries, of whom eight were natives, were engaged in the missions to the Indians. The

missions in Italy are carried on in connection with the Waldensian Church.

The *General Assembly* of the Presbyterian Church in the United States met at Charleston, South Carolina, May 20th. The Rev. T. A. Hoyt, D. D., of Nashville, Tennessee, was chosen moderator. In answer to a number of overtures which were sent up on the subject of preaching by women, the Assembly declared that the assumption of the sacred office of the ministry by women is "opposed to the advancement of true piety and the promotion of the peace of the churches, and this to such an extent as to make the introduction of women into our pulpits for the purpose of publicly expounding God's word an irregularity not to be tolerated." The rule on the subject of subscribing to the standards in the new Book of Church Order was interpreted to mean that the pledge of orthodoxy must be subscribed to by all ministers joining the Presbytery, including those who come from other Presbyteries. An overture asking the Assembly to make a deliverance on the subject of dancing was declined on the grounds that former deliverances were as full and explicit as the nature of the case allowed, and that the evil was to be remedied, not by deliverances of the Assembly, but rather by care on the part of the lower courts. A committee appointed by the previous General Assembly to consider the subject of retrenchment and reform in the management of the schemes of benevolence presented majority and minority reports. Both were ordered published for circulation among the ministers, and the consideration of the whole matter was referred to the next General Assembly. An overture was presented asking that so much of the deliverances of the previous General Assembly in relation to worldly amusements as declares that all deliverances of the General Assembly, and by necessary implication of the other courts of the Church, which are not made by them in a strictly judicial capacity, but are deliverances *en these*, can be considered as only didactic, advisory, and monitory, be repealed or modified. A paper was adopted on the subject, which declares: 1. That nothing is law to be enforced by judicial prosecution, but that which is contained in the Word as interpreted in the standards of the Church; 2. The judicial deliverances of the Church courts differ from *en these* deliverances in that the former determine, and, when proceeding from the highest court, conclude a particular case; but both these kinds of decisions are alike interpretations of the Word by a Church court, and both not only deserve high consideration, but must be submitted to, unless contrary to the Constitution and the Word, of which there is a right of private judgment belonging to every Church court, and also to every individual member. On the question whether an elder, when he is convinced that he has not been called to the office, can be demitted from it without censure, a decision

was given that this can be done only in case the elder is unacceptable to the people.

III. UNITED PRESBYTERIAN CHURCH OF NORTH AMERICA.—The following is a summary of the statistics of this Church for the year ending in May, 1880: Number of synods, 9; of presbyteries, 59; of pastors and stated supplies, 504; of licentiates, 50; of students of theology, 66; of congregations, 813; of mission stations, 82; of members, 82,119; of Sunday-schools, 760; with 8,327 officers and teachers, and 83,126 scholars; contributions for the salaries of ministers, \$439,933; for congregational expenses, \$221,497; to the boards, \$118,189; general contributions, \$44,175; total of contributions, \$826,794; average of contributions per member, \$10.43; average salary of pastors, \$896.

The *Board of Foreign Missions* reported to the General Assembly that its available resources during the year had amounted to \$69,089. The missions were in India and Egypt. The Egyptian mission included 41 stations, 8 foreign missionaries, 14 teachers, 6 ordained native ministers, 11 churches, 985 communicants, 6 licentiates, and 10 theological students. The training college at Osiout had proved to be very useful, and had given to the mission the majority of its native laborers. Churches were being organized, and native pastors were being settled in the older stations, and new stations were constantly opening up. The growing influence of Christianity was shown in the fact that the public markets in several of the large towns were now closed on Sunday. Less and less objection was made to the use of the Bible in the schools and daily instruction in it. The schools of the mission were multiplying, and the numbers attending on them were increasing. A growing interest was manifested in the education of women. The girls' boarding-schools at Osiout and Cairo were well attended, and had largely paid their own expenses. The mission in India included seventeen stations, five foreign missionaries, two native ordained ministers, ten theological students, four teachers, six churches, and 304 communicants. The native members in the two missions had contributed \$9,391.

The *General Assembly* of the United Presbyterian Church of North America met at Xenia, Ohio, May 26th. The Rev. E. T. Jeffers, D. D., President of Westminster College, was chosen moderator. The most prominent subject considered by the body was one involving the question whether the power to appoint commissions was possessed by all the courts of the Church or was confined to the General Assembly. An overture on the subject was adopted to be sent down to the Presbyteries for their action, which proposed the addition to the Book of Government and Discipline of a chapter providing for and regulating the appointment of commissions by sessions, presbyteries, and synods. The Presbytery of Sealkote, representing the mission in India, had been questioned by the previous General Assembly re-

specting its action in permitting baptism to be administered to a heathen convert who was at the time married to two women. The Presbytery replied that it had admitted to baptism a man who was thus married and living in a condition which was recognized in the civil and ecclesiastical codes of the country as one of lawful wedlock, but with a proviso that he should not be eligible to office in the Church. To determine the mind of the Assembly regarding the distinction which it had drawn concerning the conditions required in the Scriptures from private members and those holding spiritual offices, the Presbytery asked the question: "What is the meaning of the expression in 1 Timothy, iii, 2, that a bishop must be the husband of one wife? Does it permit us to receive a polygamist as a private member?" The committee to whom the subject was referred made two reports. The minority report recognized that polygamy is contrary to the plain teachings of the Word of God, and that it would be an act of inconsistency for any true Christian to desire to continue in a polygamous state, but suggested that there appeared to be Scripture authority for a temporary departure from a literal observance of a specific law, and advised the reversion of the subject to the Presbytery. The majority report declined to give a definite interpretation to the passage of Scripture which was referred to, stating that the question really brought before it was—"Can a polygamist be received into the Church during its transition state in a polygamous country, with the express understanding that this polygamy is only tolerated, and that while in this state he can never be admitted to any official position in the Church?" and said, "On the question here presented the majority answer in the negative, and declare that it is not proper to admit a polygamist to membership in the Church, even under the circumstances specified." The report of the majority was adopted. Woman's Missionary Societies were commended, and the general formation of them throughout the Church was approved. The formation of a United Presbyterian Historical Society was advised. The Board of Publication was directed to purchase certain Sunday-school papers published by private parties, and to publish a monthly paper devoted to Christian beneficence for gratuitous distribution.

IV. CUMBERLAND PRESBYTERIAN CHURCH.—The following is a summary of the statistics of this Church as they were reported to the General Assembly in May, 1880: The Statistical Committee remarked that they had received returns from a larger proportion of presbyteries than ever before: number of ordained ministers, 1,391; of licentiates, 260; of candidates for the ministry, 173; of congregations, 2,454; of members in communion, 111,969; of officers and teachers in Sunday-schools, 7,075; of scholars in Sunday-schools, 54,301; of baptisms during the year, 5,767 of adults,

1,900 of infants. Amount of contributions: From Sunday-schools, \$11,213; for home missions, \$7,608; for foreign missions, \$3,929; for education, \$6,126; for publication, \$1,762; for church building and repairs, \$75,831; for pastors' salaries and supplies, \$186,640; for presbyterial purposes, \$6,672; for charity, \$4,529; miscellaneous contributions, \$17,229; total contributions, \$321,569, or \$99,933 more than were reported in 1879; value of church property, \$1,837,809.

The *General Assembly* of the Cumberland Presbyterian Church met at Evansville, Indiana, May 20th. The Rev. A. Templeton, of Texas, was chosen moderator. A celebration of the semi-centennial anniversary of the organization of the Church took place during the sessions of the Assembly, at which a sermon was preached by J. L. Dillard, D. D., on the distinctive doctrines of the denomination; an historical sketch of the Church was read by R. Beard, D. D.; biographical sketches from memory of the fathers and early ministers of the Church were presented by H. A. Hunter, D. D.; and a sermon was preached on the field and work of the Church by A. J. McGlumphy, D. D. An overture was presented asking for a change in the name of the denomination, to which the Assembly replied that "such a change is impracticable, not to say undesirable." Delegates were appointed to represent the Church in the meeting of the Presbyterian Alliance to be held in Philadelphia, Pennsylvania, in September, 1880. A majority of the presbyteries having voted in favor of it, an amendment to the form of government was adopted under which every congregation willing to support the gospel according to its means is entitled to be represented in the Presbytery by a ruling elder. The question was asked of the Assembly whether a minister of the Church could administer the ordinance of baptism to a person who had been baptized in infancy. The Assembly answered no; for the Confession of Faith declares that "the sacrament of baptism is but once to be administered to any person, there being no example for the repetition of Christian baptism." A case came up in which a presbytery had ordained a minister who had been unusually useful and successful, but who, it was known, did not reach the standard of education required by the rules of the Church, without examining him, taking the ground that it had a right to grant a dispensation in a special and urgent case. The Synod had decided that the action of the Presbytery was irregular and unauthorized, and an appeal was taken to the General Assembly. The Assembly approved the action of the Synod. A resolution was adopted, urging the faithful execution of all laws for the restriction of the traffic in intoxicating liquors, and favoring a demand for still more stringent laws on the subject. A Sabbath committee was appointed to cooperate with the International Sabbath Association of Philadelphia.

V. PRESBYTERIAN CHURCH IN CANADA.—The sixth *General Assembly* of the Presbyterian Church in Canada met in Montreal, June 9th. The Rev. Donald McRae, of St. John, New Brunswick, was chosen moderator. The "Narrative of the State of Religion" spoke with satisfaction of the general observance of Sunday by the people of the Church, but condemned the practice of Sunday visiting as tending to disturb members of the Church at their homes, and the Sunday railway service as tending to interrupt the services of the churches. The Committee on Sabbath Observance was directed to cooperate with synodical, presbyterial, and all other committees in all well-directed efforts to secure the due observance of the Lord's-day. A committee was appointed to watch legislation that might be attempted with respect to marriage within the forbidden degrees. Gratification was expressed at the progress of legislation for repressing the sale of intoxicating liquors. A law regarding the admission of ministers from other churches, having been approved by the Presbyteries, was finally enacted. Much attention was given to the consideration of the reports of the colleges. Halifax College had a library of nine thousand volumes, and had an endowment fund of \$100,000 subscribed, of which one half had been collected. Morrin College, Quebec, returned an annual revenue of \$3,872, with a fair attendance of occasional students, but the work done by it could not be said to be increasing. Montreal College had a total of sixty-one graduates, and a revenue in excess of its expenditures. Queen's College had a year's revenue of \$19,375, with one hundred and fifteen students in art and theology, of whom fifty-one were studying for the ministry. The financial condition of Knox College had improved, but it still needed \$30,000 to clear it of debt, and its income fell below its expenditures. It had one hundred students preparing for the ministry. Manitoba College needed new buildings to meet the increasing demand in the province for higher education. Out of forty-seven Presbyterian students who had gone up to the university, sixteen were from this institution. All of the congregations were invited to contribute to its support. Reports were received from the Ladies' Colleges at Brantford and Ottawa.

VI. CHURCH OF SCOTLAND.—The *Committee on Statistics of Christian Liberty* reported to the General Assembly that the sum of the collections, contributions, and legacies to the Church and its funds during 1879 was £330,252, or £52,000 less than the receipts from the same sources in 1878. The *Committee on Sunday-Schools* gave the number of schools at 1,961, with 185,796 scholars. The *Colonial Committee* had had available funds of £6,974 wherewith to defray an expenditure amounting to £9,013. The income of the *Home Mission Committee* for the year had been £10,595, and its expenditures £11,647. It had voted funds to fifty-one mission stations, with an at-

tendance of 6,425 persons and 1,850 communicants; and seventy-eight mission churches, with 15,900 attendants and 10,023 communicants; and to thirteen church-building enterprises. The *Endowment Committee* had endowed and erected ten new parishes during the year ending April 15, 1880. Since the institution of the scheme, 293 parishes, with 129,700 communicants, had been added to the Church. The subscriptions received in aid of the special fund of £100,000 to endow one hundred additional churches now amounted to £43,349. Five hundred and sixty-five pupils were enrolled in its schools, and one baptism had taken place at Smyrna. The income of the *Foreign Mission Committee* had been £11,014, considerably less than in the previous year, while the expenditure had been £16,062, or £3,000 more than in 1878.

The *General Assembly* of the Church of Scotland met in Edinburgh, May 20th. The Rev. Dr. Archibald Watson, of Dundee, was chosen moderator. The most important action of the Assembly was the adoption for submission to the Presbyteries of a new formula for subscription by elders, which is as follows: "I believe that the true Protestant religion, as it hath of long time been professed in this land, is founded on and agreeable to the Holy Scriptures. I own and promise to adhere to the said true Protestant religion, and to the sum and substance of the doctrine of the Reformed Churches as contained in the Confession of Faith approved by former General Assemblies of this Church, and ratified by law in the year 1690. I likewise own and promise to adhere to the worship and Presbyterian government of this Church as now settled by law, and to submit to and concur with the said government, and never to endeavor, directly or indirectly, the prejudice or subversion thereof." Attention was called to the charges against the administration of the Blantyre mission on the Shire River, Central Africa, which had been made in a published pamphlet, and which had been discussed in Parliament. The investigation by the committee appointed to inquire into the subject showed that a murder had been committed at Blantyre by natives, for which the infliction of punishment was demanded. The neighboring chiefs were asked to try the murderers, but they replied that by native law and custom jurisdiction went with the territory, and as the English were in possession at Blantyre, they, and they alone, were responsible. The murderers were tried before a native jury, presided over by one of the missionaries, and sentenced to death. The missionaries hesitated to inflict the punishment; but one of the murderers escaping, the other was shot by a volley from native guns on the scene of the murder. The Committee on Missions had at one meeting expressed the deep distress with which they received this news, and at another one had disavowed all responsibility for the act, reserving their final decision in the case until further

information should have been received. Afterward, letters were received from the missionaries, pleading that the capital sentence was undoubtedly in itself righteous, and they had been little more than passive in the matter—they had only not prevented the natives from carrying out their own laws. The committee expressed the belief that its agents had done wrong legally and otherwise in partially assuming jurisdiction and sanctioning the execution, but could regard the error only as one of judgment. Forbidding the repetition of such an act, they had entered into a careful consideration of the questions of government and punishments in their infant settlement, and had also sought the advice of the Committee of the Free Church. In September, 1879, a conflict occurred with a neighboring chief who had attacked the settlement for the purpose of plunder, and the village continued to suffer till the end of the year from raids made with the object of carrying off men and women. These events had been combined in the pamphlet publication with the story of the execution, although they had no connection with it, and were seven months apart in time. Other charges were made in the pamphlet of a habit of flogging and inhuman imprisonment alleged to be practiced by the missionaries, to which the committee of inquiry said: "These charges must be thoroughly sifted. Meanwhile they are incredible. It is true there have been cases of corporal punishment. The first was in 1877, when Mr. James Stewart was in charge. The committee believe the instances to have been rare." The Assembly directed a commissioner to be sent out to inquire into the condition of the missions, and ordered that the Mission Committee should require from any commissioner that might be sent out a precise report as to the possibility of maintaining the mission without having recourse to violence or the assumption of any form of criminal jurisdiction.

VII. FREE CHURCH OF SCOTLAND.—The report of the *Finance Committee*, presented to the General Assembly in May, showed that the total income of the Church for the year had been £591,478, or £40,000 more than the income for the previous year. The contributions for the sustentation fund had amounted to £171,719. The members and adherents of the Church were stated in the report on this fund to number 302,262. The income of the *Education Committee* had been £1,499, and its expenditure £2,837. Forty-nine teachers were receiving retiring allowances. The income of the *Mission to the Jews* had been £9,702, and the ordinary expenditure in behalf of it £5,921. Eleven baptisms had taken place during the year, at Pesth, Constantinople, and Breslau, and one hundred children, three fourths of whom were of Jewish birth, were receiving instruction in the schools at those places. The whole amount of the givings of the Church during the year had been £56,000, the largest amount ever reached in one year.

The *General Assembly* of the Free Church of Scotland met at Edinburgh, May 20th. The Rev. Dr. T. Main, of Edinburgh, was elected moderator. The case of Professor Robertson Smith, who was charged with impugning the inspiration and divine authority of the Scriptures in his article on the Bible in the "Encyclopædia Britannica," came up for final disposition. An account of this case, and of the proceedings of the General Assembly of 1879 upon it, is given in the "Annual Cyclopædia" for 1879. The Assembly of 1879 had reduced the libel against Professor Smith to one count, which charged him with holding views as to the historic character of the Book of Deuteronomy contradicting the doctrine of the direct inspiration, infallible truth, and divine authority of the Scriptures. When the amended form of libel was sent down to the Presbytery of Aberdeen, Professor Smith claimed to be heard on the relevancy of the charge; and, on the Presbytery deciding to serve the libel, he took a protest to the superior courts. The Presbytery thereupon agreed to resist procedure, and report the whole case to the Synod. The Synod of Aberdeen took a similar course when the case came before it, and the matter was thus brought again into the Assembly. Several motions were made for the disposition of the case. The Assembly divided upon two of them. One of these two was moved by Sir Henry Moncrieff, and was to the effect that the libel should be dropped, but that, in view of the sense of the Church to the danger lying in the line of view and discussion adopted by Professor Smith, as embodied in the previous proceedings on the subject, and inasmuch as Professor Smith no longer retained that measure of confidence on the part of the Church which was necessary to the edifying and useful performance of his professorial work, he must now cease to occupy any longer the chair of Hebrew and Old Testament Literature in the University of Aberdeen. The Rev. Dr. Beith moved "that the General Assembly, considering that the course of the case has confirmed the report of the college committee, that they had not found any ground sufficient to justify a process for heresy against Professor Robertson Smith, inasmuch as seven of the eight counts in the original libel have been found irrelevant, while, with regard to the remaining count, the explanations offered by Professor Smith at various stages, and, in particular, his answer to the amended libel, afford satisfactory evidence that in this aspect of the case there is not sufficient ground to support the process for heresy, do resolve to withdraw the libel against him. Further, the Assembly, finding that Professor Smith is blameworthy for the unguarded and incomplete statements of his articles, which have occasioned much anxiety in the Church, and given offense to many brethren zealous for the honor of the Word of God, instruct the Moderator to admonish Professor Smith with due solemnity as

to the past, in the confident expectation that the defects referred to will be guarded against and avoided in time to come. And, finally, the Assembly declares that, in declining to decide on these critical views by way of discipline, the Church expresses no opinion in favor of their truth or probability, but leaves the ultimate decision to future inquiry, in the spirit of patience, humility, and brotherly charity, admonishing professors to remember that they are not set for the propagation of their own opinions, but for the maintenance of the doctrine and truth committed to the Church." This resolution was adopted by a vote of 299, to 290 votes for the motion of Sir Henry Moncrieff. Professor Smith accepted the settlement, and said, in response to the admonition of the Moderator: "I hope that I am not out of place when I say that, while I thank God for the issue of this evening—an issue which, I trust, will be for his glory and for the maintenance of his truth—I have never been more sensible than on the present occasion of the blame that rests upon me for statements which have proved so incomplete that, even at the end of three years, the opinion of this house has been so divided upon them. I feel that, in the providence of God, this is a very weighty lesson to one placed as I am, in the position of a teacher; and I hope that by his grace I shall not fail to learn by it." Sir Henry Moncrieff moved a resolution to invite each theological professor to send in by February, 1881, a statement of the views he was prepared to teach to his students regarding the genuineness, authenticity, and inspiration of the Scriptures. Dr. Adam moved that, while there was no good cause for taking such action as was proposed, professors and ministers alike be exhorted to lay to heart the lessons which the important case just decided was fitted to convey. Dr. Adam's motion was adopted. A resolution was adopted declaring the possession by a single church of the exceptional position and privileges of an established church to be "most unjust and thoroughly unreasonable"; that the termination of the connection between church and state "would remove a great obstacle to the religious well-being of the country, and to the prospect of a harmonious and flourishing Presbyterianism in Scotland"; that the funds set free by disestablishment "ought to be employed in objects connected with the welfare of the community, and among these is an improved and completed system of education in conformity with the convictions of the people of Scotland"; that the time has come to press this policy, and that Parliament be petitioned in favor of it.

A new volume of the "Encyclopædia Britannica" was published a short time after the Assembly adjourned, containing an article by Professor Smith on the "Hebrew Language and Hebrew Literature," in which some of the views stated in the former article on the "Bible" were substantially repeated. It embodied criticisms of the Book of Jonah and an exam-

ination of the genealogies of the Bible, in which, among other things, the writer spoke of Eber as being an "ethnological abstraction." This was considered by many in the Church as a reflection upon the genuineness of the genealogy of Christ, and was noticed in several of the Presbyteries as a new offense by Professor Smith, and a contempt of the action of the Assembly. Resolutions were adopted in twelve Presbyteries calling the attention of the Commission of the General Assembly to the subject, and requesting it at its meeting in August to take the article into consideration, "so far as to adopt such steps as they may judge fit to meet the disturbance and anxiety prevailing in the Church, and to vindicate scriptural principles." Professor Smith presented a letter to the Church through his own Presbytery of Aberdeen, explaining that the article complained of had been written and furnished to the editors of the "Encyclopædia" some time before the meeting of the Assembly; that it was wholly out of his control at that time; that he had expected the volume to be published before the meeting, so that the Assembly would be able to act with the new article before it; and that he was sorry it had been delayed. In view of the decision of the Assembly upon his case, he had felt it his duty and was arranging his work so as to avoid disturbing controversy and devote himself to such departments of church work and scholarly research as could not excite it, but might rather bring him into closer sympathy with those who differed from his critical opinions. The Commission of the Assembly met August 11th, and having considered the requests of the Presbyteries and the letter of Professor Smith, appointed a committee to examine the new article and the letter, to consider their bearing upon the accepted belief and teaching of the Church, and to report their opinion and advice to an *in hunc effectum* meeting of the Commission to be held October 27th, before which Professor Smith was cited to appear.

The committee reported at the meeting thus appointed to the effect that the writings of Professor Smith raised new questions in the history of the Church in cases of heresy respecting the infallible truth of the Holy Scriptures. The committee did not, they said, impute to Professor Smith the intention of assailing the integrity and authority of the Scriptures in the writings they had examined; but the statements made by him in many particulars were fitted, and could hardly fail to produce upon the minds of readers the impression that Scripture does not present a reliable statement of truth, and that God is not the author of it; and it greatly concerned the character and credit of the Free Church to make it clear, in opposition to any such impression, that it held firmly and would maintain the infallible truth and authority of the Scriptures as the word of God. The report then adduced particular passages supporting its views, and con-

tinued by stating that "the whole tendency of the writings examined by the committee is fitted to throw the Old Testament history into confusion, and at least to weaken, if not to destroy, the very foundation on which New Testament doctrine is built; moreover, the general method on which he proceeds conveys the impression that the Bible may be accounted for by the same laws which have determined the growth of any other literature, inasmuch as there is no adequate recognition of the divine element in the production of the book." The committee accordingly recommended that the Commission take steps for making it evident that "the Free Church can not sanction the kind of teaching inadvertently upon in this report, which these writings would justify, and for urging the General Assembly to declare to her people and to other churches that she can not sanction the ideas suggested by it." The committee took issue with Professor Smith as to the interpretation put upon the action of the previous General Assembly, saying that the Assembly neither did nor could determine a general principle as to what views were consistent with the tenure of office in the Free Church, and that the judgment it had uttered was applicable only to the case before it. A motion was offered by Dr. Wilson, approving the report of the committee, declaring that the views of Professor Smith were dangerous, and protesting against the Church being implicated in the promulgation of them; resolving to transmit the whole matter to the General Assembly for further action; in the mean time instructing Professor Smith "to abstain from teaching his classes during the ensuing session, leaving the whole question of his status and position in the Free Church to the determination of the ensuing Assembly"; and advising the College Committee to make provision for the teaching of Professor Smith's classes. Mr. Ross Taylor offered a motion blaming Professor Smith for making unguarded statements; transmitting the report of the committee to the Presbytery of Aberdeen; and calling upon Professor Smith to heed, in the discharge of his duties as professor, the admonition addressed to him at the last Assembly. The motion of Dr. Wilson was adopted by a vote of 270 to 202 for that of Mr. Taylor, and Professor Smith was suspended.

VIII. UNITED PRESBYTERIAN CHURCH OF SCOTLAND.—Reports made to the Synod of this Church at its annual meeting in May, 1880, showed that the number of members in full communion was 174,134, or 932 less than were reported at the Synod of 1879. The amount of contributions for congregational purposes had been £225,402, and the amount of missionary and benevolent contributions £79,268, making the total income of the Church for 1879, £336,738, or £30,649 less than the income for 1878.

The Synod of the United Presbyterian Church of Scotland met in Edinburgh, May 3d. The

Rev. Professor Henry Calderwood was chosen moderator. The committee, to whom certain protests in the case of the Rev. Fergus Ferguson (which largely occupied the attention of the Synod of 1879) were referred, reported that, while it would have preferred another course of action on the part of the Glasgow Presbytery (south) in the way of preliminary inquiry, it would recommend that the decision of the Presbytery, declining to institute a new prosecution against Mr. Ferguson, be sustained as competent. The Synod voted that, without expressing any opinion on the doctrines that are supposed to be involved in the protest and appeal, it would adopt the report of the committee and dismiss the case. The committee on disestablishment and disendowment made a report in which it said that "it is probable that in no former year has the cause of disestablishment made more substantial advance." The Synod adopted the report, and recommended that a petition be presented to Parliament in favor of disestablishment. The question respecting the attitude which the Church should maintain with reference to marriage with a deceased wife's sister was discussed. The Synod decided, by a vote of 145 to 118, to adhere "meanwhile" to the existing practice of the Church. A resolution was passed condemning social drinking usages, especially at funerals and ordination dinners, declaring in favor of the earlier closing of public-houses, and approving a petition to Parliament against the Contagious Diseases Acts. Twelve deputies were appointed to represent the Church at the Presbyterian and Reformed Council to be held in Philadelphia, Pennsylvania, in July, 1880.

IX. PRESBYTERIAN CHURCH OF ENGLAND.—The following is a summary of the statistics of this Church as they were reported to the Synod in May, 1880: number of Presbyteries, 10; of congregations, 268; of ministers, 249; of communicants, 54,259; of Sunday-school teachers, 6,252, with 60,775 scholars; of day-schools, 37, with 6,780 children.

X. PRESBYTERIAN CHURCH IN IRELAND.—The *General Assembly* of the Presbyterian Church in Ireland met at Belfast, June 7th. The Rev. Jackson Smith, D. D., of Armagh, was chosen moderator. The question of the use of instrumental music in public worship was brought up under the form of a resolution which was introduced for the appointment of a commission to look after the subject; and, in the event of disobedience to the laws of the Assembly by the introduction of instruments, to bring to discipline the ministers disobeying. This was lost by a vote of 250 to 263, and the question was remitted to the Presbyteries for another year. Remark was made upon the action of the late Government of the United Kingdom in announcing, just before the general election, that it was about to grant a charter to enable the united faculties of the Presbyterian colleges in Belfast and Derry to confer degrees in theology. Many members of the

Assembly were of the opinion that the announcement was designed as a trick to gain the votes of Presbyterians at the election. In connection with the subject of the privilege of conferring degrees, the action of the Committee of Education, in calling the attention of the Government to the inconvenience under which the Presbyterian Church lies in the matter as compared with the Episcopal Church, was approved; the committee was reappointed and directed to press the matter upon the attention of the Government. A resolution was considered, to lie on the table for one year, providing that theological students may attend any of the theological colleges of churches which accept the Westminster Confession and Catechism. The report of the sustentation fund showed that its receipts for the year had been £26,076, or £1,361 more than those of the previous year. The expenses of the Irish mission for the year had been £3,272, and its income had been a little less. Connected with the missions were 39 schools in Connaught, with 46 teachers and 1,463 pupils.

The income for foreign missions for the year had been £9,200. Six European missionaries, ten evangelists, and twenty-five teachers, were employed in connection with the mission in India.

XI. WELSH CALVINISTIC METHODIST CHURCH.—The following is a summary of the statistics of this Church as they were reported to the General Assembly in July, 1880: Number of churches, 1,115; of places of worship, 1,319; of ministers, 591; of preachers, 329; of communicants, 118,036; of Sunday-school teachers, 21,605; of children in Sunday-schools, 155,159. The report of the *Foreign Missionary Society* gave the following statistics: Number of churches, 29; of places of worship, 54; of church-members, 1,659.

PROTESTANT EPISCOPAL CHURCH. The "Church Almanac" gives the following statistics: Number of dioceses, 48; of missionary districts (including Africa, China, and Japan), 15; of bishops, 64; of bishops-elect, 2; of priests and deacons, 3,366; whole number of clergy, 3,432; number of parishes, about 3,000; number of baptisms in forty-seven dioceses, and thirteen missionary districts, 46,582; number of confirmations in forty-seven dioceses and thirteen missionary districts, 25,632; number of communicants in forty-eight dioceses and thirteen missionary districts, 338,333; number of Sunday-school teachers in forty-six dioceses and nine missionary districts, 31,614; number of scholars in Sunday-schools in forty-seven dioceses and twelve missionary districts, 297,407. Amount of contributions in forty-five dioceses and twelve missionary districts, \$6,727,043.

The following is a summary of the statistics of the Protestant Episcopal Church in the United States, as they are given in Whittaker's "Protestant Episcopal Almanac and Directory" for 1881:

Number of bishops, 63; of bishops-elect, 3, making the total number of clergy of all orders, 3,435. Number of missions, additional to the regularly organized parishes, 1,155. Number of baptisms during the year, 47,963; of confirmations, 25,903, so far as reported. Number of Sunday-school teachers, 34,041; of scholars in Sunday-schools, 299,070. Amount of contributions, so far as they were reported, \$7,013,762.

The periodicals of the Church are: "The American Church Review" (quarterly), New York; "The Churchman" (weekly), New

York; "The Church Eclectic" (monthly), Utica, New York; the "Church Monthly Magazine" (monthly), New York; the "Episcopal Register" (weekly), Philadelphia, New York, and Baltimore; "The Guardian" (weekly), New York; "The Living Church" (weekly), Chicago, Illinois; the "Pacific Churchman" (semi-monthly), San Francisco, California; the "Parish Visitor" (monthly), New York; the "Protestant Episcopal Church News" (weekly), Baltimore, Maryland; the "Spirit of Missions" (monthly), New York; the "Southern Churchman" (weekly), Richmond, Virginia; the "Standard of the Cross" (weekly), Cleveland, Ohio; "The Standard" (weekly), New York; "The Western Church" (weekly), Milwaukee, Wisconsin; "The Young Churchman" (monthly), Milwaukee, Wisconsin.

The *Domestic and Foreign Missionary Society of the Protestant Episcopal Church* met in the city of New York in October, in connection with the meeting of the General Convention. The *Committee of Domestic Missions* reported that its receipts for the year had been, for general domestic missions, \$105,708; designated for work among the colored people of the South, \$9,663; designated for work among the Indians, \$28,992; special contributions, not at all under the control of the committee, \$20,907: making in all, \$165,273. Its expenditures had been \$164,397. The committee employed 274 missionaries (including nine bishops) among white people, twenty-four clergymen and twenty-two lay-readers and teachers among the colored people, one Chinese clergyman among the Chinese, one bishop, twelve white and eleven native clergymen, three teachers, ten native catechists, and twelve women helpers—in all, forty-nine laborers among the Indians; making a total of 370 agents.

The total receipts of the *Foreign Committee* for the year had been \$162,084, and its expenditures \$166,670. The treasury was overdrawn on general missionary account to the amount of \$15,182. The committee held available assets to the amount of \$82,194. The missions of the Society were in Greece (consisting of a school with one American and eight native teachers and 700 scholars), Africa (Liberia and Cape Palmas), China, Japan, Hayti, and Mexico, and employed forty-six foreign missionaries, clergymen, physicians, and women missionaries, 175 native laborers, of whom twenty-nine were in holy orders, and returned an average attendance of 10,000 persons at divine service, 4,500 communicants, and 2,500 pupils in schools. A college had been established in China, and theological seminaries in Japan and Mexico, besides day and boarding schools in connection with all the missions.

The report of the *committee on the General Theological Seminary* showed that an effort to secure an endowment fund of \$250,000 had been begun in order to provide suitable salaries for the professors and enlarge the educational staff, and \$52,000 had already been given

to it. The institution had been attended during the year by ninety-four students, a larger number than had ever been present at one time since its organization.

The Rev. Thomas A. Starkey, having been elected Bishop of Northern New Jersey, to succeed Bishop Odenheimer, who died August 14, 1879, was consecrated to that office, January 8th.

The Rev. John N. Galleher was consecrated Bishop of Louisiana, February 5th, succeeding Bishop J. P. B. Wilmer, deceased.

The Rev. George K. Dunlop was consecrated Missionary Bishop of New Mexico, November 21st.

The *General Convention* of the Protestant Episcopal Church met in New York City October 6th. Bishop Herzog, of the Old Catholic Church in Switzerland, and Bishop Cotterill, of the Anglican Church, Edinburgh, Scotland, were present at the opening services as visiting delegates. Bishop Smith, of Kentucky, presided over the House of Bishops. The Rev. Dr. E. E. Beardsley, of Connecticut, was elected President of the House of Deputies.

A committee, consisting of five bishops, five clergymen, and five laymen, was appointed to examine the new revision of the English translation of the Bible and report whether it should be adopted by the Church, but was instructed to defer its report until after the Convention of Canterbury, representing the English Church, shall have acted on the subject. A report from the Committee on Christian Education was adopted, which recommended that the title of the committee should henceforth be "the Committee on Education under the Auspices and Control of the Protestant Episcopal Church"; that all churchmen use their means and energy in establishing parochial schools, and refuse to send their children to schools under the control of other denominations; that a system of higher education be provided for the schools for girls of the different parishes; and that no churchman send his children to any school which is not under diocesan control. A joint committee of bishops, presbyters, and laymen was appointed to watch what measures the Government might employ to secure to the Indians their civil rights, and to take such action as it should deem expedient for securing additional legislation. A petition was presented on the subject of free churches, asking the Convention to recognize the following principles: "1. That our churches should be so free and open that all who wish may worship in them. 2. That in them there should be no distinctions on the ground of wealth or social position. 3. That when they are consecrated, appropriated, and devoted to the honor and worship of Almighty God, they should be absolutely and unreservedly his, and in no sense the property of a limited number of persons who have bought their pews." The Convention declined to commit itself to the approval of a rule forbidding the consecration of pewed

churches. A resolution was offered recommending that the Canon on Divorce be amended in conformity with Deuteronomy xxiv, 1-4, so as to prohibit the remarriage of a divorced husband and wife. The Convention decided not to make any change in the canon. The Dioceses of Quincy, Springfield, and Illinois, having formed a federative council, the Convention was asked to recognize their organization and its power to do independent missionary work and hold an appellate court, under the name of the "Federative Council of the Province of Illinois." The Convention refused to sanction the use of the word province, but recognized the council under the name of the "Federative Council of the Dioceses of Illinois." Petitions were presented for the establishment of a court of appeals, and became the occasion of a discussion of the position of the Church on that subject. The Convention denied the petitions, and decided against making any change in the present judicial system of the Church. A joint committee, which had been appointed to consider and report on the subject of sisterhoods and deaconesses, reported that it had deemed it inexpedient to propose any specific legislation in regard to sisterhoods, but recommended a Canon on Deaconesses, which was adopted. It provides that women of devout character may be set apart by any bishop for the work of deaconesses. The duties of the office are the visitation of the Lord's poor and sick, the education of the young, the religious instruction of the neglected, the reclamation of the fallen, and other works of charity. Candidates for the office must be twenty-five years of age, though in special cases the Bishop may receive persons of twenty years of age and upward, and must have spent a year in preparation. No deaconesses can work officially in any diocese without the written permission of the Bishop, and they may be transferred from one diocese to another. An amendment to the canon was adopted allowing the minister to use a shortened form of service on certain days, with the provision that no prayers not set forth in the Book of Common Prayer should be used before or after the sermon or lecture. The Committee on the Lectionary presented a report embodying the results of their labors in revising that part of the service, which was adopted. The tables of lessons had been carefully revised and new passages had been substituted, and the lessons from the New Testament were shorter than those now in use. The following acts were also adopted:

"If in any church, upon a Sunday or holy day, both morning and evening prayer be not said, the minister may read the lessons appointed either for morning or for evening prayer." "At evening prayer on Sunday the minister may read the lesson from the Gospels appointed for the day of the month, in place of the second lesson for the Sunday," and "upon any day for which no proper lessons are provided, the lessons appointed in the calendar for any day in the same week may be read in place of the lessons for the day."

In the consideration of the missionary interests of the Church, the Convention ordered that the present system of collecting moneys for missions be superseded by a plan for subscriptions, under which members should pledge themselves to pay certain sums each year, in quarterly installments. The Board of Managers of the Missionary Society was advised to consider whether more liberal provision ought not to be made for preaching to the colored people of the South. A committee was appointed to consider the question of establishing a colored church in the South. A proposal was approved to organize a church-building commission and raise a fund of \$100,000, the interest of which is to be applied to the building of one hundred churches yearly. The appointment of a missionary bishop for every territory was decided upon, and a joint commission of twenty-one bishops, presbyters, and laymen was appointed to make provision for the new bishops. The Committee on the State of the Church, in its report, called attention to the neglected condition of the Southern and Western dioceses, and referred to a disposition discovered in some of the clergy to conform to various sentiments and opinions which once were neither considered consistent with ministerial fidelity nor approved by the worldly-minded, and to indulge in practices which were considered destructive of respect for teachers of religion.

PRUSSIA,* a kingdom of Europe, forming part of the German Empire. King, William I, German Emperor and King of Prussia. The composition of the Prussian Ministry remained in 1880 unchanged.

The population of Prussia, according to the new census of 1880, amounted to 27,260,331, an increase of 1,517,927, or 5.89 per cent., over the census of 1875. The following table gives the population of the provinces with the increase since 1875:

PROVINCES.	Population in 1880.	Increase since 1875.
Eastern Prussia.....	1,930,498	74,077
Western Prussia.....	1,402,498	59,441
Brandenburg.....	3,353,560	257,183
Pomerania.....	1,538,454	76,471
Posen.....	1,709,943	94,859
Silesia.....	4,003,223	159,524
Saxony.....	2,311,067	142,940
Schleswig Holstein.....	1,124,862	50,936
Hanover.....	2,115,745	98,352
Westphalia.....	2,040,672	134,975
Hesse-Nassau.....	1,558,344	85,446
Rhenish Provinces.....	4,087,886	238,505
Hohenzollern.....	67,579	1,118
Total.....	27,260,331	1,517,927

The budget estimates of both revenue and expenditures were as follows during each of the four years from 1878 to 1881 (the financial year ending March 31st):

YEAR.	Revenue and Expenditure, each.
1878.....	657,320,344
1879.....	718,857,764
1880.....	711,500,758
1881.....	799,200,581

* For additional statistics and information, see Article GERMANY.

Direct taxes form the chief source of revenue, and, next to them, the receipts from State railways. In recent years the income from railways and other State undertakings, such as mines, has been largely increasing, showing a tendency to become a far more fruitful source of revenue than all taxation, direct or indirect.

The public debt of the kingdom, according to the budget of 1880 to 1881, was 1,395,389,183 marks, of which 88,746,086 were debts of the new provinces.

The Diet resumed its session, which had been interrupted by the Christmas vacation, on January 8, 1880, and continued it until February 12th, when it was prorogued to make room for the German Reichstag. It met again on May 20th, and was closed on July 3d. The debates on the conflict between the State Government of Prussia and the Catholic Church were this year influenced by the fact that Prince Bismarck was in negotiation with the Papal Nuncio of Vienna about putting an end to the conflict. The Pope on February 24th addressed a letter to the deposed Archbishop of Cologne, which was officially communicated to Prince Bismarck, in which he made the concession that the Bishops should have the duty of notifying to the Government the names of the priests who were to be appointed prior to their canonical installation. In a dispatch from the Papal Secretary of State, dated March 17th, this concession was somewhat limited, and later it was taken back altogether. On April 20th Prince Bismarck declared that Prussia would not assent to a revision or a repeal of the May laws on the basis of the clerical claims, but reiterated his readiness to coöperate for a compromise based on mutual concessions. In the mean while (March 28th) the Prussian Government had introduced in the Diet a bill by which some of the provisions of the original May laws which were most offensive to the Catholic party were repealed, while, on the other hand, it was made obligatory for the bishops to notify the Government of the ecclesiastical appointments. The Catholic party, though it welcomed some of the concessions made by the Government, declared itself opposed to the bill as a whole. A special committee appointed in the Lower House advised the rejection of the bill by 13 against 8 votes; the House itself, however, in June, after rejecting a few of the clauses, adopted the remainder of the bill by 206 against 202 votes, the Conservative and Free Conservative parties and a part of the National Liberals voting for it. The bill in this shape was also adopted by the House of Lords, and went into effect on July 14th. It is to last only until January, 1882. The law afforded some relief in the administration of the dioceses which were without bishops, facilitating the appointment of priests as in vacant parishing, and providing that in future the courts shall not have the right of deposing priests from their office, but only that of declaring their incompetency, i. e.,

revoking their exequatur. During the discussion, Professor Virchow, the leader of the Party of Progress, declared again in favor of an entire separation between church and State, which the minister of worship, Herr von Puttkammer, regarded as a great danger for the State, as he thought that within twenty years it would lead to a predominance of the Ultramontane party.

The Government also introduced four bills relating to the organization of the local administration of the country. Two of them were adopted during the present session, being supported not only by the Conservative party, but also by the National Liberals and Party of the Center, and of the Party of Progress. The Diet unanimously granted to the Government a credit of several million marks for relieving several districts of Upper Silesia, which had severely suffered from inundations and a hard winter.

The second session of the Fourteenth Prussian Diet was opened in the name of the King by Count Stolberg. It was stated in the opening speech that the financial condition of the country showed a decided change for the better, and that, in view of expected surplus moneys from the Imperial exchequer, a remission of three months' class taxes, to the aggregate amount of fourteen million marks, was contemplated. In the House of Deputies, Herr von Köller was reelected President, and Herr von Benda first Vice-President, but the second Vice-President of the preceding session, Freiherr von Heeremann, was not reelected. The majority of the Conservative party refused to vote for him, because he, with the other members of the Catholic Center, had refused to attend, in compliance with the Emperor's invitation, the opening of the Cologne Cathedral.

The Government looked upon the coming session as one of unusual interest. The reorganization of the local administration of the kingdom, which had been begun in the preceding session, was to be completed, and the co-operation of the Diet for the novel, bold, and far-reaching financial schemes of Prince Bismarck, especially in regard to indirect taxes and monopolies, was to be secured. One of the Government bills referred to the appointment of a national railway council for the management of the State lines. This council will consist of a president and vice-presidents, to be nominated for three years by the king; of commissioners from the ministries of public works, trade and commerce, finance and agriculture; of three members from either House of Parliament; and of one, two, or three representatives of the various provinces, according to their importance in regard to the railways. The council is to begin its labors on January 1, 1882. The Diet referred the Government bills to committees which had not finished their work, when the Diet, on December 18th, adjourned to January 8, 1881.

On November 20th and 22d there was in

the House of Deputies a violent debate on the Jewish question. Deputy Hänel, formerly one of the vice-presidents of the House of Deputies, asked the Government what position it intended to assume with regard to the so-called Anti-Semite petition which aimed at the abolition of the constitutional rights of Jewish citizens. Count Stolberg, in the name of the Government, replied that the petition had not yet been received, and that the Government therefore had no official knowledge of its contents, but he did not hesitate to say that the State ministry had no intention to alter the present laws of Germany which guaranteed the equal rights of the religious laws in regard to the civil law. Notwithstanding this declaration of the Government, the interest taken by all the parties of the House in the Anti-Semite movement was so intense that by general consent the House engaged for two days in a general discussion of the question. The leading men of all the parties expressed their views on the agitation against the Jews. No one demanded a repeal of Jewish emancipation or a limitation of the constitutional rights of the Jewish citizens, but some of the Conservative deputies repeated the violent attacks which in some public meeting had been pronounced against the Jews as a foreign race, which was without sympathy with the German nationality, and had justly incurred a general odium by its prominent participations in the worst financial swindles of the last years. One Deputy, Herr von Ludwig, maintained that fully ninety per cent. of the participators in these financial swindles ("Gründer") had been Jews. Deputy Virchow, who severely censured the agitation, stated that it was unfortunately on the increase, especially among the students of the universities.

A royal decree of November 15th created an Economical Council (Volkswirtschaftsrath), which is to consist of seventy-five members, and to serve for five years. For forty-five of the members, the Chambers of Commerce, the heads of the commercial corporations, and of the agricultural associations, have a right of presentation. They propose the double number, from which the ministers for commerce and trades, for public works, and for agriculture select forty-five, of whom fifteen must be representatives of trades, fifteen of commerce, and fifteen of agriculture and forestry. The thirty other members of the council are elected by the ministers above members, and it is provided that one half of them must be mechanics or workmen. The council is to give its opinion on drafts of bills and decrees relating to important economical interest in commerce, trades, agriculture and forestry, before they are submitted to the king for ratification, also the motions to be made and the votes to be cast by the Prussian members of the Federal Council so far as they relate to economical questions. The council consists of three sections—for commerce, for trades, and for agri-

culture and forestry. Its standing committee consists of twenty-five members, of whom each of three sections elects five, and the ministers ten.

PUBLIC DOCUMENTS. *Annual Message of President HAYES, at the third Session of the Forty-sixth Congress, commencing December 6, 1880.*

FELLOW-CITIZENS OF THE SENATE AND HOUSE OF REPRESENTATIVES: I congratulate you on the continued and increasing prosperity of our country. By the favor of Divine Providence we have been blessed, during the past year, with health, with abundant harvests, with profitable employment for all our people, with contentment at home, and with peace and friendship with other nations. The occurrence of the twenty-fourth election of Chief Magistrate has afforded another opportunity to the people of the United States to exhibit to the world a significant example of the peaceful and safe transmission of the power and authority of Government from the public servants whose terms of office are about to expire, to their newly-chosen successors. This example can not fail to impress profoundly thoughtful people of other countries with the advantages which Republican institutions afford. The immediate, general, and cheerful acquiescence of all good citizens in the result of the election gives gratifying assurance to our country, and to its friends throughout the world, that a government based on the free consent of an intelligent and patriotic people possesses elements of strength, stability, and permanency not found in any other form of government.

Continued opposition to the full and free enjoyment of the rights of citizenship conferred upon the colored people by the recent amendments to the Constitution still prevails in several of the late slave-holding States. It has, perhaps, not been manifested in the recent election to any large extent in acts of violence or intimidation. It has, however, by fraudulent practices in connection with the ballots, with the regulations as to the places and manner of voting, and with counting, returning, and canvassing the votes cast, been successful in defeating the exercise of the right preservative of all rights—the right of suffrage—which the Constitution expressly confers upon our enfranchised citizens.

It is the desire of the good people of the whole country that sectionalism as a factor in our politics should disappear. They prefer that no section of the country should be united in solid opposition to any other section. The disposition to refuse a prompt and hearty obedience to the equal-rights amendments to the Constitution is all that now stands in the way of a complete obliteration of sectional lines in our political contests. As long as either of these amendments is flagrantly violated or disregarded, it is safe to assume that the people who placed them in the Constitution, as embodying the legitimate results of the war for the Union, and who believe them to be wise and necessary, will continue to act together, and to insist that they shall be obeyed. The paramount question still is as to the enjoyment of the right by every American citizen who has the requisite qualifications to freely cast his vote and to have it honestly counted. With this question rightly settled, the country will be relieved of the contentions of the past; by-gones will indeed be by-gones; and political and party issues, with respect to economy and efficiency of administration, internal improvements, the tariff, domestic taxation, education, finance, and other important subjects, will then receive their full share of attention; but resistance to and nullification of the results of the war will unite together in resolute purpose for their support all who maintain the authority of the Government and the perpetuity of the Union, and who adequately appreciate the value of the victory achieved. This determination proceeds from no hostile sentiment or feeling to any part of the people of our country or

to any of their interests. The inviolability of the amendments rests upon the fundamental principle of our Government. They are the solemn expression of the will of the people of the United States.

The sentiment that the constitutional rights of all our citizens must be maintained does not grow weaker. It will continue to control the government of the country. Happily, the history of the late election shows that in many parts of the country where opposition to the Fifteenth Amendment has heretofore prevailed, it is diminishing, and is likely to cease altogether, if firm and well-considered action is taken by Congress. I trust the House of Representatives and the Senate, which have the right to judge of the elections, returns, and qualifications of their own members, will see to it that every case of violation of the letter or spirit of the Fifteenth Amendment is thoroughly investigated, and that no benefit from such violation shall accrue to any person or party. It will be the duty of the Executive, with sufficient appropriations for the purpose, to prosecute unsparingly all who have been engaged in depriving citizens of the rights guaranteed to them by the Constitution.

It is not, however, to be forgotten that the best and surest guarantee for the primary rights of citizenship is to be found in that capacity for self-protection which can belong only to a people whose right to universal suffrage is supported by universal education. The means at the command of the local and State authorities are, in many cases, wholly inadequate to furnish free instruction to all who need it. This is especially true where, before emancipation, the education of the people was neglected or prevented, in the interest of slavery. Firmly convinced that the subject of popular education deserves the earnest attention of the people of the whole country, with a view to wise and comprehensive action by the Government of the United States, I respectfully recommend that Congress, by suitable legislation and with proper safeguards, supplement the local educational funds in the several States where the grave duties and responsibilities of citizenship have been devolved on uneducated people, by devoting to the purpose grants of the public lands, and, if necessary, by appropriations from the Treasury of the United States. Whatever Government can fairly do to promote free popular education ought to be done. Wherever general education is found, peace, virtue, and social order prevail, and civil and religious liberty are secure.

In my former annual messages I have asked the attention of Congress to the urgent necessity of a reformation of the Civil-Service system of the Government. My views concerning the dangers of patronage, or appointments for personal or partisan considerations, have been strengthened by my observation and experience in the Executive office, and I believe these dangers threaten the stability of the Government. Abuses so serious in their nature can not be permanently tolerated. They tend to become more alarming with the enlargement of administrative service, as the growth of the country in population increases the number of officers and place-men employed.

The reasons are imperative for the adoption of fixed rules for the regulation of appointments, promotions, and removals, establishing a uniform method, having exclusively in view, in every instance, the attainment of the best qualifications for the position in question. Such a method alone is consistent with the equal rights of all citizens, and the most economical and efficient administration of the public business.

Competitive examinations, in aid of impartial appointments and promotions, have been conducted for some years past in several of the Executive departments, and by my direction this system has been adopted in the custom-houses and post-offices of the larger cities of the country. In the city of New York over two thousand positions in the Civil Service have been subject, in their appointments and tenure of place, to the operation of published rules for this purpose, during the past two years. The results of these practical trials have been very satisfactory, and have con-

firmed my opinion in favor of this system of selection. All are subjected to the same tests, and the result is free from prejudice by personal favor or partisan influence. It secures for the position applied for the best qualifications attainable among the competing applicants. It is an effectual protection from the pressure of importunity which, under any other course pursued, largely exacts the time and attention of appointing officers, to their great detriment in the discharge of other official duties, preventing the abuse of the service for the mere furtherance of private or party purposes, and leaving the employee of the Government, freed from the obligations imposed by patronage, to depend solely upon merit for retention and advancement, and with this constant incentive to exertion and improvement.

These invaluable results have been attained in a high degree in the offices where the rules for appointment by competitive examination have been applied.

A method which has so approved itself by experimental tests, at points where such tests may be fairly considered conclusive, should be extended to all subordinate positions under the Government. I believe that a strong and growing public sentiment demands immediate measures for securing and enforcing the highest possible efficiency in the Civil Service and its protection from recognized abuses, and that the experience referred to has demonstrated the feasibility of such measures.

The examinations in the custom-houses and post-offices have been held under many embarrassments and without provision for compensation for the extra labor performed by the officers who have conducted them, and whose commendable interest in the improvement of the public service has induced this devotion of time and labor without pecuniary reward. A continuance of these labors gratuitously ought not to be expected, and, without an appropriation by Congress for compensation, it is not practicable to extend the system of examinations generally throughout the civil service. It is also highly important that all such examinations should be conducted upon a uniform system and under general supervision. Section 1753 of the Revised Statutes authorizes the President to prescribe the regulations for admission to the Civil Service of the United States, and for this purpose to employ suitable persons to conduct the requisite inquiries with reference to "the fitness of each candidate, in respect to age, health, character, knowledge, and ability for the branch of service into which he seeks to enter," but the law is practically inoperative for want of the requisite appropriation.

I therefore recommend an appropriation of \$25,000 per annum to meet the expenses of a commission, to be appointed by the President in accordance with the terms of this section, whose duty it shall be to devise a just, uniform, and efficient system of competitive examinations, and to supervise the application of the same throughout the entire Civil Service of the Government. I am persuaded that the facilities which such a commission will afford for testing the fitness of those who apply for office will not only be as welcome a relief to members of Congress as it will be to the President and heads of departments, but that it will also greatly tend to remove the causes of embarrassment which now inevitably and constantly attend the conflicting claims of patronage between the legislative and Executive departments. The most effectual check upon the pernicious competition of influence and official favoritism, in the bestowal of office, will be the substitution of an open competition of merit between the applicants, in which every one can make his own record with the assurance that his success will depend upon this alone.

I also recommend such legislation as, while leaving every officer as free as any other citizen to express his political opinions and to use his means for their advancement, shall also enable him to feel as safe as any private citizen in refusing all demands upon his salary for political purposes. A law which should thus guarantee true liberty and justice to all who are en-

gaged in the public service, and likewise contain stringent provisions against the use of official authority to coerce the political action of private citizens or of official subordinates, is greatly to be desired.

The most serious obstacle, however, to an improvement of the Civil Service, and especially to a reform in the method of appointment and removal, has been found to be the practice under what is known as the spoils system, by which the appointing power has been so largely encroached upon by members of Congress. The first step in the reform of the Civil Service must be a complete divorce between Congress and the Executive in the matter of appointments. The corrupting doctrine that "to the victors belong the spoils" is inseparable from Congressional patronage as the established rule and practice of parties in power. It comes to be understood by applicants for office, and by the people generally, that Representatives and Senators are entitled to disburse the patronage of their respective districts and States. It is not necessary to recite at length the evils resulting from this invasion of the Executive functions. The true principles of government on the subject of appointments to office, as stated in the national conventions of the leading parties of the country, have again and again been approved by the American people, and have not been called in question in any quarter. These authentic expressions of public opinion upon this all-important subject are the statement of principles that belong to the constitutional structure of the Government.

Under the Constitution the President and heads of departments are to make nominations for office. The Senate is to advise and consent to appointments, and the House of Representatives is to accuse and prosecute faithless officers. The best interest of the public service demands that these distinctions be respected; that Senators and Representatives, who may be judges and accusers, should not dictate appointments to office.

To this end the coöperation of the Legislative department of the Government is required, alike by the necessities of the case and by public opinion. Members of Congress will not be relieved from the demands made upon them with reference to appointments to office until, by legislative enactment, the pernicious practice is condemned and forbidden.

It is, therefore, recommended that an act be passed defining the relations of members of Congress with respect to appointment to office by the President, and I also recommend that the provisions of Section 1767, and of the sections following, of the Revised Statutes, comprising the Tenure-of-Office act of March 2, 1867, be repealed.

Believing that to reform the system and methods of the Civil Service in our country is one of the highest and most imperative duties of statesmanship, and that it can be permanently done only by the coöperation of the Legislative and Executive departments of the Government, I again commend the whole subject to your considerate attention.

It is the recognized duty and purpose of the people of the United States to suppress polygamy where it now exists in our Territories, and to prevent its extension. Faithful and zealous efforts have been made by the United States authorities in Utah to enforce the laws against it. Experience has shown that the legislation upon this subject, to be effective, requires extensive modification and amendment. The longer action is delayed, the more difficult it will be to accomplish what is desired. Prompt and decided measures are necessary. The Mormon sectarian organization which upholds polygamy has the whole power of making and executing the local legislation of the Territory. By its control of the grand and petit juries, it possesses large influence over the administration of justice. Exercising, as the heads of this sect do, the local political power of the Territory, they are able to make effective their hostility to the law of Congress on the subject of polygamy, and, in fact, do prevent its enforcement. Polygamy will not be abolished if the enforcement of the law depends on those who practice and uphold the crime. It can only be suppressed by

taking away the political power of the sect which encourages and sustains it.

The power of Congress to enact suitable laws to protect the Territories is ample. It is not a case for half-way measures. The political power of the Mormon sect is increasing; it controls now one of our wealthiest and most populous Territories. It is extending steadily into other Territories. Wherever it goes it establishes polygamy and sectarian political power. The sanctity of marriage and the family relation are the corner-stone of our American society and civilization. Religious liberty and the separation of church and state are among the elementary ideas of free institutions. To reestablish the interests and principles which polygamy and Mormonism have imperiled, and to fully reopen to intelligent and virtuous immigrants of all creeds that part of our domain which has been, in a great degree, closed to general immigration by intolerant and immoral institutions, it is recommended that the Government of the Territory of Utah be reorganized.

I recommend that Congress provide for the Government of Utah by a governor and judges, or commissioners, appointed by the President and confirmed by the Senate—a government analogous to the provisional government established for the territory northwest of the Ohio by the ordinance of 1787. If, however, it is deemed best to continue the existing form of local government, I recommend that the right to vote, hold office, and sit on juries in the Territory of Utah be confined to those who neither practice nor uphold polygamy. If thorough measures are adopted, it is believed that within a few years the evils which now afflict Utah will be eradicated, and that this Territory will in good time become one of the most prosperous and attractive of the new States of the Union.

Our relations with all foreign countries have been those of undisturbed peace, and have presented no occasion for concern as to their continued maintenance.

My anticipation of an early reply from the British Government to the demand of indemnity to our fishermen for the injuries suffered by that industry at Fortune Bay, in January, 1878, which I expressed in my last annual message, was disappointed. This answer was received only in the latter part of April in the present year, and when received exhibited a failure of accord between the two governments as to the measure of the inshore-fishing privilege secured to our fishermen by the Treaty of Washington of so serious a character that I made it the subject of a communication to Congress, in which I recommended the adoption of the measures which seemed to me proper to be taken by this Government in maintenance of the rights accorded to our fishermen under the treaty, and toward securing an indemnity for the injury these interests had suffered. A bill to carry out these recommendations was under consideration by the House of Representatives at the time of the adjournment of Congress in June last.

Within a few weeks I have received a communication from her Majesty's Government, renewing the consideration of the subject, both of the indemnity for the injuries at Fortune Bay and of the interpretation of the treaty in which the previous correspondence had shown the two governments to be at variance. Upon both these topics the disposition toward a friendly agreement is manifested by a recognition of our right to an indemnity for the transaction at Fortune Bay, leaving the measure of such indemnity to further conference, and by an assent to the view of this Government, presented in the previous correspondence, that the regulation of conflicting interests of the shore fishing of the provincial sea-coasts, and the vessel fishery of our fishermen, should be made the subject of conference and concurrent arrangement between the two governments.

I sincerely hope that the basis may be found for a speedy adjustment of the very serious divergence of views in the interpretation of the fishery clauses of the Treaty of Washington, which, as the correspond-

ence between the two governments stood at the close of the last session of Congress, seemed to be irreconcilable.

In the important exhibition of arts and industries which was held last year at Sydney, New South Wales, as well as in that now in progress at Melbourne, the United States have been efficiently and honorably represented. The exhibitors from this country at the former place received a large number of awards in some of the most considerable departments, and the participation of the United States was recognized by a special mark of distinction. In the exhibition at Melbourne the share taken by our country is no less notable, and an equal degree of success is confidently expected.

The state of peace and tranquillity now enjoyed by all the nations of the continent of Europe has its favorable influence upon our diplomatic and commercial relations with them. We have concluded and ratified a convention with the French Republic for the settlement of claims of the citizens of either country against the other. Under this convention a commission, presided over by a distinguished publicist, appointed, in pursuance of the request of both nations, by his Majesty the Emperor of Brazil, has been organized and has begun its sessions in this city. A congress to consider means for the protection of industrial property has recently been in session in Paris, to which I have appointed the ministers of the United States in France and in Belgium as delegates. The International Commission upon Weights and Measures also continues its work in Paris. I invite your attention to the necessity of an appropriation to be made in time to enable this Government to comply with its obligations under the Metrical Convention.

Our friendly relations with the German Empire continue without interruption. At the recent International Exhibition of Fish and Fisheries at Berlin, the participation of the United States, notwithstanding the haste, with which the commission was forced to make its preparations, was extremely successful and meritorious, winning for private exhibitors numerous awards of a high class, and for the country at large the principal prize of honor offered by his Majesty the Emperor. The results of this great success can not but be advantageous to this important and growing industry. There have been some questions raised between the two governments as to the proper effect and interpretation of our treaties of naturalization, but recent dispatches from our minister at Berlin show that favorable progress is making toward an understanding, in accordance with the views of this Government, which makes and admits no distinction whatever between the rights of a native and a naturalized citizen of the United States. In practice, the complaints of molestation suffered by naturalized citizens abroad have never been fewer than at present.

There is nothing of importance to note in our unbroken friendly relations with the governments of Austria-Hungary, Russia, Portugal, Sweden and Norway, Switzerland, Turkey, and Greece.

During the last summer several vessels belonging to the merchant marine of this country, sailing in neutral waters of the West Indies, were fired at, boarded, and searched by an armed cruiser of the Spanish Government. The circumstances, as reported, involve not only a private injury to the persons concerned, but also seemed too little observant of the friendly relations existing for a century between this country and Spain. The wrong was brought to the attention of the Spanish Government in a serious protest and remonstrance, and the matter is undergoing investigation by the royal authorities with a view to such explanation or reparation as may be called for by the facts.

The Commission sitting in this city for the adjudication of claims of our citizens against the Government of Spain is, I hope, approaching the termination of its labors.

The claims against the United States under the Florida Treaty with Spain were submitted to Con-

gress for its action at the late session, and I again invite your attention to this long-standing question with a view to a final disposition of the matter.

At the invitation of the Spanish Government, a conference has recently been held at the city of Madrid to consider the subject of protection by foreign powers of native Moors in the Empire of Morocco. The minister of the United States in Spain was directed to take part in the deliberations of this conference, the result of which is a convention signed on behalf of all the powers represented. The instrument will be laid before the Senate for its consideration. The Government of the United States has also lost no opportunity to urge upon that of the Emperor of Morocco the necessity, in accordance with the humane and enlightened spirit of the age, of putting an end to the persecutions which have been so prevalent in that country of persons of a faith other than the Moslem, and especially of the Hebrew residents of Morocco.

The consular treaty concluded with Belgium has not yet been officially promulgated, owing to the alteration of a word in the text by the Senate of the United States, which occasioned a delay, during which the time allowed for ratification expired. The Senate will be asked to extend the period for ratification.

The attempt to negotiate a treaty of extradition with Denmark failed on account of the objection of the Danish Government to the usual clause providing that each nation should pay the expense of the arrest of the persons whose extradition it asks.

The provision made by Congress, at its last session, for the expense of the Commission which had been appointed to enter upon negotiations with the Imperial Government of China, on subjects of great interest to the relations of the two countries, enabled the commissioners to proceed at once upon their mission. The Imperial Government was prepared to give prompt and respectful attention to the matters brought under negotiation, and the conferences proceeded with such rapidity and success that, on the 17th of November last, two treaties were signed at Peking, one relating to the introduction of Chinese into this country, and one relating to commerce. Mr. Trescott, one of the commissioners, is now on his way home bringing the treaties, and it is expected that they will be received in season to be laid before the Senate early in January.

Our Minister in Japan has negotiated a convention for the reciprocal relief of shipwrecked seamen. I take occasion to urge once more upon Congress the propriety of making provision for the erection of suitable fire-proof buildings at the Japanese capital for the use of the American legation, and the court-house and jail connected with it. The Japanese Government, with great generosity and courtesy, has offered for this purpose an eligible piece of land.

In my last annual message I invited the attention of Congress to the subject of the indemnity funds received some years ago from China and Japan. I renew the recommendation then made that whatever portions of these funds are due to American citizens should be promptly paid, and the residue returned to the nations, respectively, to which they justly and equitably belong.

The extradition treaty with the Kingdom of the Netherlands, which has been for some time in course of negotiation, has, during the past year, been concluded and duly ratified.

Relations of friendship and amity have been established between the Government of the United States and that of Roumania. We have sent a diplomatic representative to Bucharest, and have received at this capital the special envoy, who has been charged by his Royal Highness, Prince Charles, to announce the independent sovereignty of Roumania. We hope for a speedy development of commercial relations between the two countries.

In my last annual message I expressed the hope that the prevalence of quiet on the border between this country and Mexico would soon become so assured as to justify the modification of the orders, then in force, to our military commanders in regard to crossing the

frontier, without encouraging such disturbances as would endanger the peace of the two countries. Events moved in accordance with these expectations, and the orders were accordingly withdrawn, to the entire satisfaction of our own citizens and the Mexican Government. Subsequently the peace of the border was again disturbed by a savage foray, under the command of the Chief Victorio, but, by the combined and harmonious action of the military forces of both countries, his band has been broken up and substantially destroyed.

There is reason to believe that the obstacles which have so long prevented rapid and convenient communication between the United States and Mexico by railways are on the point of disappearing, and that several important enterprises of this character will soon be set on foot which cannot fail to contribute largely to the prosperity of both countries.

New envoys from Guatemala, Colombia, Bolivia, Venezuela, and Nicaragua have recently arrived at this capital, whose distinction and enlightenment afford the best guarantee of the continuance of friendly relations between ourselves and these sister republics.

The relations between this Government and that of the United States of Colombia have engaged public attention during the past year, mainly by reason of the project of an interoceanic canal across the Isthmus of Panama, to be built by private capital under a concession from the Colombian Government for that purpose. The treaty obligations subsisting between the United States and Colombia, by which we guarantee the neutrality of the transit and the sovereignty and property of Colombia in the Isthmus, make it necessary that the conditions under which so stupendous a change in the region embraced in this guarantee should be effected—transforming, as it would, this Isthmus, from a barrier between the Atlantic and Pacific Oceans into a gateway and thoroughfare between them for the navies and the merchant ships of the world—should receive the approval of this Government, as being compatible with the discharge of these obligations on our part, and consistent with our interests as the principal commercial power of the Western Hemisphere. The views which I expressed in a special message to Congress in March last, in relation to this project, I deem it my duty again to press upon your attention. Subsequent consideration has but confirmed the opinion "that it is the right and duty of the United States to assert and maintain such supervision and authority over any interoceanic canal across the Isthmus that connects North and South America as will protect our national interest."

The war between the Republic of Chili on the one hand, and the allied Republics of Peru and Bolivia on the other, still continues. This Government has not felt called upon to interfere in a contest that is within the belligerent rights of the parties as independent states. We have, however, always held ourselves in readiness to aid in accommodating their difference, and have at different times reminded both belligerents of our willingness to render such service.

Our good offices, in this direction, were recently accepted by all the belligerents, and it was hoped they would prove efficacious; but I regret to announce that the measures which the ministers of the United States at Santiago and Lima were authorized to take, with the view to bring about a peace, were not successful. In the course of the war some questions have arisen affecting neutral rights; in all of these the ministers of the United States have, under their instructions, acted with promptness and energy in protection of American interests.

The relations of the United States with the Empire of Brazil continue to be most cordial, and their commercial intercourse steadily increases, to their mutual advantage.

The internal disorders with which the Argentine Republic has for some time past been afflicted, and which have more or less influenced its external trade, are understood to have been brought to a close. This happy result may be expected to redound to the benefit

of the foreign commerce of that republic as well as to the development of its vast interior resources.

In Samoa, the government of King Malietoa, under the support and recognition of the consular representatives of the United States, Great Britain, and Germany, seems to have given peace and tranquillity to the islands. While it does not appear desirable to adopt as a whole the scheme of tripartite local government, which has been proposed, the common interests of the three great treaty powers require harmony in their relations to the native frame of government, and this may be best secured by a simple diplomatic agreement between them. It would be well if the consular jurisdiction of our representative at Apia were increased in extent and importance, so as to guard American interests in the surrounding and outlying islands of Oceania.

The obelisk, generously presented by the Khedive of Egypt to the City of New York, has safely arrived in this country, and will soon be erected in that metropolis. A commission for the liquidation of the Egyptian debt has lately concluded its work, and this Government, at the earnest solicitation of the Khedive, has acceded to the provisions adopted by it, which will be laid before Congress for its information. A commission for the revision of the judicial code of the Reform Tribunal of Egypt is now in session in Cairo. Mr. Farman, Consul-General, and J. M. Batchelder, Esq., have been appointed as commissioners to participate in this work. The organization of the Reform Tribunals will probably be continued for another period of five years.

In pursuance of the act passed at the last session of Congress, invitations have been extended to foreign maritime states to join in sanitary conference in Washington, beginning the first of January. The acceptance of this invitation by many prominent powers gives promise of success in this important measure, designed to establish a system of international notification, by which the spread of infectious or epidemic diseases may be more effectively checked or prevented. The attention of Congress is invited to the necessary appropriations for carrying into effect the provisions of the act referred to.

The efforts of the Department of State to enlarge the trade and commerce of the United States, through the active agency of consular officers, and through the dissemination of information obtained from them, have been unrelaxed. The interest in these efforts, as developed in our commercial communities, and the value of the information secured by this means to the trade and manufactures of the country, were recognized by Congress at its last session, and provision was made for the more frequent publication of consular and other reports by the Department of State. The first issue of this publication has now been prepared, and subsequent issues may regularly be expected. The importance and interest attached to the reports of consular officers are witnessed by the general demand for them by all classes of merchants and manufacturers engaged in our foreign trade. It is believed that the system of such publications is deserving of the approval of Congress, and that the necessary appropriations for its continuance and enlargement will commend itself to your consideration.

The prosperous energies of our domestic industries, and their immense production of the subjects of foreign commerce, invite, and even require, an active development of the wishes and interests of our people in that direction. Especially important is it that our commercial relations with the Atlantic and Pacific coasts of South America, with the West Indies and the Gulf of Mexico, should be direct, and not through the circuit of European systems, and should be carried on in our own bottoms. The full appreciation of the opportunities which our front on the Pacific Ocean gives to commerce with Japan, China, and the East Indies, with Australia and the island groups which lie along these routes of navigation, should inspire equal efforts to appropriate to our own shipping,

and to administer, by our own capital, a due proportion of this trade. Whatever modifications of our regulations of trade and navigation may be necessary or useful to meet and direct these impulses to the enlargement of our exchanges and of our carrying trade, I am sure the wisdom of Congress will be ready to supply. One initial measure, however, seems to me so clearly useful and efficient that I venture to press it upon your earnest attention. It seems to be very evident that the provision of regular steam postal communication, by aid from Government, has been the forerunner of the commercial predominance of Great Britain on all these coasts and seas, a greater share in whose trade is now the desire and the intent of our people. It is also manifest that the efforts of other European nations to contend with Great Britain for a share of this commerce have been successful in proportion with their adoption of regular steam postal communication with the markets whose trade they sought. Mexico and the States of South America are anxious to receive such postal communications with this country, and to aid in their development. Similar cooperation may be looked for, in due time, from the Eastern nations, and from Australia. It is difficult to see how the lead in this movement can be expected from private interests. In respect of foreign commerce, quite as much as in internal trade, postal communication seems necessarily a matter of common and public administration, and thus pertaining to Government. I respectfully recommend to your prompt attention such just and efficient measures as may conduce to the development of our foreign commercial exchanges, and the building up of our carrying trade.

In this connection I desire also to suggest the very great service which might be expected in enlarging and facilitating our commerce on the Pacific Ocean were a transmarine cable laid from San Francisco to the Sandwich Islands, and thence to Japan at the north and Australia at the south. The great influence of such means of communication on these routes of navigation in developing and securing the due share of our Pacific coast in the commerce of the world needs no illustration or enforcement. It may be that such an enterprise, useful and in the end profitable as it would prove to private investment, may need to be accelerated by prudent legislation by Congress in its aid, and I submit the matter to your careful consideration.

An additional and not unimportant, although secondary, reason for fostering and enlarging the Navy may be found in the unquestionable service to the expansion of our commerce which would be rendered by the frequent circulation of naval ships in the seas and ports of all quarters of the globe. Ships of the proper construction and equipment to be of the greatest efficiency in case of maritime war might be made constant and active agents in time of peace in the advancement and protection of our foreign trade, and in the nurture and discipline of young seamen, who would naturally, in some numbers, mix with and improve the crews of our merchant ships. Our merchants at home and abroad recognize the value to foreign commerce of an active movement of our naval vessels, and the intelligence and patriotic zeal of our naval officers in promoting every interest of their countrymen is a just subject of national pride.

The condition of the financial affairs of the Government, as shown by the report of the Secretary of the Treasury, is very satisfactory. It is believed that the present financial situation of the United States, whether considered with respect to trade, currency, credit, growing wealth, or the extent and variety of our resources, is more favorable than that of any other country of our time, and has never been surpassed by that of any country at any period of its history. All our industries are thriving; the rate of interest is low; new railroads are being constructed; a vast immigration is increasing our population, capital and labor; new enterprises in great number are in progress, and our commercial relations with other countries are improving.

The ordinary revenues from all sources, for the fiscal year ended June 30, 1880, were—

From customs.....	\$186,522,064 60
From internal revenue.....	124,009,873 92
From sales of public lands.....	1,016,506 60
From tax on circulation and deposits of national banks.....	7,014,971 44
From repayment of interest by Pacific Railway Companies.....	1,707,967 18
From sinking-fund for Pacific Railway Companies.....	786,621 22
From customs, fees, fines, penalties, etc.....	1,148,500 16
From fees—consular, letters patent, and lands.....	2,337,029 00
From proceeds of sales of Government property.....	282,616 50
From profits on coinage, etc.....	2,792,186 73
From revenues of the District of Columbia.....	1,809,469 70
From miscellaneous sources.....	4,999,603 88
Total ordinary receipts.....	\$333,526,610 93

The ordinary expenditures for the same period were—

For civil expenses.....	\$15,693,963 55
For foreign intercourse.....	1,211,490 58
For Indians.....	5,945,457 09
For pensions (including \$19,341,023.20 arrears of pensions).....	56,777,174 44
For the military establishment, including river and harbor improvements and arsenals.....	38,116,916 22
For the naval establishment, including vessels, machinery, and improvements at navy-yards.....	13,536,954 74
For miscellaneous expenditures, including public buildings, light-houses, and collecting the revenue.....	34,535,691 00
For expenditures on account of the District of Columbia.....	8,272,354 63
For interest on the public debt.....	95,737,575 11
For premium on bonds purchased.....	2,795,320 42
Total ordinary expenditures.....	\$267,642,957 78

Leaving a surplus revenue of.....	\$65,883,653 20
Which, with an amount drawn from the cash balance in Treasury of.....	8,084,434 21

Making..... **\$73,968,087 41**

Was applied to the redemption—

Of bonds for the sinking-fund.....	\$73,652,900 00
Of fractional currency.....	251,717 41
Of the loan of 1858.....	40,000 00
Of temporary loan.....	100 00
Of bounty-land scrip.....	25 00
Of compound-interest notes.....	16,500 00
Of 7.30 notes of 1864-5.....	2,650 00
Of one and two year notes.....	3,700 00
Of old demand notes.....	495 00
Total.....	\$73,968,087 41

The amount due the sinking-fund for this year was \$37,931,943.55. There was applied thereto the sum of \$73,904,617.41, being \$35,972,973.86 in excess of the actual requirements for the year.

The aggregate of the revenues from all sources during the fiscal year ended June 30, 1880, was \$333,526,610.93, an increase over the preceding year of \$59,699,426.52. The receipts thus far of the current year, together with the estimated receipts for the remainder of the year, amount to \$350,000,000, which will be sufficient to meet the estimated expenditures of the year, and leave a surplus of \$90,000,000.

It is fortunate that this large surplus revenue occurs at a period when it may be directly applied to the payment of the public debt soon to be redeemable. No public debt has been more constantly cherished in the United States than the policy of paying the nation's debt as rapidly as possible.

The debt of the United States, less cash in the Treasury and exclusive of accruing interest, attained its maximum of \$2,756,431,571.43 in August, 1865, and has since that time been reduced to \$1,886,019,504.65. Of the principal of the debt, \$108,758,100 has been paid since March 1, 1877, effecting an annual saving

of interest of \$6,107,593. The burden of interest has also been diminished by the sale of bonds bearing a low rate of interest and the application of the proceeds to the redemption of bonds bearing a higher rate. The annual saving thus secured since March 1, 1877, is \$14,290,453.50. Within a short period over six hundred millions of five and six per cent. bonds will become redeemable. This presents a very favorable opportunity not only to further reduce the principal of the debt, but also to reduce the rate of interest on that which will remain unpaid. I call the attention of Congress to the views expressed on this subject by the Secretary of the Treasury in his annual report, and recommend prompt legislation to enable the Treasury Department to complete the refunding of the debt which is about to mature.

The continuance of specie payments has not been interrupted or endangered since the date of resumption. It has contributed greatly to the revival of business and to our remarkable prosperity. The fears that preceded and accompanied resumption have proved groundless. No considerable amount of United States notes have been presented for redemption, while very large sums of gold bullion, both domestic and imported, are taken to the mints and exchanged for coin or notes. The increase of coin and bullion in the United States since January 1, 1879, is estimated at \$227,399,428.

There are still in existence, uncanceled, \$346,681,016 of United States legal-tender notes. These notes were authorized as a war measure, made necessary by the exigencies of the conflict in which the United States was then engaged. The preservation of the nation's existence required, in the judgment of Congress, an issue of legal-tender paper money. That it served well the purpose for which it was created is not questioned, but the employment of the notes as paper money indefinitely, after the accomplishment of the object for which they were provided, was not contemplated by the framers of the law under which they were issued. These notes long since became—like any other pecuniary obligation of the Government—a debt to be paid, and when paid to be canceled as mere evidence of an indebtedness no longer existing. I therefore repeat what was said in the annual message of last year, that the retirement from circulation of United States notes, with the capacity of legal tender in private contracts, is a step to be taken in our progress toward a safe and stable currency which should be accepted as the policy and duty of the Government, and the interest and security of the people.

At the time of the passage of the act now in force, requiring the coinage of silver dollars, fixing their value and giving them legal-tender character, it was believed by many of the supporters of the measure that the silver dollar which it authorized would speedily become, under the operations of the law, of equivalent value to the gold dollar. There were other supporters of the bill who, while they doubted as to the probability of this result, nevertheless were willing to give the proposed experiment a fair trial, with a view to stop the coinage if experience should prove that the silver dollar authorized by the bill continued to be of less commercial value than the standard gold dollar.

The coinage of silver dollars, under the act referred to, began in March, 1878, and has been continued as required by the act. The average rate per month to the present time has been \$2,276,492. The total amount coined prior to the 1st of November last was \$72,847,750. Of this amount \$47,084,450 remain in the Treasury, and only \$25,763,291 are in the hands of the people. A constant effort has been made to keep this currency in circulation, and considerable expense has been necessarily incurred for this purpose, but its return to the Treasury is prompt and sure. Contrary to the confident anticipation of the friends of the measure at the time of its adoption, the value of the silver dollar containing 412½ grains of silver has not increased. During the year prior to the passage of the bill authorizing its coinage, the market value of the silver which it contained was from 90 to 92 cents as

compared with the standard gold dollar. During the last year the average market value of the silver dollar has been 88½ cents.

It is obvious that the legislation of the last Congress in regard to silver, so far as it was based on an anticipated rise in the value of silver as a result of that legislation, has failed to produce the effect then predicted. The longer the law remains in force, requiring as it does the coining of a nominal dollar, which in reality is not a dollar, the greater becomes the danger that this country will be forced to accept a single metal as the sole legal standard of value in circulation, and this a standard of less value than it purports to be worth in the recognized money of the world.

The Constitution of the United States, sound financial principles, and our best interests, all require that the country should have as its legal-tender money both gold and silver coin of an intrinsic value, as bullion, equivalent to that which, upon its face, it purports to possess. The Constitution, in express terms, recognizes both gold and silver as the only true legal-tender money. To banish either of these metals from our currency is to narrow and limit the circulating medium of exchange to the disparagement of important interests. The United States produces more silver than any other country, and is directly interested in maintaining it as one of the two precious metals which furnish the coinage of the world. It will, in my judgment, contribute to this result if Congress will repeal so much of existing legislation as requires the coining of silver dollars containing only 412½ grains of silver, and in its stead will authorize the Secretary of the Treasury to coin silver dollars of equivalent value, as bullion, with gold dollars. This will defraud no man, and will be in accordance with familiar precedents. Congress, on several occasions, has altered the ratio of value between gold and silver, in order to establish it more nearly in accordance with the actual ratio of value between the two metals.

In financial legislation every measure in the direction of greater fidelity in the discharge of pecuniary obligations has been found by experience to diminish the rates of interest which debtors are required to pay, and to increase the facility with which money can be obtained for every legitimate purpose. Our own recent financial history shows how surely money becomes abundant whenever confidence in the exact performance of moneyed obligations is established.

The Secretary of War reports that the expenditures of the War Department for the fiscal year ended June 30, 1880, were \$39,924,773.03. The appropriations for this department, for the current fiscal year, amount to \$41,993,630.40.

With respect to the Army, the Secretary invites attention to the fact that its strength is limited by statute (section 1,115 Revised Statutes) to not more than 30,000 enlisted men, but that provisos contained in appropriation bills have limited expenditures to the enlistment of but 25,000. It is believed the full legal strength is the least possible force at which the present organization can be maintained, having in view efficiency, discipline, and economy. While the enlistment of this force would add somewhat to the appropriation for pay of the Army, the saving made in other respects would be more than an equivalent for this additional outlay, and the efficiency of the Army would be largely increased.

The rapid extension of the railroad system west of the Mississippi River, and the great tide of settlers which has flowed in upon new territory, impose on the military an entire change of policy. The maintenance of small posts along wagon and stage routes of travel is no longer necessary. Permanent quarters at points selected, of a more substantial character than those heretofore constructed, will be required. Under existing laws permanent buildings can not be erected without the sanction of Congress, and when sales of military sites and buildings have been authorized the moneys received have reverted to the Treasury and could only become available through a new appropriation. It is recommended that provision be made by a

general statute for the sale of such abandoned military posts and buildings as are found to be unnecessary, and for the application of the proceeds to the construction of other posts. While many of the present posts are of but slight value for military purposes, owing to the changed condition of the country, their occupation is continued at great expense and inconvenience, because they afford the only available shelter for troops.

The absence of a large number of officers of the line, in active duty, from their regiments is a serious detriment to the maintenance of the service. The constant demand for small detachments, each of which should be commanded by a commissioned officer, and the various details of officers for necessary service away from their commands, occasions a scarcity in the number required for company duties. With a view to lessening this drain to some extent, it is recommended that the law authorizing the detail of officers from the active list, as professors of tactics and military science at certain colleges and universities, be so amended as to provide that all such details be made from the retired list of the Army.

Attention is asked to the necessity of providing by legislation for organizing, arming, and disciplining the *active* militia of the country, and liberal appropriations are recommended in this behalf. The reports of the Adjutant-General of the Army and the Chief of Ordnance touching this subject fully set forth its importance.

The report of the officer in charge of education in the Army shows that there are seventy-eight schools now in operation in the Army, with an aggregate attendance of 2,305 enlisted men and children. The Secretary recommends the enlistment of one hundred and fifty school-masters, with the rank and pay of commissary sergeants. An appropriation is needed to supply the Judge-Advocates of the Army with suitable libraries, and the Secretary recommends that the corps of Judge-Advocates be placed upon the same footing, as to promotion, with the other staff corps of the Army. Under existing laws, the Bureau of Military Justice consists of one officer, the Judge-Advocate-General, and the corps of Judge-Advocates of eight officers of equal rank (majors), with a provision that the limit of the corps shall remain at four when reduced by casualty or resignation to that number. The consolidation of the Bureau of Military Justice and the corps of Judge-Advocates, upon the same basis with the other staff corps of the Army, would remove an unjust discrimination against deserving officers, and subserve the best interests of the service.

Especial attention is asked to the report of the Chief of Engineers upon the condition of our national defenses. From a personal inspection of many of the fortifications referred to, the Secretary is able to emphasize the recommendations made, and to state that their incomplete and defenseless condition is discreditable to the country. While other nations have been increasing their means for carrying on offensive warfare and attacking maritime cities, we have been dormant in preparation for defense; nothing of importance has been done toward strengthening and finishing our casemated works since our late Civil War, during which the great guns of modern warfare and the heavy armor of modern fortifications and ships came into use among the nations; and our earthworks, left by a sudden failure of appropriations some years since in all stages of incompleteness, are now being rapidly destroyed by the elements.

The two great rivers of the North American Continent—the Mississippi and the Columbia—have their navigable waters wholly within the limits of the United States, and are of vast importance to our internal and foreign commerce. The permanency of the important work on the South Pass of the Mississippi River seems now to be assured. There has been no failure whatever in the maintenance of the maximum channel during the six months ended August 9th last. This experiment has opened a broad, deep highway to the ocean, and is an improvement upon the permanent

success of which congratulations may be exchanged among people abroad and at home, and especially among the communities of the Mississippi Valley, whose commercial exchanges float in an unobstructed channel safely to and from the sea.

A comprehensive improvement of the Mississippi and its tributaries is a matter of transcendent importance. These great water-ways comprise a system of inland transportation spread like net-work over a large portion of the United States, and navigable to the extent of many thousands of miles. Producers and consumers alike have a common interest in such unequaled facilities for cheap transportation. Geographically, commercially, and politically, they are the strongest tie between the various sections of the country. These channels of communication and interchange are the property of the nation. Its jurisdiction is paramount over their waters, and the plainest principles of public interest require their intelligent and careful supervision, with a view to their protection, improvement, and the enhancement of their usefulness.

The channel of the Columbia River, for a distance of about one hundred miles from its mouth, is obstructed by a succession of bars, which occasion serious delays in navigation, and heavy expense for light-erage and towage. A depth of at least twenty feet at low tide should be secured and maintained, to meet the requirements of the extensive and growing inland and ocean commerce it subserves. The most urgent need, however, for this great water-way is a permanent improvement of the channel at the mouth of the river.

From Columbia River to San Francisco, a distance of over six hundred miles, there is no harbor on our Pacific coast which can be approached during stormy weather. An appropriation of one hundred and fifty thousand dollars was made by the Forty-fifth Congress for the commencement of a breakwater and harbor of refuge, to be located at some point between the Straits of Fuca and San Francisco, at which the necessities of commerce, local and general, will be best accommodated. The amount appropriated is thought to be quite inadequate for the purpose intended. The cost of the work when finished will be very great, owing to the want of natural advantages for a site at any point on the coast between the designated limits, and it has not been thought to be advisable to undertake the work without a larger appropriation. I commend the matter to the attention of Congress.

The completion of the new building for the War Department is urgently needed, and the estimates for continuing its construction are especially recommended.

The collections of books, specimens, and records constituting the Army Medical Museum and Library are of national importance. The library now contains about 51,500 volumes and 57,000 pamphlets relating to medicine, surgery, and allied topics. The contents of the Army Medical Museum consist of 22,000 specimens, and are unique in the completeness with which both military surgery and the diseases of armies are illustrated. Their destruction would be an irreparable loss, not only to the United States but to the world. There are filed in the record and pension division over 16,000 bound volumes of hospital records, together with a great quantity of papers, embracing the original records of the hospitals of our armies during the Civil War. Aside from their historical value, these records are daily searched for evidence needed in the settlement of large numbers of pension and other claims, for the protection of the Government against attempted frauds, as well as for the benefit of honest claimants. These valuable collections are now in a building which is peculiarly exposed to the danger of destruction by fire. It is therefore earnestly recommended that an appropriation be made for a new fire-proof building, adequate for the present needs and reasonable future expansion of these valuable collections. Such a building should be absolutely fire-proof; no expenditure for mere architectural

display is required. It is believed that a suitable structure can be erected at a cost not to exceed \$250,000.

I commend to the attention of Congress the great services of the commander and chief of our armies during the war for the Union, whose wise, firm, and patriotic conduct did so much to bring that momentous conflict to a close. The legislation of the United States contains many precedents for the recognition of distinguished military merit, authorizing rank and emoluments to be conferred for eminent services to the country. An act of Congress authorizing the appointment of a Captain-General of the Army, with suitable provisions relating to compensation, retirement, and other details, would, in my judgment, be altogether fitting and proper, and would be warmly approved by the country.

The report of the Secretary of the Navy exhibits the successful and satisfactory management of that department during the last fiscal year. The total expenditures for the year were \$12,916,639.45, leaving unexpended at the close of the year \$2,141,682.23 of the amount of available appropriations. The appropriations for the present fiscal year ending June 30, 1881, are \$15,095,061.45, and the total estimates for the next fiscal year, ending June 30, 1882, are \$15,953,751.61. The amount drawn by warrant from July 1, 1880, to November 1, 1880, is \$5,041,570.45.

The recommendation of the Secretary of the Navy that provision be made for the establishment of some form of civil government for the people of Alaska is approved. At present there is no protection of persons or property in that Territory, except such as is afforded by the officers of the United States ship *Jamestown*. The vessel was dispatched to Sitka, because of the fear that, without the immediate presence of the national authority, there was impending danger of anarchy. The steps taken to restore order have been accepted in good faith by both white and Indian inhabitants, and the necessity for this method of restraint does not, in my opinion, now exist. If, however, the *Jamestown* should be withdrawn, leaving the people, as at present, without the ordinary, judicial, and administrative authority of organized local government, serious consequences might ensue.

The laws provide only for the collection of revenue, the protection of public property, and the transmission of the mails. The problem is to supply a local rule for a population so scattered and so peculiar in its origin and condition. The natives are reported to be teachable and self-supporting, and, if properly instructed, doubtless would advance rapidly in civilization, and a new factor of prosperity would be added to the national life. I therefore recommend the requisite legislation upon this subject.

The Secretary of the Navy has taken steps toward the establishment of naval coaling-stations at the Isthmus of Panama, to meet the requirements of our commercial relations with Central and South America, which are rapidly growing in importance. Locations eminently suitable, both as regards our naval purposes and the uses of commerce, have been selected, one on the east side of the Isthmus, at Chiriqui Lagoon, in the Caribbean Sea, and the other on the Pacific coast, at the Bay of Golfito. The only safe harbors, sufficiently commodious, on the Isthmus are at these points, and the distance between them is less than one hundred miles. The report of the Secretary of the Navy concludes with valuable suggestions with respect to the building up of our merchant-marine service, which deserve the favorable consideration of Congress.

The report of the Postmaster-General exhibits the continual growth and the high state of efficiency of the postal service. The operations of no department of the Government, perhaps, represent with greater exactness the increase in the population and the business of the country. In 1860 the postal receipts were \$8,518,067.40; in 1880 the receipts were \$33,315,470.84. All the inhabitants of the country are directly and personally interested in having proper mail facilities, and naturally watch the post-office very closely.

This careful oversight on the part of the people has proved a constant stimulus to improvement. During the past year there was an increase of 2,134 post-offices, and the mail routes were extended 27,177 miles, making an additional annual transportation of 10,804,191 miles. The revenues of the postal service for the ensuing year are estimated at \$38,845,174.10, and the expenditures at \$42,475,932, leaving a deficiency to be appropriated out of the Treasury of \$3,630,757.90.

The Universal Postal Union has received the accession of almost all the countries and colonies of the world maintaining organized postal services, and it is confidently expected that all the other countries and colonies now outside the Union will soon unite therewith, thus realizing the grand idea and aim of the founders of the Union of forming, for purposes of international mail communication, a single postal territory, embracing the world, with complete uniformity of postal charges and conditions of international exchange for all descriptions of correspondence. To enable the United States to do its full share of this great work additional legislation is asked by the Postmaster-General, to whose recommendations especial attention is called.

The suggestion of the Postmaster-General that it would be wise to encourage, by appropriate legislation, the establishment of American lines of steamers by our own citizens, to carry the mails between our own ports and those of Mexico, Central America, South America, and of trans-pacific countries, is commended to the serious consideration of Congress.

The attention of Congress is also invited to the suggestions of the Postmaster-General in regard to postal savings.

The necessity for additional provision to aid in the transaction of the business of the Federal courts becomes each year more apparent. The dockets of the Supreme Court, and of the Circuit Courts in the greater number of the circuits, are encumbered with the constant accession of cases. In the former Court, and in many instances in the Circuit Courts, years intervene before it is practicable to bring cases to a hearing.

The Attorney-General recommends the establishment of an Intermediate Court of Errors and Appeals. It is recommended that the number of judges of the Circuit Court in each circuit, with the exception of the second circuit, should be increased by the addition of another judge; in the second circuit, that two should be added; and that an Intermediate Appellate Court should be formed in each circuit, to consist of the circuit judges and the circuit justice, and that in the event of the absence of either of these judges the place of the absent judge should be supplied by the judge of one of the district courts in the circuit. Such an appellate court could be safely invested with large jurisdiction, and its decisions would satisfy suitors in many cases where appeals would still be allowed to the Supreme Court. The expense incurred for this intermediate court will require a very moderate increase of the appropriations for the expenses of the Department of Justice. This recommendation is commended to the careful consideration of Congress.

It is evident that a delay of justice, in many instances oppressive and disastrous to suitors, now necessarily occurs in the Federal Courts, which will in this way be remedied.

The report of the Secretary of the Interior presents an elaborate account of the operations of that department during the past year. It gives me great pleasure to say that our Indian affairs appear to be in a more hopeful condition now than ever before. The Indians have made gratifying progress in agriculture, herding, and mechanical pursuits. Many, who were a few years ago in hostile conflict with the Government, are quietly settling down on farms where they hope to make their permanent homes, building houses, and engaging in the occupations of civilized life. The introduction of the freighting business among them has been remarkably fruitful of good results, in giving many of them congenial and remunerative employment, and in stimulating their ambition to earn their own

support. Their honesty, fidelity, and efficiency as carriers are highly praised. The organization of a police force of Indians has been equally successful in maintaining law and order upon the reservations, and in exercising a wholesome, moral influence among the Indians themselves. I concur with the Secretary of the Interior in the recommendation that the pay of this force be increased as an inducement to the best class of young men to enter it.

Much care and attention have been devoted to the enlargement of educational facilities for the Indians. The means available for this important object have been very inadequate. A few additional boarding-schools at Indian agencies have been established, and the erection of buildings has been begun for several more, but an increase of the appropriations for this interesting undertaking is greatly needed to accommodate the large number of Indian children of school age. The number offered by their parents from all parts of the country for education in the Government schools is much larger than can be accommodated with the means at present available for that purpose. The number of Indian pupils at the Normal School at Hampton, Virginia, under the direction of General Armstrong, has been considerably increased, and their progress is highly encouraging. The Indian school established by the Interior Department, in 1879, at Carlisle, Pennsylvania, under the direction of Captain Pratt, has been equally successful. It has now nearly two hundred pupils of both sexes, representing a great variety of the tribes east of the Rocky Mountains. The pupils in both these institutions receive not only an elementary English education, but are also instructed in house-work, agriculture, and useful mechanical pursuits. A similar school was established this year at Forest Grove, Oregon, for the education of Indian youth on the Pacific coast. In addition to this, thirty-six Indian boys and girls were selected from the Eastern Cherokees and placed in boarding-schools in North Carolina, where they are to receive an elementary English education and training in industrial pursuits. The interest shown by Indian parents, even among the so-called wild tribes, in the education of their children is very gratifying, and gives promise that the results accomplished by the efforts now making will be of lasting benefit.

The expenses of Indian education have so far been drawn from the permanent civilization fund at the disposal of the Department of the Interior; but the fund is now so much reduced that the continuance of this beneficial work will in the future depend on specific appropriations by Congress for the purpose; and I venture to express the hope that Congress will not permit institutions so fruitful of good results to perish for want of means for their support. On the contrary, an increase of the number of such schools appears to me highly advisable.

The past year has been unusually free from disturbances among the Indian tribes. An agreement has been made with the Utes by which they surrender their large reservation in Colorado in consideration of an annuity to be paid to them, and agree to settle in severally on certain lands designated for that purpose, as farmers, holding individual title to their land in fee-simple, inalienable for a certain period. In this way a costly Indian war has been avoided, which at one time seemed imminent, and, for the first time in the history of the country, an Indian nation has given up its tribal existence to be settled in severally, and to live as individuals under the common protection of the laws of the country.

The conduct of the Indians throughout the country during the past year, with but few noteworthy exceptions, has been orderly and peaceful. The guerrilla warfare carried on for two years by Victorio and his band of Southern Apaches has virtually come to an end by the death of that chief and most of his followers on Mexican soil. The disturbances caused on our northern frontier by Sitting Bull and his men, who had taken refuge in the British dominions, are also likely to cease. A large majority of his followers have

surrendered to our military forces, and the remainder are apparently in progress of disintegration.

I concur with the Secretary of the Interior in expressing the earnest hope that Congress will at this session take favorable action on the bill providing for the allotment of lands on the different reservations in severalty to the Indians, with patents conferring fee-simple title inalienable for a certain period, and the eventual disposition of the residue of the reservations, for general settlement, with the consent and for the benefit of the Indians, placing the latter under the equal protection of the laws of the country. This measure, together with a vigorous prosecution of our educational efforts, will work the most important and effective advance toward the solution of the Indian problem, in preparing for the gradual merging of our Indian population in the great body of American citizenship.

A large increase is reported in the disposal of public lands for settlement during the past year, which marks the prosperous growth of our agricultural industry, and a vigorous movement of population toward our unoccupied lands. As this movement proceeds, the codification of our land laws, as well as proper legislation to regulate the disposition of public lands, become of more pressing necessity, and I therefore invite the consideration of Congress to the report and the accompanying draft of a bill, made by the Public Lands Commission, which were communicated by me to Congress at the last session. Early action upon this important subject is highly desirable.

The attention of Congress is again asked to the wasteful depredations committed on our public timberlands, and the rapid and indiscriminate destruction of our forests. The urgent necessity for legislation to this end is now generally recognized. In view of the lawless character of the depredations committed, and the disastrous consequences which will inevitably follow their continuance, legislation has again and again been recommended to arrest the evil, and to preserve for the people of our Western States and Territories the timber needed for domestic and other essential uses.

The report of the Director of the Geological Survey is a document of unusual interest. The consolidation of the various geological and geographical surveys and exploring enterprises, each of which has heretofore operated upon an independent plan, without concert, can not fail to be of great benefit to all those industries of the country which depend upon the development of our mineral resources. The labors of the scientific men, of recognized merit, who compose the corps of the Geological Survey, during the first season of their field operations and inquiries, appear to have been very comprehensive, and will soon be communicated to Congress in a number of volumes. The Director of the Survey recommends that the investigations carried on by his bureau, which so far have been confined to the so-called public-land States and Territories, be extended over the entire country, and that the necessary appropriation be made for this purpose. This would be particularly beneficial to the iron, coal, and other mining interests of the Mississippi Valley, and of the Eastern and Southern States. The subject is commended to the careful consideration of Congress.

The Secretary of the Interior asks attention to the want of room in the public buildings of the Capital, now existing and in progress of construction, for the accommodation of the clerical force employed and of the public records. Necessity has compelled the renting of private buildings in different parts of the city for the location of public offices, for which a large amount of rent is annually paid, while the separation of offices belonging to the same department impedes the transaction of current business. The Secretary suggests that the blocks surrounding Lafayette Square on the east, north, and west be purchased as the sites for new edifices for the accommodation of the Government offices, leaving the square itself intact, and that, if such buildings were constructed upon a harmonious plan of architecture, they would add much to the

beauty of the national Capital, and would, together with the Treasury and the new State, Navy, and War Department building, form one of the most imposing groups of public edifices in the world.

The Commissioner of Agriculture expresses the confident belief that his efforts in behalf of the production of our own sugar and tea have been encouragingly rewarded. The importance of the results attained have attracted marked attention at home, and have received the special consideration of foreign nations. The successful cultivation of our own tea and the manufacture of our own sugar would make a difference of many millions of dollars annually in the wealth of the nation.

The report of the Commissioner asks attention particularly to the continued prevalence of an infectious and contagious cattle disease known and dreaded in Europe and Asia as cattle-plague, or pleuro-pneumonia. A mild type of this disease, in certain sections of our country, is the occasion of great loss to our farmers, and of serious disturbance to our trade with Great Britain, which furnishes a market for most of our live stock and dressed meats. The value of neat-cattle exported from the United States for the eight months ended August 31, 1880, was more than twelve million dollars, and nearly double the value for the same period in 1879, an unexampled increase of export trade. Your early attention is solicited to this important matter.

The Commissioner of Education reports a continued increase of public interest in educational affairs, and that the public schools generally throughout the country are well sustained. Industrial training is attracting deserved attention, and colleges for instruction, theoretical and practical, in agriculture and mechanic arts, including the Government schools recently established for the instruction of Indian youth, are gaining steadily in public estimation. The Commissioner asks special attention to the depredations committed on the lands reserved for the future support of public instruction, and to the very great need of help from the nation for schools in the Territories and in the Southern States. The recommendation heretofore made is repeated and urged, that an educational fund be set apart from the net proceeds of the sales of the public lands annually, the income of which, and the remainder of the net annual proceeds, to be distributed on some satisfactory plan to the States and the Territories and the District of Columbia.

The success of the public schools of the District of Columbia, and the progress made, under the intelligent direction of the Board of Education and the Superintendent, in supplying the educational requirements of the District with thoroughly trained and efficient teachers, is very gratifying. The acts of Congress, from time to time, donating public lands to the several States and Territories in aid of educational interests, have proved to be wise measures of public policy, resulting in great and lasting benefit. It would seem to be a matter of simple justice to extend the benefits of this legislation, the wisdom of which has been so fully vindicated by experience, to the District of Columbia.

I again commend the general interests of the District of Columbia to the favorable consideration of Congress. The affairs of the District, as shown by the report of the Commissioners, are in a very satisfactory condition.

In my annual messages heretofore, and in my special message of December 19, 1879, I have urged upon the attention of Congress the necessity of reclaiming the marshes of the Potomac adjacent to the Capital, and I am constrained by its importance to advert again to the subject. These flats embrace an area of several hundred acres. They are an impediment to the drainage of the city, and seriously impair its health. It is believed that, with this substantial improvement of its river front, the Capital would be, in all respects, one of the most attractive cities in the world. Aside from its permanent population, this city is necessarily the place of residence of persons from every section of the country engaged in the public service. Many

others reside here temporarily for the transaction of business with the Government.

It should not be forgotten that the land acquired will probably be worth the cost of reclaiming it, and that the navigation of the river will be greatly improved. I therefore again invite the attention of Congress to the importance of prompt provision for this much-needed and too-long-delayed improvement.

The water supply of the city is inadequate. In addition to the ordinary use throughout the city, the consumption by Government is necessarily very great in the navy-yard, arsenal, and the various departments, and a large quantity is required for the proper preservation of the numerous parks and the cleansing of sewers. I recommend that this subject receive the early attention of Congress, and that, in making pro-

vision for an increased supply, such means be adopted as will have in view the future growth of the city. Temporary expedients for such a purpose can not but be wasteful of money, and therefore unwise. A more ample reservoir, with corresponding facilities for keeping it filled, should, in my judgment, be constructed. I commend again to the attention of Congress the subject of the removal from their present location of the depots of the several railroads entering the city; and I renew the recommendations of my former messages in behalf of the erection of a building for the Congressional Library, the completion of the Washington Monument, and of liberal appropriations in support of the benevolent, reformatory, and penal institutions of the District.

RUTHERFORD B. HAYES.

EXECUTIVE MANSION, December 6, 1880.

R

REFORMED CHURCHES. I. REFORMED CHURCH IN AMERICA.—The following is a summary of the statistics of this Church, as reported to the General Synod in June, 1880:

CLASSES.	Churches.	Ministers.	Communicants.
Albany.....	17	18	3,163
Arcot.....	21	8	1,286
Bergen.....	16	17	2,174
South Bergen.....	11	14	1,785
Cayuga.....	11	12	1,108
Geneva.....	17	18	1,852
Grand River.....	15	12	2,328
Greene.....	7	8	1,454
Holland.....	17	15	2,887
Hudson.....	10	14	1,948
Illinois.....	22	20	2,084
Kingston.....	14	18	2,492
North Long Island.....	20	28	8,877
South Long Island.....	17	28	8,950
Michigan.....	9	10	766
Monmouth.....	11	14	1,380
Montgomery.....	23	17	2,581

Ulster.....	15	19	2,680
Westchester.....	14	17	2,007
Wisconsin.....	28	17	2,498
Total.....	510	545	80,208

Number of families connected with the Church, 43,289; number of Sunday-schools, 645, with 80,445 scholars; amount of contributions for religious and benevolent purposes, \$171,614; for congregational purposes, \$852,286.

Reports were made to the General Synod of the condition of the funds and benevolent enterprises of the Church, as follows:

Widows' Fund: Present amount, \$52,703; income for the year, \$3,074; annuities had been paid to the amount of \$2,319. Ten widows, four ministers, and two orphans had been aided during the year.

Disabled Ministers' Fund: Amount of invested funds, \$19,614; total increase for the

year, \$5,806, of which amount \$3,778 had been paid out to disabled ministers. Twenty-five persons had been relieved by this fund during the year.

Board of Education: Contributions of the churches during the year, \$9,479; indebtedness of the board, \$10,820. Seventy-two students had been under the care of the board.

Board of Publication: Net profits of the year, \$708; surplus of assets over liabilities, \$7,300; funded debt, \$5,200.

The *Board of Domestic Missions* reported that its own receipts for the year had been \$34,527, and the receipts on account of the church-building fund, \$7,139. The latter fund was in debt to the amount of \$4,616.

The receipts of the *Board of Foreign Missions* had been \$63,185, or \$4,742 more than the receipts of the previous year. Two missionaries had been sent to Japan during the year. The missions at Amoy, China, Arcot, India, and in Japan returned 14 stations, 101 out-stations, 16 missionaries, 21 assistant missionaries, 11 native ministers, 38 catechists or preachers, 14 assistant catechists, 32 readers, 40 schoolmasters and teachers, 9 schoolmistresses, 35 churches with 2,341 communicants, 3 academies (in India and Japan) with 96 scholars, 49 day-schools (in China and India), with 1,719 scholars, 12 theological students (in China and Japan), 1 dispensary (in India), in which 12,001 patients were treated, and contributions from the native churches amounting to \$2,250. The growth of the missions, during fifteen years, is shown in an increase of 24 churches, 85 out-stations, 1,626 communicants, 5,500 adherents, and 1,541 scholars from December, 1864, to December, 1879.

The receipts of the *Woman's Board* for the year had been \$8,879, or nearly \$500 more than those of the previous year. This society was about to assume all the work among women and girls connected with the missions.

The *General Synod of the Reformed Church in America* met in Brooklyn, New York, June 2d. The Rev. John A. De Baun, D. D., was chosen President. Four classes had sent memorials to the Synod on the subject of Freemasonry and secret societies, which they consid-

ered, for reasons which were specifically given, to be "anti-republican, anti-Christian, and anti-Reformed," asking the Synod to make a deliverance on the subject, embodying its advice, testimony, and the evidence of its active opposition against such societies. The Synod, in reply, adopted a declaration—

"that while as the *ex parte* evidence of the memorials now before it, this Synod can not properly give its official testimony for or against Freemasonry and other oath-bound secret societies; and while it holds as sacred the indefeasible rights of all its ministers and members to their individual conscientious convictions and liberty of speech and action, subject only to their prior loyalty to Christ and to his Church, yet it hereby declares that no communicant member and no minister of the Reformed Church in America ought to unite with, or remain in, any society or institution, whether secret or open, where principles, practices, and obligations are anti-Christian or contrary to the faith and practice of the Church to which we belong; that this Synod solemnly believes and declares that any system of religion or morals whose tendency is to hide our Saviour, or to supplant the religion of which he is the founder, should receive no countenance from his professed followers; and, furthermore, that no human, benevolent, or philanthropic, or reforming agency in this world can take the place of the Church of our Lord and Saviour Jesus Christ, whose principle is to 'do good to all men, but especially to those that are of the household of faith'; and, therefore, that all who belong to this Church are in duty bound to give it the preëminence over all inferior institutions, and to promote, to the utmost of their power, its unity, peace, and prosperity, and especially its great charities and philanthropies; that this Synod also advises consistories and classes of the Church to be very kind and forbearing and strictly constitutional in their dealings with individuals on this subject, and that they be and are hereby cautioned against setting up any new tests of communion in the Christian Church."

A plan for systematic benevolence was adopted. It provides for the submission yearly, by the several boards of benevolence, of statements of their condition and needs, and for the apportionment, by the Synod's Committee of Systematic Benevolence, of the sums to be raised among the several classes, and a further apportionment by the several classes among the individual churches.

A resolution was adopted expressing the judgment of the Synod, that the members of the Church owe it to themselves and their Christian profession not to encourage by their own subscriptions, or in any way, the circulation of Sunday papers.

II. REFORMED CHURCH IN THE UNITED STATES.—The following is a summary of the statistics of this Church, as they are given in the "Almanac of the Reformed Church in the United States" (Reformed Church Publication Board, Philadelphia) for 1881:

SYNODS.	Ministers.	Congregations.	Members.
Synod of the United States.....	208	487	64,637
Synod of Ohio.....	145	295	21,250
Synod of the Northwest.....	162	249	22,080
Synod of Pittsburg.....	56	121	11,073
Synod of the Potomac.....	130	266	27,264
German Synod of the East.....	44	39	9,508
Total.....	748	1,405	155,857

Number of classes, 18. Of the members, 96,463 are returned as "members unconfirmed." Number of persons who communed during the year, 127,334; number of baptisms, 14,304 of infants, 1,208 of adults; number of persons confirmed, 10,639. Number of Sunday-schools, 1,339, with 104,169 scholars. Amount of contributions, for general benevolence, \$79,906; for local objects, \$736,181. Number of students for the ministry, 151.

The "Almanac" gives a list of six colleges, two theological seminaries, one mission house, and seven collegiate institutes, seminaries, and high-schools for young men and young women; in all, sixteen educational and literary institutions, under the care of the Church. The orphan homes at Womelsdorf, Berks County, Pennsylvania, and Butler, Butler County, Pennsylvania, had, together, 105 orphans under care.

The periodicals of the Church include one quarterly, five monthly, two semi-monthly, and three weekly publications in the English language; one monthly, one semi-monthly, and one weekly publication in the German language.

The *Home Missions* of the Tri-Synodic Board (of the Eastern, the Pittsburg, and the Potomac Synods) of Missions included 38 missionaries, 2,910 members, and 2,988 Sunday-school scholars. The number of additions during the year was 324; number of baptisms, 292; value of church property, \$125,000, against which were debts of about \$30,000.

The first *Board of Foreign Missions* was organized in 1838, and coöperated till 1860 with the American Board. The Rev. O. J. Sohr, of this Church, has been laboring in India for several years, as a missionary of the German Evangelical Missionary Society of the United States. A mission has been established in Japan, under the direct care of the board, and is supplied by the Rev. A. D. Gring.

III. GENERAL COUNCIL OF THE REFORMED CHURCHES HOLDING THE PRESBYTERIAN SYSTEM.—The second General Council of the *Alliance of the Reformed Churches throughout the World holding the Presbyterian System* met in Philadelphia, Pennsylvania, September 23d. The Alliance was organized in London in 1875 at a meeting of delegates from the several Presbyterian churches appointed for the purpose, and the first regular meeting of the General Council was held at Edinburgh, Scotland, in July, 1877. The history of the organization of the Alliance, and of the first meeting, is given in the "Annual Cyclopædia" for 1875 and 1877. By the provisions of the constitution of the Alliance, any church organized on Presbyterian principles, which holds the supreme authority of the Scriptures of the Old and New Testaments in matters of faith and morals, and whose creed is in harmony with the consensus of the Reformed Churches, is eligible to membership in it. The following churches were represented at the Council of 1880 by full delega-

tions: Presbyterian Church in the United States of America; Presbyterian Church in the United States; United Presbyterian Church of North America; Synod of the Reformed Presbyterian Church; General Synod of the Reformed Presbyterian Church; Associate Reformed Synod of the South; Reformed Church in America; Reformed Church of the United States; Welsh Calvinistic Methodist Church; Presbyterian Church of Canada; Church of Scotland; Free Church of Scotland; United Presbyterian Church of Scotland; Presbyterian Church of England; Presbyterian Church of Ireland; National Reformed Church of France; Free Evangelical Church of Germany; Spanish Christian Church; Free Church of Switzerland; Missionary Church of Belgium; Reformed Church of Bohemia; Presbyterian Church of Victoria; Presbyterian Church of New South Wales; Presbyterian Church of Tasmania; Presbytery of Ceylon; and Mission Synod of the New Hebrides. Delegates were also present from India, South Australia, and several Presbyterian missions. The whole number of delegates was 265—180 ministers and 85 elders.

Delegates were appointed to the Council from the Cumberland Presbyterian Church, but the Council was not fully satisfied that the doctrines of that Church are in harmony with the consensus of the Reformed Confessions, and they were not admitted. The sessions of the Council were continued till the 3d of October; during their continuance, the following papers were read, and debated in brief discussions:

"The Ceremonial, the Moral, and the Emotional in Christian Life and Worship," Professor Roswell D. Hitchcock, D. D., LL. D., New York City; "Modern Theological Thought," Principal Robert Rainey, D. D., Edinburgh; "Religion in Secular Affairs," Principal G. M. Grant, D. D., Kingston, Canada; "Inspiration, Authenticity, and Interpretation of the Scriptures," Professor E. P. Humphrey, D. D., LL. D., Louisville, Kentucky, and Professor Robert Watts, D. D., Belfast; "Distinctive Principles of Presbyterianism," Professor Samuel J. Wilson, D. D., LL. D., Allegheny City, Pennsylvania; "Worship of the Reformed Churches," John DeWitt, D. D., Philadelphia; "Ruling Elders," Rev. O. H. Reed, D. D., Richmond, Virginia; "The Application of the Gospel to Employers and Employed," William G. Blaikie, D. D., LL. D., Edinburgh; "Christianity the Friend of the Working Classes," Chief-Justice C. D. Drake, Washington, D. C.; "Revealed Religion in its Relations to Science and Philosophy," Professor Henry Calderwood, LL. D., Edinburgh; "How to deal with Young Men trained in Science in this Age of Unsettled Opinions," President James McCosh, D. D., LL. D., Princeton, New Jersey; "Agnosticism," Professor Robert Flint, D. D., LL. D., Edinburgh; "Creeds and Confessions," Dr. A. B. Van Zandt, New Brunswick, New Jersey;

"Bible Revision," Professor J. W. Chambers, D. D., New York City; "Presbyterianism and Education," Professor Edward D. Morris, D. D., Cincinnati, Ohio; "Religion and Politics," Professor Lyman H. Atwater, D. D., Princeton, New Jersey; "Presbyterianism in Relation to Civil and Religious Liberty," Sylvester H. Savell, D. D., Pittsburg, Pennsylvania; "Catholicity of Presbyterianism," George C. Hutton, D. D., Paisley, Scotland, Principal D. H. MacVicar, D. D., LL. D., Montreal, Canada, and William H. Campbell, D. D., New York City, "The Vicarious Sacrifice of Christ," Principal John Cairns, D. D., Edinburgh, and Professor A. A. Hodge, D. D., Princeton, New Jersey; "Church Extension in Large Cities," R. M. Patterson, D. D., Philadelphia, Pennsylvania, and William J. R. Taylor, D. D., Newark, New Jersey; "Church Extension in Sparsely-settled Districts," W. J. Reid, D. D., Pittsburg, Pennsylvania; "The Conflict between Faith and Rationalism in Holland," Professor J. J. Van Oosterzee, D. D., Utrecht; Paper, "The Theology of the Reformed Church with Special Reference to the Westminster Standards," Professor Alexander Mitchell, D. D., St. Andrews; "Grounds and Methods of Admission to Sealing Ordinances," Rev. D. D. Bannerman, M. A., Perth; "Baptism," T. P. Stevenson, D. D., Philadelphia, Pennsylvania; "Sabbath Observance," Professor William Gregg, D. D., Toronto; "Popular Amusements," Theodore L. Cuyler, D. D., Brooklyn, New York; "The Proper Care, Support, and Training of Candidates for the Ministry," Herrick J. Johnson, D. D., Chicago, Illinois; "Future Retribution," T. D. Witherspoon, D. D., Petersburg, Virginia; "Temperance," Hon. William E. Dodge, New York City; "Our Relations to the Churches of the European Continent," J. S. McIntosh, Belfast, Ireland; "Personal Religion," Rev. David Steele, D. D., Philadelphia, Pennsylvania; "Regeneration," Professor J. H. A. Bomberger, D. D., Ursinus College, Pennsylvania.

Addresses were made by delegates from the several countries on the state of religion, and particularly of churches of the Presbyterian order in France, Switzerland, Ireland, Italy, Moravia, Bohemia, and Spain. Addresses were also made upon the condition of religious and mission work in Japan, China, the New Hebrides Islands, Syria, India, among the Choctaw Indians, and in South Africa. A report was made on the foreign missions of the Presbyterian Churches of the United States and Canada, in which the statistics of all the missions were shown to be as follows:

American ministers in the field.....	195
Native ministers.....	135
Native licentiate preachers.....	193
Medical missionaries and teachers.....	18
American women connected with the missions.....	266
Teachers and Bible-readers.....	894
Communicants.....	13,871
Scholars in boarding-schools.....	1,691
Scholars in day-schools.....	12,987

Two committees, one American and one Eu-

ropean, were appointed to secure coöperation and close union of the several churches in the work of the mission-field. A committee on "the Desiderata of Presbyterian History" reported that the work of collecting the returns was still incomplete, and was continued. Committees were appointed to reconsider the desirableness of defining the consensus of the Reformed Churches as required by the constitution of the Alliance, and report at the next meeting of the Council, and to define grounds for and act upon applications for admission to membership in the Alliance. A resolution was adopted in favor of arbitration as a means of preserving peace among nations. It was decided that the next meeting of the Council should be held in Belfast, Ireland, in 1884.

RHODE ISLAND. The adjourned, or January, session of the General Assembly of Rhode Island began on the 20th of January and continued until the 16th of April. There was little of general interest or importance in its proceedings. An effort to secure to women the right to vote on matters pertaining to public education was defeated, as was an attempt to amend the insolvency laws and to pass a new act in relation to the sale of intoxicating liquors. An act was passed abolishing the tribal authority and tribal relations of the Narragansett Indians, also one for the punishment of tramps. The Legislature of 1879 assigned to a joint special committee the duty of examining and reporting "as to what course is most advisable for the State to pursue in relation to the future management of the Providence Reform School," etc. The committee reported at the January session in favor of the transfer of the institution to the State, and an act was passed in April to effect this purpose. The Board of State Charities and Correction was requested to make a report to the Legislature at the May session on the general subject of Reform School management.

Before the adjournment of the General Assembly the State election had been held and a new Legislature chosen. The first of the political conventions was that of the Prohibitory party, which was held in the hall of the House of Representatives at Providence, on the 19th of February. A letter was received from Governor Van Zandt expressing his gratitude for the "constant support of the temperance men of Rhode Island," and declining the use of his name for a renomination. Albert C. Howard, of East Providence, was nominated for Governor; T. M. Seabury, for Lieutenant-Governor; Joshua M. Addeman, for Secretary of State; Willard Sayles, for Attorney-General; and Samuel Clark for General Treasurer. Mr. Seabury subsequently declined to be a candidate for Lieutenant-Governor, and the name of Harrison H. Richardson was substituted by the State Central Committee of the party. The Convention adopted no platform.

The Republican Convention was held at Providence on the 18th of March. The candidates

nominated for State officers were: Alfred H. Littlefield, of Lincoln, for Governor; Henry H. Fay, of Newport, for Lieutenant-Governor; Joshua M. Addeman, of Providence, for Secretary of State; Willard Sayles, of Providence, for Attorney-General; and Samuel Clark, of Lincoln, for General Treasurer. Delegates to the National Convention of the party were also chosen, but no platform was adopted.

The Democrats held their Convention at Providence on the 22d of March. Horace A. Kimball, of Burrillville, was nominated as a candidate for Governor; Stephen P. Slocum, of Newport, for Lieutenant-Governor; W. B. W. Hallett, for Secretary of State; Hugh J. Carroll, for Attorney-General; and Daniel B. Pond, for General Treasurer. Delegates to the National Convention at Cincinnati were chosen, and the following declarations were adopted:

The Democrats of Rhode Island, in convention assembled, congratulate the country upon the multiplying evidences that the Republican party is passing into a condition of disintegration and decay. It has outlived its usefulness; the old leaders who brought it into being—Seward, Chase, Sumner, Lincoln, Morton, and a long list of great men—have passed away, and in their places we see the Conklings, the Blaines, the Shermans, the Camerons—corrupt and scheming men, the names of many of whom have become a stench in the nostrils of the body politic. These men, already gorged with plunder, are pushing to the front, eager to slake their drunken thirst from the very vitals of the nation's life. Another four years of Republicanism in power will furnish a spectacle of greed, recklessness, and rascality never witnessed since the formation of the republic. This country is at the crisis of its fate. All good men see the necessity of a change of administration and methods. The Democratic party is the only power ready and able to face the impending peril and rescue the Government from the grasp of the usurper and destroyer. With returning prosperity should be dealt the final blow to rapacity and dishonesty. Unless that blow is struck in this year of grace 1880, the party of centralization, a "strong Government," and imperialism, will make its grasp perpetual and too powerful to be shaken off. It is best for Democrats to look the danger in the face. And that the people of this enterprising State may understand the objects and motives which actuate us, we herewith put forward the following declaration of principles:

Whereas, The Democracy of the State of Rhode Island, anxious to bear their part in the great work of redeeming the nation from Republican misrule, find themselves hampered and restricted by an unjust and oppressive enactment in contravention of the Constitution of the United States, and the great principles of manhood suffrage which lies at the basis of all popular liberty; and

Whereas, This enactment alone prevents Rhode Island from becoming a Democratic State by a decisive and permanent majority; therefore,

Resolved, That we give notice to liberty-loving men in all parts of these United States that fully one fourth of the citizens of this Commonwealth are deprived of the right of suffrage by the accident of birth, no citizen of the United States of foreign nativity, no matter how long his residence, how upright his character, or how eminent his usefulness, being allowed access to the polls unless endowed with a property qualification not exacted of the meanest vagabond or vilest criminal of native birth.

Resolved, That, having borne this wrong meekly for successive generations, we now resolve unitedly and courageously to wage war upon it by all lawful means until it is stricken from the Constitution; and we appeal to Democrats everywhere to make common cause

with us in resisting this great wrong, which has imposed upon us an oligarchy as oppressive and merciless as the meanest despotism of Asia.

Resolved, That we arraign the Republican party as wholly responsible for the perpetuation of this proscriptive principle, which is keeping back population, depressing industry and enterprise, and will rob the State of one representative in Congress.

Resolved, That we recognize a tendency toward the same proscriptive system in our Federal Government, which, by the employment of United States marshals and soldiers at the polls, has already stifled the voice of the majority in more than one State, making our boasted right of suffrage a mockery and by-word, and bringing contempt upon republican institutions in all nations which boast the supremacy of their "strong Governments." That man must be blind indeed who does not see in this crushing out of suffrage a positive and rapid tendency toward monarchy and absolutism.

Resolved, That the time has not yet come for the Democracy to be forgetful of the stupendous fraud of 1876-'77, when the President and Vice-President of the United States, elected by an overwhelming majority of the people, and by a decisive vote in the electoral college, were deprived of their offices by an infamous conspiracy concocted by men now high in official position and the confidence of the Administration; and we do hereby denounce and condemn, and hold up to the execration of the world the foul crime against our institutions by which the right of the people to choose their rulers was denied for the first time in the history of the republic.

Resolved, That we refer with pride to the forbearance of the Democracy in submitting to this great wrong, and ask the people of the United States to contrast with it the boast of the Republican party that the man whom they nominate at Chicago is to be inaugurated, even if he calls 500,000 soldiers to his aid.

Resolved, That the men who are elected to the offices of President and Vice-President of the United States in November, 1880, shall be inaugurated.

Resolved, That we regard the recent developments of dishonesty in high official circles in this State as the legitimate fruit of that condition of irresponsibility in politics fostered by the ring which holds the majority of voters with a grip of iron; and we unhesitatingly declare that our only security from further disgrace is in the ascendancy of Democratic principles, by which these Augean stables of Republican rule shall be cleansed.

Resolved, That the Republican ring of this State has shown itself the enemy of the soldier, as exhibited in the preference for office of civilians, whose only claim is party service. We denounce this as a breach of faith, and the most glaring hypocrisy on the part of a party which claims an exclusive patent upon everything "truly loyal," and assumes to be the soldier's only friend.

Resolved, That the policy of a large proportion of the Republican party, of electing to the Presidency for a third term the man whose administration was conspicuous chiefly for its failures and the numerous scandals arising from the employment of dishonest and incompetent men in office, should be condemned, not only as in violation of a tradition that has been held sacred for a century both by the people and the most eminent of Presidents and statesmen, but as perilous to the permanence of the Government itself and the liberties of the people under it; and we appeal to the people of the United States to rise up as one man against this contemplated plot to overthrow a precedent as firmly established as the Constitution itself, and the possible results of which no patriot can contemplate without horror.

Resolved, That for a general avowal of the great principles which underlie the Democratic party, and which shall receive our support in the coming contest, we hereby solemnly declare:

1. Fidelity to all the provisions of the Constitution, retrenchment and economy in Federal and State ad-

ministration, and the lessening of the burdens imposed upon labor by the reduction of offices and taxation.

2. The strict accountability of all officials and the reduction of the Democratic tests of honesty, fidelity, and capacity as essential qualifications for all public officers.

3. The honest payment of the public debts in such currency as its terms imply, and the preservation of the public faith.

4. Home rule, no centralization of State or Federal powers; no Federal interference in municipal, State, or Federal elections.

5. A just and equitable revenue tariff.

6. Manhood suffrage. To vote is a duty the citizen owes his State. The provision for a pecuniary consideration in the case of the registered voter should be annulled. Tax the citizen, not the citizen's vote.

Resolved, That the Democracy of Rhode Island will earnestly labor for purer and more economical administration; that the State ticket nominated to-day shall receive our united and hearty support, and that we hail with satisfaction the evidence of a growing desire on the part of the people to emancipate themselves from the party of political bigotry, intolerance, and ring-rule which has for years controlled this State. Convinced that the Republican party, made infamous by the most gigantic crimes, can not always prosper or maintain its ascendancy over a free people, we call upon all who believe in honest government and desire the perpetuity of our institutions, to aid in strengthening our organization, which must be the ultimate hope of the State and the Union when political crime shall become exposed in all its hideousness and the people are thoroughly aroused to the danger that threatens them from those who would abridge their liberties, who have turned the Government into a refuge of thieves, and who to-day are prospering in crime.

The election took place on April 7th. When the new Legislature, which consisted of twenty-seven Republicans and seven Democrats in the Senate, and fifty-nine Republicans and twelve Democrats in the House of Representatives, came together at Newport on the 25th of May, and the votes were canvassed in the "Grand Committee," it was found that the whole number cast for Governor was 22,809, making 11,405 necessary to a choice. Alfred H. Littlefield received 10,224, Horace A. Kimball 7,440, Albert C. Howard 5,047, and 98 were "scattering." There was, therefore, no choice of Governor by the popular vote. The same was the case in regard to the Lieutenant-Governor. The whole number of votes for Secretary of State was 22,585, of which Joshua M. Addeman received 15,097, William B. W. Halliett 7,406, and 82 were scattering. Willard Sayles was elected Attorney-General, and Samuel Clark General Treasurer, by a similar vote. The Governor and Lieutenant-Governor were chosen by a joint ballot of the two branches of the Legislature, the choice being confined to the two candidates receiving the highest vote at the election. In a total vote of 102, Littlefield for Governor had 82, Kimball 20; and Fay for Lieutenant-Governor 81, and Slocum 21. The inauguration of Littlefield followed immediately on the first day of the "May session" of the Legislature. This session was brief, continuing only from May 25th to 28th, inclusive, with an adjourned sitting on the 8th and 9th of June for the election of United States Senator in accordance with the

requirement of the Federal law, that the first vote shall be taken on the second Tuesday of the session. General Ambrose E. Burnside was reelected to the Senate of the United States, the vote being as follows: In the Senate, A. E. Burnside, 25; George H. Brown, 7; C. O. Van Zandt, 2. In the House, Burnside, 54; Brown, 9; Van Zandt, 2; and J. Lewis Diamond and William P. Sheffield, 1 each.

The legislation of the May session was of small amount and little importance. The report of the State Board of Charities and Correction on the question of dealing with juvenile offenders was received, and an act was passed locating the new Reform School on the State farm at Cranston, and providing for the erection of the necessary buildings. An act was also passed to prevent deception in the sale of butter, requiring "oleomargarine" to be labeled with its proper designation. A resolution was adopted authorizing the Governor to appoint a committee to revise and digest the public laws of the State. John F. Tobey, Joshua M. Addeman, and George M. Carpenter, Jr., were appointed on this commission, and their work was completed and submitted to the Legislature at the adjourned session in January, 1881. The plan adopted in regard to changes in the laws is thus stated in their report:

1. To make all amendments, whether by addition, removal, or substitution, which are required by the language of all amendatory statutes passed since 1872, and by the literal interpretation of those statutes.

2. To make such amendments as seem to be required by a fair construction of the meaning and intent of those amendatory statutes, and such as seem to be required in order to carry them into practical effect. Under this class the changes are comparatively few in number, but of several distinct kinds, and, perhaps, do not need to be enumerated. Prominent among these are the change, in some instances, of the formal and subordinate duties of various town officers, in order to conform to the systems of registration, and of militia enlisting and returns which have lately been made, and the various changes rendered necessary by the establishment of certain administrative boards.

3. To make a revision of the form and language of the General Statutes as thus amended, so as to secure greater clearness of arrangement and ease of reference, and to make the language more concise, uniform, and accurate in those particulars where, in consequence of the necessary haste in which some acts have been passed, it seemed desirable.

State Conventions were held in October for the nomination of candidates for electors of President and Vice-President of the United States, and district Conventions for the nomination of candidates for members of Congress. The Republican State Convention occurred on the 8th, at Providence, and speeches were made expressive of the party sentiment on national questions, but no formal declarations were adopted, and no business was transacted except the nomination of electors. The Congressional District Conventions were held the same day and at the same place. The delegates of the first district nominated Nelson W. Aldrich without opposition, but those of the second took eighty-eight ballots before effect-

ing a nomination, and the result was then brought about by the withdrawal of W. A. Pierce, one of the prominent candidates before the Convention. The name finally agreed upon was that of Jonathan Chase, of Lincoln.

The Democratic State Convention took place at Providence on the 13th, and its action was confined to the selection of candidates for Presidential electors. The Eastern District Convention nominated Isaac Lawrence, of Newport, as a candidate for Congress, and the Western District Convention agreed upon Mr. Treat, of Warwick.

A State Convention of the Greenback party was held at Providence on the 19th of October for the nomination of electors, and the following platform was adopted:

1. The Greenback-Labor party of Rhode Island affirms the Chicago platform of June 9, 1880, and heartily supports the candidates nominated thereon.

2. It demands the payment of the bonded indebtedness of the United States without unnecessary delay;

3. The substitution of non-interest-bearing greenbacks, in place of double-interest-bearing national bank notes;

4. That the national Government alone shall issue currency, and shall control its volume, and preserve unchanged its purchasing power as sacredly as measures of weight, length, and kindred measures are preserved, and for like obvious reasons;

5. Universal suffrage without distinction of sex, and universal education.

6. That the Congress of the United States perform, without evasion and without delay, its sworn duty to invest the naturalized citizens of the United States in Rhode Island with the privileges and immunities, as well as permit to be imposed upon them the duties of citizenship, to this end refusing, if necessary, to seat any representative from Rhode Island till the oligarchy here shall observe the supreme law of the land in this regard.

Candidates for Congress were also nominated by the delegates from the districts. That for the First or Eastern District was Henry C. Cram, of Providence; for the Second or Western District, John Francis Smith, of Cranston.

At the November election the total vote for Presidential electors was 29,235, of which 18,195 were for the Republican ticket, 10,779 for that of the Democrats, 236 for the Greenback, 20 for the Prohibition, 4 for the American candidates, and 1 was reported as "scattering." The Republican plurality over the Democratic vote was 7,416; majority over all, 7,155. In the first Congressional District Aldrich was elected by a vote of 9,510 to 4,586 for Lawrence, and 188 "scattering"; in the second, Chase was elected by a vote of 8,515 to 6,027 for Treat, and 139 "scattering."

The population of Rhode Island, according to the new Federal census, is 276,528, of which 104,850 is in the city of Providence, 19,030 in Pawtucket, 16,053 in Woonsocket, 15,693 in Newport, 13,765 in Lincoln, and 12,165 in Warwick, or 181,554 in the six cities, leaving but 94,974, or little more than one third, for the rest of the State.

The receipts of the State Treasury for the year were \$837,323.43, including a balance on

hand at the beginning of \$166,164.08. The expenditures were \$751,460.25, leaving a balance on hand at the close of \$85,865.20. The amount of State bonds outstanding is \$2,523,500, against which there is a sinking fund amounting to \$825,595.05. This leaves as the net indebtedness \$1,697,904.95, and shows a decrease of \$134,558 during the year. The State bonds are payable as follows:

Bonds issued October 1, 1861, payable 1881.....	\$500
Bonds issued September 2, 1862, payable 1882.....	954,000
Bonds issued April 1, 1863, payable 1883.....	200,000
Bonds issued July 1, 1863, payable 1893.....	631,000
Bonds issued August 1, 1864, payable 1894.....	738,500
Total.....	\$2,523,500

The school statistics of the year are as follows:

Number of children from five to fifteen years enumerated.....	52,273
Number of children reported as attending public schools.....	33,504
Number of children reported as attending Catholic schools.....	4,817
Number of children reported as attending select schools.....	1,891
Number of children reported as not attending any schools.....	12,279
Number of pupils enrolled in day-schools.....	30,112
Average number.....	27,217
Average attendance.....	824
Number of schools.....	9 mos., 4 days.
Average length of schools.....	889
Number of teachers regularly employed.....	\$390,558 34
Amount paid teachers.....	4,176
Number of pupils enrolled in evening-schools.....	2,846
Average number.....	1,843
Average attendance.....	40
Number of schools.....	168
Average number of teachers employed.....	124 weeks.
Average length of the schools.....	\$538,450 86
Total receipts.....	456,862 91
Current expenditures.....	57,387 64
Permanent expenditures (land, building, etc.).....	

The School for the Deaf, which has been established only four years, is on a successful basis, and has twenty-five pupils. The permanent school fund of the State is \$240,376.37, invested chiefly in the stock of Providence banks, and \$26,573.54 awaiting investment.

The penal, correctional, and charitable institutions on the State farm at Cranston cost \$147,190.57 for support during the year. A new Reform School, with separate departments for boys and girls, has been added, for which the buildings are not yet complete. At the close of the year the Workhouse and House of Correction contained 180 men and 57 women; the Asylum for the Incurable Insane, 113 men and 132 women; the Almshouse, 76 men, 77 women, 21 boys, and 4 girls—178 in all; the State Prison, 76 men and 6 women. The Providence County Jail contained 109 men and 14 women; that of Washington County, 3 men; that of Bristol County, no inmates at all; Newport County, 1 man; Kent County, 2 men.

There are thirty-nine savings-banks in the State, with 97,682 depositors and an aggregate of \$44,755,625.49 in deposits, making the average due each depositor \$458.18. The increase of deposits for the year was \$1,660,091.68; increase in number of depositors, 4,489. The average rate of dividends was $4\frac{1}{2}$ per cent.

RIPLEY, GEORGE, LL. D., died July 4, 1880, in New York. The family from which he sprung has produced many eminent men, generals and divines. He was born at Greenfield, Massachusetts, September 3, 1802. He graduated at Harvard in 1823, and in 1826 at the Cambridge Divinity School. During three years he occupied the pulpit of a Unitarian church in Boston. In 1831 he definitively retired from the ministry, and went to Europe to study philosophy. From that time he kept up with the foremost wave of thought. The schools of Fourier, Comte, and St. Simon were then in high vogue. Though his mind was strongly imbued with some of their theories, he never avowed himself a disciple. On his return to Boston, in 1835, he became a propagandist of advanced French and German philosophy. His translations of such works helped to popularize the new views. Between 1838 and 1842, in conjunction with Dr. Hedge, he published "Specimens of Foreign Standard Literature," in fourteen octavo volumes. In 1839 Dr. Ripley published "Discourses on the Philosophy of Religion." Professor Andrews Norton, of Cambridge, replied to this in a pamphlet entitled "The Latest Form of Infidelity." A vigorous, prolonged, and bitter controversy ensued. He was intimately connected with the inception of New England Transcendentalism. Ralph Waldo Emerson was his college mate and friend. Dr. Ripley wrote for "The Dial," the exponent of their peculiar views. In 1844 he invested and lost his slender fortune in the Brook Farm experiment. He was the actual head of this socialistic colony, established near Roxbury, where Margaret Fuller, Nathaniel Hawthorne, and other American philosophers, male and female, lived on a communistic plan. Their organ, "The Harbinger," asserted that this was not at first a Fourierite movement, but that those principles were adopted after the fusion of the New York with the Boston community. Whether or not they could have succeeded in this nineteenth century in fleeting the time carelessly as they did in the golden world, after three years a fire swept away their buildings, and the philosophers dispersed. Dr. Ripley moved to New York, and in 1849 became literary editor of the "Tribune." He was a consummate critic, and his reviews helped to form public taste. He superintended the literary department of "Harper's Monthly," and occupied the post of "reader" to that publishing firm. Mrs. Ripley was his coadjutor in all his literary and philosophic enterprises. In 1852 he and Bayard Taylor edited a "Handbook of Literature and the Fine Arts." In 1858, in conjunction with Charles A. Dana, he undertook the editing of "Appletons' New American Cyclopædia," which is largely indebted to his erudition and fidelity of research. A revised edition appeared in 1873. Labors so arduous precluded much original writing, and upon these works his fame must rest. From the time when a knot of young enthusiasts

broke through all trammels, good and bad, in their zeal for the ideal, to ripe old age, when he persistently presented the claims of science and literature in an absorbed and practical community, Dr. Ripley's influence on the thought of his day was continuous.

ROBERTS, MARSHALL OTIS, was born in New York, in 1812. He began life as a ship-chandler. During the Mexican War he accumulated a fortune by contracts for stores and transportation. This he ultimately lost. During the rapid colonization of California he was largely interested in a steamship company, which was awarded a lucrative contract for transportation of mails across the Isthmus of Panama. The company became bankrupt, Mr. Roberts acquired their claims against the Government, and years after obtained a judgment for above a million dollars. In 1856 he was a delegate to the first National Convention of the Republican party, at Pittsburg, which nominated Fremont for the Presidency. In 1861 Mr. Roberts was an ardent friend of the Union. He placed the steamer *Star of the West* at the disposal of General Scott. His patriotism was acknowledged by the award of contract after contract, by which he amassed a colossal fortune. He was connected with many enterprises. He was at the head of the Tehuantepec Canal and Railroad Company. He was one of the five capitalists who undertook the laying of the Atlantic cable. On the assassination of President Lincoln Mr. Roberts presented his family with a gift of ten thousand dollars. He was also a munificent patron of art, and expended in the acquisition of pictures more than a million of dollars, the greater part of which went to the encouragement of native art. He was the founder of the Women's Christian Association and the Home for Girls in New York City. He died at Saratoga, New York, September 11, 1880, in the sixty-eighth year of his age.

ROMAN CATHOLIC CHURCH. During the year 1880 the Roman Catholic Church remained under the direction of Pope Leo XIII, the position at Rome being unchanged. The Italian Government pursued its course of seizing ecclesiastical property, all that belonging to the College of the Propaganda, the great missionary college of the Church, arising from contributions from all countries, being taken, and, though the Propaganda appealed to the courts, the judges decided (November 13th) in favor of the Government from whom they received their salaries. Pope Leo XIII continued to encourage the study of the works of St. Thomas Aquinas, and set apart rooms for the preparation of a new and careful edition. Theological disputations were frequently conducted in his presence. In February he addressed an encyclical to the Lenten preachers on marriage and the tendency of civil government to undermine it, by opening the door to divorces on any pretext.

In Germany no new laws were passed op-

pressing the Catholics, but those on the statute-book were enforced, gradually depriving Catholics in that empire of all religious services, and punishing with rigor any attempt to supply the vacancies.

In Switzerland the Catholics, by taking part in the elections in some places, recovered their churches by electing their duly appointed parish priests.

The French Republic, by the decrees of March 29, 1880, ordered the suppression of all unauthorized religious orders, that is, of orders that were not incorporated and recognized under the French laws. The appeals of the episcopate and clergy to the President and his Cabinet were disregarded. Under this the Jesuits were expelled from their houses and colleges by the police at Paris, Angers, and elsewhere, convents of Carmelites and Récollets were mobbed, and even the famous Sister Jeanne de Chantal, known as the heroine of Châteaudun, for her services during the war with Germany, was driven from her convent. Similar scenes were enacted throughout the republic, and religious orders were compelled to disperse and break up their colleges, academies, and schools, as well as institutions of charity and houses for home missions among the poor and neglected. Many of these *religieuses* took up temporary residence in England and the British Isles, and in Spain. In many cases the *religieuses* protested against the decrees and against invasion of their individual rights, and yielded only to force. Large bodies of troops were at times sent against monasteries to overawe the people while the expulsion was effected. On the 11th of November Cardinal Guibert addressed a letter to the members of the communities dispersed under the March decrees.

On the 31st of November a preliminary agreement was signed between the Holy See and the Russian Government in regard to the nomination of bishops and the regulation of seminaries. This gave hopes of some freedom to members of the Catholic Church in the Russian dominions, although many points were not touched, especially the condition of the United Greeks in Poland. It was hailed, however, as an indication of better feeling toward the Catholics in general, but the death of Alexander II, before the agreement was completely carried out, left the whole matter in a state of uncertainty.

To encourage the Slav Catholics, Leo XIII, on the 30th of September, issued an encyclical on their apostles Sts. Cyril and Methodius, and the church founded by them, and made their feast one of higher rank in the church-at-large.

The ancient order of St. Benedict celebrated the fourteen hundredth anniversary of the birth of its founder, the Prince-Archbishop of Salzburg officiating, at Monte Casino, April 6th, and similar celebrations took place in Austria, Switzerland, England, the United States, and other parts where the order still flourishes;

the abbey at Montserrat in Spain celebrating on the same month its millennial.

Pilgrimages took place in various parts; and Knock, in Ireland, in consequence of apparitions said to have occurred there, became a resort visited by pious gatherings from all parts of Ireland and England, and even from the United States.

In Belgium a school law hostile to religious influence led to a rupture between that kingdom and Rome, the Belgian Minister to the Holy See closing his embassy on the 6th of July. Pope Leo XIII, on the 27th, addressed a letter to Cardinal Dechamps on the subject, and on the 20th of the following month he reviewed the whole subject in an allocution to the Cardinal.

The United States of Colombia in June passed a law recalling from banishment Bishop Bermudez, of Popayan; Bishop Restrepo, of Pasto; Bishop Gonzalez, of Antioquia; Bishop Montoya, of Medellin; and Bishop Carra, of Pamplona, who had been driven into exile.

No promotion of cardinals occurred during the year, except that of Anthony Hassun, Patriarch of Cilicia, of the Armenians, who was created cardinal in December, the only member of the Sacred College representing any of the Oriental rites. Cardinal Pie, Bishop of Poitiers, died May 17, 1880; Cardinal F. X. Apuzzo, Archbishop of Capua, July 30th; Cardinal Pacea, October 14th.

Among other eminent Catholics who died during the year were the Dominican prior, Very Rev. Joseph Mulledy, an archæologist, author of "St. Clement and his Basilica in Rome" (June 25th); Mgr. G. Martigny, author of the "Dictionnaire des Antiquités Chrétiennes" (August 18th); and the Countess Clotilda von Bochoitz, foundress of a diocesan seminary at Paderborn, Germany (August 29th).

ROUMANIA, a kingdom in Southeastern Europe. Reigning King, Charles I, born April 20th, 1839; accepted his election as Prince of Roumania May 10, 1866; was proclaimed King by the Parliament of Roumania on March 26, 1881.

The area of Roumania is estimated at 129,947 square kilometres, and the population at 5,376,000. The largest cities are Bucharest, with 177,646 inhabitants; Jassy, with 90,000; and Galatz, with 80,000.

The revenue for the financial year 1879 amounted to 114,228,041 lei (1 lei = 1 franc = 19·3 cents); the expenditure to 114,340,586 lei. The public debt, on January 1, 1880, was 597,964,953 lei.

The effective force of the territorial army in 1879 was 22,463 infantry, and 12,184 cavalry with 12,192 horses. The navy consists as yet of only four steamers and six gunboats, and has thirty officers and five hundred men.

The imports were valued in 1879 at 254,483,000 lei; the exports at 238,650,000 lei. The number of vessels entering the ports of the Danube in 1879 was 22,349, with 3,929,032

tons; the number of vessels cleared 21,913, with 3,904,369 tons. In September, 1880, there were 1,098 kilometres of state railroads and 223 kilometres of private roads in operation, exclusive of one road in the Dobrudja of 63 kilometres. The aggregate length of the telegraph lines was 5,238 kilometres, of the wires 8,323 kilometres; the number of dispatches sent, 879,138. The postal establishment carried 5,150,848 private letters, 1,103,544 official letters, 531,548 registered letters, 697,210 postal-cards. The number of offices was 233; the revenue, 3,637,784 francs.

The attention of the Cabinet and the Chambers was chiefly directed to measures of internal administration, and to the enlargement and improvement of commercial facilities. The independence of the nation was recognized at the beginning of February by the Government of the Netherlands. On the 7th of February the Austro-Hungarian Government addressed a note to England, France, and Germany, inviting these Governments, in view of the intrigues of the Roumanian Cabinet to press forward the emancipation of the Jews, formally to acknowledge the independence of the principality. On the 20th of February a joint note acknowledging the independence of Roumania was presented to the Government by the representatives of the three powers named. The announcement of the fact was received in the Chambers with so much applause that the sittings had to be temporarily suspended. Immediately after the note was presented, Mr. W. A. White, the British Consul-General, submitted his credentials as Envoy Extraordinary and Minister Plenipotentiary to the Roumanian Government.

The relations between Roumania and Bulgaria came to a rupture in May, when Mr. Stourdza, the Roumanian representative to Bulgaria, was recalled, on the ground that he had been treated discourteously, and that the Bulgarian Government had insinuated that Roumania was secretly supporting insurrection in Bulgaria. This act was followed by the recall of the Bulgarian agent, Mr. Georgieff, from Bucharest. Another difference arose upon the introduction of a bill in the Bulgarian Parliament for the naturalization of all Bulgarians dwelling in Roumania and Servia as subjects of the Bulgarian Principality. This bill was, however, withdrawn, in deference to the objections urged by Roumania that such a measure would interfere with its territorial rights.

In the matter of the settlement of the frontier line of the Danube, Russia, in June, gave its consent to a delimitation by which the fort of Arab Sabia proper and the intrenchments situated on the heights of Yumen and Yelianli, with their western surroundings, should be allotted to Roumania, while the southeastern part of the intrenchments, with Fort Odo, should be kept by the Bulgarians. The Roumanians were willing to accept this line, notwithstanding that they alleged that the last-mentioned position, which would be left in the

hands of Bulgaria, commanded the bridge over the Danube. The details of the settlement of the frontier line between Roumania and the Dobrudja were afterward agreed upon by the powers, and communicated to the Roumanian Government, whose duty it then became to come to an understanding with Bulgaria respecting the actual work of marking the boundary.

The unfriendly feeling toward Russia, which had been quite strong ever since the negotiation of the Treaty of Berlin, became more intense while these negotiations respecting the frontier were going on. It was aggravated by charges on the one side that the Russians were carrying on intrigues in Roumania, and on the other by a Russian accusation that the Government at Bucharest was harboring incendiary agents who desired to stir up revolution in Russia. The Russian Government made representations to that of Roumania concerning the Nihilists who had taken refuge within its territory, but the Roumanian Government found no authority in law for taking any decisive measures against them. The reports of the extent of these jealousies, and of the character of the correspondence to which they led, appear to have been much exaggerated, but they were sufficiently real to influence the course of the Government and lead it to seek closer relations with Germany and Austria. The feeling of the Government was not shared by all of the people, and a part, including Prince Gregory Stourdza, son of the late Hospodar of Moldavia, favored Russia. During the debate of the Senate on the address in February, Prince Stourdza had attacked the Ministry, and urged that the true policy for the country would be to seek an intimate union with Russia and an alliance with the other principalities of the Balkan Peninsula. The speech was intended as a kind of political programme for a new party to be formed out of the members of the Opposition and some malcontents who had hitherto belonged to the Ministerial part, and was followed by the establishment of a new Opposition journal, the "Demokratia Nationala."

The Government published a memorandum on the question of the Danube in September, in which it complained of a disposition of Austria to assume dictatorial power over the navigation of the river, and claim the sole right of police surveillance. It demanded that a European commission, to include representatives of Roumania, Servia, and Bulgaria, should decree what rules should be established. An arrangement was made between the Austrian and Roumanian Governments in October, by which Austria should retain the presidency and the casting vote which it had claimed in the mixed Danubian Commission, but that Roumania should appoint the Inspector-General, and the Commission should reside at Giurgevo instead of Rustchuk.

A new Cabinet was formed at the beginning

of August, as follows: J. C. Bratiano, Minister of Finance and President of the Council of Ministers; A. Boeresco, Minister of Foreign Affairs; A. Teriakio, Minister of the Interior; General G. Slaniceno, Minister of War; Colonel Dabija, Minister of Public Works; B. Conta, Minister of Public Instruction and Justice. Teriakio, Dabija, and Conta were new members.

An attempt was made, December 14th, to assassinate Mr. Bratiano, the Premier, as he was leaving the Chamber of Deputies. The assailant, who succeeded in wounding the Minister in two places with a knife, was arrested, and found to be one Jean Pietraro, who had been discharged from a position in the Ministry of Finance on account of his bad reputation.

The succession to the throne of Roumania was settled by vote of the Senate, October 10, 1880, upon Prince Ferdinand of Hohenzollern, nephew to Prince Charles, in the event of the latter remaining childless.

RUSSIA (EMPIRE OF ALL THE RUSSIAS), an empire in Europe and Asia. The Emperor Alexander II, who was born April 17 (new style), 1818, and succeeded his father, Nicholas I, February 18, 1855, was assassinated on March 13, 1881. He was succeeded by his eldest son, Alexander III, born February 26, 1845; married, October 28, 1866, to Marra Feodorovna (formerly called Sophia Frederica Dagmar), daughter of King Christian IX of Denmark, born November 14, 1847. Offspring of this union are four children: 1. Nicholas, heir-apparent, born May 6, 1868; 2. George, born April 27, 1871; 3. Xenia, born March 25, 1875; 4. Michael, born November 23, 1878. Brothers of the Emperor: 1. Vladimir, born April 10, 1847, married August 16, 1874, to Princess Marie, of Mecklenburg-Schwerin. Offspring of this union are three sons, Cyrille, born 1876, Boris, born 1877, and Andreas, born 1879. 2. Alexis, born January 2, 1850; 3. Sergius, born April 29, 1857; 4. Paul, born September 21, 1860. Uncles of the Emperor: 1. Constantine, High-Admiral of the Russian Navy, born September 9, 1827, married, August 30, 1848, to Princess Alexandra of Saxe-Altenburg, of which union there are issue four children: Nicholas, born 1850; Olga, Queen of Greece, born 1851; Vera, widow of Prince Eugen of Wurtemberg, born 1854; Constantine, born 1858; Dimitis, born 1860; 2. Nicholas, born July 27, 1831, field-marshal in the Russian Army, married to Princess Alexandra of Oldenburg, of which marriage there are two sons, Nicholas, born 1856, and Peter, born 1864; 3. Michael, born October 13, 1832, field-marshal in the Russian Army, married to Princess Cecilia of Baden, of which marriage there are six sons, Nicholas, born 1859; Michael, 1861; George, 1863; Alexander, 1866; Sergius, 1869; Alexis, 1875, and one daughter, Anastasia, born 1860, and married, in 1879, to Prince Frederic Fraul of Mecklenburg-Schwerin.

The area and population of the great di-

ALEXANDER III

EMPEROR OF RUSSIA.

visions of Russia were estimated as follows in 1880 ("Gotha Almanac," 1881):

DIVISIONS.	Area in square kilometres.	Population.
1. European Russia.....	4,909,193·7	65,864,910
Poland.....	127,316·5	6,528,017
Annexed districts in Bessarabia.....	9,274	127,000
2. Grand duchy of Finland.....	378,536·2	1,990,847
3. Caucasasia.....	439,187·7	5,391,744
Government of Kars.....	25,769	236,600
4. Siberia.....	12,495,109·5	3,440,362
5. Central Asia.....	3,950,587·1	4,503,576
Russian Empire.....	21,759,973·7	88,085,856

The following cities have, according to the latest enumerations, more than 100,000 inhabitants: Petersburg (in 1869), 667,963; Moscow (1871), 601,969; Warsaw (in 1878), 336,703; Odessa (1873), 184,819; Kiev (1874), 127,251; Riga, 103,000; Kishinev, 102,427; Kharkov (1879), 101,175.

For religious and other statistics of the empire, see "Annual Cyclopædia" for 1877 and 1878.

The budget for 1880, as published in January, showed a probable balance between revenue and expenditure, the totals in each case being estimated at 666,000,000 rubles. The

receipts were estimated according to the normal average yield of the various sources of revenue, and were regarded as sufficient completely to cover the outlay, notwithstanding the expenditure, which included the interest on the new loans, had increased by 38,000,000 rubles. Of the items of increased expenditure, the payment of interest for the state debts, after reckoning the reduction effected by the redemption of the former loans, required 15,000,000 more than in the previous year, while the war and naval budgets were increased by 11,000,000 rubles, and the estimates of the Ministry of the Interior by 2,000,000, the last addition being attributable to the reinforcement of the police. On the other side, the increase of revenue was produced chiefly by receipts on account of excise, customs, forests, and repayments by railway companies. It was computed that the additional revenue from this source would amount to about 30,000,000 rubles, and a further increase of 7,000,000 rubles was expected to accrue in small amounts from miscellaneous items.

The foreign commerce of Russia in 1877 and 1878 was as follows (value in rubles):

	IMPORTS.		EXPORTS.	
	1877.	1878.	1877.	1878.
Baltic ports.....	138,815,000	235,738,000	249,821,000	186,329,000
Overland.....	136,007,000	270,924,000	211,221,000	179,048,000
Southern ports.....	15,927,000	50,280,000	35,135,000	221,106,000
White Sea ports.....	712,000	778,000	12,105,000	10,061,000
Total commerce with Europe.....	291,461,000	557,715,000	508,282,000	596,544,000
" " Finland.....	9,030,000	9,768,000	12,752,000	12,331,000
" " Asia.....	20,446,000	28,105,000	6,902,000	9,290,000
Total.....	321,037,000	595,583,000	527,936,000	618,165,000

The movement of shipping was in 1878 as follows:

PORTS.	Entered.	Cleared.
Baltic Sea.....	8,133	8,145
Southern.....	5,994	6,918
White Sea.....	781	813
Caspian Sea.....	597	421
Total.....	15,505	16,297
Of these were steamers.....	5,704	5,656

The commercial fleet in 1878 consisted of 3,643 sailing-vessels, with 308,230 tons, and 259 steamers, of 74,324 tons.

The strength of the Russian army in 1880 was as follows:

	PEACE FOOTING.		WAR FOOTING.	
	Men.	Horses.	Men.	Horses.
I. REGULAR ARMY:				
Infantry.....	623,981	10,985	1,800,710	31,540
Cavalry.....	85,860	61,727	94,466	93,440
Artillery.....	108,610	21,252	210,772	118,330
Engineers.....	20,624	661	43,352	14,020
Total.....	839,075	94,625	2,149,800	257,300
II. IRREGULAR ARMY:				
Infantry.....	6,500		8,510	
Cavalry.....	34,196	32,754	142,400	128,810
Artillery.....	2,912	1,989	12,650	11,440
Total.....	43,608	34,743	163,560	140,250

The Russian fleet was in 1880 composed as follows:

	No.	Guns.	Tons.	Horse-power.
1. Baltic fleet:				
Ironclads.....	24	273	200,000	30,000
War-steamers.....	145	860		
Transport-steamers.....	85	...		
2. In the Black Sea:				
Ironclads.....	4	18	30,000	10,515
War-steamers.....	25	92		
Transports.....	58	...		
3. In the Caspian Sea:				
War-steamers.....	13	37	8,686	858
Non-armed steamers.....	4	..		
4. Aral Sea flotilla steamers.....	6	18	1,180	217
5. Siberian flotilla war-steamers.....	10	43	9,000	1,725
Non-armed steamers.....	15	...		
Total.....	389	886	248,866	42,810

On January 1, 1880, there were 22,434 kilometres of railroad in operation, exclusive of Finland. The number of post-offices in 1879 was 4,374; of letters sent, 102,461,031; of wrappers, 8,303,025; of registered letters, 5,789,493; of money letters, 8,782,662; of packages, 2,519,535; of newspapers and periodicals, 78,620,531. The aggregate length of telegraph-lines was, in 1878, 99,917 kilometres, of which 75,081 were state lines. The

number of offices was 2,534; the number of dispatches, 5,761,731. The receipts of the telegraph-office (in 1878, 28,113,702 francs) showed in recent years a small annual surplus, which is, by imperial decree, always devoted to the extension of the telegraphic system.

There were indications that the principles of the Nihilists were spreading in the army; four officers in one regiment were arrested during the first week in January on a charge of disseminating revolutionary publications, copies of some of which were found at their lodgings. Two officers who had assisted eight political prisoners to escape were arrested, and special courts-martial were established in two districts where Nihilism was discovered in the regiments. A depository of revolutionary publications, with galvanic batteries, was discovered in Moscow on the 6th, and led to the revelation of a plot to blow up the Czar on his next journey to that city. A petty officer and seaman, having their sea-chests filled with revolutionary books and pamphlets, were arrested at Nicolaieff. Anxiety was increased by the disaffection of a number of superior officers, some of them high in command, and it appeared that a considerable proportion of those who had failed to obtain promotion and honors after the late war had espoused the revolutionary cause. A proclamation to Russian society was published by students of the high-schools, complaining of the oppressive measures which the Government had taken against them, and of the system of education which was imposed upon them. It charged the Government with giving the preference to the classical system as one which tended to keep the public in ignorance, dwarf their reasoning power, and incapacitate them for active life; demanded educational liberty and the right to enter the universities; and declared that, although society would do nothing for its authors, they would fight the great Moloch, called the Russian Government, to the end, even though the best of them might perish in the struggle. Another secret press was discovered at St. Petersburg, with type set for the third number of the new revolutionary paper, "*Narodnaja Wolia*," which was said to contain, among other things, a programme of the Executive Committee, proposing to overthrow the Government and transfer the reins of power to an assembly of organization. The press, and copies of another revolutionary journal, called "*Tschornog Peredol*" (the Black Distribution of Land), was discovered a few days afterward.

On the 17th of February, at seven o'clock in the evening, just as the imperial family were about to dine, a mine was exploded in the basement of the Winter Palace, immediately under the imperial guard-room, which was situated beneath the dining-room. The guard-room was blown up, ten soldiers were killed, and forty-five wounded. Fortunately, none of the imperial party had yet entered the dining-

room, although the Czar and Prince Alexander, of Bulgaria, who had been conversing in the Czar's study, were about to enter it through one door, and the imperial Princesses were about going in through another door. The Empress was asleep in a remote part of the palace, and was not disturbed by the shock of the explosion. An examination of the premises showed that the mine was filled partly with dynamite and partly with gun-cotton, and that the train was laid to a cellar in an inner court, where a battery, by which it was fired, was concealed among a store of fuel. Though the cellars were used by workmen, none of the regular workmen employed about the palace appeared to be implicated in the offense. The Czar was very much affected by the occurrence, so that, at one time, he almost, it is said, lost his self-command. When Lord Dufferin, the British ambassador, called to congratulate him on his escape, he remarked that he was indebted to Divine Providence, and that God, having mercifully delivered him twice, recently, from very imminent peril, he was content to trust his life for the future to his protecting hand. Congratulations on his escape were sent to the Czar by the heads of all the principal states. To a dispatch from President Grévy, of France, his Majesty replied: "I cordially thank you for the sentiments you express. The spirit of evil is unwearied, like Divine grace. I am glad to reckon on the sympathies of right-thinking men." On the Sunday after the attempt, the Czar visited the Paulowski military school, where he received an ovation from the students, whose cheering was taken up by the crowds assembled on the quay.

On the 24th of February a ukase was issued, in which the Czar, having declared his firm determination to put down the attempts to disturb order in Russia, appointed a Supreme Executive Commission to sit in the capital, of which General Count Loris-Melikoff was named as president, and the members of which were to be selected by him. The head of the Commission, whose duty it was made to watch over the safety of the Russian Empire, was invested with the rights of commander-in-chief in St. Petersburg and the adjacent district, and further, with the direct control over all political trials held in the capital, the military district of St. Petersburg, and throughout the empire. All the local authorities, governors, governors-general, and town commanders, were placed under the jurisdiction of the chief of the Executive Commission, and all persons employed in the various departments were commanded to afford him their entire coöperation. The head of the Commission was given authority to adopt any measure which might appear to him desirable for the protection of order, and his orders were to be unconditionally obeyed. The office of the Provisional Governor-General of St. Petersburg, held hitherto by General Gourko, was abolished. The first

act of the newly-appointed Supreme Executive was to issue the following proclamation to the inhabitants of St. Petersburg:

A series of attempts of unparalleled atrocity, aimed at the subversion of public order and at the sacred person of his Majesty the Emperor, just at the time when all classes are preparing to celebrate the twenty-fifth anniversary of the reign, so beneficial at home and so glorious abroad, of the most magnanimous of monarchs, has evoked not only the deep resentment of the Russian nation, but the horror and indignation of all Europe. The Government has already repeatedly appealed to society to combine in a struggle against criminal tendencies destructive to the foundations of civil order, upon which the development of every well-ordered state depends. At the present time the Government is forced to resort to more energetic measures to repress an evil assuming dimensions perilous to public security. According to the supreme will of the Emperor, the difficult task has fallen on me to assume the conduct of the measures rendered unavoidable by the present situation. Confiding in the Most High, and with a firm belief in the steadfastness of the Russian system of government, which has already passed through manifold and serious crises; fully convinced, moreover, from my long service to the Emperor and the country, of the healthy feeling and moral strength of the Russian nation, I humbly accept this new sign of the sovereign's confidence in my feeble powers, I fully recognize the difficulty of the task before me, and I do not conceal from myself the responsibility with which I am laden. Without entertaining exaggerated and premature expectations, I can only promise one thing—that I will employ every effort and the fruits of my lengthened experience, on the one hand, not to permit the slightest forbearance or to shrink from the most exemplary punishments in respect of actions which are an insult to Russian society; and, on the other, to protect in a peaceful condition the lawful interests of the well-disposed portion of the community. I am assured that I shall meet with the support of all right-minded people, who are devoted to the Emperor, and are sincerely attached to their country, now suffering such unmerited trials. To society I look as the mainstay of the authorities in the renewal of a regular and orderly course of national life, through the interruption of which its own interests suffer in the highest degree. In this trust I appeal, in the first place, to the residents of the capital as immediate witnesses of the late unprecedented deeds, with the urgent request to await the future with dignity and serenity, and not to be led astray by either malicious or frivolous whisperings, speeches, or rumors. In the discreet and firm attitude of the population, in face of the present oppressive situation, I view a security for our success in attaining an end alike wished for by all—the restoration of order and the return of the Fatherland to those paths of peace and prosperity which the benevolent intentions of its leader so clearly pointed out.

The twenty-fifth anniversary of the accession of the Czar Alexander II to the throne was celebrated March 2d. The day was observed as a general holiday in St. Petersburg. First in order of the ceremonies of the day, the Czar received the congratulations of the various members of his family. He then, amid the playing of bands and the firing of salutes, appeared on the balcony of the Winter Palace, and for twenty minutes saluted the multitude assembled there in acknowledgment of their acclamations. A reception was afterward given to the imperial suite and the dignitaries of the empire, and was followed by a thanksgiving service in the palace, while the whole diplo-

matic body awaited the return of his Majesty to the throne-room. The levee which was given here was attended by nearly four thousand persons. In the afternoon a cantata, composed by Prince Peter of Oldenburg, the national anthem, and the hymn, "Long Life to the Czar," were sung in the white drawing-room by six hundred school-children. The Emperor drove through the city during the day, and was loudly cheered. In connection with the celebration, a number of decrees were published, remitting arrears of taxes and fines due to the state from various classes of people. The festivities were not marred by any disturbance or inappropriate event, but on the next day General Loris-Melikoff was shot at as he was alighting from his carriage before his official residence in the Grand Morskaya. The assassin was so close that General Melikoff was able to strike him in the face with his fist, and was at once secured. He proved to be a baptized Jew, named Wladetsky Minsk. He was tried and sentenced to death on the 4th of March, and was executed on the 5th. He maintained a defiant demeanor throughout the trial, and refused to stand up or make any defense, or take any part in the proceedings. He said that he was a Jew who had turned Christian because it was impossible otherwise to live. After judgment had been pronounced upon him, he addressed the Court, saying that he had been arrested in the previous year in St. Petersburg, and departed to his native district. On hearing from his companions that they were preparing a revolution for the 2d of March, he had returned to the capital. Orders were, however, given that nothing should be done on that day. He then determined to kill General Melikoff, as the cause of the postponement of the movement by which he had been prevented from obtaining money. He said, also, that General Melikoff would be killed by some of his comrades. Although his own attempt had failed, a second would be made, and, if that miscarried, a third man would be found to execute the deed. The Revolutionary Committee issued a proclamation declaring that the attempt of Wladetsky on General Melikoff was his own act, and was not undertaken at their instance.

The appeal of Count Melikoff was well responded to by the citizens of St. Petersburg, who gave him many assurances of support. He invited the town council to elect four members to participate in the labors of the Supreme Commission for the maintenance of public safety in the city; divided the city into nine districts, each of which was placed under the superintendence of one civil and two military officers; and, not satisfied with merely repressive measures, entered upon a policy looking to the removal of the sources of existing evils. General Drenteln having resigned the office of Chief of the Third Section, or the Secret Police, he undertook the management of that department with the intention of purging it from

its obnoxious features. The first sitting of the Supreme Executive Commission was held March 16th.

A ukase was issued in the latter part of August, appointing General Loris-Melikoff Minister of the Interior, abolishing the Supreme Commission and the Third Section of the Privy Chancellery, and creating the post of Minister of Posts and Telegraphs, to which Mr. Makoff, hitherto Minister of the Interior, was appointed. The decree was received with great satisfaction, it was said, "as a public announcement of the close of the era of domestic troubles and extraordinary measures." General Loris-Melikoff, on the 25th of August, held a reception of the officers of the Ministry of the Interior, and made an address soliciting their coöperation and assistance. At the request of General Melikoff, and the Minister of Justice, the Czar gave his assent to a measure for a revision of all branches of administration in the provinces, one of the features of which was a provision securing to subordinate officers the right to appeal to a higher authority against their dismissal by their superiors. The Czar, also, in a rescript announcing the investiture of General Melikoff with the insignia of the order of St. Andrew, expressed his warmest thanks for the energy which that officer had displayed in the discharge of his functions as President of the Supreme Executive Commission.

The editors of the chief Russian journals in St. Petersburg, who had become outspoken in their demands for liberal reforms, were called before General Loris-Melikoff during September, and told that their continued discussion of the subject of a constitution for Russia had highly displeased the Czar and his court, and that nothing more on that subject would be allowed to appear in print. The Minister, at this interview, described the programme of the policy of the Government to be: 1. The better guarantee of the public and corporate institutions in the enjoyment of their rights, and the extension of the latter as may seem necessary. 2. The bringing of the police department into harmony with the new state of affairs. 3. The enlargement of the competency of local institutions, with a view to decentralization. 4. A thorough inquiry into the necessities of the local population. 5. The according to the press of liberty to discuss the various measures and ordinances of Government, but with the condition that it should not agitate the public mind with illusory dreams.

The Mayor of St. Petersburg was authorized by General Melikoff, in October, to abolish the system which had been introduced by General Gourka, in 1879, under which all the householders of the city were required to station doorkeepers as watchmen outside their houses during both the day and the night, but was instructed that it would be necessary to increase the police force.

The representatives of the principal newspa-

pers of St. Petersburg, on invitation, met the committee appointed by the Government to inquire into the press regulations, November 17th. They suggested that charges against the press should be subject to the jurisdiction of the ordinary legal tribunals. General Melikoff discouraged impatience on the subject, but was believed to be in favor of emancipating newspapers from all arbitrary and oppressive restrictions.

An official project for the readjustment of taxation, which appeared in December, proposed that incomes derived from capital, trade, commerce, labor, land, and property, should be taxed according to an equal percentage; that all foreigners living in Russia should be taxed equally with Russians; that all Government securities should be taxed without distinction, but that foreigners permanently living abroad should not pay the tax upon incomes derivable from the paper securities upon which Russia bound itself, at the time of their issue, to pay interest abroad. Foreign bondholders, who might wish to avail themselves of this immunity, would, however, have to certify to the bankers that they were not Russian subjects.

Michael Dragomiroff, formerly professor at the University of Kiev, a member of the revolutionary organization, addressed a letter to General Loris-Melikoff, in April, stating the conditions on which the Revolutionists would "conclude an armistice" with the Government. They were: 1. The dismissal of all the governors appointed with arbitrary powers since the attempt of the 2d of April, 1879. 2. Abolition of all the measures ordered by them, and also of the exceptional decrees of 1873. 3. Abolition of the special tribunals established for the hearing of political trials. 4. An amnesty and restoration of rights to those persons who had been deprived of them in consequence of the arbitrary measures above referred to. 5. Abolition of the Third Section, with all its agents; guarantees against imprisonment without trial. 6. Grant of freedom to the press, the right of meeting, and the right of forming societies. Mr. Dragomiroff added that, if these conditions were not accepted, the contest would be pursued by the Revolutionary party with all the means at its command. New Wladetskis and Solovieffs would arise, and, "instead of the single Executive Committee of the year 1878-'79, there will be a whole confederation of political societies to carry on the struggle for the liberation of the people from tyranny." A few days afterward the "Bereg," the newly-established semi-official journal, published what it called the programme of the Revolutionary Executive Committee. It was as follows:

First, the Government being regarded as an enemy, the end justifies all means that may be employed for its overthrow. Secondly, all elements of opposition, though not actually allied with us, will have our assistance and protection. Thirdly, persons and social groups knowingly aiding the Government in our struggle with it, and exceeding the bounds of neutrality, will be treated as enemies.

The trial of eleven prisoners, seven men and four women, charged with being Nihilists, and with being concerned in Solovieff's attempt on the life of the Czar, and in the assassination of General Mesentzeff, was begun at St. Petersburg May 18th. Among the prisoners was Dr. Weimar, who held a high office at court, and who was charged with having lent his carriage to the murderer of General Mesentzeff, with having procured for Solovieff the revolver which he fired at the Emperor, and the poison which was found in his possession, and with having, three years before, assisted in the flight of Prince Krapotkine, who was charged with Nihilism. All the prisoners were found guilty. Two of them were sentenced to be hanged, the others to terms of imprisonment and labor—Dr. Weimar to fifteen years of labor in the mines. The sentences were afterward all commuted, the sentences of death to terms of labor in the mines, the other sentences to shorter terms.

Twenty-one persons were convicted at Kiev of forming an illegal society with the object of forcibly overthrowing the existing order of the state, and sentenced to death and imprisonment. Their sentences were also commuted in accordance with the new policy adopted by the Government of mitigating the severity of its administration. The Czar had previously, in April, granted a full pardon to three students of the University of Kharkov, who had been sentenced to exile in Siberia for carrying on a revolutionary propaganda, with the effect of producing a more favorable impression on the students of the university. A trial was begun before the military tribunal of St. Petersburg, under the presidency of Major-General Leicht, November 10th, of sixteen prisoners, among whom were the supposed authors of the explosions in the Winter Palace and under the railway at Moscow, and the man who was accused of having prepared the mine near the Alexandrovsky station on the Sebastopol Railroad. The presumed author of the explosion in the Winter Palace was a peasant from the government of Viatka, named Stephen Chaltasen, who was employed as a carpenter in the palace under an assumed name. The mine near the Alexandrovsky station was laid in 1879 for the purpose of blowing up the imperial train, but had only recently been discovered, on the occasion of the train passing the spot. It was divided into two partitions, each filled with dynamite, and connected by a wire with the roadway adjacent to the railway track. On the approach of the imperial train a carriage drawn by three horses came rapidly up on the roadway, but drove off after the train had passed. It is supposed the carriage contained an electric battery, and that the attempt proved unsuccessful on account of the wire having been accidentally cut. Another of the prisoners was charged, upon the confession of the actual murderer, with being concerned in the assassination of General Krapotkine, the Governor of Kharkov.

The prisoners were permitted to address the Court in their own defense. Several of them admitted that the charges against them were substantially true, but maintained that their acts were justified by the coercive measures of the Government. One of them asserted that it was no crime to belong to a secret society, inasmuch as there was no other country in the civilized world where meetings were not allowed. Another one told the judges that the struggle would not be finished with the death of the prisoners. Five of them were sentenced to death, the others to various terms of imprisonment and servitude. Three of the capital sentences were commuted, but two of the convicted persons were hanged November 16th.

A Russian named Hartmann was arrested in Paris in February on a supposition that he was the owner of the house in Moscow whence the mine was laid in 1879 to blow up the railway train carrying the Czar. Although no extradition treaty existed between the two countries, the Russian Government asked the French Government to surrender him. The French Government, after examining the case, declined to give up the prisoner, on the ground that the evidence of his identity and participation in the offense charged against him was not clear enough to justify it, and permitted him to go to England. The refusal caused a temporary coolness of feeling.

After negotiations extending over several months, a preliminary agreement has been concluded between Russia and the Vatican referring to the ecclesiastical organization of the Roman Catholic bishoprics in Russia. It deals with the position of the bishops, the regulation of several dioceses, the control of the bishops over ecclesiastical seminaries, and the instruction of the clergy. The Holy See was, in November, about to examine the question of providing for the vacant sees in Poland, in view of the recommendations of the Russian Government concerning the choice of the new prelates.

An imperial decree, published in May, relieved Count Tolstoi, at his own request, of the posts of Minister of Education and Supreme Procurator of the Holy Synod, and appointed him a member of the Council of the Empire. Privy Councillor Saburoff, Curator of the Dorpat Educational District, was made Minister of Education, and promoted to the rank of Secretary of State, and Privy Councillor and Senator Pobedonosszeff was appointed Supreme Procurator of the Holy Synod. The new Minister of Education, immediately after his appointment, gave notice that all religious instruction in the elementary schools would in the future be given by lay teachers. The first stone of the University of Tomsk, in Siberia, was laid September 7th.

Mr. Greig, Minister of Finance, resigned his office in November, and was succeeded by Mr. Abaza, who, on assuming office, stipulated for a more complete control of the spending power

of his department. Mr. Bunge, a professor in the University of St. Vladimir, was appointed Vice-Minister of Finance. He was regarded as the superior in intellectual position and attainments of any officer who had ever been placed in this post, and was well known in Europe as a scientific man and political economist. He had had much experience in financial management as Director of the Branch Bank of Russia, at Kiev, and had spent much of his life in aiding and fostering industries.

The Czar, accompanied by General Melikoff, went to Livalia in September for a few weeks' sojourn. The railway was carefully guarded along the whole line of his route by forty thousand men, selected for that duty from among the peasantry, the police, the soldiers, and the gendarmes. Watchmen were stationed along the line at distances of thirty paces from each other; bodies of infantry were posted at the more important points; every bridge was examined; the carriages of the train were carefully inspected; and the houses along the railway were jealously searched. The journey was made in safety. The Czarevitch and Czarevna joined the Czar in October, for the purpose, it was understood, of arranging for the future position of the Princess Dolgorouki whom the Czar was about to marrymorganatically, and her children. The Czar returned to St. Petersburg in December, General Melikoff having been sent for to escort him. The railways were guarded as before. Servant-trains were arranged to run on parallel lines, and the train which carried the Emperor was kept unknown. The Czar arrived at St. Petersburg December 8d. On the 8th the festival of St. George was celebrated at the Winter Palace by a dinner at which three thousand knights of the order were present. The first toast was proposed to the health of the German Emperor, by the Czar, who recapitulated the military services of the Emperor, and bore witness to his unfailing friendship for Russia and its sovereign. The health of the Czar was proposed by the Grand Duke Nicholas.

According to the Russian official journal, some very extensive operations in draining marshes have been executed within a few years. At the end of 1879 twenty million acres of the Polessié marshes had been reclaimed, with six hundred and thirty-two miles of canals, the more important of which were made by the state, the others by resident proprietors. Half a million of the reclaimed acres were already arable land, and were the means of adding fourteen million rubles to the national wealth. Great drainage-works had also been carried out in the governments of St. Petersburg, Olonetz, and Yaroslav, with very satisfactory results. Preparatory works have been set on foot on the shores of the Black and Caspian Seas, in the provinces of Kherson and Catherinoslav, for the drainage of the marshes in those regions. The surveys cover a surface of 12,500 acres, while it is intended

that the works shall ultimately spread over a surface of five million acres. It is also proposed to explore parts of the provinces of Voronezh, and Samara, with the object of irrigating the steppes of the Calmuck nomads. In this way it is hoped that the great barren belt which disfigures and impoverishes southern Russia may by degrees be brought under cultivation.

General Loris-Melikoff entered in April into negotiations with a number of eminent and influential Poles, among whom were Count Wielopolski, Count Zamoyski, Count Ostrowski, and Mr. Krasneviski, the author, with a view of endeavoring to conciliate the Polish nationality, and bring about an understanding with it. The Polish negotiators demanded, as the basis of any understanding, that their nation should be placed in political and constitutional relations absolutely on a par with the Russians, and that the political disabilities under which they now labored should be abolished. General Melikoff advised the Polish gentlemen to draw up a memorial explaining what reforms they demanded, counseled them concerning the nature of the demands which would be most prudent, and engaged to lay the memorial before the Minister of the Interior.

The fiftieth anniversary of the Polish revolution of 1830 was celebrated in various parts of Europe, November 29th, by banquets, at which patriotic speeches were delivered. The "Golos," in an article on these celebrations, said: "We may view the celebration with calmness, Russia being so strong that she can not be disquieted by any foreign manifestations. Polish society has made sufficient progress to understand the importance of its relations with Russia, especially on the eve of the approaching administrative reforms."

Forty-two thousand people had emigrated from the province of Kars from the time of the Russian occupation up to October 13, 1879. The emigrants were said to have received half a million rubles on account of expropriation, which were contributed in nearly equal shares by the Government for their land and by private buyers of houses and property in Kars. A correspondent of the "Cologne Gazette," writing from Moscow in January, observed that that part of Asia Minor—comprising Batoum, Kars, Olti, and Artwin—which had been acquired by Russia under the Treaty of Berlin, was a district very rich in natural productions, and capable of great development under an efficient administration. Its agricultural productiveness was not great, but it had an abundance of wood and metals, and its climate and soil were well suited for the cultivation of silk and tobacco. The natives appeared reconciled to the new state of things; they had ceased to emigrate into Turkish territory, and hoards of money which had hitherto been concealed had made their appearance in the towns. Batoum, thanks to its great advantages as a harbor,

was increasing in size, while Poti, notwithstanding its dockyard and railway, was gradually declining. In December, 1878, the customs receipts at Batoum amounted to 480 rubles; in October, 1879, they had increased to 7,000 rubles. The German consul at Batoum made a statement somewhat at variance with this in his report on the trade and industry of the Caucasus. During the past twelve months, he said, adverse economic conditions

had been experienced in Trans-Caucasia, and the province had derived no advantage from the possession of Batoum since it had come under Russian control. The inhabitants of the district were not consumers of European goods, and the land-traffic with the interior of Asia Minor by way of Batoum was rendered almost impossible by the want of roads. At present the port was absolutely useless, except for strategic purposes.

S

SARGENT, EPES, author, was born at Gloucester, Massachusetts, in 1812, of a family well known in literary circles of New England. He entered Harvard College, but left before graduating. He was a persistent worker in the under walks of literature. In his early boyhood he conducted a paper called the "Literary Journal." He connected himself with Mr. S. G. Goodrich in the management of "The Token" and "Peter Parley's Magazine." Together they compiled the Peter Parley series of school-books, which have had so wide a circulation. In 1836 he produced his first play, "The Bride of Genoa," which was followed the next year by "Velasco," a tragedy written for Miss Ellen Tree, and played both in America and England. He edited the "New England Magazine," the "Boston Daily Advertiser," and the "Atlas," the "New Monthly Magazine," and the "Boston Transcript." He wrote a comedy, various juvenile tales, novels, lives of Henry Clay and Benjamin Franklin. He also published a volume of verses, among which "A Life on the Ocean Wave" is well known, and will probably live. He edited a number of the lesser English poets, and wrote their biographies, besides which he prepared for the press "The Modern Standard Drama," in seven volumes. He wrote much on spiritualism, in which he had a devout belief. He was a voluminous contributor to the periodical literature of the day, especially "The Knickerbocker" and the "Atlantic Monthly." But his most remunerative labors were in the preparation of readers, speakers, spellers, and other educational works. He died in Boston, in the sixty-ninth year of his age.

SOUTH CAROLINA. An extra session of the Legislature was called by the Governor for the purpose of voting appropriations, the Supply Bill passed at the preceding session having been adjudged invalid by the Supreme Court. In addition to the Supply Act, the Governor in his Message called the attention of the General Assembly to the need of a registration law and other matters. The session opened February 10th. Besides the Appropriation and Supply Bill, two bills amending the debt settlement were among the more important acts passed. In the act of 1878 to utilize convict labor, the section which provided that railroad

scrip might be taken in payment for the labor of the convicts was rescinded. A report of the Directors of the Penitentiary shows the number of convicts leased to be 306 out of a total number of 593, the hire being from \$3 to \$5 per month. The office of Railroad Commissioner was abolished.

The consolidation of the Augusta, Knoxville, and Greenwood Railroad Company, and the Augusta and Knoxville Railroad Company, of Georgia, was authorized, and the Blue Ridge Railroad was chartered.

On the 1st of September the Governor, W. D. Simpson, resigned his office to take the Chief Justiceship, and Lieutenant-Governor T. B. Jeter was installed as Chief Magistrate of the State. At the opening of the regular session of the Legislature in November there was a discussion upon the right and propriety of Governor Jeter's receiving a seat in the Senate to which he had been elected and acting as *pro tempore* President of the Senate while discharging the functions of Governor. The new Governor, Hagood, was inaugurated on November 30th. He called attention in his inaugural address to the fact that the accounts of the State had been cleared from all confusion or uncertainty, and a true and accurate account of the actual state of the treasury laid before the people. The Assembly passed a resolution to submit the question of calling a Constitutional Convention to the people at the next general election.

The condition of the State debt at the close of 1880 was as follows:

Consols.....	\$5,210,793 82
Deficiencies.....	564,855 98
State scrip (Agricultural College).....	191,800 00
To be funded, principal and interest, ante-bellum.....	196,570 91
To be funded, principal and interest, post-bellum.....	896,316 00
To be funded for fundable interest.....	146,659 07
To be funded for bills, bank of the State.....	22,145 00
Total bonded debt.....	\$6,639,170 78

In this statement the estimate of invalidity in part of the debt and of the amount of the bills of the Bank of the State to be funded is an approximation.

INTEREST ON THE DEBT.

The appropriation to meet the interest on the debt for the year 1879-'80 was \$515,508, of which there was paid up to October 31st,

\$348,245.75, leaving a balance unpaid of \$167,262.25. Of this unpaid balance there is due for interest on bonds already funded \$115,650.91, and to meet interest on bonds not yet funded \$51,611.34.

The amount of interest to be provided for 1881 is estimated at \$398,350, being the amount estimated on the basis of a bonded debt of \$6,639,170.

The following is a statement of the receipts of the State Treasury from November 1, 1879, to October 31, 1880:

Forfeited lands.....	\$21,370 83
Taxes previous to 1879.....	161,734 43
Taxes of 1879.....	249,356 40
Railroad assessments.....	248 52
Phosphate royalty.....	65,001 95
Agricultural Bureau.....	9,243 57
Secretary of State's fees.....	2,127 80
Trustees State Orphan Asylum.....	199 65

Net receipts.....	\$509,282 70
Amount in Treasury, November 1, 1879..	243,488 04

Aggregate.....	\$752,770 74
----------------	--------------

The expenditures for the same period were as follows:

On old accounts.....	\$26,778 29
Governor, Comptroller, Secretary of State, and Treasurer.....	25,381 50
Adjutant-General's department.....	4,908 28
Educational department.....	5,484 88
Health department.....	5,100 00
Tax department.....	19,338 10
Legislative department.....	65,612 07
Judiciary department.....	58,065 85
Penal and charitable institutions.....	34,458 27
Lunatic Asylum.....	82,000 00
Deaf, Dumb, and Blind Institute.....	8,800 00
Catawba Indians.....	800 00
Adjustment of debt.....	6,274 95
Salaries of State-House keeper and watchmen..	1,300 00
Publishing Treasurer's statements.....	1,000 00
Civil contingent fund.....	1,697 45
Repairs to Executive Mansion, etc.....	1,115 14
State-House and grounds.....	225 32
Illred convict-labor returned to the Penitentiary	3,354 01
Claims passed by the Legislature.....	3,405 51
Sundry expenses.....	1,771 50
Interest of public debt.....	345,245 75

Aggregate expenditures.....	\$704,511 88
Aggregate receipts.....	752,770 74

Balance in the Treasury November 1, 1880	\$48,258 86
---	-------------

The uncollected balance of the year's tax levy for general purposes was \$320,644. This amount, with the unreserved balance in the Treasury of \$27,761.44, would make \$348,405.44 available for unpaid balances of 1878-'79, amounting in the aggregate to \$231,229.51, leaving a balance in the Treasury of \$117,175.93. Deducting about \$7,000 of appropriations against this balance, surplus to be carried to the fiscal year 1880-'81 is, in round numbers, \$110,000.

The value of all the real and personal property in the State is as follows:

Real property returned.....	\$59,978,998
Counties not yet reported, estimated.....	17,680,668
Total value of real estate.....	\$77,609,666
Personal property returned.....	35,892,790
Counties not yet reported.....	6,892,973
Total personal property.....	\$42,785,763
Railroad property.....	13,767,400
Total assessment.....	\$134,162,824

The estimates of the amount to be provided for the fiscal year 1880-'81 are as follows:

For ordinary current expenses.....	\$270,941 53
For interest on the public debt.....	398,350 00

Total.....	\$669,291 53
------------	--------------

Against this there is to be set off the phosphate royalty, based on the returns of the last year.....	\$65,000
Probable surplus from taxes of 1879.....	110,000
	\$175,000 00

Leaving to be provided.....	\$494,291 53
-----------------------------	--------------

Which amount can be raised by a tax levy of $4\frac{1}{4}$ mills, as against $4\frac{1}{4}$ mills in 1879.

The State Railroad Board of Equalization was governed in their action in raising the valuation of the railroads by the sale of the Greenville Railroad, which road brought at auction more than twice what it had been previously assessed at by the board, which was compelled by the law, therefore, to raise the assessment 100 per cent., and the valuation of the other roads was increased in the same proportion.

The enforcement of the collection of the poll-tax was stopped by the decision of one of the Circuit Judges to the effect that the penalty enacted was unconstitutional. For 1878-'79 the collections were \$111,415.57; for the previous year they were \$13,818.15 less.

The Comptroller states that the lands forfeited to the State for non-payment of taxes have been repeatedly offered at public sale and not sold for want of bidders, and suggests that the words "at public sale" be stricken from the act of 1879.

The insurance statistics show that fifteen new fire and three new life companies have entered the State, and seven fire and three life companies discontinued business here during the year. There are now licensed seventy fire companies with a paid-up capital of \$46,000,000, and nine life companies with a paid-up capital of \$800,000, not including mutual companies.

The royalty paid into the State from September 1, 1879, to September 1, 1880, was \$65,313.98, as against \$97,002.77 for the preceding year, a falling off of \$31,688.79, or about 33 per cent.

Reports show the amount of the school fund, the school attendance, and the number of schools and teachers, to be greater than at any previous time. The number of educational institutions in the State was as follows: Colleges, male and female, 12; professional schools, 2; industrial training-schools, 3; private academies or high-schools, 81; public academies or high-schools, 49; elementary evening-schools, 3; private elementary schools, 208; public schools, 2,793.

At the last session of the General Assembly the agricultural fund, which had been lost, was restored, and vested in the trustees of the South Carolina University, who are authorized to open the agricultural and mechanical school in connection with the university. The fund is deemed sufficient to establish a technical school of the best class. The Institute for the

Deaf, Dumb, and Blind admitted during the year fifty-six pupils.

The Penitentiary reports show a decrease of thirty-five. The death rate was less than two per cent. Important improvements have been made in the buildings and walls. The Penitentiary farms have been successful, the estimated clear profits being between \$9,000 and \$10,000.

In the Department of Agriculture the offices of Phosphate Inspector and Phosphate Agent have been abolished, and the duties transferred to a special assistant of the Agricultural Bureau. The amount of phosphate rock mined and shipped, upon which the State receives a royalty of \$1 per ton, was 53,054 tons. According to the report of the Fish Commission, 30,000 California salmon, 15,000 landlocked salmon, 2,230,000 shad, and 3,500 California trout have been distributed in the waters of the State.

The passage of the stock law has resulted in bringing under cultivation thousands of acres which were almost valueless for want of timber for fencing them. The report of the Land Commission estimates the lands unsold at 56,371 acres; total value, \$158,076.04; balance of purchase-money due, \$47,493.87.

The report of the Superintendent of the Lunatic Asylum shows that at the beginning of the year there were 375 patients—181 males and 184 females. Of these 252 were white, and 123 colored patients. During the year 166 were admitted, making the whole number treated 541; of this number 31 recovered, 3 escaped, 55 died, and 31 were released, leaving 420 patients in the asylum—268 white and 152 colored. Of this number 29 were paying patients. The expenses have been less than the appropriation, leaving a balance of \$7,691, which has been transferred to the building fund. The receipts for the year were \$94,355.08, and the disbursements \$86,753.90. A farm of about fifty acres has been purchased. A lodge has been erected for the colored women, with wards to accommodate forty patients. It is already full, and an extension has been put under contract. The gross earnings of all the railroads in the State in 1879 were \$1,008,802.87; the expenses were \$3,098,346.79; net earnings, \$910,456.08; the gross earnings in 1880 amounted to \$4,943,074.39; expenses, \$3,585,766.61; net earnings, \$1,357,307.78; increase of gross earnings, \$934,271.52; increase of expenses, \$488,419.82; increase in net earnings, \$446,851.70, or nearly 50 per cent.

The mineral wealth of the State is not yet appreciated. Gold, iron, lead, manganese, bismuth, plumbago, soapstone, coal, black-lead, and asbestos are to be found in abundance, and granite of the finest grain, as well as burr-stone and materials for pottery and porcelain.

The total production of the phosphate rock since its discovery in 1866 amounts to 1,500,000 tons, worth \$9,000,000. The accessible de-

posits cover 10,000 acres, estimated to contain 8,000,000 tons of rock, worth at present prices \$30,000,000. The factories for the manufacture of this fertilizer have a capital of between \$600,000 and \$800,000.

The port of Charleston during the year was visited by 1,090 vessels—249 foreign and 841 domestic. In the fleet were 31 foreign steamships which came for cotton cargoes. The total tonnage was 600,059—127,095 foreign, and 472,964 domestic, not including vessels of under 100 tons burden.

At no time since the war has South Carolina been so prosperous. Lands have slowly but steadily improved in value. The people are generally out of debt, and have learned to work successfully under the new system. There are seventeen cotton-factories in operation, with 95,938 spindles and 1,933 looms, producing 101,338 yards of cloth and 17,438 pounds of yarn, and consuming 54,394 pounds of cotton each working day. They employ 2,612 operatives, who support 8,143 persons. The capital employed amounted to \$2,293,600, on which the profits are from 18 to 50 per cent. per annum. The water-power unutilized in the middle and upper counties of the State is enough to turn the spindles of all the cotton-mills in the United States.

The sea-islands of South Carolina, which were apparently ruined through the war, are so improved by the new system of subsoil drainage and heavy manuring that their land ranges in value from \$40 to \$200 an acre. A net profit of \$100 an acre on an expenditure of \$80 for fertilizers, labor, and ginning was realized by a planter on James Island, near Charleston. The State possesses an almost inexhaustible supply of pine, hickory, walnut, maple, cedar, poplar, and other timber. Cotton is grown in every part of the State. The cultivation of South Carolina rice, which is preferred in the markets to any other sort, is exceedingly profitable. Grain can be produced in abundance, and every variety is cultivated, though the yield is usually small, owing to imperfect tillage. Tobacco, sorghum, hemp, flax, indigo, and hops have become common crops. Good wine is made in some of the counties. The culture of fruits and vegetables for market is extending rapidly. Governor Hagood, in his inaugural address, dwelt upon the improved condition of agriculture in the State, attributable to the improved methods of culture and to the hopeful energy and increased thrift of all classes of the people. One field of 350 acres had yielded for two years 350 bales of cotton. Over a large area of the same county the crops upon the uplands were as luxuriant as upon the finest alluvial soil, and these uplands were of the character usual throughout the middle belt of the State, which in their unimproved condition would require three or more acres to produce a bale. Much more attention is paid to live-stock by the farmers, and the results in small grains are four or five times as great as were for-

merly obtained; four and a half tons per acre of Bermuda-grass hay have been grown on light, sandy lands, specially fertilized, near Charleston; while in other parts of the State, on alluvial lands not fertilized, a meadow had yielded for three years an average of two and a half tons to the acre of the same valuable hay, which is sold in the adjacent markets at from \$20 to \$25 a ton.

The returns of the census give the total number of acres cultivated in cotton, corn, and small grains, as 3,090,972, which is 80,442 more than all the "improved land" in the State in 1870. The product of cotton is 516,490 bales, against 224,500 in 1870, a gain of about 130 per cent. In corn the increase is from 7,614,207 bushels in 1870 to 11,763,729 bushels in 1880, or more than 50 per cent. In oats the tables show 2,715,443 bushels, against 613,593 bushels in 1870. In wheat the increase is from 783,610 bushels in 1870 to 962,431 bushels in 1880, or nearly 20 per cent.

The United States Agricultural Report, for 1879, shows that the average yield of cotton per acre for all the cotton States in that year was 188 pounds. The smallest yield in any county in South Carolina for 1880 is in Beaufort, where it is reported at 362, and that was long-staple cotton. The average yield of corn per acre is reported as only nine bushels, against an average yield in the United States in 1879 of twenty-nine bushels. The average yield of wheat is given at 5.6 bushels, the crop of the whole country in 1879 having averaged 13.8 bushels. The average yield of oats is given at 13 bushels as against 28.7 bushels average per acre in the United States in 1879.

The greatest aggregate yield of cotton, 34,907 bales, is in Edgefield County; of corn, in York, 626,305 bushels; of oats, in Edgefield, 415,243 bushels; and of wheat, 107,608 bushels in Abbeville County. The greatest yield of cotton per acre is in Marlboro', where it is 857 pounds; of corn the largest yield is 13.3 bushels in Kershaw County; of oats, 18.2 bushels in Georgetown County; and of wheat, 12 bushels in Charleston County, the result of experimental farming.

The returns of the census, showing an increase in population of about 43 per cent. since 1870, were much questioned upon their first publication, in the latter part of the summer, and suspicions that the count had been falsified for political purposes were freely expressed. Superintendent Walker, while confident that the work had been honestly performed, ordered a new enumeration in certain districts showing the largest gains, in order to satisfy the public mind. The investigation substantially corroborated the first returns. The recount was taken in eighteen districts in all, and the returns were subjected to examination by United States officials and by citizens, the latter being persons of acknowledged reputation and standing, and in nearly every case members of the

Republican party. The investigation revealed no evidence of fraud, but left no doubt of the defective character of the ninth census in this State.

The Republican Convention met at Columbia, April 27th. Of the delegates attending, forty were white and eighty colored. The Convention instructed its delegates to the National Convention to support Grant for President.

The Democratic Convention assembled at Columbia, June 1st, to choose delegates to the National Convention, Presidential electors, and State officers. The following platform was adopted:

The Democratic party of the State of South Carolina, in convention assembled, reiterates its adhesion to the doctrines of the great National Democratic party of the United States, and renews the declaration of the principles laid down in its platforms of 1876 and 1878. It has redeemed its pledges to reform the abuses of the State government, to reduce expenditures, and to use the people's money for the benefit of the people only.

It confidently appeals to the general sense of the country upon its records, and challenges the comparison of the present happy and prosperous condition of the State with the bitterness, venality, and suspicion, which under Republican misrule distracted our people and sapped the foundations of their prosperity.

It calls upon all good citizens who favor an honest, economical, and liberal administration to rally to the standard of the Democracy and to lead it to victory.

The State ticket was nominated as follows: For Governor, General Johnson Hagood; Lieutenant-Governor, John D. Kenedy; Secretary of State, R. M. Sims; Comptroller-General, J. C. Coit; Attorney-General, Leroy F. Youmans; Superintendent of Education, Hugh S. Thompson; Adjutant and Inspector-General, A. M. Manigault; and State Treasurer, J. P. Richardson.

In the State election Hagood received 117,432 votes, and Blair, the Republican candidate, 4,277. The other Democratic candidates were elected also by large majorities. In the new Legislature, out of 34 Senators and 124 Representatives, the Democrats had a majority on joint ballot of 152.

SPAIN, a kingdom of Southern Europe. King, Alfonso XII, born November 28, 1857; proclaimed king December 30, 1874. He was married on January 23, 1878, to Maria de las Mercedes, who died June 26, 1878; and next to Maria Christina, daughter of the Archduke Charles Ferdinand of Austria, born July 21, 1858. Daughter, Maria de las Mercedes, Princess of Asturias, born September 12, 1880.

The area of Spain, inclusive of the Balearic Islands and Canaries, is 508,066.9 square kilometres; the population, according to the census of 1877, was 16,623,384. There were also 2,476 inhabitants of the Spanish possessions in Northern Africa, making a total of 16,625,860.

The area and population of the foreign colonies are as follows:

COLONIES.	Area in sq. kilometres.	Population.
1. AMERICA :		
Cuba	118,883	1,894,516
Porto Rico	9,315	661,494
Total	128,148	2,056,010
2. ASIA AND OCEANICA :		
Philippines	300,000	6,300,000
Carolines	700	14,800
Palaos	750	14,000
Ladrones or Marianas	1,140	8,200
Total	302,590	6,337,000
3. AFRICA :		
Guinea Islands	2,208	85,000
Total colonies	432,941	8,428,010

The following cities of Spain and the Spanish colonies have more than 100,000 inhabitants:

Madrid	397,690
Barcelona	249,106
Havana (Cuba)	230,000
Manila (Philippines)	160,000
Valencia	143,856
Seville	133,938
Malaga	113,832

The revenue was estimated in the budget of 1879-'80 at 812,363,790 pesetas (1 peseta=19.3 cents), and the expenditures at 828,237,108 pesetas. The public debt on June 30, 1879, amounted to 12,916,046,162 pesetas.

According to the law of May 14, 1879, the army in Spain is to consist, in time of peace, of 90,000 men, of whom 59,993 will belong to the infantry, 12,783 to the cavalry, 9,955 to the artillery, and 4,168 to the corps of engineers. In time of war the army is to comprise 450,000 men. The same law fixes the strength of the army in Cuba at 38,000 men, in the Philippines at 10,500 men, and in Porto Rico at 3,346 men.

The fleet in 1879 consisted of 121 steamers, of 21,576 horse-power, with 525 guns.

The imports in 1878 amounted to 397,800,000, and the exports to 431,300,000 pesetas.

The political situation at the opening of the year was regarded as critical. General Martinez Campos was seeking, by interviews with Señor Sagasta and others, to strengthen the Constitutional party through fresh alliances. The senators and deputies from Navarre had demanded the reestablishment of the constitutional guarantee in that province, but the Government had refused to accede to their request. The opposition deputies had absented themselves from the Chamber since December 10th, having taken offense at the course of the Prime Minister during the sittings of that day, and would not return until Señor Canovas del Castillo had made apologies to them.

The Cortes assembled after the Christmas holidays, on January 11th. The members of both Houses on the next day resolved, after a long debate, to resume their seats in the Cortes. Count Toreno, who resigned the office of Minister of Foreign Affairs, was elected President of the Chamber of Deputies, January 21st, in

place of Señor Lopez de Ayala, who had died on the 30th of December previous. Señor Canovas del Castillo took the portfolio of Foreign Affairs as a temporary measure. The discussion of the bill for the gradual abolition of slavery in Cuba was begun in the Chamber of Deputies January 14th. The bill was passed by the Chamber, January 21st, by a vote of 230 to 10, the members of the minority and the friends of General Martinez Campos abstaining from voting; was passed by the Senate, after it had received some modifications at the hands of a mixed committee of the two Houses, January 30th, by a vote of 156 to 28, and was promulgated as a law in the "Official Gazette," February 18th. A motion made in the Senate for the establishment of two schools for apprentices to the profession of *toreadors* was opposed by the Minister of Public Instruction, who said that he hoped that, in a short time, the manners of the people would be so changed as to permit the suppression of the barbarous spectacle of bull-fighting. The motion was then withdrawn.

At the sitting of the Senate, March 9th, Marshal Martinez Campos declared himself to be the adversary of Señor Canovas del Castillo, adding that he was anxious to promote the unity of the Liberal party. The Premier replied that he himself was no adversary of Marshal Martinez Campos, since they had both great interests to defend in common.

Stormy debates, extending over several days, took place in the Chambers in June, on a motion for a vote of confidence in the Government. In the Senate, Marshal Martinez Campos denounced the conduct of the Ministry vehemently. Señor Canovas del Castillo replied, maintaining the correctness of the course followed by his Cabinet, and protesting against what he described as the threatening language of Marshal Campos. The vote was taken on the 12th, by a division of 170 to 22, after further speeches by Marshal Campos and the Premier. A vigorous discussion took place on the same motion in the Chamber, ending in the adoption of the resolution by a vote of 246 to 13. The opposition abstained from voting in both Houses. The Cortes was prorogued June 23d. The provincial elections resulted in large majorities for the ministerial candidates all over the kingdom. The dynastic Liberals, however, abstained from voting, except at about fifty polls. The Cortes was opened December 30th by King Alfonso, who said in the speech from the throne that, actuated by no ambition abroad, and fettered by no fears at home, Spanish diplomacy was endeavoring to extend the commercial relations of the country with America and Europe, and would neglect no effort to obtain from foreign nations equal advantages with those which Spain granted to them by treaties of commerce. His Majesty also stated that it was necessary to increase the naval forces and strengthen the national defenses.

The Premier made a speech before a private meeting of his supporters, in which he declared that, having consolidated the monarchy and pacified the country and its principal colony, the Government would continue the same policy it had pursued, and would in the forthcoming session give special attention to finance and the promotion of the material interests of the nation.

A democratic manifesto was published in Madrid, April 6th, signed by 279 former deputies and senators, and 21 journalists. It demanded religious liberty, liberty of the press and of public meeting, association and education, universal suffrage, decentralization, obligatory military service for all, economy in the public service, respect for the rights of individuals, improved control over the finances, assimilation of Cuba to the mother-country, and the irremovability of the judges.

An arrangement was made known during May which had been effected between Señors Sagasta de Posada Herrera and Alonzo Martinez, as the respective leaders of every shade of dynastic Liberalism in the country, with Marshal Martinez Campos, for the coalescence of all their factions into one party against the Conservative Administration that had now been in office for six years. This movement, which was regarded as one of great importance to the realm, since it would give it two parties supporting the monarchy, was embraced in a few days by 131 Monarchist senators and deputies, 3 marshals, and 115 generals. A meeting of the leaders of the party was held at San Sebastian, in August, when very strong language was used against the Conservative Cabinet of Señor Canovas del Castillo. On the 7th of November, Marshal Martinez Campos had an interview with Marshal Serrano, in the course of which it was shown that both statesmen shared the opinions of dynastic Liberalism and of Señor Sagasta. Marshal Serrano, however, expressed himself determined not to issue from the voluntary retirement which he had maintained for six years.

Señor Castelar, speaking at Alcira, October 8th, said that his principal wish was to see order maintained in the army and in the Church, the tenure of property guaranteed, and the principle of administrative decentralization carried out, and that he would support any Government which could maintain order.

The Minister of the Interior was given a dinner, late in November, by 450 members of the Liberal-Conservative party in Seville, when he said, in his speech that Señor Canovas del Castillo had made Spain one of the freest nations in Europe, and described the King as the symbol of the happiness, welfare, and progress of the nation.

The budget for 1880-'81 was presented in the Chamber of Deputies, February 17th, by the Marquis de Orovio, Minister of Finance, who estimated the revenue for the coming year at 792,000,000 pesetas, and the expenditure at

829,000,000 pesetas. The maximum amount of the floating debt for the year would be one fourth of the estimated receipts, and the Minister asked for authorization to borrow money to that amount. He pointed out that it might be necessary to exceed the maximum named in the event of the outbreak of war or serious disturbances. The Minister also demanded leave to procure the sum destined for the service of the floating debt by means of bonds, anticipating the receipts of the present budget. The Government furthermore wished to be able to obtain funds, in exchange for pagares or drafts on the Imperial Treasury, at a rate to be fixed by the Minister of Finance. The pagares would be drawn at three, six, or nine months.

The budget for Cuba was presented by the Minister for the Colonies, February 19th. The ordinary expenditure was set down at 37,500,000 pesetas, and the extraordinary expenditure at 10,000,000 pesetas. Various new taxes would have to be imposed during the continuance of the war. Authorization was asked to contract a loan, in order to repay the advance made by the Hispano-Colonial Bank, cover the deficit, and unify the debts. In the discussion of these estimates, April 5th, Señor Laiglesia said, in behalf of the Budget Committee, that it was imperatively necessary to borrow a sufficient sum to pay off 50,000,000 pesetas, which were owing to the army, and 67,000,000 pesetas that were owing to the military contractors. The entire budget was finally adopted. The floating debt of the island was limited to 6,000,000 pesetas, except in the event of unforeseen circumstances. The strength of the permanent army in Cuba was fixed at 40,000 men.

Affairs continued to be disturbed in Cuba, with insurrectionary movements and occasional skirmishes. At the beginning of April applications for amnesty had been made by 382 persons, including several leaders and subordinate officers. Five persons out of a number who were condemned to death for complicity in a conspiracy were shot in May, and the sentences of the other leaders of the movement were commuted. Calisto Garcia, the leader of the former insurrection, disembarked in May, near Santiago de Cuba, with fifteen men. Troops were immediately sent in pursuit of him. The insurgent leader in the district of Cinco Villas and the remnant of his band surrendered themselves in September. Measures were adopted for withdrawing a part of the forces from the island, and in November the commander-in-chief had disarmed several war-vessels, and was disbanding one thousand men of the army weekly, and perfect tranquillity was said to prevail throughout the island. A plot to create disturbances among the creoles in Cuba, to which, however, the semi-official press in Madrid attached but little importance, was discovered in December. A general rising of the free blacks and mulattoes in the mountains and jungle around Santiago de Cuba was planned to

take place on the 15th, and assistance was expected from expeditions of filibusters. Arrests were made in eleven towns, 350 colored men being implicated in Santiago de Cuba alone.

The activity of the Carlists and Ultramontanes, under the impunity accorded to them by the Government, began to attract attention in August. The press of the party openly proclaimed Carlist views, discussed the prospects of the cause, and published letters from the Pretender; and the Carlist candidates in the elections of the Councils-General were canvassing with confidence, for the first time in thirty years, that they would be able to secure a majority. The Council of Ministers finally decided to take preventive measures against the further development of the strength of the party. It was determined to institute proceedings against all priests who should introduce political subjects into their sermons, and to dismiss from their posts all mayors who were notorious Carlists. Directions were given by the Minister of the Interior to the governors of the Basque provinces to observe the sermons of the local clergy, and immediately report the name of any priest who should use the pulpit to preach against the Government.

The Government, having received many petitions from religious orders about to be expelled from France with reference to establishing themselves in northern Spain, issued a circular to the civil authorities, in June, giving instructions that no order, college, or establishment belonging to religious houses leaving France, should be permitted in any province near the French frontier, or in the rest of the Peninsula, except after having received due authorization from the Government.

The anniversary of St. Ignatius Loyola, the founder of the order of Jesuits, was celebrated, August 3d, at the monastery of Loyola, in the province of Guipuzcoa, with great ceremony. More than fifty thousand Basque peasants and mariners, and several hundred members of aristocratic families in the neighborhood, assembled to witness the festivals and religious ceremonies. About three hundred Jesuit fathers were present, and many visitors attended from France. The "Correspondencia de España," semi-official, announced in November that the members of religious orders expelled from France, who had taken refuge in Spain, were at liberty to establish themselves separately in any part of the country they might see fit, but that they would not be allowed to form themselves into religious associations or wear publicly the habit of their order.

The trial of Otero for the attempt to assassinate the King on December 30, 1879, was concluded in the Court of First Instance, February 9th. It was urged for the defense that the accused was of weak intellect and not responsible for his actions. The prisoner was sentenced to death. An appeal was taken to the Court of Cassation, and denied by it. The counsel of the prisoner then appealed to the

King to exercise his clemency toward the regicide, and asked the Queen and the Princess of the Asturias to intercede in his behalf. The King replied, "As King I have pardoned Otero, but I must submit the question to my responsible Ministers." The sentence was finally confirmed by the Council of Ministers, and Otero was executed April 14th. A paper purporting to be a confession of the regicide was afterward published in a newspaper of Madrid, which represented that Otero had been ordered at a secret meeting of masked men to kill Señor Canovas del Castillo, and was paid for the work and supplied with a weapon for the purpose, but that afterward the order was changed, and he was told to kill the King, under pain of being killed himself if he refused.

SPRAGUE, PELEG, was born in Duxbury, Massachusetts, April 27, 1793, and died in Boston, October 13, 1880, in the eighty-eighth year of his age. He graduated at Harvard College in 1812, studied law at the Litchfield Law-School, was admitted to the Plymouth County bar in August, 1815, practiced two years in Augusta, Maine, and then settled in Hallowell, where he speedily acquired distinction. He was a member of the Maine Legislature in 1820-'21; member of Congress, 1825-'29; United States Senator, 1829-'35; and United States District Judge from 1841 to 1865. In 1835 he became a resident of Boston; in 1858 he published "Speeches and Addresses," and "Decisions" in 1841-'68. He began public life as a Whig, and, though never an extreme partisan, was always identified with the Republican party. In 1840 he was Presidential elector on the Harrison and Tyler ticket; in 1847 he received the degree of LL. D. from Harvard College. He was the last surviving member of the memorable United States Senate of 1830-'32, in which the illustrious names of Webster, Clay, Calhoun, Benton, Hayne, and others were enrolled. As a lawyer and judge he was greatly esteemed by clientage and bar, and in the National Assembly he was regarded as a fine debater.

ST. JOHN, ISAAC MUNROE, was born in Georgia, and died on the 7th of April, 1880, at Greenbrier, Sulphur Springs, in West Virginia. He graduated at Yale College, and entered his professional life as civil engineer on the Baltimore and Ohio Railroad, where he soon attracted the attention of eminent engineers. At the breaking out of the civil war he was living in South Carolina, and joined fortunes with the Confederacy. Soon after his enlistment as a soldier in the army at Richmond, he was placed in the engineer corps, and assigned to duty under General Magruder on the Peninsula, where he rendered valuable service in the construction of fortifications during McClellan's first campaign. The ability which St. John displayed in the arduous duties of the field, decided the War Department at Richmond to place him at the head of a bureau even more important than that of engi-

neering. The Niter and Mining Bureau having become the sole reliance of the Confederacy for the production of gunpowder, General St. John was promoted to that branch of the service, with his headquarters at Richmond. In that position he established a high reputation, and rendered great benefits to the Confederacy. When General John C. Breckinridge was appointed Secretary of War, he found the commissariat in such a condition as demanded a change, and he selected General St. John for the place. In this new field his success was greater than ever, and he established a system by which supplies for the army were collected directly from the people and placed in depots ready for transportation. He was with President Davis and his Cabinet in the retreat after the evacuation of Richmond, but became separated from Mr. Davis before the capture. Soon after the war he resumed his profession in Kentucky, and became Chief Engineer of the Louisville, Cincinnati and Lexington Railroad. He built the Short-line to Cincinnati, which was regarded as a great feat in civil engineering. After the completion of the Short-line he became consulting engineer of the city of Louisville, and was afterward elected City Engineer. To him the city is indebted for the first topographical map, and the establishment of its present system of sewerage. He declined a reelection to the office of City Engineer, and became Consulting Engineer of the Chesapeake and Ohio Railroad, and Chief Engineer of the Lexington and Big Sandy Railroad, which position he held at the time of his death. He left to posterity a character to be revered for its chivalric tone, its earnest convictions, and its devotion to duty in both military and civil life.

SUNDAY-SCHOOLS. The following is a summary of the statistics of Sunday-schools as they were reported at the Sunday-school Centennial Meeting which was held in London in June, 1880:

COUNTRIES.	Teachers.	Scholars.	Total.
England and Wales.....	422,250	3,800,000	4,222,250
Scotland.....	47,972	494,538	542,505
Ireland.....	32,548	384,627	417,175
Canada.....	41,712	340,170	381,882
Australia.....	3,970	37,915	41,885
New Zealand.....	1,191	9,947	11,048
Total under English Government.....	549,553	5,067,192	5,616,745
Other European countries.....	26,000	40,000	420,000
India, China, and Africa.....	2,000	100,000	102,000
South America.....	3,000	150,000	153,000
Total outside of United States.....	574,553	5,717,192	6,291,745
United States.....	886,328	6,623,124	7,509,452
Total.....	1,460,881	12,340,316	13,801,197

The one hundredth anniversary of the organization of Sunday-schools in England by Robert Raikes was celebrated in England and the United States in June. A general celebration, which was participated in by delegates from the different countries in which Sunday-

schools have been established, was held in London, June 26th, and during the following week. A meeting for the reception of the foreign delegates was held at the rooms of the Sunday-school Union in the Old Bailey, on the evening of June 26th. On Sunday, the 27th, special services, with sermons appropriate to the occasion, were held in the different churches. A general meeting was held at the Guildhall, Monday, June 28th, at which the Lord Mayor presided. Resolutions were adopted acknowledging the benefits which had accrued to the whole of Christendom from the establishment of Sunday-schools, and inviting all Christians to make the present opportunity an occasion for earnest and prayerful effort for the further development and progress of those institutions. Conferences were afterward held, at which papers were read on subjects relating to Sunday-schools and their work, and information was given concerning their condition in different countries. Celebrations were held during the following days under the auspices of the Church of England Sunday-school Institute and the Sunday-school Union (nonconformist), among the exercises of which were children's festivals at the Crystal Palace and the Archbishop's Palace at Lambeth. The latter festival was attended by the Prince of Wales and members of the royal family. Statues of Robert Raikes were unveiled at Gloucester, where Raikes organized his Sunday-schools, and in London, the latter being on the Thames Embankment, near the Egyptian obelisk. A monument was erected in front of the Unitarian chapel in Essex Street, London, in memory of the founders of the first twelve Sunday-schools, beginning with Cardinal Borromeo, 1580, and ending with Theophilus Lindsay and Robert Raikes, 1780.

SUTTER, General JOHN AUGUSTUS, California pioneer, was born at Kandern, Baden, on the Swiss frontier, of a Swiss family, in 1803. He graduated from the military college at Berne in 1823. He entered the French army as an officer of the "Swiss Guard," and served in 1823-'24 through the Spanish campaign. At Grenoble the guard attempted a vain resistance to the Revolution of 1830, which drove out Charles X and upset the Bourbon monarchy. In 1834 he emigrated to the United States and settled in what was then the small frontier town of St. Louis. After being naturalized, he moved to Westport. While employed in the cattle-trade with New Mexico he heard, at Santa Fé, such accounts of the Pacific coast that in 1838 he set out with six men and traveled two thousand miles through regions which no white man's foot had ever before trod. He went first to Oregon, descending the Columbia River to Fort Vancouver. He embarked for the Sandwich Islands, where he purchased a vessel and sailed to Sitka in Russian America. After selling his cargo to great advantage, he brought his vessel to San Francisco Bay, where he landed July 2, 1839.

He called his settlement New Helvetia. He built a mill, tannery, and fort, equipped with two or three small cannon, on the Sacramento River. In 1841 he already owned several thousand head of cattle. He carried on a lucrative fur-trade with the Indians. The Mexican Government invested him with the magistracy, but so many Americans gathered about him, and the project of annexing California was so little concealed, that he fell under the ban of that Government. When the Wilkes Exploring Expedition reached San Francisco, Sutter gave them aid and information. One of the vessels, the *Peacock*, was wrecked on the bar of the Columbia River, and it became necessary to send a party overland under the command of Lieutenant Emmons. Beset with perils, by sea and land, these men were received and entertained by Sutter with unstinted and uncompensated hospitality while resting at his fort. He furnished them with horses and a launch to enable them to rejoin the fleet.

He extended a similar welcome to Fremont and his expedition. The Mexican Government became suspicious. They offered to buy him out. Sutter was the owner of over a hundred thousand acres of land and countless cattle. They then endeavored to drive him out and to incite the Indians to hostility. To protect himself, he gathered a large body of immigrants around him. Castro ordered them to leave the country. Colonel Fremont's second expedition opportunely arrived. It was judged necessary to raise the United States flag, and this was the initial step toward the addition of California to the States. A squadron was on the way round the Horn, and General Kearney began his transcontinental march, but the annexation was practically completed before their arrival. California was ceded to the United States by treaty in February, 1848. In that very month gold was discovered in Sutter's mill-race. This event flooded the Pacific coast with population. General Sutter was elected first Alcalde of his district and delegate to the Convention to make a Constitution. He was also Indian commissioner. Lands became valuable, and his titles were contested. He filed a claim for thirty-three square leagues, eleven of which had been granted him in 1841 by Governor Alvarado, and twenty-two by Micheloreno in 1845, in recompense of his military services. His claim was allowed by the commissioner. It was appealed to the Supreme Court, and decided adversely to Sutter. Deprived of his property and reduced to want, the California Legislature granted him a pension of \$250 a month. In 1864 his homestead was burned out. In 1873 he removed to Pennsylvania. He died in Washington, June 17th, at the age of seventy-seven.

SWEDEN AND NORWAY, two kingdoms of Northern Europe, united under the same dynasty. The King, Oscar II, born January 21, 1829, succeeded to the throne at the death

of his brother, Charles XV, September 18, 1872. He married on June 6, 1857, Sophia, daughter of the Duke of Nassau, born July 9, 1836. Their oldest son is Gustavus, heir-apparent, Duke of Wermland, born June 16, 1858.

SWEDEN.—The executive authority is in the hands of a King who acts under the advice of a Ministry, which at the close of 1880 was composed as follows: Count A. R. F. Posse, Minister of State; Baron C. F. L. Hochschild, Foreign Affairs; Dr. J. H. Lovén; Dr. H. L. Forssell, Justice; Baron C. G. von Otter, Navy; Colonel O. F. Taube, War; F. L. S. Hederstjerna, Interior; and Dr. C. G. Hammarskjöld, Ecclesiastical Affairs.

The area of Sweden, inclusive of inland lakes, is 170,741 square miles; the population on December 31, 1879, was 4,578,901, of which 2,228,855 were males, and 2,350,046 were females. In 1878 there were 29,151 marriages, 138,385 births, 85,339 deaths, and 3,921 stillbirths. The population of Stockholm in 1879 was 173,433.

The budget for 1881 estimates the receipts and expenditures at 74,995,000 crowns each (1 crown = 26·8 cents). The public debt of Sweden on December 31, 1879, amounted to 220,296,130 crowns. The Swedish army in 1879 numbered 183,063 men. The navy consisted of 43 steamers, of 20,271 horse-power and 155 guns; 10 sailing-vessels of 105 guns, and 87 smaller vessels of 113 guns. The imports in 1878 amounted to 239,518,000 crowns, the exports to 184,320,000 crowns.

NORWAY.—In Norway the executive is represented by the King, who exercises his authority through a Council of State, composed of two ministers of state and nine councillors. Two of the councillors, who are changed every year, together with one of the ministers, form a delegation of the Council of State, residing at Stockholm near the King.

The area of Norway is 122,280 square miles, and the population, according to the census of 1875, was 1,806,900. The receipts for 1879 amounted to 40,724,200 crowns (1 crown = 26·8 cents), and the expenditures to 48,571,600 crowns. The public debt on June 30, 1879, amounted to 99,632,000 crowns. The imports in 1879 were valued at 132,226,000 crowns, and the exports at 89,222,000 crowns.

The King, in opening the Swedish Rigsdag, January 17th, announced that, inasmuch as a committee on taxation had been appointed in the previous year, all the schemes for a thorough reform of the system would, for the present, be postponed.

In considering the army bill, the First Chamber adopted a paragraph extending the age at which men shall be liable to military service to forty years. The bill was rejected by the Second Chamber, and the Ministry in consequence resigned, April 13th. A new Cabinet was formed, in which Count Posse, who held the office of Minister of State and Councilor of

State, was also temporarily assigned the duties of Minister for Foreign Affairs. In November the King accepted the resignation of Dr. Forsell, the Minister of Finance, and Count Posse was given the portfolio of that office in addition to that of Minister of State. M. Thempander, one of the chiefs of department, was appointed Councilor of State.

The Norwegian Storting was opened on February 11th. A difference with the Government arose on the army question. A Government bill which did not recognize the principle of a general liability to military duty, was rejected by the Chamber.

A more severe conflict arose on the question, whether the members of the Council should be compelled to attend the meetings of the Chamber. According to the Norwegian Constitution, the King has no absolute veto, and when a bill has been passed three times by the Storting it becomes a law. The bill providing for the attendance of the members of the Council had been passed at two previous sessions of the Storting, and had been vetoed by the King on both occasions. The bill passed the Storting for the third time on March 17th, but, as it proposed a change of the Constitution, the King claimed the right of an absolute veto in this case—a claim which was denied by the opposition.

A complete rupture between the King and the popular House was brought about by the passage, on June 9th, of a bill authorizing the army committee to continue its sessions until the next meeting of the Storting. This bill was also vetoed by the King. The Storting was closed on June 23d.

SWITZERLAND, a republic of Central Europe, consisting of twenty-two cantons, three of which are each divided into two independent half-cantons. The President of the Federal Council for 1880 was Dr. E. Welti, of Aargau; and the Vice President, F. Anderwert, of Thurgau. The area is 15,981 square miles, and the population, according to an official estimate of July 1, 1879, 2,808,493. The movement of population in 1879 was—19,447 marriages, 89,692 births, 67,158 deaths, and 3,512 still-births. The total revenue of the Confederation for 1879 amounted to 41,456,213 francs, and the expenditures to 39,525,274 francs. The budget for 1880 estimated the receipts at 40,599,000 francs, and the expenditures at 40,782,000 francs. The liabilities of the republic amounted at the close of 1879 to 32,331,284 francs, as a set-off against which there was Federal property amounting to 43,782,000 francs.

The most important subjects that received attention in the course of the year were the defenses of the Confederation, and propositions for a revision of the Constitution.

The chief of engineers was directed by the Council of State, in January, to draw up a report relative to the strength and condition of the fortifications on the frontier. A meeting held at Thun in February, which was attended

by a considerable number of officers of the army, adopted resolutions declaring—1. That the sacrifices lately made for the development of the armed forces of Switzerland can only benefit the country when the principal avenues leading into it have been so secured as to render it impossible for an enemy to advance suddenly into the interior, and before the mobilization of the militia can have been accomplished; 2. That the fortification of the frontiers of Switzerland is therefore a precaution necessary for self-preservation; 3. That, if this step be neglected, a grave responsibility will devolve, in case of disaster, upon those to whom the country has confided the care of its interests, and especially of its independence; 4. That the meeting trusts that the Federal Assembly will vote the sums necessary for completing an efficient system of defensive works, and for arming them with suitable ordnance, and expresses its own readiness to make the necessary sacrifices. The subject engaged almost universal interest. Addresses were made upon it in the larger towns and in the villages, and it was discussed in the daily papers as well as in the journals devoted to the interests of the military service. The people were reminded that, whenever in olden times their small and comparatively insignificant state successfully defended itself against the onslaughts of its more powerful neighbors, it always relied largely upon the artificial defenses which in those days existed in large numbers throughout the country. So it would most likely be in the future. It was further shown that it would not be enough to erect fortifications designed to oppose an army coming from France only, for the country was exposed also on its northern frontier, and might be invaded from that direction.

The Council of State in September adopted the proposals of the National Council for a revision of the Constitution, and the question was submitted to a popular vote on the 31st of October. The revision was generally opposed by the Catholic cantons; the Liberals were not decided upon it, and no great popular interest was excited in it. The *plébiscite* resulted in the rejection of the proposed revision by a majority of two thirds.

The Landgemeinde of the Canton of Appenzel, at its annual meeting in May, decided by a large majority in favor of the restoration of capital punishment for the crimes of murder and incendiarism resulting in death. The Canton of Schwytz reëstablished capital punishment in July, and ordered that executions should take place in public. This was the fourth canton that had restored the penalty of death.

A bill for the separation of Church and state was submitted in July by the Great Council of the Canton of Geneva to a popular vote. It was intended to take effect from the beginning of 1882, and provided that, while the Protestant and Old Catholic congregations might use the churches, as they had previously done, for re-

igious services, the property of them should be vested in the communes in which they are situated. The measure was rejected, July 5th, by a vote of 9,306 against it to 4,064 in favor of it, more than a majority of the whole number of registered voters in the canton (17,451) voting against it. A new Great Council was elected at Geneva, November 14th, in which a majority was returned of the anti-Catholic extreme radical party.

A controversy between the Canton of Thurgau and the Grand Duchy of Baden respecting boundaries, which has been going on since the fifteenth century, has been finally adjusted. The dispute was marked by armed conflicts; two treaties which were made with the object of settling it, in 1687 and 1786, failed to accomplish the object. The controversy was reopened in 1816, and carried on again for fifteen years. At last an international commission was appointed in 1878, to deal with the whole subject amicably. Its report was adopted by the two states, and, the boundary-stones having been planted by the duly appointed commissioners and geometers, the final treaty was signed on the first day of May.

The committee of the National Council, appointed to examine questions of Federal administration, requested the Federal Council, in May, to take measures to prevent the Jesuits expelled from France from establishing themselves on Swiss territory.

The Federal Council decided in August, at the request of Don Carlos, to annul the decree of 1873 respecting the internment of the Duchess of Madrid, and further to restore the cannon which had been sequestered at her residence in Geneva.

The contractors of the St. Gothard Tunnel in October applied to the Federal Tribunal for a prolongation by seven hundred days of the time originally fixed for the completion of their undertaking, the effect of which would be to delay the opening of the tunnel for traffic till late in 1882. The Federal Council in November arranged for the immediate conveyance of the mails through the tunnel, while passengers will still have to follow the old route. It is expected that, after the line is opened, express trains will run from Basle to Milan in thirteen hours, and from Lucerne to Milan in ten hours.

The elections for the executive office in December resulted in the choice of M. Anderwert, of Thurgau, as President, and M. Droz, of Neuchâtel, as Vice-President, of the Confederation. Both officers were of the Extreme Democratic party. M. Anderwert committed suicide, December 25th, on the public promenade at Berne, by shooting himself with a revolver. He had for some days before his death been in a state of melancholy, and imagined himself to be surrounded by enemies who were plotting to take his life. The small majority by which he was elected to the Presidency is also said to have preyed on his spirits.

The Conference of the International Association for the reform and codification of international law was opened at Berne, August 25th, by M. Welti, President of the Swiss Confederation, and M. Koenig, President of the Society of Swiss Jurists. About sixty members were present, including the Japanese Minister in London. Papers were read on "Consular Jurisdiction in the Levant," by Sir Travers Twiss; "Consular Jurisdiction in Japan," by Mr. Tyre, a Japanese gentleman; the "Protection of Submarine Telegraph Cables," by Sir James Carmichael; "Literary Copyright," by Sir Travers Twiss; "General Average," by Dr. Wendt; "Limited Partnership," by Mr. Jenkins; "Marriage Laws," by Mr. Alexander; "Testamentary Lands and Matrimonial Rights," by Mr. Tristram. The subject of bankruptcy was also considered, and reports were made by committees on bills of exchange and negotiable securities.

The country was disturbed by earthquakes to an unusual extent; a shock felt at Schaffhausen, in December, was said to be the eighteenth recorded during the year. The scientific societies have begun a systematic investigation of earthquakes, with observers in all parts of the republic who will take notice of all the phenomena of the shocks and the circumstances attendant upon them, whenever they occur.

The East Swiss Geographical Commercial Society of St. Gall has decided to fit out a small exploring party to investigate the special nature of the trade at various points on both coasts of the Red Sea, in order to obtain information respecting the imports of the shore countries with a view to the development of Swiss trade.

T

TENNESSEE. The Republicans of Tennessee assembled in State Convention at Nashville, on May 6th, to select twenty-four delegates to the National Republican Convention, and to nominate a candidate for Governor and two Presidential electors for the State at large, with the following results: For Governor, Alvin Hawkins was nominated. The selection of delegates to the Chicago Convention was made as usual. The Presidential

electors nominated for the State at large were George Maney and A. A. Taylor. The following platform was unanimously adopted:

The Republican party of Tennessee, in convention assembled, at Nashville, May 6, 1880, do declare as follows:

Resolved, That we hereby reaffirm our devotion to the national Republican party and its principles, as heretofore declared, believing those principles to be founded in political wisdom, and essential to the prosperity and equality of every citizen, and to the main-

tenance of the Union of the States under the Constitution.

Resolved, That the bonds of Tennessee, heretofore deliberately recognized by both the Republican and Democratic parties as legally issued, are a valid indebtedness, binding in law and in morals upon the property and conscience of the State, and that any attempt to impair the obligations of that indebtedness, or to readjust or scale it, or in any other manner to change the letter and spirit of the contract, without the voluntary consent of the bondholders previously, fairly, and understandingly obtained, is downright repudiation and an act of high-handed dishonesty.

Resolved, That any voluntary proposition from our creditors to take less than the face value of their bonds, in consequence of losses incurred by our citizens during the war of the rebellion, should be thankfully and unhesitatingly accepted, and the new contract faithfully and promptly complied with; and we denounce the refusal of the Democratic party to accept the sixty-and-six proposition as the refusal of a liberal and voluntary reduction; and we recognize in said refusal overwhelming evidence that a large majority of the Democratic party intends to repudiate the bonded debt of the State, and thereby to subject our State to the opprobrium of all peoples who regard the contracts of a State with her creditors as of sacred inviolability.

Resolved, That the reasons prompting the Democratic party of Tennessee, and of other States of the South, to repudiate the debts of their respective States, will, when logically carried out, prompt them also to repudiate the entire war debt of the United States; and we hereby declare our solemn judgment to be that, as soon as the repudiating element of the Democratic party has wiped out the debts of their respective States, they will declare in favor of repudiating the debt incurred by the nation in preserving the Union.

Resolved, That we renew our declarations in favor of free common schools for the education of all the children of the State, we believing that schoolhouses are cheaper than court-houses, and that intelligence is the mother of morality and liberty.

Resolved, That we recognize the rights of the laboring men and women of Tennessee as deserving of our most tender parental solicitude; and we denounce all legislation that discriminates against the poor and in favor of the rich, believing that the poor should be protected, that labor is the creator of all our wealth, and that there can be no permanent public or private prosperity except it be based upon perfect harmony between labor and capital.

Resolved, That we are opposed to bringing convict-labor into unnecessary competition with free labor, and, as one means of preventing this, we favor the employment of Penitentiary convicts, below a certain grade, on public works and in improving the public roads throughout the State.

Resolved, That we are in favor of law and order, and opposed to mob violence; that we demand the impartial enforcement of the laws everywhere and at all times; that we denounce social ostracism because of political opinion as a standing reproach to a free government, as calculated to discourage the incoming of capital and labor, and as destructive to the business prosperity of the people; that we advocate all measures that promote peace, protect industry, encourage temperance, and advance morality; and we pledge the voices and votes of the Republican party to every good work that will benefit the individual, build up the State, and strengthen the nation.

The Greenback-Labor party, represented by sixty delegates, five among them being colored, held its State Convention at Nashville, on May 22d, when they appointed delegates to the National Greenback Convention, meeting at Chicago on June 9th, and nominated their candidates for Governor and Presidential elec-

tors, as follows: For Governor, R. M. Edwards was nominated by acclamation. As Presidential electors for the State at large were nominated R. M. McKee, of East Tennessee, and H. M. Hill, of West Tennessee.

To instruct these delegates how they should act with their fellow-Greenbackers at the general meeting in Chicago, the following resolutions were offered by different members, and adopted by the Convention:

Resolved, That the delegates to the Chicago Convention of June 9th are hereby instructed to vote for no man for Presidential or Vice-Presidential nominee unless he be an unconditional, uncompromising, outspoken Greenbacker—one who has given unmistakable evidence of having cast his lot with the Greenback party.

Whereas, The dissensions heretofore existing between the two portions of the Greenback party, viz., the Greenback clubs and the National party, ought to be, and for the benefit of the entire party should be, healed, in order to more effectually turn our weapons against our common foe: therefore,

Resolved, That our delegates to Chicago be instructed to use every honorable means to effect a reconciliation between the two, in accordance with the old motto, "United we stand, divided we fall."

The Secretary of the Committee on Platform and Resolutions reported the following, which was adopted:

Resolved, We adopt the following as our platform of principles:

1. We oppose all banks of issue.
2. We are in favor of the General Government furnishing the currency of the country.
3. We are in favor of paying the national debt now due and to become due according to the terms of the original contracts.
4. We are opposed to the creation of a bonded indebtedness in any form.
5. We affirm and adopt as part of our platform the resolutions known as the "Weaver resolutions," lately introduced in Congress as follows:

Resolved, That it is the sense of this House that all currency, whether metallic or paper, necessary for the use and convenience of the people, should be issued and its volume controlled by the Government, and not by, or through, the bank corporations of the country; and, when so issued, should be a full legal tender in payment of all debts, public and private.

Resolved, That, in the judgment of this House, that portion of the interest-bearing debt of the United States which shall become redeemable in the year 1881, or prior thereto, being in amount \$782,000,000, should not be refunded beyond the power of the Government to call in said obligations and pay them at any time, but should be paid as rapidly as possible and according to contract. To enable the Government to meet these obligations, the mints of the United States should be operated to their fullest capacity in the coinage of standard silver dollars, and such other coinage as the business interests of the country may require.

6. We demand a graduated tax on all incomes above one thousand dollars a year.
7. We favor the regulation of inter-State commerce by Congress, and transportation charges by the State Legislatures.
8. We are in favor of equal taxation of all property owned by individuals or corporations.
9. We favor a thorough system of public-school education; that the Legislature prescribe the textbooks to be used in the schools, prohibit frequent changes of the same, and prevent a monopoly of the sale of the same.

And in relation to the State debt, we declare:

Believing that the railroad bonds were issued with-

out authority of law; that they were paid over to railroad companies in violation of the conditions governing their issuance; that the debt in law and in equity is a railroad debt, which the railroads alone should pay: therefore, with these views as to the nature and validity of the debt, we oppose any measure whatever looking to the payment of the same in whole or in any amount whatever, principal or interest.

1. That neither the State of Tennessee nor its citizens are bound in law or morals to pay the bonds issued in aid of the railroads, amounting to \$25,000,000, and that such bonds are no part of the State debt.

2. That we are opposed to scaling the railroad bonds, and to any other act recognizing them, because the people of Tennessee do not owe them.

3. That the railroad companies have persistently disregarded the law under which the bonds were issued, and have no grounds of equity to ask the people to aid them, by taxation, to pay for the property and franchises of corporations controlled for private benefit and gain.

4. That the State debt proper should be paid, but, that there may be no misapprehension what the State debt is, we adopt the description of it from the report of S. W. Hatchett, the State Comptroller, made in October, 1865, and substantially adhered to by his successors, and which at present embraces the following items, to wit:

Capitol bonds.....	\$493,000
Union Bank bonds.....	125,000
Bank of Tennessee bonds.....	214,000
Hermitage bonds.....	35,000
Agricultural Bureau bonds.....	18,000
Stock in turnpike bonds.....	728,000
Stock in railroad bonds.....	412,000
Total.....	\$2,025,000

That in the work of sifting the false from the true, and the illegal from the legal, the leaders of the Democratic and Republican parties have stood in the way, and united or coöperated to deceive the people by one funding act after another, the aim of which was to wipe out and destroy or conceal the evidence of wrong done, and finally to allure the voters into approval of the crimes of the funding schemers, at the ballot-box, under the cry of a compromise of a debt that the State does not owe.

Resolved, That the members of the State Executive Committee for the respective Congressional districts be urged to call a Congressional Convention, not later than the 4th of July, to select Presidential electors, and in default of such assembly and selection, the members of the State Executive Committee for such district shall be empowered to appoint such elector.

The following preamble and resolution, subsequently offered by a member, were also adopted by the Convention:

Whereas, The antagonism of the Republican and Democratic parties keeps alive the passions, prejudices, and hatred of the past, renewing from year to year the sectional idea of a North and South, ever conducive to panic and disorder, to the great neglect of the present distress and suffering of the people, and unmindful in their party pride and ambition of the purposes of the glorious future that awaits a harmonious and undivided whole country: therefore,

Resolved, That we have forever severed our connection therewith, and pledge ourselves to the building up of a true national party, in pursuance of the principles embraced in the foregoing platform and resolutions, and that we cordially invite all men, of whatever party affiliation heretofore sustained by them, to join with us in securing to themselves and the whole people their inalienable rights.

The Democrats of Tennessee assembled in State Convention at Nashville, on June 8th, to select delegates to the National Democratic

Convention and to nominate Presidential electors, and accomplished their object.

The Democrats met in State Convention again on August 11th, to nominate their candidate for Governor, and determine the policy of the party in the administration of State affairs, the number of delegates in attendance being so great that the hall of the House of Representatives, where the meeting was held, could not contain them, some of the delegations occupying the galleries. The Committee on the Basis of Representation reported to give to each county one delegate for every one hundred votes, and every fraction of fifty or more, which gave for all the ninety-four counties 1,349 delegates, the numerical proportions of these ranging from one in Scott County to eighty-six in Shelby County. This Convention is considered to have been the most numerous of any ever assembled in the city of Nashville, and at the same time the most earnest, though divided in purpose. The contrariety of sentiments severally advocated and adhered to by large numbers among the delegates regarded almost exclusively the State debt, as to its validity, its amount, and the mode of its settlement. Within the Committee on Resolutions, composed of thirty members, three from each Congressional district, the disagreement on the State debt, while they were deliberating on the draught of a platform, was such that three distinct platforms were reported from that body, and submitted to the Convention for its exclusive adoption—a majority report, signed by twenty-one members, with the chairman at the head of the list, and two minority reports, each signed by four members, and commonly styled the Garner and Johnson reports, from the names of their first subscribers. Each of the three platforms was read to the Convention, the majority one being as follows:

The Democratic party of Tennessee in convention assembled do declare:

1. Our unabated allegiance to the national Democracy, and an unflinching faith in and devotion to its traditions and principles.

2. That we endorse the action of the late National Democratic Convention at Cincinnati, and reaffirm the principles enunciated in the Cincinnati platform; and pledge our earnest and undivided support to the Democratic nominees as presented to the country by the Cincinnati Convention.

3. That in the nomination of Winfield Scott Hancock, of Pennsylvania, and William H. English, of Indiana, for President and Vice-President of the United States, we recognize the complete restoration of fraternal feelings to all sections of our common country.

4. We reassert our opposition to the repudiation of any of the public obligations of the State or Federal Government, and declare that the repudiation of either under any pretext or disguise would be the most direful of evils, moral, financial, and political, and, in the patriotic language of the national Democratic platform, we pledge ourselves to the strict maintenance of the public faith, State or national.

5. We recognize a disposition upon the part of the creditors of the State, in view of the great losses entailed by the late war, the great depression of business, and the general shrinkage in values, to make a liberal reduction in both the principal and interest of our

bonded indebtedness, and we declare that we favor a prompt settlement by the Legislature with our creditors upon the best terms that can be agreed upon as a result of negotiation.

6. *Resolved*, That we demand the most rigid economy in the administration of all the public affairs of the State and national Government, the suppression of any and all extravagances in public expenditure, the reduction of all salaries and fees of office, so far as can be done consistently with the proper discharge of public offices, and the strictest honesty in the management and application of all public revenues.

7. *Resolved*, That we regard a thoroughly organized system of public instruction as a matter of the utmost importance to the people of our State, and pledge our united support to its institutions of learning and to the maintenance and better perfection and development of our system of public schools.

8. *Resolved*, That we are unalterably opposed to the usurpations of the Republican party, and we recognize the fact that the administration of the Government, both State and Federal, by that party, will, under its rapid strides to centralization, soon result in the destruction of our republican form of government.

9. That, in view of the complaints coming up from every part of the State against the policy of the railroads discriminating against local freight and passengers, and in favor of through freight and passengers, it is the sense of this Convention that the coming Legislature shall pass a law requiring the railroads to do justice to the trade and business of the State.

The two minority reports, agreeing generally with the majority on other points, dissent from it in regard to the State debt by making its settlement, and consequently its amount, ultimately depend on the people's judgment expressed for that purpose by a direct vote, though in different ways, as follows: The Garner report says, in section 4:

We are unalterably opposed to any settlement of the State debt by the Legislature until the same has been first submitted to the people, at a separate election, and ratified by their free voices at the ballot-box.

The Johnson report, in the ninth and last section or paragraph:

We favor a compromise and settlement of the State's indebtedness upon the most favorable terms that can be honorably obtained; and we favor the inauguration by the next Legislature of measures for a just and honorable settlement with the creditors of the State; and that any settlement proposed to the Legislature by the creditors lie over for action thereon by the succeeding Legislature, to the end that such settlement may be fully discussed before the people in the Legislative canvass, and such settlement, when effected, shall be final.

The final result of the very warm debate which was held was as follows:

The Johnson minority report was first put to vote on a motion to lay it on the table, which passed—yeas 740, nays 580. A motion made on the following day to take this report from the table was, after another long-protracted discussion, lost—nays 751, yeas 578.

The Garner minority report was put upon the question whether it should be substituted for the majority report, and it was voted down—nays 849, yeas 470.

The majority report was adopted—yeas 825, nays 455.

On the day previous to the adoption of the majority report, a delegate proposed, as an ad-

dition and amendment to it, the following resolution, which was adopted:

Resolved, That we are opposed to making coupons receivable for dues to the State, and we demand that no settlement be made which embodies such a feature.

Upon the adoption of the majority report being announced, and the motion made by a member that the Convention proceed to nominate a candidate for Governor, about one hundred and sixty delegates left the hall in a body, organized themselves elsewhere into a State Convention of the Democracy of Tennessee, observing all the usual forms of convention proceedings, and nominated S. F. Wilson as the Democratic candidate for Governor, by acclamation, and, by acclamation also, adopted the following platform:

The Democratic party of Tennessee, represented in convention by its delegates, who have been elsewhere denied the right to reflect the will of the party and the people, by the opposition of men assuming to be the managers and masters of the Democratic party, by the combination of its enemies and the mistakes of its friends, by the manipulation and fraud of the vast railroad corporations who have their iron grasp upon the liberty of the people, and are determined to destroy it, and who, to perpetuate their power, have labored assiduously in every manner, even to the furnishing of free tickets and free passes to many delegates to the State Convention, and are determined to uphold them and their action, and deny to the people not only their rights, but to take from them also the privilege of voting upon them; and they brought here all the power which they could secure to capture the State Convention in their interest, and override the expressed will of the State, and this power has united with the small element of the Democratic minority of the State Convention, and in such unholy combination have been able to stifle the voice of the people, in the rejection of Democratic doctrine, and in denial of the only right the people have been able to secure after years of struggle and contest, the right to settle for themselves by direct vote their alleged indebtedness. And that combination have asserted in unequivocal terms their determination to have the debt of the railroads paid by the people of the State, while the holders of the bonds are claiming that the railroads owe the debt, and are now, by suit, trying to enforce its collection against them.

Regarding, as we do, such combinations as destructive of the liberty and prosperity of the people, and such doctrines as monstrous subversions of every principle of Democracy and of justice, we refuse to surrender to them the sovereignty of the masses we represent, and, in justice to our people, we stand with them—the Democracy of Tennessee—and decline to abandon their principles at the behest of such an alliance; and, therefore,

We denounce the action of such combination, pretending to be a State Democratic Convention, as undemocratic; and, as a platform of Democratic principles, on which we invite the support of the Democratic party and all friends of true Democracy, we declare

We approve the national platform adopted at Cincinnati, and heartily endorse the nomination of Hancock and English.

We declare our allegiance to the time-honored principles of the Democratic party; the right of the majority to rule; the subordination of the military to the civil authority; opposition to fraud and violence, and the supremacy of law and order, and the economical administration of the State and national Governments.

We favor the adjustment and speedy payment of the State debt proper.

We deny the validity against the State of all that part of our alleged indebtedness represented by bonds issued for or on account of railroads, and declare they shall be left for settlement where they belong, in the judicial controversy between the bondholders and the railroads.

We deny the validity of bonds issued for war interest, and assert that the demand for such interest and its concession by men pretending to represent the State at a time when we were disfranchised, is a crime against the people, and no part of such debt shall be recognized in any settlement to be made.

We declare that in no event, upon any settlement, shall the coupons be made receivable for taxes.

We recognize the sovereignty and supremacy of the people, and declare that no settlement of any part of our alleged indebtedness shall be made which is not first submitted to them for ratification or rejection at the ballot-box at a special election to be held for that purpose only.

We favor the widest dissemination of intelligence among the masses, and will encourage and promote the most liberal and efficient free-school system.

We oppose the competition of convict with free labor, and favor the enactment of such wise and salutary laws as shall restrain it, so far as the best interests of the free laboring people shall require.

We favor such regulation of the taxes as shall lift a part of the burden from the shoulders of the laboring land-owners and place it on railroads, capitalists, incomes, and salaries.

We favor the enactment of such laws as will secure the collection of railroad taxes, and as will compel the railroads to deal justly with the people of the State, and prevent unjust discrimination between through and local freights.

On this platform of principles we invite the co-operation of the honest men of all parties.

Before the final adjournment of this Convention, commonly called that of the Repudiators, its president appointed a State Executive Committee, consisting of fifteen members, chosen in equal numbers from the three grand divisions of the State—East, Middle, and West Tennessee.

The regular State Convention, in the Hall of Representatives, after the majority report on the platform had been adopted, on the third day of its session proceeded to nominate a candidate for Governor. John W. Wright, of Shelby, was unanimously declared the nominee.

The Republican nominee was elected by an exceedingly great majority over either of his two Democratic competitors. The aggregate number of votes polled in the State for Governor at this election was 243,396, of which Mr. Hawkins had 103,964; Mr. Wright, 78,783; Mr. Wilson, 57,188; Mr. Edwards, 3,459. Two votes were reckoned scattering.

The Legislature was divided as follows: In the Senate—Democrats 15, Republicans 10; in the House of Representatives—Democrats 36, Republicans 37, Greenbackers 1.

As to Congressmen, the Republicans had three of their candidates elected—in the first, second, and tenth Congressional districts; the Democrats seven of theirs—in the third and following districts to the ninth, inclusive.

The Forty-second General Assembly of Tennessee met at Nashville, on January 3, 1881, and the two Houses were duly organized.

By prudent legislation the expenses of the State government have been steadily reduced, while the population has largely increased. The census of 1880 returns it at 1,542,469.

The literary education of youth is well cared for, and progressing. The State University is reported to be in a flourishing condition, and the common-school system as accomplishing the best results. The summaries presented show an increase in enrollment and average attendance, and a larger number of schools taught and of teachers employed. The reports of county superintendents, with a few exceptions, indicate also a better class of instruction, a higher standard of teaching, and a spirit of improvement in all the details of school management. The school population in Tennessee, white and colored, the number of her free schools, and of pupils enrolled, are given in the subjoined official statement, embracing six years—1875 to 1880:

SCHOOL POPULATION.

YEARS.	White.	Colored.	Total.
1875.....	310,745	106,241	426,612
1876.....	325,812	108,519	434,131
1877.....	330,935	111,523	442,458
1878.....	336,817	112,100	448,917
1879.....	388,355	126,288	514,643
1880.....	403,353	141,509	544,862

PUBLIC SCHOOLS.

YEARS.	White.	Colored.	Total.
1875.....	3,127	770	3,942
1876.....	3,070	827	3,897
1877.....	3,640	964	4,604
1878.....	4,205	1,141	5,346
1879.....	4,386	1,227	5,612
1880.....	4,334	1,188	5,522

PUPILS ENROLLED.

YEARS.	White.	Colored.	Total.
1875.....	(not classified)	(not classified)	199,058
1876.....	(not classified)	(not classified)	194,150
1877.....	171,535	43,043	227,643
1878.....	206,810	54,342	261,152
1879.....	208,558	55,829	264,687
1880.....	209,290	60,551	290,141

The charitable and other public institutions in the State are generally under excellent management in all respects, realizing the purposes of their existence.

There is no reform school in Tennessee for the correction and education of wayward youth, the offending ones among them, who are not few, being committed to the State Prison, mixed up, as it were, with the adult hardened convicts under sentence. There are at present in the Penitentiary 308 State prisoners, whose ages range between twelve and twenty years, and 637 between twenty and thirty years.

The whole number of convicts in the Penitentiary on December 1, 1880, and at the same date in 1878, as well as of those discharged, pardoned, and deceased during the interval of the said two years, with other particulars,

appears from the following statistical tables, officially published:

Number of convicts December 1, 1878.....	1,153
Number of convicts received since December 1, 1878..	1,104
Number of escaped convicts recaptured	29

Total..... 2,286

Number of convicts December 1, 1880.....	1,241
Discharged under the acts of 1866 and 1870.....	651
Discharged at expiration of sentence.....	85
Died.....	185
Pardoned.....	81
Escaped.....	86
Released by order of Court.....	8
Remanded for new trial and released.....	4

Total..... 2,286

The convicts are now confined at the following places:

At main prison, Nashville.....	663
At Tracy mines, Grundy County.....	302
At Coal Creek mines, Anderson County.....	112
At Ensey's farm, Shelby County.....	189
At Spence's farm, Davidson County.....	25

Total..... 1,241

Of these 1,241 convicts, the number of white persons is 420—males 409, females 11; colored 821—males 790, females 31. Among them there are 507 married persons and 734 single.

TEXAS. The opposite political parties of Texas, besides holding their conventions to select delegates to the National Conventions that were to assemble in June at Chicago and Cincinnati respectively, also assembled in State Conventions, to choose their nominees for State officers and Presidential electors.

The Greenbackers, so called, convened at Austin, on June 23d, and continued in session two days, one hundred and forty-eight delegates from all sections of the State being present. About twenty among the delegates were colored. The nominations were as follows: For Governor, W. H. Hamman; Lieutenant-Governor, George W. Givens; Attorney-General, — Jenkins; Comptroller, Ward Taylor; State Treasurer, — Guffin; Commissioner of the General Land-Office, R. T. Kennedy; Presidential electors for the State at large, H. L. Bentley and Andrew Young.

The following platform was adopted:

We, the representatives of the Greenback party of Texas, in convention assembled, view with pride the action of the National Greenback-Labor party of the United States, in convention at Chicago, and most cordially and heartily ratify and endorse the platform of principles adopted, and candidates nominated by said convention.

SECTION 1. Realizing the fact that there exist great abuses and wrongs in the administration of the State government, under the control and management of the party in power, we condemn the Democratic party of Texas for its wasteful and extravagant expenditure of money in the administration of the government, and demand a reduction in governmental expenditures.

SEC. 2. We demand a reduction in the rate of taxation from 50 to 33½ cents on the one hundred dollars' worth of property.

SEC. 3. We demand the repeal of the occupation-tax and the substitution thereof of a graduated income-tax.

SEC. 4. We demand the prompt abolishment of all

useless offices, and a general and radical decrease of all public salaries, and that county officers shall not be allowed to receive exceeding \$1,500 per annum for their services, and, whenever practicable, especially in judicial offices, compensation should be fixed by special salaries; and, further, that in future the government of Texas shall be conducted on the strictest business principles and on the most economical plan.

SEC. 5. We favor a radical change in our cumbersome and expensive judicial system, and demand a more economical and effective system.

SEC. 6. We demand the repeal of the iniquitous road law, poll-tax law, and law for the collection of *ad valorem* taxes from delinquents.

SEC. 7. We demand the repeal of the present pretense of a school law, and the establishment of an efficient system of public free schools, and demand the appropriation by the Legislature of the full constitutional limit of one fourth of the general revenue for that purpose.

SEC. 8. Believing it to be the part of wisdom to preserve the public-school lands of Texas as the basis of a grand school fund, we demand the immediate repeal of all laws providing for the sale of the same, other than to actual settlers, in quantities of not more than one hundred and sixty acres to any one purchaser.

SEC. 9. We demand that the public domain of Texas be reserved for a permanent school fund, and for the benefit of actual settlers under the homestead laws, and a repeal of the law providing for the sale thereof.

SEC. 10. Believing that labor is the basis of all wealth and prosperity, and that an increase in population will add to the material wealth of Texas, inducements should be offered to all honest and intelligent immigrants to come to assist in the development of the resources of the great State of Texas.

SEC. 11. We demand a modification of the Sunday law.

SEC. 12. We demand the immediate and unconditional repeal of the bell-punch law.

SEC. 13. We demand a perfect and positive protection that will guarantee safety both to the settler and the vast interest of our herdsmen.

SEC. 14. We denounce all laws restricting the right of suffrage, or impairing the secrecy of the ballot-box, and any legislative interference with the free exercise of religious opinion by the people of this State. The Greenback party everywhere denounces the attempted disfranchisement of citizens as a crime, whether committed by Republicans or Bourbon Democrats in Texas.

SEC. 15. That we are unqualifiedly opposed to convict-labor coming in conflict with honest labor, and demand the repeal of all laws permitting the same.

SEC. 16. The heroes whose valor wrested this State from the Government of Mexico deserve the profoundest gratitude of a generous people, and we demand payment of an annual pension to the survivors of that memorable struggle.

SEC. 17. We remember with profound gratitude the struggle of the fathers of Texas in defense of the right of themselves and their fellow-citizens, and, viewing the government which they consecrated with their sufferings and cemented with their blood as a rich and inestimable boon handed down by them to us, we are pledged to aid in every way possible in securing its prosperity, and will oppose with all the earnestness of our nature every step looking to the destruction or the impairing of its integrity.

Finally, having thus set forth our distinctive principles and views, we most cordially invite the coöperation of all men in Texas, regardless of their antecedents and political affiliations, who love the weal of their State and the prosperity of her people more than party, however differing with us on other questions, substantially agreeing with us in their affirmation and support.

The Democrats assembled in State Convention, at Dallas, on the 11th of August, and

nominated a full ticket, as follows: For Governor, Oran M. Roberts; Lieutenant-Governor, L. J. Storey; Treasurer, Francis R. Lubbock; Comptroller, W. M. Brown; Attorney-General, J. H. McLeary; Commissioner of the General Land-Office, W. C. Walsh; Judge of the Court of Appeals, J. M. Hurt; Presidential electors (State at large), J. W. Throckmorton and R. B. Hubbard.

In deliberating upon the platform, there was disagreement among the members of the Committee on Resolutions, in consequence of which two platforms were submitted to the Convention, the one signed by twenty-four, the other by seven members of the said committee. After the reading of both documents, the Convention adopted the majority report, which was as follows:

The Democratic party of Texas, in convention assembled, declare:

1. We heartily approve the declarations of principles made by the Democratic National State Convention at Cincinnati, and cordially endorse its nominees, pledging them the united and enthusiastic support of the Democracy of Texas.

2. We favor the free coinage and full remonetization of silver.

3. We favor such action by Congress, within its constitutional power, as will prevent unjust discriminations and extortionate rates of charges for the transportation of inter-State commerce.

4. We regard the maintenance of a practical system of public free schools of the utmost importance, and to this end favor the largest appropriation, within constitutional limits, justified by the financial condition of the State. And we favor the adoption by the next Legislature of appropriate measures looking to the fulfillment of the constitutional requirements for the organization and maintenance of "the University of Texas."

5. We repudiate as false the charge that the Democratic party of Texas has been opposed to immigration, and, while the Constitution prohibits the use of public money for the support of a bureau of immigration, we urge the next Legislature to make ample provision for the collection and dissemination of statistics pertaining to our agricultural and other resources, to the end that all seeking new homes, knowing our great advantages, may settle in our midst, extending to them a most cordial welcome.

6. The suffering and losses of our people on the frontier enlist our deepest sympathy, and we pledge our most energetic efforts to afford them adequate protection in person and in property, and demand of the General Government that protection for our people thus exposed to which they are entitled under the Constitution of the United States, and which they have never yet received.

7. We enjoin upon the next Legislature the duty of proposing such constitutional amendments as will secure a more efficient judiciary system.

8. We favor the most vigorous enforcement of the law for the suppression of all lawlessness and crime, and pledge the Democratic party of Texas to hold all officers to the fullest measure of duty and responsibility in that behalf.

9. We demand the most rigid economy, consistent with efficiency, in all the departments of the government, and favor the reduction of taxation as soon as the same can be safely done.

The disagreement between the two reports related chiefly to the system of public free schools in the State; to the sale of the State school lands, in regard to the terms of purchase and quantity sold to each purchaser; to

the encouragement to immigration of foreigners into Texas for settlement; and to the protection of the sparsely-settled, unorganized counties in the State. On these points the minority report seemed to express more defined views in detail, and to require a more energetic action on the part of the Legislature and the Executive for the successful carrying out of the respective measures.

The Republican party assembled in State Convention at Hearne, on the 25th of August, when the nominations of their candidates were as follows: For Governor, E. J. Davis; Lieutenant-Governor, A. Siemering; State Treasurer, — Thomas; State Comptroller, S. D. Wood; Attorney-General, W. O. Hutcheson; Commissioner of the General Land-Office, Jacob Heuchler; Judge of the Court of Appeals, J. W. Williamson.

The sheriffs of Texas held their annual convention at Dallas early in August. In his official address to the meeting, Sheriff Corwin stated that a larger number of fugitives from justice had been captured and brought to trial by the State constabulary during the year than in the preceding one. He pointed to the great difficulties met with by a peace-officer in the discharge of his duty, owing to the numberless ways of escape open to criminals in the vastness of the unsettled portions of Texas, and to such facilities for evading arrest when pursued, or conviction when arrested and held to trial, as were afforded them by the criminal laws and criminal procedure, both of which he averred to be exceedingly defective. As the practical discharge of a sheriff's duty, when pursuing malefactors for arrest, and when holding them for trial and punishment, gives him the best means and opportunities for ascertaining the defects of the penal law or procedure, with a view chiefly to have these defects fully set forth and presented to the Legislature, and thereby to secure a thorough correction of them, the following resolutions were adopted by the Convention:

1. We disclaim all effort or inclination upon the part of this association to increase the fees now allowed by law to sheriffs, but we rely upon the wisdom of our Legislature to so regulate them as to justly compensate us for services rendered and money expended.

2. We believe that the peculiar relations which sheriffs sustain to the execution of the criminal law in this State discover to them many defects therein which would escape the attention of the most careful and conscientious legislator, and that it is our duty as well as privilege, as sheriffs, to call the attention of our Legislature to such defects, to the end that in its wisdom it may make such changes and corrections as will promote the prompt and faithful execution of every provision of our penal code and code of criminal procedure.

3. Believing that the proper preparation of such suggestions to the Legislature would require more time and deliberation than this association can at present bestow; and believing it to be all-important that such suggestions be so formulated as to present fully and particularly the views of the sheriffs of Texas:

4. We, therefore, suggest that this association appoint a committee of five to prepare a bill, or bills, fully embodying the changes or corrections in the

law which this association deems necessary to be made.

5. That the members of this body who are present, as well as our brethren who are absent, and the executive officers of the State generally, be requested to correspond with the chairman of said committee, before the first day of November next, giving fully their views upon the needed changes and corrections in our criminal laws.

6. That said committee, at some convenient time and place, after November 1st, meet and formulate for the Legislature such bill, or bills, as will fully express the wishes and suggestions of the association.

7. That said committee be also charged with the duty of having said bill, or bills, properly presented and referred at the next session of our Legislature, thus bringing our suggestions squarely before them, and preventing the silent evasion which alone was accorded us at its last session.

8. It is believed that each sheriff in Texas should be supplied with printed copies of the work of said committee as soon as the same is completed, to the end that he may secure the support of his immediate representative in securing the passage of such bills.

9. Whether the last suggestion is the will of the association, or not, still we urge upon every sheriff in the State the supreme necessity, by himself and through his friends, of securing the earnest support of his representative in effecting these needed reforms, and it is believed that, if we can bring our representatives to fully understand the difficulties in the way of a prompt and efficient administration of our criminal laws, they can but be with us in this attempt to protect the fair name and fame of our beloved State.

The State election of November 2d resulted in favor of the Democratic party, whose nominees were generally elected. The aggregate number of votes polled in the State for Governor was 264,343, of which the Democratic candidate received 166,102; the Republican, 64,382; the Greenback, 33,721; the remaining 139 votes were reckoned scattering. In 1878 the distribution of the votes for Governor among the competing parties was—Democratic candidate, 158,933; Republican, 23,402; Greenback, 55,002.

In regard to the election of members of the Legislature, the political complexion of that body is as follows: In the Senate—twenty-nine Democrats, two Republicans; in the House of Representatives—sixty-nine Democrats, six Independent Democrats, seven Republicans, three Greenbackers. The Democrats claimed for their party, as the result of the election, a gain of one Senator and four Representatives. Among the members returned for either House, the number of persons engaged in the law profession is twenty-three of the thirty-one Senators and thirty-seven of the eighty-five Representatives.

The members-elect of the Seventeenth Legislature of the State assembled at Austin on January 11, 1881, when both Houses were organized by the election of their respective officers.

The State census, taken in 1880, shows the population of Texas to be above one million and a half, or nearly twice as numerous as it was in 1870.

The State tax paid by the people on their property of all kinds is assessed at the rate of fifty cents for every hundred dollars; the ag-

gregate sum annually received into the public Treasury from this source being somewhat more than \$1,500,000, as the entire value of taxable property in the State amounts to \$300,-525,427. The summary table of totals hereto subjoined represents the various kinds of such property, as classified and valued in the tax-rolls for 1879:

Land, 88,166,029 acres, valued at.....	\$139,634,101
Town lots.....	46,608,894
Railroads, 1,769 miles.....	14,471,198
Telegraph lines, 2,008 miles.....	122,870
Land certificates.....	83,141
Steamboats, sailing-vessels, etc.....	121,300
Carrriages, wagons, etc., 134,452.....	4,742,404
Manufacturers' tools, etc.....	3,709,688
Materials and manufactured articles.....	475,939
Horses and mules, 966,760 head.....	18,561,569
Cattle, 3,552,198 head.....	19,866,679
Jacks and jennets, 4,982 head.....	159,074
Sheep, 2,546,582 head.....	8,354,515
Goats, 255,759 head.....	196,364
Hogs, 1,596,686 head.....	2,028,168
Goods, wares, and merchandise.....	14,921,408
Miscellaneous.....	24,544,108

Total (on which the State *ad valorem* tax of 50 cents on the \$100 is \$1,502,668.67).... \$300,525,407

The poll-tax assessed for the same year on 260,294 polls, two dollars *per caput*, adds \$520,-588 to the amount of the aforesaid tax on property; the public revenue from these two sources for 1879 being \$2,023,256.67.

The annual expenditures of the State government for all purposes, ordinary and extraordinary, are less than the receipts from the said two taxes by above a hundred thousand dollars, as appears from the following statement of such expenditures embodied by the State Comptroller in his report for the two fiscal years ended March 1, 1879, and March 1, 1880:

EXPENDITURES.	1878-'79.	1879-'80.
Actual current expenses.....	\$1,411,709 80	\$1,111,255 00
Expenses for permanent public improvements, buildings, etc.....	59,998 29	95,588 27
Extraordinary and occasional expenses.....	90,698 91	142,548 09
Expense on account of public debt.....	868,846 70	567,842 06
Total expenses of government for all purposes from taxation.....	\$1,920,753 70	\$1,916,989 42

The charitable institutions in Texas are well provided for by the State. The appropriations for the maintenance of the Lunatic Asylum, the Deaf-Mutes, and the Blind, during the last two years, were \$77,433.89, \$34,607.13, \$34,-592.87 respectively; the sum expended on each of these institutions in the second year was by several thousands greater than in the first.

For the public schools, the State's expenditure during the same period of time was \$1,-020,092.49; of which total \$640,000 were paid in the first year, \$380,092.49 in the second. For payments made on account of schools the year is reckoned from August 31st. The total amount expended on them for all purposes within that period was \$1,632,485. The total school expense for 1880 was \$717,485; for the previous year, \$915,000.

The number of public free schools in operation in 1879 was 5,804 in 145 counties; and for 1880, 111 counties, heard from up to March 1st, had 4,648 schools in operation, estimating their total number in the State at 6,500. The average school-term for each year has been four months. The children of school age in the State numbered about 230,000.

In the Sam Houston Normal School, at Huntsville, the number of students in attendance in April, 1880, was 109; thirty among whom graduated in June, to be employed as teachers in the public free schools, having received a thorough training for that purpose within their own State. The principal of this school estimates that the number of its students hereafter will be double what it has been.

The Prairie View Normal School, established in Waller County for colored students, and first opened on October 6, 1879, with twelve State and four local students, has grown up so rapidly within a few months that on March 1, 1880, the number of students attending it was forty-nine.

The condition of public instruction in Harris County, and probably in the other districts of Texas, during the four years last past, has steadily gained in the lengthened time of tuition and in the lessened cost of maintaining the schools, especially with regard to the compensation paid to teachers.

As a public endowment and permanent fund for educational and charitable purposes, the subjoined quantities of State lands were for sale in Texas at the close of the year 1880, the proceeds to be funded and the income applied exclusively to the advancement of the above-named objects:

School lands (acres)	30,000,000
University lands	219,906
Asylum lands	407,615

The condition of the State Penitentiary in Texas, as officially represented, is improved in many respects, and generally better than it had been for a number of years. The number and employment of the State prisoners have been as follows: "In February, 1881, the total number of convicts, including 31 United States convicts, was 1,982, an increase of 242 since the last report, in November, 1878. The increase has been gradual. The total number of pardons delivered during that period was 84. . . . During the same period there were 522 discharged, 174 deaths, and 244 escapes. . . . As to the employment of the convicts, there were 333 of them at regular prison work in Huntsville; 233 building the new brick penitentiary; 127 at the iron-foundry in Marion County; 146 on the Texas Pacific and International and Great Northern Railways; 174 cutting wood on the line of the first-named road; 933 at work on plantations in Brazos River Valley; 15 at saw-mills; and 21 hired out as servants in Huntsville."

TURKEY, an empire in Eastern Europe, Western Asia, and Northern Africa. The

reigning sovereign is Sultan Abdul-Hamid II, born September 22, 1842. He succeeded his older brother, Sultan Murad V, August 31, 1876. The heir-presumptive to the throne is his brother, Mehemet Reshad Effendi, born November 3, 1844. The total area of Turkey, inclusive of all dependencies, was estimated in 1880 at 2,119,800 square miles, with a population of 45,578,000. (For other statistics, see "Annual Cyclopædia" for 1879.)

The British ambassador at Constantinople had suspended official relations with the Porte two days before the new year began, although a kind of semi-official intercourse was still maintained, because a demand which he had made for the release of a Turkish priest who had been condemned to death for translating parts of the Bible into the Turkish language had not been complied with. The case arose out of the arrest of a German missionary named Köller, an agent of an English missionary society, for distributing Christian tracts among Mussulman subjects. A Turkish ulema, Ahmed Tevfik, had taken part in the preparation of the tracts, and was condemned as a Mohammeden who had published matter contrary to the faith. Sir Henry Layard had sent a communication to the Government, demanding the restitution of Mr. Köller's papers, the release of Ahmed Tevfik, and the dismissal from their posts of the chief of police, Hafiz Pasha, who was said to have ordered Ahmed Tevfik's arrest, and of the military commandant of Van, who had used insulting language toward England and the British consular agents in Turkey. The Porte replied that Mr. Köller was a German subject, and denied that Ahmed Tevfik had been sentenced to death. The German Government interested itself in the matter, out of regard to the nationality of Mr. Köller; and at length the Sultan, with his own hands, delivered to the British ambassador the papers of the missionary, which had been confiscated. An assurance was given that Ahmed Tevfik should be released and treated well. The dismissal of Hafiz Pasha was waived, upon his statement that he was ignorant of the arrest till it had taken place; and he was shortly afterward invested with the grand cordon of the order of the Medjidie.

Sir Henry Layard resumed official relations with the Porte on the 2d of January. The Sultan promised to assist the family of Ahmed Tevfik; but, in reply to a demand that the sentence passed upon him should be annulled, the Turkish Government pointed out that the religious *Fetna* condemning the mollah did not constitute a judgment, and that, therefore, there was no necessity for canceling it. A few days later, a note, addressed by the Porte to Sir Henry Layard, reviewing and replying to the three points of the demand which he had made concerning this affair, was published. It argued that the proceedings of Mr. Köller justified the seizure of his papers, which were only returned to him out of regard for Eng-

land; that Ahmed Tefvik deserved the punishment awarded to him, in conformity with the religious laws of the country, and that he was liberated only by the clemency of the Sultan; and expressed satisfaction at the resumption of official relations with Sir Henry Layard. Hafiz Pasha gave an explanation of his part in the affair, which was accepted as satisfactory; and it was agreed that Ahmed Tefvik should be removed to an island having a Christian population. The exchange of notes on the subject, however, still continued. Sir Henry Layard refused to accept the principle laid down by the Turkish officers that a foreigner might be arrested, provided his ambassador were informed of the fact within twenty-four hours of the events. The aspect of the case in view of the Treaty of Berlin was reviewed. Sawas Pasha insisted that the seizure of Mr. Köller's papers was justified, and that the release of Ahmed Tefvik was an act of grace on the part of the Sultan. Sir Henry Layard recognized the good intentions of the Sultan, and was disposed to consider the matter settled. Negotiations were continued in January and February between Sir Henry Layard and Sawas Pasha for the constitution of a Protestant community in Turkey, under the direction of a chief ecclesiastic, for whom the British ambassador claimed the privileges of a Patriarch. The Porte, however, insisted upon certain restrictions in respect to these privileges.

The Council of Ministers concluded the discussion of the budget in March. It was resolved to introduce the gold standard with the Turkish pound as the monetary basis, its value being fixed at one hundred piasters. The revenue from all sources was required to be paid into the Treasury in gold, but provision was made for the acceptance of the debased metallic currency in payment of arrears due the Government at the rate of two hundred piasters to the Turkish pound. Reductions of nearly thirty per cent., which it was proposed to realize from the abolition of certain of the Ottoman embassies abroad, were decided upon in the estimates of the Ministry for Foreign Affairs. Other retrenchments included reductions in the salaries of many of the state officers. The Government also resolved to double the land-tax, in order to balance the budget.

A decree fixing the value of the medjidie at nineteen instead of twenty piasters, the effect of which involved a depreciation of the currency and a loss to the public of six or seven million pounds, was the occasion of great discontent and some serious disturbances. Business was suspended in Crete. In Aleppo, the Mussulmans denounced the Christians as the cause of the poverty of the Government. At Damascus, the traders refused to accept the metallic money with which the soldiers had been paid, and trouble arose. Similar scenes took place in other towns in Asia; and Midhat Pasha, Governor of Syria, declared that he

could not guarantee the carrying out of the measure, and that it was likely to be attended with grave consequences. The Austrian *chargé d'affaires* remonstrated against the depreciation of the currency, because it involved a change in the construction of the treaty with Austria. Sir Henry Layard informed the Government that the payment of customs, light-house, and sanitary dues would be made under protest, because the depreciation was equivalent to an increase of those duties. Sir Henry Layard also formally protested against an arrangement which had been entered into by the Porte with the Galata bankers, declaring that the indirect taxes had already been hypotheated to the English bondholders.

The budget was criticised by the Minister of the Interior, Mahmoud Nedim Pasha, who declared that the estimates of revenue were illusory. He refused to give the proof of his allegations when asked to do so by the officers whom the Sultan had designated to examine his objections, saying it was the duty of the Council to point out the inaccuracies of the estimates. The Sultan then referred the budget to the Council, which proceeded to examine the details in the presence of Khereddin and Safvet Pashas. On the conclusion of the examination and discussion, Said Pasha proposed that, in view of the opposition it had met with, the budget should be signed afresh by all the Ministers, notwithstanding that it had been already signed. All the Ministers who were present assented to the proposition and attached their names to the document, except Mahmoud Nedim Pasha, who left the Council. The budget was approved by the Sultan. The Government suffered great stringency for the want of money. A reduction in the number of departments of the Imperial Council was ordered as a measure of economy; the telegraph service was impeded on account of the want of means to pay the operatives. When, in the latter part of April, the Sultan ordered three battalions to Yemen to subdue the recalcitrant tribes of southwestern Arabia, the small sum required for transport and maintenance could not be raised. All the principal bankers of Galata were applied to in vain, and his Majesty had finally to content himself with dispatching three engineers to try to protect the scanty garrisons on the spot by constructing earthworks.

The Ottoman Bank in September made an advance to the Government of £50,000 Turkish. Early in October the British and French Governments, having claimed from the Porte the payment of the funds for the coupon of the loan of 1855, the Porte applied to the bankers who farmed the indirect taxes to advance the amount required out of the sum which had been set apart for the foreign bondholders. The bankers declined to accede to the request until the Government had come to an arrangement on the matter with the holders of bonds of all the other loans. The Government a few

days afterward issued a notice inviting the bondholders to appoint delegates to represent them at Constantinople in the arrangement of a thorough and practical solution of the question of the debt, stating that the questions of the floating debt and the Russian war indemnity would be taken into consideration in connection with the new arrangement. The British and Italian ambassadors objected to the proposal of the Porte to enter into direct negotiations with the bondholders, and signified a demand for the appointment of an International Commission in accordance with the eighteenth protocol of the Treaty of Berlin. Their suggestion was declined, on the ground that the Sultan was opposed to European interference with the internal affairs of the empire. In answer to a question by the Minister of Foreign Affairs, whether the International Commission would imply any guardianship of Turkish finance, Mr. Goschen replied that executive functions were not contemplated. In the mean time, the credit of the Government was gradually depreciating, and it was with great difficulty that it succeeded in getting from the bankers in November half the amount of the advance it asked, with which to make the customary payment of arrears to the civil officers and troops. The amounts paid were considerably short of what was due, and nothing was paid to the navy. The Stock Exchange Committees of London and Paris, according to the "Vakit" of Constantinople, signified their willingness in December to accept the Porte's proposal for a financial arrangement as the basis of negotiations. The London "Morning Post," with a view of showing that the financial situation of the empire was not so desperate as it seemed, published a statement in December that the Porte had, during the past year, paid one million pounds of its floating debt in cash, and would have by the end of the year five hundred thousand pounds in the Ottoman Bank at the disposal of its bondholders.

Trouble arose with the Albanians during the negotiations for the rectification of the Montenegrin frontiers, on account of their opposition to the surrender of any Albanian territory. In April a proclamation was issued by the leaders of the Albanian League, declaring that Europe had created a principality for the Bulgarians, had delivered Bosnia and Herzegovina to Austria, had endowed Serbia and Montenegro with increased territory and independence, and had given Roumelia autonomy; but Albania had received nothing. The Albanians, it added, must claim the right to create a state for themselves. The paper was signed by Ali Pasha and the secular and ecclesiastical chiefs of the Mohammedan and Roman Catholic tribes. A conference was held at Scutari, May 29th, when the party which was adverse to offensive action, and willing to await the decision of the powers, proved to be predominant, and it was decided to address another memorandum to

the consular corps. The result of the conference was said to be to widen still more the breach that already existed between the Mohammedan and Roman Catholic chieftains. The representatives of the Albanian League sent a dispatch to Mr. Gladstone congratulating him on his appointment as First Minister of the Crown, and invoking "the exalted protection of the English nation for the cause of their territorial integrity and the preservation of their rights, to which they had devoted their efforts and their life."

The attitude of the Porte toward the powers, in view of the proceedings that were taken with reference to securing the enforcement of the provisions of the Treaty of Berlin, was, in the mean time, becoming more equivocal. A conference of the powers had been called to meet at Berlin, June 16th, to consider the question of the rectification of the Greek and Montenegrin frontiers, and reforms in Armenia, and the Porte seemed to be acting under a policy of resistance. Excitement prevailed at Constantinople, and European residents began to be anxious about their personal safety. A council of the ulemas, called to consider whether Veli Mohammed, the assassin of the Russian Colonel Commeroff, should be executed, and whether European intervention in Turkish affairs should be accepted, decided both questions in the negative. The Sheik-ul-Islam refused to sign the order for the execution of Veli Mohammed. The Ministers cultivated the fanatical party. A part, however, including even some of the officers, were pleased with the idea of a European intervention; and Musurus Pasha, at a Cabinet council, endeavored to reassure the Ministers respecting the course of the English Government, and the mission of Mr. Goschen. Said Pasha was, however, notoriously opposed to any concession being made to English representations, and the Ministry had not yet been brought to believe that any united action of Europe with regard to their dominions was possible.

Mr. Goschen arrived at Therapia, the headquarters of the embassy on the Bosphorus, on the special mission on which he had been dispatched by the new British Government, May 28th, and Sir Henry Layard left Constantinople on the 2d of June. Mr. Goschen was given an audience with the Sultan on the 3d of June, when, having presented his credentials, he said it was his first duty to fulfill his mission to the satisfaction of the Queen, who had confided it to him. At the same time, he should be happy if during his stay, which would be limited, he could assist in bringing about an amelioration of the condition of the Sultan's subjects, without distinction of race or religion, which he was convinced his Majesty ardently desired. Mr. Goschen afterward had a private interview with the Sultan, which lasted half an hour. The Sultan, in his reply to Mr. Goschen, said that his most lively desire was to promote prosperity and order in the em-

pire, and develop the well-being of his people, in accordance with the necessities of the times. All his efforts were directed to that end. He also expressed his confidence that the personal qualities of the ambassador afforded a sure guarantee that his Excellency would serve as a means of realizing the benevolent dispositions with which the British Government, the old friend of Turkey, was animated, and that these personal qualities would help to consolidate the ties of friendship uniting the two governments.

A change of Ministry was announced June 9th, when Said Pasha and Sawas Pasha were dismissed, and replaced by Cadri Pasha, hitherto Minister of Commerce, as Prime Minister, and Abeddin Pasha as Minister of Foreign Affairs; Cadri Pasha retained the office of Minister of Commerce. The Prime Minister was instructed, in the imperial *hatt* containing the nominations, to introduce necessary reforms without delay, and to preserve such good relations with the powers as were consistent with the interests of the empire. The change in the Ministry was generally believed to be due to Mr. Goschen's private communication to the Sultan; but it was thought by many persons that the new Ministers were the creatures of Said Pasha, whom the Sultan had dismissed in order to please England, with the appearance of discharging him, while he virtually retained him in power. In July, Osman Pasha was dismissed from the Ministry of War, and was succeeded by Hussein Husni Pasha, formerly Governor of Scutari.

The spirit of the Albanian League was not weakened by the dissensions which had arisen between the Mussulmans and the Roman Catholics; and the body sent a message to the conference at Berlin, saying that its members would never consent to the dismemberment of their country, or to an exchange by which they might be subjected to foreign rule. The decision of the conference to assign Dulcigno to Montenegro was received by them with indignation, and bodies of men were promptly stationed at points commanding that place to prevent its occupation. New levies were also called for. The final cession of Dulcigno had the effect of disheartening the Albanian Mohammedans. Desertions took place among the Turkish reserves, and many Mohammedan notables manifested a disposition to come to an understanding with Greece, and accept the special privileges which that country offered them. The Porte having resolved to send the Prince of the Miridites and the chiefs of the Albanian League for trial before a council of war, the Austrian ambassador presented a note pointing out the privileges which were assigned to the Prince under the Treaty of Berlin, and demanding that he be released from arrest and reinstated in his rank. A conciliatory reply was made to these representations. The suppression of the Albanian League was ordered in December. Agitation again broke out in

northern Albania near the end of that month, when the men liable to military service refused to obey the conscription regulations, and the order to call out the reserves remained without effect. Turkish functionaries at Prisrend, Uskup, and Ipek were dismissed and replaced by Albanians, and the League issued a summons calling the male population to arms. The year ended with the authority of the Porte seriously compromised. The proceedings of the conference at Berlin, and the action of the powers with reference to it, were watched by the Porte with strict attention, and an evident disposition to make the most of every defect in form or substance of its decisions, and to take advantage of any sign that might appear of disagreement or of interruption to the European concert. The conference adopted a note to be presented by the powers as a collective one, describing the territory that should be allotted to Montenegro, defining the line which should be followed as the boundary of Greece, so as to give it a large part of Thessaly and Epirus, and insisting upon the execution of reforms in Armenia. This note was presented to the Porte, July 15th, by Count Hatzfeld, the German ambassador. Great excitement had prevailed on the subject among the Turkish population of Constantinople and in court circles, but it had begun to calm down, and the disposition of the Sultan and his Ministers was more conciliatory than when the conference first met. Still, the communication was far from being a pleasant one, and many of its demands were extremely disagreeable. The Porte replied that it objected to ceding Janina, Metzovo, and Larissa to Greece, as well for strategical reasons as on the ground of nationality, but was willing to make concession to the Hellenic kingdom; and it hoped that the powers would not deny its right to take part in the settlement of the Greek frontier, as it had done in those of Servia and Montenegro, and that they would authorize their representatives at Constantinople to treat with it concerning these and other questions. A second collective note was addressed to the Porte, declining to reopen the discussion, and insisting upon the resolutions of the conference, but expressing the willingness of the powers to receive the proposals of the Porte as to the manner in which the territory should be evacuated and handed over. Before a reply to this note was received, the powers had instituted a grand naval demonstration in the waters of the Adriatic, to enforce the surrender of Dulcigno to Montenegro. On the 17th of September the Porte addressed a note to its representatives abroad, explaining what it had done to overcome the objections of its Mussulman population to the cession of territory and to secure the execution of the demands of the powers, and complaining of their urgency and uncompromising attitude. On the 4th of October, the Turkish Government presented a note to the ambassadors, undertaking to induce the local population of Dulcigno to con-

sent to the cession to Montenegro, but disavowing all complications that might arise from the failure of the attempt; declaring it impossible to give to Greece the territory designated by the conference, and suggesting another boundary which it would establish within a hundred days; promising certain reforms in districts inhabited by Armenians, which should be made effective within three months; demanding that all means of pressure "be both now and for the future absolutely and finally renounced," and claiming the rights reverting to it under the Treaty of Berlin in relation to the demolition of the Danubian fortresses and the occupation of the Balkans by Ottoman troops. The powers presented their ultimatum on the next day, and on the 11th the Porte made a positive agreement to deliver Dulcigno to Montenegro. The fleets of the powers separated after the surrender was effected, November 26th. The debates respecting the territory to be ceded to Greece were protracted into 1881.

The Porte, at the beginning of July, had prepared a scheme for the government of Armenia, the principal points of which were—a Christian governor; the division of the provinces into small districts, the governors of which should be Christian or Moslem according to the faith of the majority of the population; the governor to be assisted by two Moslems if a Christian, by two Christians if a Mussulman; stringent courts of law for the several districts, and a police force in each district, to consist of six men, four of whom should be Christians if a majority of the population were Christian—four Moslem if the majority were Mussulmans.

The Governor of Beyrout came to Constantinople at about the same time with a scheme of reforms proposed for Asia Minor by Midhat Pasha, asking that the latter should be given the same power over the army that he had when Governor of Bagdad and Bulgaria, when he had entire command; that he have the sole right to appoint the *caimakans* and *mutasarriffs* to superintend the law courts, to suspend the judges, and stop the execution of judgments; that the gendarmerie be put at his service exclusively; that he be authorized to raise the salaries of the public officers to the old rates, and to guarantee their payment on certain revenues; that he be allowed to collect the tithes and other taxes in any way he might think best, and through officers of his own choice; that he might divide Syria for purposes of government as he should think best; that he should be permitted to control municipal matters through his agents, and the functions of the municipal councils be limited to a consultative voice; and that he be authorized to suppress the allowance of fifty thousand pounds from Syria for the annual expenses on account of the pilgrimages to Mecca.

A collective note on the Armenian question
VOL. XX.—44 A

was presented by Mr. Goschen in September. It refuted the statement of Abeddin Pasha that the Government had already begun the work of reform, and, after criticising the projected reforms, declared that they were inadequate to the object in view, and that a much greater development of the principles of decentralization and religious equality, the organization of a better police force, more energetic protection against the Kurds, and more definite provisions concerning the functions of governors-general could alone satisfy the rights and expectations created by the sixty-first article of the Treaty of Berlin.

The British vice-consul at Van in December reported that the working of the new arrondissements created in Armenia had greatly disappointed the Armenians, inasmuch as the districts were divided in such a manner as to give the Mussulmans a majority. He added, in his report, that European supervision was an indispensable condition for carrying out the desired reforms.

The International Commission for Reform in the European provinces completed its work, and signed the organic law for those provinces, August 24th. It was considered a very complete code, containing, it was said, everything essential for good government. It is modeled upon the organic law of Crete, defines the attributes of the Wali, principal officers, and general council, makes provision for the appointment in each province of a director of education and agriculture, stipulates for the assignment of a portion of the surplus revenue to public works, and gives the councils power to raise taxes for expenditure upon local objects.

Reports were published in August of a condition of general uneasiness among the Mohammedan people. A movement was believed to be on foot to excite discontent among the Indian Mohammedans, which was to be aroused by publications showing that the British Government was pursuing an unfriendly policy toward the Sultan, the representative of the Caliphs. Great agitation at Damascus and Diarbekir, which had the appearance of being of a political character and not a mere outbreak of fanaticism, excited the anxiety of the Porte. The Sultan was represented as being unpopular with his people, in consequence of the ills which had befallen Turkey ever since his accession to the throne. A prince, who conveyed an order to the Bey of Tunis, was said to have instruction to confer with prominent Arabs in Algeria in the interest of his sovereign. The Sultan, however, denied that any pamphlets had been sent to India, with his knowledge, with the object of stirring up the Mohammedan population against England.

Suffering from scarcity of food prevailed in many parts of the empire from the beginning of the year. Apprehensions that a famine would be general on the eastern frontier, which

were expressed early in January, were realized long before the summer. Great distress prevailed in European Turkey, especially among the refugees, in the winter. Dreadful accounts began to be made in the spring of distress in Armenia. The winter wheat had been frozen out, the price of breadstuffs was advancing, and the people were dying from the effects of bad food, while their cattle and sheep were also perishing. The distress grew as the season advanced, and was aggravated by the depredations which were committed by the insurgent Kurds in Turkey and Persia. The writer of a letter published in the London "Daily News," in June, describing the scenes he witnessed during a journey from Diarbekir to Bagdad, said that people were continually dying in the streets at Mosul, and it was common to see them lying there in the last stages of weakness and destitution. On the 15th of June about three thousand starving people pillaged the Government grain-depot and other stores at Diarbekir. Order was restored in this and a subsequent attack at the expense of several persons killed and wounded. The ravages of the famine continued to increase through July, and the depredations of the Kurds were added to them. The Bishop of Van asserted that all the money in the world could not prevent the total destruction of the Armenians if pillage and murder under these fearful circumstances continued, and supplicated the Sultan for redress. Dr. Parsons, an American missionary, and his American servant, were murdered, August 1st, a short distance from Ismidt, while on the road to distribute relief to the famished population. The murderers, who belonged to a nomad tribe, were arrested and confessed the crime on examination. The Government of the United States instructed its *chargé d'affaires* to impress upon the Porte the necessity of taking prompt and energetic steps to punish the murderers; and Mr. Heap, the *chargé*, delivered a note demanding that they be immediately brought to Constantinople and put upon their trial. The disturbances among the Kurds assumed a more general character in September, when new troubles were reported in the district south of New Bajazid in the sandjak of Musch, and in other parts of the same region. Incendiary proclamations were addressed to the Armenians by the insurgent chiefs, and the Governor-General of Van applied to Constantinople for reinforcements, but was answered that none could be spared. On the 20th of September the Kurds had destroyed thirteen Armenian villages. The British consul-general at Bagdad reported, about the 1st of October,

that the measures taken by the Turkish authorities, for the protection of life and property on the Tigris, were wholly inadequate. The consul in Kurdistan also commented on the inactivity shown by the Governor, in face of the lawless proceedings of the Kurds.

A proposition was submitted by Midhat Pasha, in September, for the suppression of brigandage in the vilayet of Smyrna, by the organization of a force of gendarmerie and the institution of extraordinary commissions to try criminals.

Tribal disturbances broke out, in the latter part of May, in the pashalik of Bassora. Four battalions of Turkish troops, sent to Ilha, were surrounded by Arabs, and telegraphic communication was cut. Works were thrown up along the course of the Tigris, preventing the passage of the English steamers on that river.

The Grand Shereef of Mecca was stabbed, March 19th, as he was entering the town of Jiddah, by a man in the dress of a dervish, and died from the effects of his wound on the following Sunday. An attempt was made in June on the life of his successor, who, however, escaped unhurt.

A fearful state of anarchy and brigandage prevailed in Thessaly and Epirus in the latter months of the year. Colonel Synge, who had been sent by Sir Henry Layard to distribute relief to the Mussulman refugees in Eastern Roumelia, was captured near Salonica, in February, by the notorious Greek brigand Niko, who demanded a heavy ransom for his release, and threatened to kill him if any armed force was sent to deliver him. The captured man sent a message to the British consul-general, earnestly requesting that no troops might be sent in pursuit; and the Turkish Government cautioned its officers against adopting a course that might exasperate the brigands to execute their threat. A small guard was, however, sent in search of the brigands, and this, it was said, had the effect of delaying the negotiations for the payment of the ransom of twelve thousand lira and various presents which they demanded, and for the release of the prisoner. Their demands were finally satisfied, and Colonel Synge was set free, after having been held a prisoner for about a month. He was kept, during the whole period of his captivity, in a cave guarded by five men. He had to put up with indifferent fare, but received no bad treatment. Once, however, when the brigands heard that another band had proposed to the British consul to capture Niko and hold him in exchange for Colonel Synge, they threatened to roast him alive.

U

UNITARIANS. *The National Conference of the Unitarian and other Liberal Christian Churches* met in its biennial session at Saratoga Springs, New York, September 21st. The Hon. E. R. Hoar presided. The Council of the Conference reported that it had saved the Church of the Messiah, in New York City, from a forced sale; had raised \$115,000 to endow two new professorships in Harvard Divinity School; and had secured funds for the Channing Memorial Church at Newport, Rhode Island. The report recommended that steps be taken, without infringing on the independence of the churches, to organize the forces of the denomination for united work; that delegates to the Conference be authorized to pledge the churches for certain amounts; and that funds be raised for a business building in Boston, to be called the Channing Memorial Building. The American Unitarian Association reported that its average annual receipts were \$25,000, and that larger contributions were needed to increase its work in America, India, and Hungary; and recommended that \$50,000 be raised for the next year. The Western Conference reported that fifty active societies were supplied by thirty-five preachers, and that in the last two years church debts amounting to \$95,000 had been paid, and thirteen new churches had been built. Favorable reports were made of the condition of the churches in New Orleans, Charleston, Philadelphia, and Baltimore. Reports were made of the condition of 250 Unitarian Sunday-schools, with 5,000 teachers and 25,000 pupils. The Conference recommended that \$5,000 be raised for the Sunday-school Association, and \$10,000 for the school at Hampton, Virginia, for colored children; that an annual tax of one dollar be assessed on each pew-holder, for the care of aged and disabled clergymen. Delegates were appointed to carry the greetings of the Conference to the next General Convention of the Universalists. Pledges of \$30,000 were obtained during the meeting of the Conference for the Divinity School at Meadville, Pennsylvania. A report was made from a Committee on Woman's Associations, which had been appointed at the previous Conference, relating to the organization of a Woman's Auxiliary Conference to promote local organizations for Christian work, and to bring all such organizations into the Association, which should hold a biennial business meeting in connection with the National Conference.

UNITED BRETHREN CHURCH. The following is a summary of the organized churches, and number of ministers and members of this Church, as they are given in the "United Brethren Almanac" for 1881:

CONFERENCES.	Organized churches.	Number of ministers.	Number of members.
Alleghany.....	167	53	6,674
Auglaize.....	157	67	6,116
California.....	23	29	684
Central Illinois.....	78	45	2,671

West Nebraska.....	60	19	862
Western Reserve.....	79	44	3,188
White River.....	111	79	6,006
Wisconsin.....	76	39	2,150
Total.....	4,524	2,196	157,585

Number of Sunday-schools, 3,043, with 26,819 officers and teachers, and 159,141 children; number of meeting-houses, 2,168; of parsonages, 318. Amount of collections for salaries of ministers, \$345,169; for ministerial aid, \$2,755; for missions, \$41,592; for bishops, \$6,225; for church-erection, \$1,831; for church building and expenses, \$234,117; for the educational fund, \$20,882; for ministerial education, \$1,244; Sunday-school collections, \$45,066; collections for the general Sunday-school fund, \$1,646; total amount of collections, \$700,531. The returns show an increase of 3,039 members from the previous year.

The bishops of the United Brethren Church are: Rev. J. J. Glossbrenner, Churchville, Virginia; Rev. Jonathan Weaver, D. D., Dayton, Ohio; Rev. John Dickson, D. D., Westerville, Ohio; Rev. Nicholas Castle, Philomath, Oregon; Rev. Milton Wright, D. D., Cedar Rapids, Iowa. The general publishing-house is in Dayton, Ohio. The periodicals include one

English religious weekly newspaper, five publications in the interest and for the purposes of Sunday-schools and children, one paper in the interest of missions, a German religious weekly newspaper, and a youth's paper in the German language. The educational institutions are: Lebanon Valley College, Annville, Pennsylvania; Otterbein University, Westerville, Ohio; Hartsville University, Hartsville, Indiana; Westfield College, Westfield, Illinois; Lane University, Lecompton, Kansas; Western College, Western, Iowa; Philomath College, Philomath, Oregon; Green Hill Seminary, Green Hill, Indiana; Avalon Academy, Avalon, Missouri; Elroy Seminary, Elroy, Wisconsin; Edwards Academy, Greenville, Tennessee; Fostoria Academy, Fostoria, Ohio; and the Union Biblical Seminary, Dayton, Ohio.

UNITED STATES. The tenth census of the United States was taken during the year, but the tables of statistics, excepting those of population, have not been completed. The following shows the population in June compared with that of 1870:

STATES.	1880.	1870.
Alabama.....	1,262,794	996,992
Arkansas.....	802,564	484,471
California.....	864,686	582,081
Colorado.....	194,649	47,164*
Connecticut.....	622,638	537,454
Delaware.....	148,654	125,015
Florida.....	267,351	158,248
Georgia.....	1,539,048	1,164,109
Illinois.....	8,078,709	2,589,491
Indiana.....	1,978,362	1,680,437
Iowa.....	1,624,620	1,192,002

The table on the following page shows the classification of population by race, nativity, and sex.

Few important changes occurred in any part of the administration of the Government during the year. Postmaster-General D. M. Key retired in the month of May, and was appointed District Judge in Tennessee. His successor was Horace Maynard, of Tennessee, previously Minister to Turkey, General James Longstreet taking his place at Constantinople. In January, James Russell Lowell, of Massachusetts, was transferred from Madrid to London, as United States Minister, succeeding John Welsh, of

Pennsylvania, and being succeeded by Lucius Fairchild, of Wisconsin, previously vice-consul at Paris. The vacant mission at St. Petersburg was filled, near the beginning of the year, by the appointment of John W. Foster, of Indiana. In December, Justice William Strong, of the Supreme Court, retired from the bench, and Judge William B. Woods, of the Fifth Circuit, was appointed his successor. Justice Hunt continued unable to perform his judicial duties, and toward the close of the year Justice Clifford became incapacitated by sickness and age. The bench was further weakened early in 1881 by the resignation of Justice Swayne, and a prolonged vacancy in the position formerly occupied by him.

The attention of the people of the country was largely taken up during the year by the canvass for the Presidential election. General Grant, who had returned late in 1879 from his tour around the world, which had occupied most of the interval since he left the Executive chair in March, 1877, and during which he had received extraordinary attentions and honors in most of the countries of Europe and of Southern and Eastern Asia, was much

talked of as the candidate of the Republican party. The call for the National Convention was issued by the Executive Committee of the party, J. D. Cameron, of Pennsylvania, chairman, on the last day of 1879. The State Conventions of Pennsylvania and New York were held in February, and, under the lead of Senators Cameron and Conkling respectively, declared for the candidacy of General Grant, and instructed their delegates to the National Convention to support it unitedly. Their action was followed later in the canvass by the party in Illinois under the lead of Senator Logan. In each of these States more or less division of sentiment was developed among the delegates, and, in Illinois, contesting delegates were chosen from the Chicago district. (See articles on ILLINOIS, NEW YORK, and PENNSYLVANIA.)

A considerable independent and anti-third-term sentiment had in the mean time been worked up throughout the country, and, on the 6th of May, a Republican Anti-Third-Term Convention was held at St. Louis, which was presided over by General J. B. Henderson, and which adopted the following resolutions:

1. In pursuance of the demand, and representing the convictions of what we believe to be a majority of the Republican party throughout the Union, this Convention of Republicans has assembled for the purpose of declaring those convictions with reference to the present aspect of political affairs. This action is necessary in view of the determined efforts to force upon the party the nomination of a candidate for the Presidency for a third term, in defiance not only of the traditions of the Government, but also of the solemn declarations of the Republican party through its conventions in the largest and controlling Republican States, reaffirmed by its representatives in the popular branch of Congress, and adopted by the entire party in the declarations of its latest Presidential candidate.

2. We reaffirm our adhesion to the principles of the Republican party as heretofore set forth by its authorized representatives, especially the declarations of the State Republican Convention of New York in 1875, opposing a third term for the President; of Pennsylvania in 1875, and reaffirmed in 1876, to the same effect; of Ohio in 1875; Massachusetts the same year; and of Minnesota and other Republican States, all to the same effect; also by the House of Representatives, in December, 1875, by an overwhelming majority.

3. We declare that the nomination of a third-term candidate will put the party on the defensive by reviving the memory of the public scandals and official corruptions which brought the party to the verge of ruin. We believe the questions now at issue—finance, tariff, etc.—require a trained statesman for President; and we find additional objection to a third-term candidate in that it would substitute a dangerous tendency to personal government for an unwearied effort for the true reform of civil service, which is vital to the welfare and safety of the republic.

4. As Republicans, we can not be hero-worshippers, and we demand from a party without a master the nomination of a candidate without a stain.

5. *Resolved*, That a National Committee of One Hundred be appointed and instructed, in the event of the nomination of General Grant, to meet in the city of New York, at the call of the chairman of this committee, and there to act in such a manner as they shall then deem best to carry out the spirit and purpose of these resolutions, the said committee to be selected by a committee of thirteen, and published at its earliest convenience.

The prominent candidates for the Republican nomination, besides General Grant, were Senator James G. Blaine, of Maine, and John Sherman, of Ohio, Secretary of the Treasury; and there was some talk among the anti-third-term and independent Republicans of Senator George F. Edmunds, of Vermont.

The Republican National Convention gathered at Chicago, in accordance with the terms of the call, on Wednesday, the 2d of June, and was called to order by J. D. Cameron, chairman of the Executive Committee, at one o'clock. Senator George F. Hoar, of Massachusetts, was chosen temporary chairman, and the committees were constituted, after which an adjournment was taken until the next day. On the second day a permanent organization was effected, Mr. Hoar being continued in the chair, but the time was taken up by the consideration of contested cases by the Committee on Credentials. The main source of controversy was the question of the power of State Conventions to name delegates from Congressional districts, and to bind their action by instructions. The third and fourth days of the

Convention were spent mainly in settling contests, but the platform was adopted on the fourth day, Saturday, June 5th. At the beginning of the discussion on Friday, Mr. Conkling, of New York, offered a resolution in these terms:

Resolved, As the sense of this Convention, that every member of it is bound in honor to support its nominee, whoever that nominee may be, and no man should hold a seat here who is not ready to so agree.

This was carried by a vote of 719 to 3, the latter being cast by delegates from West Virginia. Mr. Conkling then offered a resolution "that the delegates who, on this roll-call, have voted No on this resolution, do not deserve to have, and have forfeited their votes in this Convention." After some warm discussion, in which General Garfield, of Ohio, took a conciliatory part, this resolution was withdrawn. The contested cases were settled in accordance with the principle that Congressional districts have the right to choose their own delegates, and that instructions of State Conventions for united action are not binding. The platform, as reported, was as follows:

The Republican party, in National Convention assembled, at the end of twenty years since the Federal Government was first committed to its charge, submits to the people of the United States this brief report of its administration.

It suppressed a rebellion which had armed nearly a million of men to subvert the national authority. It reconstructed the Union of the States with freedom instead of slavery as its corner-stone. It transformed 4,000,000 human beings from the likeness of things to the rank of citizens. It relieved Congress from the infamous work of hunting fugitive slaves, and charged it to see that slavery does not exist. It has raised the value of our paper currency from 38 per cent. to the par of gold. It has restored upon a solid basis payment in coin for all the national obligations, and has given us a currency absolutely good and equal in every part of our extended country. It has lifted the credit of the nation from the point where 6 per cent. bonds sold at 86 to that where 4 per cent. bonds are eagerly sought at a premium. Under its administration, railways have increased from 31,000 miles in 1860, to more than 82,000 miles in 1879. Our foreign trade has increased from \$700,000,000 to \$1,150,000,000 in the same time, and our exports, which were \$20,000,000 less than our imports in 1860, were \$264,000,000 more than our imports in 1879. Without resorting to loans, it has, since the war closed, defrayed the ordinary expenses of Government, besides the accruing interest on the public debt, and has annually disbursed more than \$30,000,000 for soldiers' pensions. It has paid \$888,000,000 of the public debt, and by refunding the balance at lower rates, has reduced the annual interest-charge from nearly \$151,000,000 to less than \$89,000,000. All the industries of the country have revived; labor is in demand; wages have increased, and throughout the entire country there is evidence of a coming prosperity greater than we have ever enjoyed.

Upon this record the Republican party asks for the continued confidence and support of the people, and this Convention submits for their approval the following statements of the principles and purposes which will continue to guide and inspire its efforts:

1. We affirm that the work of the last twenty-one years has been such as to commend itself to the favor of the nation, and that the fruits of the costly victories which we have achieved through immense difficulties should be preserved; that the peace regained should be cherished; that the dissevered Union, now happily restored, should be perpetuated; and that the liber-

ties secured to this generation should be transmitted undiminished to future generations; that the order established and the credit acquired should never be impaired; that the pensions promised should be extinguished by the full payment of every dollar thereof; that the reviving industries should be further promoted, and that the commerce already so great should be steadily encouraged.

2. The Constitution of the United States is a supreme law, and not a mere contract. Out of confederated States it made a sovereign nation. Some powers are denied to the nation, while others are denied to the States; but the boundary between the powers delegated and those reserved is to be determined by the national, and not by the State, tribunals.

3. The work of popular education is one left to the care of the several States, but it is the duty of the national Government to aid that work to the extent of its constitutional power. The intelligence of the nation is but the aggregate of the intelligence in the several States, and the destiny of the nation must not be guided by the genius of any one State, but by the average genius of all.

4. The Constitution wisely forbids Congress to make any law respecting an establishment of religion, but it is idle to hope that the nation can be protected against the influence of sectarianism while each State is exposed to its domination. We therefore recommend that the Constitution be so amended as to lay the same prohibition upon the Legislature of each State, and to forbid the appropriation of public funds to the support of sectarian schools.

5. We affirm the belief, avowed in 1876, that the duties levied for the purpose of revenue should so discriminate as to favor American labor; that no further grant of the public domain should be made to any railway or other corporation; that slavery having perished in the States, its twin barbarity, polygamy, must die in the Territories; that everywhere the protection accorded to citizens of American birth must be secured to citizens by American adoption; and that we esteem it the duty of Congress to develop and improve our watercourses and harbors, but insist that further subsidies to private persons or corporations must cease. That the obligations of the republic to the men who preserved its integrity in the hour of battle are undiminished by the lapse of the fifteen years since their final victory. To do them perpetual honor is, and shall for ever be, the grateful privilege and sacred duty of the American people.

6. Since the authority to regulate immigration and intercourse between the United States and foreign nations rests with Congress, or with the United States and its treaty-making power, the Republican party, regarding the unrestricted immigration of the Chinese as an evil of great magnitude, invokes the exercise of those powers to restrain and limit that immigration by the enactment of such just, humane, and reasonable provisions as will produce that result.

7. That the purity and patriotism which characterized the earlier career of Rutherford B. Hayes, in peace and war, and which guided the thoughts of our immediate predecessors to him for a Presidential candidate, have continued to inspire him in his career as Chief Executive, and that history will accord to his Administration the honors which are due to an efficient, just, and courteous discharge of the public business, and will honor his interpositions between the people and proposed partisan laws.

8. We charge upon the Democratic party the habitual sacrifice of patriotism and justice to a supreme and insatiable lust of office and patronage; that to obtain possession of the national and State governments, and the control of place and position, they have obstructed all efforts to promote the purity and to conserve the freedom of suffrage, and have devised fraudulent certifications and returns; have labored to unseat lawfully-elected members of Congress; to secure, at all hazards, the vote of a majority of the States in the House of Representatives; have endeavored to

occupy, by force and fraud, the places of trust given to others by the people of Maine, and rescued by the courageous action of Maine's patriotic sons; have, by methods vicious in principle and tyrannical in practice, attached partisan legislation to appropriation bills, upon whose passage the very movement of the Government depends, and have crushed the rights of individuals; have advocated the principles and sought the favor of rebellion against the nation, and have endeavored to obliterate the sacred memories of the war, and to overcome its inestimably valuable results of nationality, personal freedom, and individual equality. The equal, steady, and complete enforcement of laws, and the protection of all our citizens in the enjoyment of all privileges and immunities guaranteed by the Constitution, are the first duties of the nation. The dangers of a solid South can only be averted by a faithful performance of every promise which the nation has made to the citizen. The execution of the laws and the punishment of all those who violate them are the only safe methods by which an enduring peace can be secured, and genuine prosperity established throughout the South. Whatever promises the nation makes the nation must perform, and the nation can not with safety relegate this duty to the States. The solid South must be divided by the peaceful agencies of the ballot, and all opinions must there find free expression, and to this end the honest voter must be protected against terrorism, violence, or fraud. And we affirm it to be the duty and the purpose of the Republican party to use every legitimate means to restore all the States of this Union to the most perfect harmony that may be practicable; and we submit it to the practical, sensible people of the United States to say whether it would not be dangerous to the dearest interests of our country at this time to surrender the administration of the national Government to the party which seeks to overthrow the existing policy under which we are so prosperous, and thus bring distrust and confusion where there are now order, confidence, and hope.

The following, offered by a delegate from Massachusetts, was added after some debate, and the whole adopted:

The Republican party, adhering to the principles affirmed by its last National Convention, of respect for the constitutional rules governing appointment to office, adopts the declaration of President Hayes, that the reform in the civil service shall be thorough, radical, and complete. To that end it demands the co-operation of the legislative with the executive department of the Government, and that Congress shall so legislate that fitness, ascertained by proper practical tests, shall admit to the public service; that the tenure of administrative offices (except those through which distinctive policy of the party in power shall be carried out) shall be made permanent during good behavior, and that the power of removal for cause, with due responsibility for the good conduct of subordinates, shall accompany the power of appointment.

The first ballot was taken on Monday, June 7th, the fifth day of the Convention, and resulted in 304 votes for General U. S. Grant, of Illinois; 284 for James G. Blaine, of Maine; 93 for John Sherman, of Ohio; 34 for George F. Edmunds, of Vermont; 30 for Elihu B. Washburne, of Illinois; and 10 for William Windom, of Minnesota. The balloting continued during two days, thirty six votes being taken in all, and resulted finally in the nomination of General James A. Garfield, of Ohio, as the candidate of the Republican party for the office of President of the United States. The following table exhibits the result of the several ballotings:

BALLOTS.	Grant.	Blaine.	Sherman.	Edmunds.	Washburne.	Windom.	Garfield.	McCray.	Hayes.	Harrison.	Dawson.	Hartman.	Total.

The nomination of General Garfield was made unanimous on motion of Mr. Conkling, of New York. General Chester A. Arthur, of New York, was nominated for Vice-President on the first ballot, the vote being 468 for Arthur; 193 for E. B. Washburne, of Illinois; 44 for Marshall Jewell, of Connecticut; 30 for Horace Maynard, of Tennessee; 8 for B. K. Bruce, of Mississippi; 2 for E. J. Davis, of Texas; 4 for J. L. Alcorn, of Mississippi; 1 for Thomas Settle, of North Carolina; and 1 for Stewart L. Woodford, of New York.

The Greenback or National Greenback-Labor party took an active part in the canvass. Early in the year its Executive Committee called a National Convention to be held at Chicago on the 9th of June. On that day there were two separate factions gathered in that city, but they succeeded in effecting a union, and the business of the Convention was disposed of on the day following. The following platform was adopted:

Civil government should guarantee the divine right of every laborer to the results of his toil, thus enabling the producers of wealth to provide themselves with the means for physical comfort, and the facilities for mental, social, and moral culture; and we condemn as unworthy of our civilization the barbarism which imposes upon the wealth-producers a state of perpetual drudgery as the price of bare animal existence. Notwithstanding the enormous increase of productive power, the universal introduction of labor-saving machinery, and the discovery of new agents for the increase of wealth, the task of the laborer is scarcely lightened, the hours of toil are but little short-

ened, and few producers are lifted from poverty into comfort and pecuniary independence. The associated monopolies, the international syndicates, and other income classes demand dear money and cheap labor; a "strong government," and hence a weak people.

Corporate control of the volume of money has been the means of dividing society into hostile classes, of the unjust distribution of the products of labor, and of building up monopolies of associated capital endowed with power to confiscate private property. It has kept money scarce, and scarcity of money enforces debt, trade, and public and corporate loans. Debt engenders usury, and usury ends in the bankruptcy of the borrower. Other results are deranged markets, uncertainty in manufacturing enterprise and agriculture, precarious and intermittent employment for the laborers, industrial war, increasing pauperism and crime, and the consequent intimidation and disfranchisement of the producer, and a rapid declension into corporate feudalism; therefore, we declare—

1. That the right to make and issue money is a sovereign power, to be maintained by the people for the common benefit. The delegation of this right to corporations is a surrender of the central attribute of sovereignty, void of constitutional sanction, conferring upon a subordinate, irresponsible power absolute dominion over industry and commerce. All money, whether metallic or paper, should be issued and its volume controlled by the Government, and not by or through banking corporations, and, when so issued, should be a full legal tender for all debts public and private.

2. That the bonds of the United States should not be refunded, but paid as rapidly as is practicable, according to contract. To enable the Government to meet these obligations, legal-tender currency should be substituted for the notes of the national banks, the national banking system abolished, and the unlimited coinage of silver, as well as gold, established by law.

3. That labor should be so protected by national and State authority as to equalize its burdens and insure a just distribution of its results. The eight-hour law of Congress should be enforced, the sanitary con-

* One vote for Philip H. Sheridan.

† One vote for Roscoe Conkling.

dition of industrial establishments placed under rigid control, the competition of contract convict-labor abolished, a bureau of labor statistics established, factories, mines, and workshops inspected, the employment of children under fourteen years of age forbidden, and wages paid in cash.

4. Slavery being simply cheap labor, and cheap labor being simply slavery, the importation and presence of Chinese serfs necessarily tends to brutalize and degrade American labor; therefore immediate steps should be taken to abrogate the Burlingame treaty.

5. Railroad land-grants forfeited by reason of non-fulfillment of contract should be immediately reclaimed by the Government, and henceforth the public domain reserved exclusively as homes for actual settlers.

6. It is the duty of Congress to regulate inter-State commerce. All lines of communication and transportation should be brought under such legislative control as shall secure moderate, fair, and uniform rates for passenger and freight traffic.

7. We denounce as destructive to prosperity and dangerous to liberty the action of the old parties in fostering and sustaining gigantic land, railroad, and money corporations and monopolies, invested with and exercising powers belonging to the Government, and yet not responsible to it for the manner of their exercise.

8. That the Constitution, in giving Congress the power to borrow money, to declare war, to raise and support armies, to provide and maintain a nation, never intended that the men who loaned their money for an interest consideration should be preferred to the soldier and sailor who periled their lives and shed their blood on land and sea in defense of their country; and we condemn the cruel class legislation of the Republican party, which, while professing great gratitude to the soldier, has most unjustly discriminated against him and in favor of the bondholder.

9. All property should bear its just proportion of taxation, and we demand a graduated income-tax.

10. We denounce as most dangerous the efforts everywhere manifested to restrict the right of suffrage.

11. We are opposed to an increase of the standing army in time of peace, and the insidious scheme to establish an enormous military power under the guise of militia laws.

12. We demand absolute democratic rules for the government of Congress, placing all representatives of the people upon an equal footing, and taking away from committees a veto power greater than that of the President.

13. We demand a government of the people, by the people, and for the people, instead of a government of the bondholder, by the bondholder, and for the bondholder; and we denounce every attempt to stir up sectional strife as an effort to conceal monstrous crimes against the people.

14. In the furtherance of these ends we ask the coöperation of all fair-minded people. We have no quarrel with individuals, wage no war upon classes, but only against vicious institutions. We are not content to endure further discipline from our present actual rulers, who, having dominion over money, over transportation, over land and labor, and largely over the press and the machinery of government, wield unwarrantable power over our institutions and over life and property.

The proceedings of the Convention ran through the night of June 10th, and in the early morning of the 11th the nominations for President and Vice-President were made. The first ballot for candidate for President was informal, and resulted in 224½ votes for General J. B. Weaver, of Iowa; 126½ for Hendrick B. Wright, of Pennsylvania; 119 for Stephen B. Dillaye, of New Jersey; 95 for Benjamin F. Butler, of Massachusetts; 89 for Solon Chase,

of Maine; 41 for E. P. Alhs, of Wisconsin; and 21 for Alexander Campbell, of Illinois. By changes in the votes before the result was declared, General Weaver was unanimously nominated. General B. J. Chambers, of Texas, was nominated for Vice-President on the first ballot.

The Prohibition party held a National Convention at Cleveland, Ohio, on the 17th of June. There were 142 delegates present from twelve States. Neal Dow, of Maine, was nominated by acclamation as the candidate for President, and A. M. Thompson, of Ohio, was made the candidate for Vice-President. A platform was adopted setting forth the well-known principles of the party in regard to the manufacture and sale of alcoholic liquors. It declared in favor of a national prohibition law for the District of Columbia and the Territories, condemned both the Republican and Democratic parties for their attitude on the liquor question, demanded the right of suffrage for women, and asserted that the experience of nations shows no loss of revenue following the abolition of liquor-taxes.

Nominations were also made by the "American Antimason" party. The candidates were General John W. Phelps, of Vermont, for President, and the Hon. Samuel C. Pomeroy, of Kansas, for Vice-President. The declared object of this party was to "expose, withstand, and remove secret societies, Freemasonry in particular, and other anti-Christian movements, in order to save the churches of Christ from being depraved; to redeem the administration of justice from perversion, and our republican government from corruption."

On the 23d of February the National Executive Committee of the Democratic party held a meeting in Washington, and determined on Cincinnati as the place, and June 22d the time for holding the National Convention. The question of the candidacy of Samuel J. Tilden, of New York, was prominent throughout the preliminary canvass in the several States, and was likely to affect somewhat seriously the proceedings of the Convention; but two days before it was organized the following letter was received by the New York delegates in Cincinnati, withdrawing his name:

NEW YORK, June 18, 1880.

To the Delegates from the State of New York to the Democratic National Convention:

Your first assembling is an occasion or which it is proper for me to state to you my relation to the nomination for the Presidency which you and your associates are commissioned to make in behalf of the Democratic party of the United States. Having passed my early years in an atmosphere filled with the traditions of the war which secured our national independence, and of the struggles which made our continental system a government for the people, by the people, I learned to idolize the institutions of my country, and was educated to believe it the duty of a citizen of the republic to take his fair allotment of care and trouble in public affairs. I fulfilled that duty to the best of my ability for forty years as a private citizen. Although during all my life giving at least as much thought and effort to public affairs as to all other ob-

jects, I have never accepted official service except for brief periods for a special purpose, and only when the occasion seemed to require of me that sacrifice of private preferences to public interests.

My life has been substantially that of a private citizen. It was, I presume, the success of efforts in which, as a private citizen, I had shared to overthrow a corrupt combination then holding dominion in our metropolis, and to purify the judiciary, which had become its tool, that induced the Democracy of the State in 1874 to nominate me for Governor. This was done in spite of the protest of a minority that the part I had borne in those reforms had created antagonisms fatal to me as a candidate. I felt constrained to accept the nomination as the most certain means of putting the power of the gubernatorial office on the side of reform, and of removing the impression, wherever it prevailed, that the faithful discharge of one's duty as a citizen is fatal to his usefulness as a public servant.

The breaking up of the canal ring, the better management of our public works, the large reduction of taxes, and other reforms accomplished during my administration, doubtless occasioned my nomination for the Presidency by the Democracy of the Union, in the hope that similar processes would be applied to the Federal Government. From the responsibilities of such an undertaking, appalling as it seemed to me, I did not feel at liberty to shrink.

In the canvass which ensued, the Democratic party represented reform in the administration of the Federal Government, and a restoration of our complex political system to the pure ideas of its founders. Upon these issues the people of the United States, by a majority of more than a quarter of a million, chose a majority of the electors to cast their votes for the Democratic candidates for President and Vice-President. It is my right and privilege here to say that I was nominated and elected to the Presidency absolutely free from any engagement in respect to the exercise of its powers or the disposal of its patronage. Through the whole period of my relation to the Presidency I did everything in my power to elevate and nothing to lower moral standards in the competition of parties.

By what nefarious means the basis for a false count was laid in several of the States I need not recite. These are now matters of history about which, whatever diversity of opinion may have existed in either of the great parties of the country at the time of their consummation, has since practically disappeared. I refused to ransom from the returning boards of Southern States the documentary evidence by the suppression of which and by the substitution of fraudulent and forged papers a pretext was made for the perpetration of a false count. The constitutional duty of the two Houses of Congress to count the electoral votes as cast, and to give effect to the will of the people as expressed by their suffrages, was never fulfilled. An electoral commission, for the existence of which I have no responsibility, was formed, and to it the two Houses of Congress abdicated their duty to make the count by a law enacting that the count of the commission should stand as final unless overruled by the concurrent action of the two Houses. Its false count was not overruled, owing to the complicity of a Republican Senate with the Republican majority of the commission. Controlled by its Republican majority of eight to seven, the Electoral Commission counted out the men elected by the people, and counted in the men not elected by the people.

That subversion of the election created a new issue for the decision of the people of the United States, transcending in importance all questions of administration. It involved the vital principle of self-government through elections by the people. The immense growth of the means of corrupt influence over the ballot-box which is at the disposal of the party having possession of the executive administration, had already become a present evil and a great danger, tending to make elections irresponsible to public opinion, hampering the power of the people to change rulers, and

enabling the men holding the machinery of government to continue and perpetuate their power.

It was my opinion in 1876 that the opposition attempting to change the administration needed to include at least two thirds of the voters at the opening of the canvass in order to retain a majority at the election. If, after such obstacles had been overcome, and a majority of the people had voted to change the administrations of their government, the men in office could still procure a false count founded upon frauds, perjury, and forgeries, furnishing a pretext of documentary evidence on which to base the false count, and if such a transaction were not only successful, but if, after allotments of its benefits were made to its contrivers, abettors, and apologists, by the chief beneficiary of the transactions, it were condoned by the people, a practical destruction of elections by the people would have been accomplished. The failure to install the candidates chosen by the people—a contingency consequent upon no act of omission of mine, and beyond my control—has thus left me for the last three years and until now, when the Democratic party, by its delegates in National Convention assembled, shall choose a new leader, the involuntary but necessary representative of this momentous issue, as such denied the immunities of private life, without the powers conferred by public station, subject to unceasing falsehoods and calumnies from the partisans of an Administration laboring in vain to justify its existence.

I have, nevertheless, steadfastly endeavored to preserve to the Democratic party of the United States the supreme issue before the people for their decision next November, whether this shall be a government by the sovereign people through elections, or a government by discarded servants, holding over by force and fraud, and I have withheld no sacrifice and neglected no opportunity to uphold, organize, and consolidate against the enemies of republican institutions the great party which alone, under God, can effectually resist their overthrow.

Having now borne faithfully my full share of labor and care in the public service, and wearing the marks of its burdens, I desire nothing so much as an honorable discharge. I wish to lay down the honors and toils of even quasi-party leadership, and to seek the repose of private life. In renouncing renomination for the Presidency, I do so with no doubt in my mind as to the vote of the State of New York, or of the United States, but because I believe it is a renunciation of reelection of the Presidency. To those who think my nomination and reelection indispensable to an effectual vindication of the right of the people to elect their rulers, violated in my person, I have accorded as long a reserve of my decision as possible, but I can not overcome my repugnance to enter into a new engagement which involves four years of ceaseless toil.

The dignity of the Presidential office is above a merely personal ambition, but it creates in me no illusion. Its value is as a great power for good to the country. I said four years ago, in accepting the nomination: "Knowing as I do, therefore, from fresh experience, how great the difference is between gliding through an official routine and working out a reform of systems and policies, it is impossible for me to contemplate what needs to be done in the Federal Administration without an anxious sense of the difficulties of the undertaking. If summoned by the suffrages of my countrymen to attempt this work, I shall endeavor, with God's help, to be the efficient instrument of their will."

Such a work of renovation after many years of misrule, such a reform of systems and policies to which I would cheerfully have sacrificed all that remained to me of health and life, is now, I fear, beyond my strength. With unfeigned thanks for the honors bestowed upon me, with a heart swelling with emotions of gratitude to the Democratic masses for the support which they have given to the cause I represented, and their confidence in every emergency, I remain, your fellow-citizen,

SAMUEL J. TILDEN.

The proceedings of the Convention occupied three days, a contesting Tammany delegation from New York being rejected. On Thursday, June 24th, General Winfield Scott Hancock, of Pennsylvania, was nominated for

President on the third ballot taken, and William H. English, of Indiana, was made the candidate for Vice-President by a single ballot. The votes on the three ballots for candidate for President were as follows:

BALLOTS.	Hancock.	Handicks.	Bayard.	Tilden.	Thurman.	Field.	Randall.	J.E. English.	Morrison.	Seymour.	Payne.	Ewing.	McCallan.	Others.	Total.
I.....	171	49½	153½	88	6½	65	6	1	62	8	81	10	3	12	735½
II.....	320	81	111	6	50	65½	128½	19	788
III.....	705	80	2	1	785

The following is the platform adopted:

The Democrats of the United States, in convention assembled, declare:

1. We pledge ourselves anew to the constitutional doctrines and traditions of the Democratic party, as illustrated by the teachings and example of a long line of Democratic statesmen and patriots, and embodied in the platform of the last National Convention of the party.

2. Opposition to centralizationism, and to that dangerous spirit of encroachment which tends to consolidate the powers of all the departments in one, and thus to create, whatever be the form of government, a real despotism; no sumptuary laws; separation of Church and state for the good of each; common schools fostered and protected.

3. Home rule, honest money, consisting of gold and silver, and paper convertible to coin on demand; the strict maintenance of the public faith, State and national, and a tariff for revenue only.

4. The subordination of the military to the civil power, and a general and thorough reform of the civil service.

5. The right to a free ballot is the right preservative of all rights, and must and shall be maintained in every part of the United States.

6. The existing Administration is the representative of conspiracy only, and its claim of right to surround the ballot-boxes with troops and deputy-marshals, to intimidate and obstruct the electors, and the unprecedented use of the veto to maintain its corrupt and despotic power, insults the people and imperils their institutions.

7. The great fraud of 1876-'77, by which, upon a false count of the electoral votes of two States, the candidate defeated at the polls was declared to be President, and, for the first time in American history, the will of the people was set aside under a threat of military violence, struck a deadly blow at our system of representative government. The Democratic party, to preserve the country from the horrors of a civil war, submitted for the time, in firm and patriotic faith that the people would punish this crime in 1880. This issue precedes and dwarfs every other. It imposes a more sacred duty upon the people of the Union than ever addressed the conscience of a nation of freemen.

8. We execrate the course of this Administration in making places in the civil service a reward for political crime, and demand a reform by statute which shall make it for ever impossible for the defeated candidate to bribe his way to the seat of a usurper by billeting villains upon the people.

9. The resolution of Samuel J. Tilden not again to be a candidate for the exalted place to which he was elected by a majority of his countrymen, and from which he was excluded by the leaders of the Republican party, is received by the Democrats of the United States with sensibility, and they declare their confidence in his wisdom, patriotism, and integrity, unshaken by the assaults of a common enemy, and they further assure him that he is followed into the retirement he has chosen for himself by the sympathy and respect of his fellow-citizens, who regard him as one who, by elevating the standards of public morality, and adorning and purifying the public service, merits the lasting gratitude of his country and his party.

10. Free ships and a living chance for American commerce on the seas and on the land. No discrimination in favor of transportation lines, corporations, or monopolies.

11. Amendment of the Burlingame treaty. No more Chinese immigration except for travel, education, and foreign commerce, and therein carefully guarded.

12. Public money and public credit for public purposes solely, and public land for actual settlers.

13. The Democratic party is the friend of labor and the laboring-man, and pledges itself to protect him alike against the cormorants and the Commune.

14. We congratulate the country upon the honesty and thrift of a Democratic Congress, which has reduced the public expenditure \$40,000,000 a year; upon the continuation of prosperity at home and the national honor abroad, and above all upon the promise of such a change in the administration of the Government as shall insure us genuine and lasting reform in every department of the public service.

General Weaver was formally notified of his nomination by the Convention of the National Greenback-Labor party on the 23d of June by a committee appointed for the purpose, and on July 3d signified his acceptance in a long letter, of which the following are the material parts:

It being the duty of man to earn his bread in the sweat of his face, it becomes the first duty of civil government to foster industry. All laws, therefore, which place a premium upon idleness, whether of men or money, unjustly discriminate in favor of capital, or withhold from honest men the full and just reward for their labor, are simply monstrous. Capital should be the servant of labor rather than its master.

This great truth can never be realized until there is an adequate circulating medium. Inasmuch as this circulating medium is for the benefit of all, its issue and volume should be sacredly kept under the control of the people, without the intervention of banking corporations. All money, whether gold, silver, or paper, should be issued by the supreme authority of the nation, and be made a full legal tender in payment of all debts, public and private.

The system which now prevails gives into the hands of banking corporations absolute control over the volume of the currency, and through this they have the power to fix the price of the labor and property of fifty millions of people. By provision of law, the method is clearly defined whereby they may, without limit, inflate or contract the currency at will. Cognate to this and a part of the same scheme, stands the system of funding the public debt. Like national banking, this was borrowed from the English monarchy. By this system an enormous non-taxable, interest-bearing debt is to be perpetuated. The bonds support the banks, and the banks foster the public debt. If you pay off the bonds, the banks must cease to exist. Hence, if the national banks are to continue, we must have a perpetual bonded debt. Both patriotism and sound statesmanship loudly call for the abolition of banks of issue, and the substitution of legal-tender Treasury notes for their circulation. Pay the bonds according to contract, and as rapidly as possible.

Seven hundred millions of the public debt become redeemable, at the option of the Government, during this and the ensuing year. Two funding bills are now pending before Congress—one introduced by the Democratic and the other by the Republican leader of the House, whereby it is proposed to deprive the people for twenty and thirty years of the lawful right to pay said bonds. This is a crime against the laborer and the tax-payer, and should cause widespread alarm among all classes. . . .

The two great agents of commerce are money and transportation. It is undeniable that both of these agents are under absolute control of monopolies. By controlling the volume of money, the banks fix the price of all labor and property; and the railroads, by combination, render competition impossible, and control absolutely the price of transportation. . . .

The Republican and Democratic platforms are either silent with regard to these vital issues, or they have pronounced in favor of the monopolies and against the people. With fifty millions of people looking them in the face and pleading for relief, they utter not one word of promise or hope. Their leaders and platform makers are in the toils of the syndicate, gigantic bank corporations and railroad monopolies, and have neither the disposition nor the courage to strike one generous blow for industrial emancipation.

An area of our public domain larger than the territory occupied by the great German Empire has been wantonly donated to wealthy corporations; while a bill introduced by Hon. Hendrick B. Wright, of Pennsylvania, to enable our poor people to reach and occupy the few acres remaining, has been scouted, ridiculed, and defeated in Congress. In consequence of this stupendous system of land-grabbing, millions of the young men of America, and millions more of industrious people from abroad, seeking homes in the New World, are left homeless and destitute. The public domain must be sacredly reserved to actual settlers, and where corporations have not complied strictly with the terms of their grants, the lands should be at once reclaimed.

The immigration of persons from foreign countries, seeking homes and desiring to become citizens of the United States, should be encouraged, but the importation of Chinese servile laborers should be prohibited by stringent laws. . . .

One of the grand missions of our party is to banish for ever from American politics that deplorable spirit of sectional hatred which for base purposes has been fostered by the leaders of the old parties. This has greatly deceived and embittered the public mind, both North and South.

Our civilization demands a new party, dedicated to the pursuits of peace, and which will not allow the war issues ever to be reopened, and will render the military strictly subordinate to the civil power. The war is over, and the sweet voice of Peace, long neglected, calls us to worship at her altars; let us crowd her temples with willing votaries. Let us have a free ballot, a fair count, and equal rights for all classes—for the laboring-man in Northern manufactories, mines, and workshops, and for the struggling poor, both white and black, in the cotton-fields of the South.

I most earnestly and solemnly invoke united action of all industrial classes, irrespective of party, that we may make a manly struggle for the independence of labor, and to reestablish in the administration of public affairs the old-time Democracy of Jefferson and Jackson, and the pure Republicanism of Abraham Lincoln and Thaddeus Stevens.

General Garfield accepted the nomination of the Chicago Convention in the following letter addressed to its president:

MENTOR, OHIO, July 10, 1880.

DEAR SIR: On the evening of the 8th of June last I had the honor to receive from you, in the presence of the committee of which you were chairman, the

official announcement that the Republican National Convention at Chicago had that day nominated me as their candidate for President of the United States. I accept the nomination, with gratitude for the confidence it implies, and with a deep sense of the responsibilities it imposes. I cordially endorse the principles set forth in the platform adopted by the Convention. On nearly all the subjects of which it treats, my opinions are on record among the published proceedings of Congress. I venture, however, to make special mention of some of the principal topics which are likely to become subjects of discussion.

Without reviewing the controversies which have been settled during the last twenty years, and with no purpose or wish to revive the passions of the late war, it should be said that while the Republicans fully recognize and will strenuously defend all the rights retained by the people, and all the rights reserved to the States, they reject the pernicious doctrine of State supremacy, which so long crippled the functions of the national Government, and at one time brought the Union very near to destruction. They insist that the United States is a nation, with ample power of self-preservation; that its Constitution and the laws made in pursuance thereof are the supreme law of the land; that the right of the nation to determine the method by which its own Legislature shall be created, can not be surrendered without abdicating one of the fundamental powers of government; that the national laws relating to the election of Representatives in Congress shall neither be violated nor evaded; that every elector shall be permitted, freely and without intimidation, to cast his lawful ballot at such election, and have it honestly counted, and that the potency of his vote shall not be destroyed by the fraudulent vote of any other person. The best thoughts and energies of our people should be directed to those great questions of national well-being, in which all have a common interest. Such efforts will soonest restore to perfect peace those who were lately in arms against each other, for justice and good-will will outlast passion. But it is certain that the wounds of the war can not be completely healed, and the spirit of brotherhood can not fully pervade the whole country, until every citizen, rich or poor, white or black, is secure in the free and equal enjoyment of every civil and political right guaranteed by the Constitution and the laws. Wherever the enjoyment of these rights is not assured, discontent will prevail, immigration will cease, and the social and industrial forces will continue to be disturbed by the migration of laborers and the consequent diminution of prosperity. The national Government should exercise all its constitutional authority to put an end to these evils; for all the people and all the States are members of one body, and no member can suffer without injury to all.

The most serious evils which now afflict the South arise from the fact that there is not such freedom and toleration of political opinion and action that the minority party can exercise an effective and wholesome restraint upon the party in power. Without such restraint party rule becomes tyrannical and corrupt. The prosperity which is made possible in the South by its great advantages of soil and climate will never be realized until every voter can freely and safely support any party he pleases.

Next in importance to freedom and justice is popular education, without which neither justice nor freedom can be permanently maintained. Its interests are intrusted to the States and to the voluntary action of the people. Whatever help the nation can justly afford should be generously given to aid the States in supporting common schools, but it would be unjust to our people and dangerous to our institutions to apply any portion of the revenues of the nation or of the States to the support of sectarian schools. The separation of the Church and the State in everything relating to taxation should be absolute.

On the subject of national finances, my views have been so frequently and fully expressed that little is needed in the way of additional statement. The pub-

lio debt is now so well secured, and the rate of annual interest has been so reduced by refunding, that rigid economy in expenditures and the faithful application of our surplus revenues to the payment of the principal of the debt will gradually but certainly free the people from its burdens, and close with honor the financial chapter of the war. At the same time, the Government can provide for all its ordinary expenditures, and discharge its sacred obligations to the soldiers of the Union, and to the widows and orphans of those who fell in its defense. The resumption of specie payments, which the Republican party so courageously and successfully accomplished, has removed from the field of controversy many questions that long and seriously disturbed the credit of the Government and the business of the country. Our paper currency is now as national as the flag, and resumption has not only made it everywhere equal to coin, but has brought into use our store of gold and silver. The circulating medium is more abundant than ever before, and we need only to maintain the equality of all our dollars to insure to labor and capital a measure of value from the use of which no one can suffer loss. The great prosperity which the country is now enjoying should not be endangered by any violent changes or doubtful financial experiments.

In reference to our customs laws, a policy should be pursued which will bring revenue to the Treasury, and will enable the labor and capital employed in our great industries to compete fairly in our own markets with the labor and capital of foreign producers. We legislate for the people of the United States, not for the whole world, and it is our glory that the American laborer is more intelligent and better paid than his foreign competitor. Our country can not be independent unless its people, with their abundant natural resources, possess the requisite skill at any time to clothe, arm, and equip themselves for war, and in time of peace to produce all the necessary implements of labor. It was the manifest intention of the founders of the Government to provide for the common defense, not by standing armies alone, but by raising among the people a greater army of artisans, whose intelligence and skill should powerfully contribute to the safety and glory of the nation. Fortunately for the interests of commerce, there is no longer any formidable opposition to appropriations for the improvement of our harbors and great navigable rivers, provided that the expenditures for that purpose are strictly limited to works of national importance. The Mississippi River, with its great tributaries, is of such vital importance to so many millions of people that the safety of its navigation requires exceptional consideration. In order to secure to the nation the control of all its waters, President Jefferson negotiated the purchase of a vast territory, extending from the Gulf of Mexico to the Pacific Ocean. The wisdom of Congress should be invoked to devise some plan by which that great river shall cease to be a terror to those who dwell upon its banks, and by which its shipping may safely carry the industrial products of twenty-five millions of people. The interests of agriculture, which is the basis of all our material prosperity, and in which seven twelfths of our population are engaged, as well as the interests of manufactures and commerce, demand that the facilities for cheap transportation shall be increased by the use of all our great watercourses.

The material interests of this country, the traditions of its settlement, and the sentiment of our people, have led the Government to offer the widest hospitality to immigrants who seek our shores for new and happier homes, willing to share the burdens as well as the benefits of our society, and intending that their posterity shall become an undistinguishable part of our population. The recent movement of the Chinese to our Pacific coast partakes but little of the qualities of such an immigration, either in its purposes or its result. It is too much like an importation to be welcomed without restrictions; too much like an invasion to be looked upon without solicitude. We can not consent to allow any form of servile labor to be intro-

duced among us under the guise of immigration. Recognizing the gravity of this subject, the present Administration, supported by Congress, has sent to China a commission of distinguished citizens for the purpose of securing such a modification of the existing treaty as will prevent the evils likely to arise from the present situation. It is confidently believed that these diplomatic negotiations will be successful, without the loss of commercial intercourse between the two powers, which promises a great increase of reciprocal trade and the enlargement of our markets. Should these efforts fail, it will be the duty of Congress to mitigate the evils already felt and prevent their increase by such restrictions as, without violence or injustice, will place upon a sure foundation the peace of our communities and the freedom and dignity of labor.

The appointment of citizens to the various executive and judicial offices of the Government is, perhaps, the most difficult of all duties which the Constitution has imposed on the Executive. The Convention wisely demands that Congress shall cooperate with the Executive department in placing the civil service on a better basis. Experience has proved that, with our frequent changes of Administration, no system of reform can be made effective and permanent without the aid of legislation. Appointments to the military and naval service are so regulated by law and custom as to leave but little ground for complaint. It may not be wise to make similar regulations by law for the civil service. But, without invading the authority or necessary discretion of the Executive, Congress should devise a method that will determine the tenure of office and greatly reduce the uncertainty which makes that service so uncertain and unsatisfactory. Without depriving any officer of his rights as a citizen, the Government should require him to discharge all his official duties with intelligence, efficiency, and faithfulness. To select wisely from our vast population those who are best fitted for the many offices to be filled, requires an acquaintance far beyond the range of any one man. The Executive should, therefore, seek and receive the information and assistance of those whose knowledge of the communities in which the duties are to be performed best qualifies them to aid in making the wisest choice.

The doctrines announced by the Chicago Convention are not the temporary devices of a party to attract votes and carry an election; they are deliberate convictions resulting from a careful study of the spirit of our institutions, the events of our history, and the best impulses of our people. In my judgment, these principles should control the legislation and administration of the Government. In any event, they will guide my conduct until experience points out a better way.

If elected, it will be my purpose to enforce strict obedience to the Constitution and the laws, and to promote, as best I may, the interest and honor of the whole country, relying for support upon the wisdom of Congress, the intelligence and patriotism of the people, and the favor of God.

With great respect, I am, very truly, yours,

J. A. GARFIELD.

To the Hon. GEORGE F. HOAR, Chairman of Committee.

The President and Secretary of the Cincinnati Convention formally notified the Democratic candidates of their nomination, by letter, on the 13th of July. The following is General Hancock's letter of acceptance:

GOVERNOR'S ISLAND, NEW YORK, July 29, 1880.

To Hon. JOHN W. STEVENSON, President of the Convention, Hon. JOHN P. STOCKTON, Chairman, and others of the Committee of the National Democratic Convention.

GENTLEMEN: I have the honor to acknowledge the receipt of your letter of July 13, 1880, apprising me formally of my nomination to the office of President of

the United States, by the National Democratic Convention, lately assembled in Cincinnati. I accept the nomination, with grateful appreciation of the confidence reposed in me. The principles enunciated by the Convention are those I have cherished in the past and shall endeavor to maintain in the future.

The thirteenth, fourteenth, and fifteenth amendments to the Constitution of the United States, embodying the result of the war for the Union, are inviolable. If called to the Presidency I shall deem it my duty to resist, with all my power, any attempt to impair or evade the full force and effect of the Constitution, which, in every article, section, and amendment, is the supreme law of the land. The Constitution forms the basis of the Government of the United States. The powers granted by it to the legislative, executive, and judicial departments define and limit the authority of the General Government. The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, belong to the States respectively, or to the people. The General and State Governments, each acting in its own sphere without trenching on the lawful jurisdiction of the other, constitute this Union. This Union, comprising a General Government with general powers, and State governments with State powers for purposes local to the States, is a political system, the foundations of which were laid in the profoundest wisdom. This is the Union our fathers made, and which has been so respected abroad and so beneficent at home. Tried by blood and fire, it stands to-day a model form of free popular government, a political system which, if rightly administered, has been, and will continue to be, the admiration of the world. May we not say, nearly in the words of Washington: "The unity of government which constitutes us one people is justly dear to us. It is the main pillar in the edifice of our real independence, the support of our peace, safety, and prosperity, and of that liberty we so highly prize and intend at every hazard to preserve"? But no form of government, however carefully devised, no principles, however sound, will protect the rights of the people unless the Administration is faithful and efficient.

It is a vital principle in our system that neither fraud nor force must be allowed to subvert the rights of the people. When fraud, violence, or incompetence controls, the noblest constitutions and wisest laws are useless. The bayonet is not the fit instrument for collecting the votes of free men. It is only by a full vote, free ballot, and fair count, that the people can rule in fact, as required by the theory of our Government. Take this foundation away, and the whole structure falls. Public office is a trust, not a bounty bestowed upon the holder. No incompetent or dishonest person should ever be intrusted with it, or, if appointed, he should be promptly ejected.

The basis of substantial, practical, civil-service reform must first be established by the people in filling elective offices. If they fix a high standard of qualifications for office, and sternly reject the corrupt and incompetent, the result will be decisive in governing the action of the servants whom they intrust with the appointing power.

The war for the Union was successfully closed more than fifteen years ago. All classes of our people must share alike in the blessings of the Union, and are equally concerned in its perpetuity, and in the proper administration of public affairs. We are in a state of profound peace. Henceforth let it be our purpose to cultivate sentiments of friendship, and no animosity against our fellow-citizens.

Our material interests, varied and progressive, demand our constant and united efforts. A sedulous and scrupulous care of the public credit, together with a wise and economical management of our governmental expenditures, should be maintained, in order that labor may be lightly burdened, and that all persons may be protected in their rights to the fruits of their own industry.

The time has come to enjoy the substantial benefits of reconciliation. As one people we have common

interests. Let us encourage that harmony and generous rivalry among our own industries which will revive our languishing merchant marine, extend our commerce with foreign countries, assist our merchants, manufacturers, and producers to develop our vast natural resources, and increase the prosperity and happiness of our people.

If elected I shall, with the divine favor, labor with what ability I possess to discharge my duties with fidelity according to my convictions, and shall take care to protect and defend the Union, and to see that the laws are faithfully and equally executed in all parts of the country alike. I will assume the responsibility, fully sensible of the fact that to administer rightly the functions of government is to discharge the most sacred duty that can devolve upon an American citizen. I am, very respectfully,

WINFIELD S. HANCOCK.

The canvass was conducted with considerable warmth and activity, although the leading questions of reform or change in administration and policy entered into the contest to only a slight degree. The issues of the past and the contest of sections were still dwelt upon, and the resources of political management were brought into full play to secure the result. Some incidental and confusing use was made of the question of protection of home industry and that of restricting Chinese immigration, but they were not directly in issue. (For the forged "Chinese letter," see New York.)

The election took place on the 2d of November, and the result of the popular vote in the several States was as follows:

STATES.	Garfield (Republican)	Hancock (Democrat)	Weaver (Green.)	Dow (Prohib.)
Alabama.....	56,221	91,185	4,642	...
Arkansas.....	42,436	60,775	4,079	...

The plurality of Garfield over Hancock, as shown in these returns, was 3,033; but in the whole vote the majority against the former was

316,708. In addition to the votes summed up in the table, there were 707 for the American or Antimason ticket, and 989 imperfect and scattering. In Louisiana there were two Garfield tickets, the "regular" and the "Beattie" ticket. The former received 27,676 and the latter 10,340 votes. In Maine the Hancock vote was cast for a "Fusion" ticket, consisting of four Greenbackers and three Democrats, but there was also a straight Greenback ticket. In Virginia there were two Hancock tickets, that of the regular Democrats and that of the "Readjusters." The former received 96,912 and the latter 31,674 votes.

The electoral votes of the several States were cast on the 6th of December, with the exception of those of Georgia, which, in accordance with a State law, were cast on the second Wednesday of that month. The votes were as follows:

STATES (38).	PRESIDENT.		VICE-PRESIDENT.		Total.
	Garfield.	Hancock.	Arthur.	Englsh.

A decision of the Supreme Court, rendered in March, upholds the constitutionality of the law under which a State Judge may be indicted and punished for excluding colored citizens from jury-lists. The case arose in Virginia, where Judge Rives, of the United States District Court, had directed his grand jury to find indictments against State Judges charged with this offense. Judge Coles, of the State Court, who had been indicted and placed under arrest, denied the jurisdiction of the Federal Court, and refused to give bail. The case was brought before the Supreme Court, by an

application for a writ of *habeas corpus*, with a view to testing the validity of the act of March 4, 1879. The Court refused the application, and held that the act under which Judge Coles was indicted was authorized by the thirteenth and fourteenth amendments of the Constitution, Justice Strong delivering the opinion. Justices Clifford and Field dissented, the latter arguing that nothing can be found in the Constitution or its amendments which authorizes any interference by Congress with the States in the administration of their government and the enforcement of their laws, with respect to any matter over which jurisdiction was not surrendered to the United States. Nothing, in his judgment, could have a greater tendency to destroy the independence and autonomy of the States, and reduce them to a humiliating and degrading dependence upon the Central Government, engender constant irritation, and destroy that domestic tranquillity which it was one of the objects of the Constitution to insure, than the doctrine asserted in this case—that Congress can exercise coercive authority over the judicial officers of the States in the discharge of their duties under State laws. It will be only another step in the same direction toward consolidation, when it assumes to exercise similar coercive authority over the Governors and legislators of States.

Another decision, rendered on the 8th of March, upheld the validity of the Federal election laws. Certain election officers in Baltimore had been convicted in the United States Circuit Court and imprisoned, for interfering with the Federal supervisors of election and deputy-marshals in the discharge of their duties. The case was brought before the Supreme Court by a petition for writs of *habeas corpus* and *certiorari*, on the ground that the provision of the Federal election laws, under which the State officers were indicted, were unconstitutional. Justice Bradley delivered the opinion of the Court, and held—

1. That the Federal election laws are constitutional and valid.
2. That Circuit Courts have jurisdiction of indictments under these laws.
3. That, under the Constitution, Congress has supervisory power over regulations made by a State for the management of Congressional elections, and may either alter, modify, or add to them entirely new regulations.
4. That in the exercise of such supervisory power Congress may impose new duties on officers of election, or additional penalties for breach of duty, or provide for the attendance of officers to prevent frauds and see that elections are legally and fairly conducted.
5. That the exercise of such power can properly cause no collision of regulations or jurisdiction, because the authority of Congress over the subject is paramount and supersedes all inconsistent regulations of a State.
6. That there is nothing in the relation of the State and national sovereignties to preclude the coöperation of both in the matter of elections of representatives.
7. That Congress has power, under the Constitution, to vest in Circuit Courts the appointment of supervisors of elections.
8. That the provision which authorizes deputy-mar-

shals to keep the peace at elections is not unconstitutional, and that the national Government has the right to use physical force in any part of the United States to compel obedience to its laws.

9. That the supervisory power of Congress includes the power to compel State officers of elections to observe such State laws, with regard to the election of representatives, as Congress may have left unchanged.

Justices Clifford and Field dissented in this case also, the latter submitting an elaborate opinion, in which he maintained that it is not competent for Congress to punish a State officer for the manner in which he discharged the duties imposed upon him by State laws. The judicial power of the Government, he argued, is limited by the Constitution to "cases in law and equity arising under the Constitution and laws of the United States," and to certain other cases which the Constitution enumerates. It can not be enlarged by Congress so as to embrace cases not enumerated by the Constitution. Furthermore, the Federal law to punish a State officer for the manner in which he performs a duty imposed upon him by his State asserts a power inconsistent with and destructive of the independence of the States in matters over which their authority has never been surrendered. If the Federal Government can punish the violation of the laws of a State, it may also punish obedience to them, and graduate the punishment according to its own judgment of their propriety and wisdom. It may thus exercise supervision over the legislation of States, subversive of all their reserved powers. If the Federal Government can do this, the tenth amendment is a delusion, and the States may at any time be degraded to the level of municipal corporations, existing at the will of Congress.

The Commissioners Plenipotentiary sent to China for the purpose of negotiating a treaty which should restrict immigration from that empire to the United States, concluded their negotiations with the signature of two treaties at Peking, on the 17th of November, one of which was of a commercial character only. The most important feature of the latter is a prohibition of all participation by American citizens or American vessels in the opium-traffic. The following is the text of the treaty which relates to immigration :

Whereas, In the eighth year of Heen-fung, Anno Domini 1858, a treaty of peace and friendship was concluded between the United States of America and China, to which were added, in the seventh year of Tung Chih, Anno Domini 1868, certain supplementary articles to the advantage of both parties, which supplementary articles were to be perpetually observed and obeyed ; and

Whereas, The Government of the United States, because of the constantly increasing immigration of Chinese laborers to the territory of the United States, and the embarrassments consequent upon such immigration, now desires to negotiate a modification of the existing treaties, which shall not be in direct contravention of their spirit :

Now, therefore, the President of the United States of America has appointed James B. Angell, of Michigan ; John F. Swift, of California ; and William Henry Trescott, of South Carolina, as his Commissioners

Plenipotentiary, and his Imperial Majesty the Emperor of China has appointed Pao Chun, a member of his Imperial Majesty's Privy Council, and Superintendent of the Board of Civil Office, and Li Hung Tsao, a member of his Imperial Majesty's Privy Council, as his Commissioners Plenipotentiary ; and the said Commissioners, having conjointly examined their full powers, and having discussed the points of possible modification in existing treaties, have agreed upon the following articles in modification :

ARTICLE I. Whenever, in the opinion of the Government of the United States, the coming of Chinese laborers to the United States, or their residence therein, affect, or threaten to affect, the interests of that country, to endanger the good order of the said country, or of any locality within the territory thereof, the Government of China agrees that the Government of the United States may regulate, limit, or suspend such coming or residence, but may not absolutely prohibit it. The limitation or suspension shall be reasonable, and shall apply only to Chinese who may go to the United States as laborers, other classes not being included in the limitation. Legislation taken in regard to Chinese laborers will be of such a character only as is necessary to enforce the regulation, limitation, or suspension of immigration, and immigrants shall not be subject to personal maltreatment or abuse.

ART. II. Chinese subjects, whether proceeding to the United States as teachers, students, merchants, or from curiosity, together with body and household servants, and Chinese laborers who are now in the United States, shall be allowed to go and come of their own free-will and accord, and shall be accorded all the rights, privileges, immunities, and exemptions which are accorded to the citizens and subjects of the most favored nation.

ART. III. If Chinese laborers or Chinese of any other class, now either permanently or temporarily residing in the territory of the United States, meet with ill-treatment at the hands of any other persons, the Government of the United States will exert all its power to devise measures for their protection, and to secure to them the same rights, privileges, immunities, and exemptions as may be enjoyed by the citizens or subjects of the most favored nation, and to which they are entitled by treaty.

ART. IV. The high contracting powers having agreed upon the foregoing articles, whenever the Government of the United States shall adopt legislative measures in accordance therewith, such measures will be communicated to the Government of China. If such measures, as enacted, are found to work hardships upon the subjects of China, the Chinese Minister at Washington may bring the matter to the notice of the Secretary of State of the United States, who will consider the subject with him ; and the Chinese Foreign Office may also bring the matter to the notice of the United States Minister at Peking, and consider the subject with him, to the end that mutual and unqualified benefit may result.

In faith whereof, the respective plenipotentiaries have signed and sealed the foregoing at Peking, in English and Chinese, being three originals of each text, of even tenor and date, the ratifications of which shall be exchanged at Peking, within one year from the date of its execution.

Done at Peking, this 17th day of November, in the year of our Lord 1880, Kuang Tsu, sixth year, tenth moon, fifteenth day.

JAMES B. ANGELL,

JOHN F. SWIFT,

WILLIAM HENRY TRESCOTT,

Signatures of Chinese Commissioners,

Both treaties await ratification by the Senate.

(For matters pertaining to national and international trade, see COMMERCE ; for condition of military and naval forces, see ARMY and NAVY, respectively ; for financial movements

and operations, see FINANCES; for matters of domestic policy and internal affairs, see CONGRESS, PUBLIC DOCUMENTS, and the several States under their respective names.)

UNIVERSALISTS. The Board of Trustees reported to the General Convention in October, 1880, that the statistical returns they had received were more nearly full than ever before; those from New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, Illinois, Wisconsin, and Minnesota were complete, and those from New Jersey, Pennsylvania, Ohio, and Kentucky substantially so. No returns had been received from Missouri or Georgia. The following is the summary of the statistics, the numbers in parishes not reporting being estimated:

STATES.	Parishes.	Families.	Church-members.	Members of Sunday-schools.
Maine.....	72	3,499	1,412	5,041
New Hampshire.....	89	1,821	735	1,758
Vermont.....	66	2,711	1,594	2,749
Massachusetts.....	113	9,904	6,120	15,731
Rhode Island.....	3	591	655	1,418
Connecticut.....	15	1,057	925	1,590
New York.....	187	5,634	6,477	7,734
New Jersey.....	9	345	189	1,300
Pennsylvania.....	36	941	1,558	2,025
Maryland.....	2	149	814	814
District of Columbia.....	1	95	70	...
Georgia.....	13	80	307	163
Alabama.....	12	183	349	...
Ohio.....	110	2,905	5,136	4,265
Michigan.....	32	833	532	1,302
Indiana.....	55	733	2,213	1,603
Illinois.....	65	2,638	2,390	3,151
Wisconsin.....	24	567	445	761
Minnesota.....	9	392	342	601
Iowa.....	34	1,050	665	1,467
Kansas.....	5	127	71	187
Nebraska.....	2	40	...	50
Dakota Territory.....	1	30	...	50
Colorado.....	1	20	...	20
Kentucky.....	8	225	410	65
Province of Quebec.....	5	123	199	67
Nova Scotia.....	1	71	...	100
Oregon.....	10	150	332	...
Wyoming Territory.....	4	100	119	...
Total.....	889	37,209	33,579	53,512

The total amount of property owned by the churches above the amount of indebtedness was \$6,752,100; the total amount of expenditures for church purposes was \$1,180,997. The receipts of the Board of Trustees had been \$15,275. The Murray Centenary Fund amounted to \$121,757. The indebtedness of the Convention had been reduced from \$15,120 to \$11,631. The J. G. Gunn Ministerial Fund amounted to \$8,152. The Woman's Centenary Association had received during the year \$1,329, and had a permanent fund of \$2,150. The Publication and Tract Committee had distributed 587,000 pages of tracts and large numbers of denominational papers and books throughout the United States, and in Scotland, Mexico, Central America, and Australia. The Trustees had obtained a charter under the laws of Massachusetts in

order to gain greater freedom in investments than they enjoyed under their charter from New York. A number of local missions were supported, including one among the Indians. A communication had been received from the Universalist Convention in Scotland asking for the fellowship of the General Convention. The Convention did not contemplate extending formal fellowship to ecclesiastical bodies beyond the limits of America, but made an expression of sympathy and fraternal interest toward the Scottish Convention. The special scholarship fund amounted to \$7,215; forty students had been aided from it.

The *General Convention* of Universalists met at Hudson, N. Y., October 20th. Mr. J. D. W. Joy, of Massachusetts, was reelected President. A report of the Board of Trustees on pastoral settlements showed that a large number of the parishes were idle; that the average length of pastoral terms was short; and that a large amount of church property was suffering through neglect. The action of the Trustees in withholding beneficiary aid from students who use tobacco was approved. A committee appointed by the previous General Convention on the subject of the International Sunday-school Lessons reported that these Lessons were generally approved in Universalist Sunday-schools, that they were received with favor and taught with good results. A minority report, signed by one member, urged that the Lessons were subject to the objection that they were selected by a body in which Universalists were not represented, and that Universalists might make a selection more suitable to themselves. Both reports were accepted. An earnest debate took place over a proposition to modify the Confession of Faith by substituting, instead of the present form, for the words, "will finally restore the whole family," in Article II, words which shall make the sentence read: "We believe there is one God, whose nature is Love, revealed by one Holy Spirit of Grace in one Lord Jesus Christ, through whom the whole family of mankind will finally attain holiness and happiness." The proposition was indefinitely postponed. It was ordered that proceedings for the restoration of clergymen who have been disfellowshipped shall take place on the application of the party himself, but not until after the lapse of three years. Restoration may take place on the concurrence of two thirds of the Board of Trustees of the General Convention with the favorable action of the Committee of Fellowship. It was decided that ordination shall not be conferred within one week of the meeting of the Council ordering it; that the authority to ordain be confined to judicial bodies duly appointed; and that one of the Committee of Fellowship shall at the ordination give fellowship in due form.

V

VERMONT. The Vermont Republicans assembled in State Convention at Montpelier, on February 25th, for the selection of four delegates at large to the National Republican Convention, which was to assemble at Chicago on June 2d. The Convention was numerously attended, above five hundred members being present; and, as soon as it had been organized, the following resolution was adopted by a unanimous vote:

The Republicans of Vermont present to the Republicans of the country George F. Edmunds as a suitable person to be made the candidate of the Republican party for the next President. We do this not wholly or chiefly from our State pride in a man whose public service has been so honorable to the people whom he has represented, but because his pure life, his eminent ability, his valuable public service, and his unflinching Republicanism, have marked him, by a higher title than the accident of birthplace or residence, as a person fit to be President of the United States. Himself a representative of what the Republican party ought to hold as its most precious possession, an unwavering fidelity to the principles upon which the party was built and has won its great reputation, and of the intellectual power and moral sense and courage through which alone it can preserve what it has so worthily achieved, his candidacy would be of itself a declaration of principles and the sign of success.

The four delegates appointed to the Chicago Convention were, John Gregory Smith, of St. Albans; John W. Stewart, of Middlebury; Frederick Billings, of Woodstock; and George W. Hooker, of Brattleboro.

The following resolutions were adopted:

Resolved, That the Republican party, organized in the interest of freedom and equal rights, has established its right to live, not only by carrying the nation through the most gigantic civil war in history, but by successful maintenance of the theory that this is a nation and not a mere confederation of independent sovereignties; by the payment of nearly eight hundred millions of the public debt; by the accomplishment of a return to a specie basis of the currency, and by important retrenchments and economies in the administration of the Government.

Resolved, That the developments of the past four years, in the disclosures of plots to subvert the choice of the people in the election of a President by bribery of electors; in the practical overthrow of popular government in seven States of the Union by terrorism and ballot-box frauds, and in the recent desperate attempt to steal the State government of Maine, as part of a scheme to taint the vote of the State in the next electoral college, furnish occasion for just alarm on the part of friends of a republican form of government; and that all honest and patriotic citizens should resist these tendencies to anarchy, and put the stamp of their condemnation on such practices, by their votes at the polls.

Resolved, That the Republican party must be sustained, as the only effective barrier to the success of such treasonable schemes, and as the efficient supporter of the national unity, credit, and honor, until free thought, free speech, a free press, protection of the person, property, and civil rights of the citizen in any part of the Union in which he sees fit to reside, irrespective of color, party, or religion, and the right

of every voter to cast one free, unmolested ballot at each election, and to have it honestly counted, shall be established throughout the length and breadth of the Union.

Resolved, That while we record our firm determination that the results of the war for the Union shall not be lost, we have no hatred toward our brethren of the South. We ask of them only what we hold ourselves bound to render—obedience to law, maintenance of order, equality of rights, and acceptance of the fair rule of the majority in elections; and for all who honestly accept these fundamental principles of democratic government we have only the kindly and fraternal feeling which should animate the citizens of one nation.

Resolved, That we commend the Administration of President Hayes for its successful resistance to the attempts of the Democratic party in Congress to subvert the independence of the constituent departments of the Government, and to coerce the President into the signing of bills making important changes which he could not approve; for its support of honest money and a currency of intrinsic value; and for its efforts to purify and keep clean the public service.

Resolved, That we welcome every well-directed effort to raise the standard of official and personal character in the public servants and representatives, and to elevate the civil service by making the choice and retention of public officials dependent on honesty, capacity, and fidelity, rather than on the caprice of personal favor of Congressmen and heads of departments.

A resolution was offered, "directing the State Committee in the future to call the State Conventions for the selection of the whole delegation from the State."

The Republicans convened at Burlington, on June 23d, to nominate their candidates for State officers and two Presidential electors, for the State at large, which resulted as follows: For Governor, Roswell Farnham, of Bradford; for Lieutenant-Governor, John L. Barstow, of Shelburne; for State Treasurer, John A. Page, of Montpelier. For Presidential electors at large, William W. Wynde, of Brattleboro, and William Y. W. Ripley, of Rutland, were nominated.

The Committee on Resolutions reported the following, which were adopted as the platform of the Convention:

Resolved, That we, the Republicans of Vermont, in State Convention assembled, do hereby adopt as our platform of principles for the coming campaign the platform adopted by the National Republican Convention at Chicago.

Resolved, That with Farnham, Barstow, and Page as our standard-bearers, the State of Vermont hereby pledges to her sister Commonwealths to give her accustomed Republican majority in September, to be followed in November only by a greater and grander victory under the banner of Garfield and Arthur.

The Greenback-Labor party held their State Convention at Essex Junction, on June 24th, about fifty members being in attendance, and nominated the following ticket:

For Governor, Madison O. Heath, of Johnson; for Lieutenant-Governor, Columbus F

Clough, of Waterbury; for State Treasurer, Fletcher Tarbell, of Swanton; for Presidential electors for the State at large, G. J. Stannard, of Burlington, and J. J. Burgess, of St. Albans.

The resolutions adopted by the Convention endorse the platform and nominee of the National Labor Convention held at Chicago; call for the enforcement of the grand list laws, for the equalization of taxes, and for cutting down officers' salaries. They also endorse the nominations previously made for State officers.

The Vermont Democrats assembled in State Convention at Burlington on July 22d, and made the following nominations: For Governor, Edward J. Phelps, of Burlington; for Lieutenant-Governor, George W. Gates, of White River Junction; for State Treasurer, James H. Williams, of Bellows Falls; for Presidential electors at large, Cyrus Jennings, of Hubbardston, and Joseph W. Bliss, of Bradford.

The platform adopted by the Convention endorsed the platform of the National Democratic Convention at Cincinnati, and ratified its nominations; pledged hearty support to the Democratic State ticket, and commended it to the suffrages of the people of Vermont; called for a purer and more economical administration of State affairs, and hailed with satisfaction the wish of the people to get rid of the Republican rule which has so long controlled the State. The resolutions in regard to the specific subjects of State expenditures and taxation were as follows:

Resolved, That we denounce that policy of profligacy in the State government which has increased our State tax from seventeen to forty cents on the dollar of the grand list in the past twenty-five years, and has swollen the strictly current State expenses, which were only \$160,000 in 1856 and only \$279,000 after the war, to nearly or quite \$400,000 since.

Resolved, That all classes should contribute to the expenses of supporting the Government in proportion to their material wealth. We therefore demand such legislation as shall make taxation both equal and effectual.

Resolved, That all property which the law protects ought to bear its just share of the expenses of that protection. Therefore we demand that the corporate wealth of the State be taxed in equal proportion with the property of the farmer, merchant, mechanic, and day-laborer; and that all laws which specially exempt the property of any business interests should be repealed.

A resolution calling for the enactment of an anti-prohibitory law in the State was proposed by some among the members of the Convention, and its insertion in the foregoing platform recommended; but the motion did not prevail.

At the election in September for State officers and Congressmen, as in that of November 2d for Presidential electors afterward, the Republican nominees were generally elected by great majorities. The entire number of votes polled in the State for Governor was 70,684, of which 47,848 were cast for the Republican candidate, 21,245 for the Democratic, 1,578 for the Greenback-Labor, and 13 scattering. At the district elections for Congressmen the

majorities of the Republican candidates over the Democratic exceeded the proportion of two to one, they having been 15,645 to 6,711—15,960 to 6,698—12,253 to 6,191, respectively. As to the members-elect of the State Legislature, the 30 Senators were all Republicans, and of the 236 Representatives 217 were also Republicans. In the previous Legislature, the Democrats had one Senator, and 43 Representatives in the Lower House, where the Greenbackers also had 9, and the Independents 5.

The Legislature assembled at Montpelier on October 6th, when both Houses were speedily organized by the election of their respective officers.

On October 20th George F. Edmunds was reelected a Senator in Congress for the full term of six years from March 4, 1881.

For the election of the seven Judges of the Supreme Court, the two Houses held joint conventions on November 11th and December 3d, when the following persons by a *viva voce* vote, and one by ballot, were elected: For Chief-Justice, John Pierpoint, of Vergennes; for First Assistant Justice, Homer E. Royce, of St. Albans; second, Timothy P. Redfield; third, Jonathan Ross, of St. Johnsbury; fourth, H. Henry Powers, of Morrisville; fifth, Wheelock G. Weazey, of Rutland; sixth, Russell S. Taft, of Burlington.

The State of Vermont is free from debt. Her assets at the close of the last fiscal year amounted to \$235,074.35, made up of \$213,840.82 ready cash in the Treasury and in banks; \$17,375.79 due from savings-bank taxes; and \$3,857.74 due on State tax of 1879. Her aggregate liabilities at the same date were \$185,971.69; of which sum, \$135,500 of the Agricultural College fund will not fall due before 1890, and \$11,519.96 due to towns.

The entire number of depositors in the savings-banks and trust companies within the State on July 1, 1880, was 34,869, or 2,214 more than at the same date in 1879. Their deposits amounted in the aggregate to \$9,075,314.39, showing an increase of \$996,568.58 over the deposits of the previous year. The tax of one half of one per cent., laid on these corporations by an act of the Legislature of 1878, has given the State an income of \$50,126.04 during the eighteen months in which that law has been in force.

The education of youth in the State has continued in about the same condition as previously.

In the University of Vermont and State Agricultural College, the number of undergraduates in the academical department during the year 1878-'79 was 82, and in the medical department 140 students; during the year 1879-'80 the undergraduates numbered 81; the medical students 143. The works among the farmers, executed by the university in connection with the Superintendent of Agriculture, in these two years, have proved successful.

This institution is very economically man-

aged by its trustees, who keep the expenses within the income. They aver in their report that its condition and usefulness are, for want of means, much below the plane on which it might and ought to stand, saying, among other things, "The satisfactory balance-sheet must not be suffered to disguise the fact that the higher education in Vermont is suffering, because the State University has not sufficient means to do its work as that work is done in other States." This is believed to be the chief reason why a large number among the studious youth of Vermont go away from home to seek elsewhere that instruction in various branches of knowledge which they can not receive in their own State. During the academical year 1877-'78 there were in Dartmouth College 98 students from Vermont—60 academical, 14 scientific, and 24 medical students.

The charitable, reformatory, and penal institutions of the State are under good management generally, and accomplish their special objects. The blind, deaf-mutes, and feeble-minded children are kept in neighboring States where institutions for their instruction have been established—the Perkins Institution for the Blind, the American Asylum and Clarke Institute for Deaf-Mutes, the Massachusetts School for Idiotic and Feeble-minded Youth. For their support and education, the annual sums of \$4,000, \$5,000, and \$2,000 are respectively appropriated. The officers of the above-mentioned institutions give satisfactory reports on the conduct and proficiency of the Vermont children under their care, and testify that some among them are considerably above the average in comparison with their fellow-pupils.

In the State Reform School for the correction of youth the number of inmates on July 31, 1880, was 122—boys 103, girls 19. At the same date in 1878 they were 122 and 33 respectively, or in all 33 more than in 1880. The commitments during the year were boys 22, girls 3; and all the commitments since the establishment of the school have been 619—the age of the offenders committed ranging from six to nineteen years. The expenses of the school for the two years ended July 31, 1880, amounted to \$39,384.25. The net earnings were \$4,953.32; the total receipts, \$13,647.11; leaving to the State's charge a deficiency of \$25,737.14, which is \$9,262.86 less than the sum appropriated for the school.

The State Prison was personally inspected by Governor Proctor, soon after entering office in October, 1878, and from what he saw, as well as on other evidence, he found it in a very unsatisfactory condition, for lack of discipline, and of system in its management under the superintendent who had it in charge. Seeing the necessity of appointing a new superintendent, possessed of rare experience in such matters, and of other uncommon qualifications in regard to personal character, and finding no such man in Vermont, he appointed one from a neighboring State. The number of convicts

therein detained at the beginning of October, 1880, was 142.

Governor Farnham ascribes the decrease in the number of convicts partly to a proportion of them being received in the House of Correction, "but principally to a great decrease in high crime in the State"; although, while speaking in the same message on the subject of public education, and its necessity as a means of diminishing the number of criminals, he avers that the State does not do her whole duty in that regard, and acknowledges that crime is of native growth in Vermont, and not imported, saying: "In 1878 there were sixty-eight commitments to the State Prison; of these, thirty-one were natives of Vermont, and only thirteen foreigners. I use the statistics of 1878, because I have not those of 1880 at hand. In 1878 there were one hundred and eighty-six convicts in the State Prison; of these, seventy-two were natives of Vermont, and only thirty-nine of foreign birth. Surely, we can not charge the crimes of our State upon the uneducated foreigners who come to our shores."

The militia of Vermont is apparently a small force, consisting of one regiment and a portion of one battery, but in excellent condition as to discipline and presumable efficiency if called upon for active service, while it costs very little to the State.

The number of divorces granted in Vermont during the year 1879 was one hundred and twenty-six, or in the proportion of one to twenty-one marriages, which is less than in any year since 1865, and one third less than in 1878, when they numbered one hundred and ninety-two, in the proportion of one divorce to fourteen marriages. This desirable decrease in the number of divorces is ascribed to the operation of the law enacted at the session of 1878 "in restraint of divorces."

The aggregate population of Vermont in 1880, as appears from the census, is 332,648, showing an increase of 2,097 during the ten previous years, her population in 1870 having been 330,551.

A most noteworthy event of the year for Vermont seems to be the completion of the "Revision of the State Laws," enjoined by an act of the Legislature passed for that purpose at the session of 1878, the mode and objects of the revision being accurately expressed in the first section of the act, as follows:

SECTION 1. The Governor is hereby authorized and directed to appoint two commissioners, whose duty it shall be to revise, redraught, compile, consolidate, and arrange in methodical order, in plain and simple language, the public statutes of this State, upon the basis, plan, and general form of the general statutes, with authority to omit redundant enactments, reject superfluous words, circuitous and ambiguous phraseology, recommend amendments, and condense the whole into as concise and comprehensive form as is consistent with a full and clear expression of the will of the Legislature, and report the same to the General Assembly at its next biennial session.

Governor Proctor appointed, as such Commissioners, Charles W. Willard and Wheelock

G. Weazey. During the work of the revision, Mr. Willard died, yet at a time when the greater part of it had been perfected, and the rest so far advanced that Mr. Weazey, assisted chiefly by Ashton R. Willard, son of the deceased Commissioner, and well acquainted with the whole scope of the revision, and with the views entertained about it by his father, to whom he had been a constant assistant, has in due time completed the work, and reported on it as the act prescribes.

VIRGINIA. The Legislature of this State closed its session of 1879-'80 by final adjournment on March 9th, having passed during its continuance a large number of acts and joint resolutions, mostly of private or local interest.

The most important bill of general interest passed by the Legislature at this session, but prevented from becoming a law by the Governor's veto, was the Senate bill 176, entitled "An act to reestablish the public credit of the State," purporting to repudiate above \$13,000,000 of the hitherto acknowledged principal of the State debt; to cut off one half of the promised interest upon the residue, and to make nearly all of the residue itself depend on the State, city, and county taxation. This bill passed the Senate on February 11th, by a vote of yeas 23, nays 17. The House of Representatives passed it on February 26th, with an amendment, as reported from its Committee on Finance two days before, striking the thirteenth section out of the original bill and inserting a new one instead, which amendment was agreed to by the Senate at the night session of March 1st, upon the motion and remarks made for that purpose by the author of the bill; the vote on agreeing to the House amendment having stood—yeas 24, nays 11.

The Governor, to whom this bill was submitted for his approval, returned it to the Senate, accompanied with a communication setting forth his objections in detail, and concluding as follows:

I can not put my signature in approval to this bill. I respectfully return it to your honorable body in which it originated, because I believe it to be in violation of the Constitution of the State, in violation of the Constitution of the United States, in violation of the spirit which has ever moved and inspired the traditions of the Commonwealth and made her name so honored among men.

The veto was sustained by the Senate on March 8th, as the number of votes for passing the bill over it fell short of the required two thirds—being yeas 19, nays 16. That portion of Governor Holliday's message to the Legislature respecting the said bill in which he officially states the cause and origin of the debt, the benefits accrued, and still accruing, to the State and her people from its having been contracted, and the solemn declarations whereby she has repeatedly recognized it and promised to pay—principal and interest—was as follows:

For many years our Commonwealth enjoyed the rich bounties of her climate and soil, satisfied that her people should live in inherited comfort and refinement,

and that her sons should be the leaders of political thought upon the continent. The time came when activities operating upon other sections of the country impelled her to arouse herself, lest with her great resources she should be left behind in the march of material development. She inaugurated a system of internal improvements, and, for the purpose of effecting them, went into the market and borrowed large sums of money, of which she expended more than \$34,000,000 in their construction within her present borders. For these sums of money so borrowed she executed her bonds, and as the basis of credit as far back as 1838, pledged "the faith of the State to provide sufficient funds, and for that purpose to levy adequate taxes." This was the origin of the debt, the consideration of which survives to this day in our midst, increasing manifold the values of the property; indeed, without which, great portions of Virginia would be a waste. It will not be denied that its origin was most laudable and wise, and worthy of the faith the Commonwealth had pledged. She had no trouble in getting the money, for the part she had always played in peace and in war gave her a name the very synonym of honor.

She fulfilled her promises, and promptly paid the interest as it fell due till the war came, and with it its attendant devastations and woes. While it lasted, she was cut off from numbers of her creditors who were scattered in this country and Europe, and the interest failed to be met. But no sooner was peace proclaimed than a General Assembly, composed of her best citizens—men of the old *regime*—unanimously reaffirmed the obligation. This was repeated in one form or another not less than four times. For several years she was under military rule, but when permitted to vote she adopted by an immense majority, 210,585 for, to 9,136 against—about 23 to 1—a Constitution, which fully admitted the sanctity of the debt, and in many clauses provided for its payment. The earliest General Assembly under that Constitution made provision for it, and passed a funding bill which likewise recognized it in its entirety. This bill, as to one of its features, was repealed at the next session, but without disputing in any way the amount of the debt. So events moved on, with frequent repetition of these views, till the fall of 1877 a General Assembly was elected solely upon this issue. They went diligently to work, and during the first session settled over again, after long, able, and heated discussion, those mooted questions—the war and reconstruction, interest, and the *quantum* of the debt—and at its second session passed, by a large majority, a bill which was based upon the consent of the creditors, and was regarded by the outside world as honorable and fair.

No bill of force ever became a law, and the act of the last Legislature brought the debt within the present rate of taxation. In the annual message sent a few weeks ago to your honorable body I show how the law was working admirably, and but for the impediments thrown in its way would have been a complete success, and with the present revenues would in a short time have discharged the annual expenses of government, and of the public free schools, the interest on the State debt funded in the new bonds, and left a large surplus in the Treasury.

The funding, of course, has ceased in presence of this opposition, and a majority of this General Assembly propose to abrogate its provisions.

The Republican party of Virginia, represented by some 140 delegates, met in State Convention at Staunton on April 22d, to select delegates to the National Republican Convention to be held at Chicago on June 3d, and also to nominate candidates for Presidential electors. The nomination of an electoral ticket at this time was opposed by a large proportion of the delegates in attendance, who would have it remitted to a future Convention called for

that purpose. But no sooner was the Convention organized than a delegate offered three resolutions: the first, endorsing U. S. Grant; the second, instructing the delegation to Chicago to vote as a unit for Grant; the third, declaring the inexpediency of nominating an electoral ticket at that time, and empowering the State Central Committee, hereafter to be appointed, to call a convention for the 28th of July to nominate an electoral ticket. These resolutions were referred for consideration to a committee, who subsequently reported on them, and at the same time presented two minority reports, both advocating the nomination of an electoral ticket now and by this Convention.

This view of the subject finally prevailed, but the apparently irreconcilable opposition of large numbers of delegates upon that point was the cause of very heated and stormy debates, almost uninterruptedly continued for two days and nights, till five o'clock in the morning of April 24th, when the following resolutions were adopted:

1. *Resolved*, That no elector shall be placed upon the Republican electoral ticket who is not pledged to support the Republican nomination made at Chicago.
2. *Resolved*, That the Convention now proceed to nominate and elect our full electoral ticket.

These resolutions had been offered by a delegate on the previous day, and signed also by the President of the Convention, with three more among the most prominent delegates, and the sentiment manifested in the adoption of either was remarkably different. The first resolution was adopted unanimously; the second by a very small majority, the votes on it having been 69 for and 61 against.

The nomination of Presidential electors and the selection of delegates to the Chicago Convention were then successively acted upon, with the following results:

For electors at large: W. C. Wickham, of Hanover, and J. M. Dawson (colored), of Williamsburg, were nominated unanimously.

For district electors: first district, L. R. Stuart, of Richmond County; third, John W. Poindexter, of Louisa; fourth, William P. Austin, of Lunenburg; fifth, Asa T. Whitlock, of Floyd; sixth, Samuel Collier, of Amherst; seventh, E. W. Early, of Albemarle; eighth, A. W. Harris, of Alexandria; ninth, H. H. Flanagan.

The selection of the second district elector was by resolution remitted to a Congressional convention of that district, subject to the conditions imposed by the Convention.

For delegates to the Chicago Convention from the State at large: D. S. Lewis, Peter J. Carter, John W. Poindexter, and Joseph Jorgensen.

The Democrats held their State Convention at Richmond on the 29th of May, the meeting being very numerous attended, and most harmonious in its proceedings. For delegates to the National Democratic Convention which

was to assemble at Cincinnati on June 22d, and for Presidential electors representing the State at large, those were declared appointed or nominated who at the ballots taken for the purpose had received the highest numbers of votes among the competitors.

For Presidential electors at large: John Echols, of Augusta, and P. W. McKinney, of Prince Edward.

For delegates to the Cincinnati Convention from the State at large: John W. Daniel, William Terry, James Barbour, and S. H. Moffett. Alternates: R. B. Berkeley, of Farmville, and Carson Patteson, of Buckingham.

To direct the action of these delegates, a resolution was adopted, instructing them "to oppose the abrogation of the two-thirds rule."

The platform adopted was as follows:

1. *Resolved by the Democratic party of Virginia, in convention assembled*, That we are in affiliation with the national Democracy, and will support its nominees for President and Vice-President of the United States.
2. That party lines in Federal politics should be drawn with sole reference to Federal issues.
3. That it becomes a manly people to demand of candidates for representative positions, and honest aspirants, to decide where they stand as between the two great parties of the country, and we will support for elector no person who does not manifest his adherence to the national Democracy, and its candidates on the presidential ticket.
4. That the national Democracy deserves the confidence and support of the people for its steady adherence to the principles of constitutional liberty upon which the republic was founded, and for cherishing those traditions and customs which tend to purify the public service, and restrain the encroachments of centralized power; that we endorse the general policy, and especially its course in reducing the tax on our great staple product tobacco, in maintaining the independence of the State judiciary, and the supremacy of the civil over the military power, in resisting the prostitution of the army to illegal interference in elections, and the use of a partisan and unscrupulous police to intimidate and corrupt the suffrages of the people, and in advocating liberal measures to wipe out the hostile legislation which belonged to a period of war, and has no fitting use in times of peace and reconciliation.
5. That we hold in abhorrence the high-handed and ever-to-be-remembered fraud by which the Republican party foisted a defeated candidate into the Presidential chair in contempt of a large majority of the votes of the people and of the electoral voice of the States, thereby bringing odium upon the country, and strengthening the hostility of monarchical and autocratic governments to free institutions. The time to rebuke that fraud and to vindicate the outraged sovereignty of the people has come; and without regard to any past differences between us, we invoke the honest, liberty-loving masses of the people to unite with us, and give the sentence of popular condemnation so clear and emphatic an utterance that fraud shall never again prove triumphant in undermining the Constitution and the laws, and trampling down the people's will.

The Virginia Readjusters, who once belonged to the Democratic party, and profess still to act as such, but by reason of their contrariety of sentiments, chiefly on the debt of the State, formally separated from it, and on February 25, 1879, organized themselves into a distinct body, held their State Convention at

Richmond on July 7th, above five hundred delegates being present, and nominated an electoral ticket in favor of the national Democratic nominees for President and Vice-President of the United States.

Electors for the State at large: William E. Cameron, of Petersburg, and H. H. Riddlebarger, of Shenandoah.

The following platform, expressing the unanimous sentiment of all the members of the committee appointed to draught it, was adopted by the Convention:

The Readjusters of Virginia, in convention assembled, renewing their declaration of allegiance to the principles of local self-government, and reaffirming their unalterable purpose to keep them steadily in view—

Resolved, That party lines should be drawn with sole reference to issues born of fundamental principles; and that the highest guarantees for the faithful execution of any public trust are a rigid and resolute adherence to this canon of political liberty, and a free avowal of sincere purpose to promote the welfare and maintain the legal rights of all the people of the State, neither consenting to the subordination of the one nor acquiescing in the postponement of the other, from any considerations of policy or of expediency.

2. That they reassert the right of the people, through their representatives, to exercise sovereign control of the revenues, and protest again against all devices to subordinate the support of government and the maintenance of public institutions to any other claim whatsoever; and solemnly reaffirming the principles and policy laid down by the Convention held at Mozart Hall on February 25, 1879, do hereby approve and endorse the "bill to reestablish the public credit"—upon which the people were denied the privilege of passing judgment by a partisan and arbitrary exercise of the Executive veto—as correctly embodying the same, as fairly meeting the equities of the case and the necessities of the people, and as constituting the extreme limit of legal and moral obligations upon the part of this Commonwealth to the holders of her bonds.

3. That while it is of grave importance to every interest of the Commonwealth that the question of the public debt should be finally and fairly disposed of, no settlement can have the essential feature of finality which shall lack the approval of the people; and consent will never be given by the majority, for whom this Convention is empowered to speak, to any plan which involves an increase of taxation, which creates any lien upon the revenues, which endangers the system of free education ordained by the Constitution, which includes war and reconstruction interest in computation of the debt, which recognizes any liability for that portion set aside to West Virginia, which makes or continues discrimination between different classes of the public creditors, which places the interests of State or bondholder in the keeping of agents other than the financial affairs of the Government, which relieves from taxation any property not specifically exempted by the Constitution, which converts a currency obligation into one payable in gold, or which imposes an interest liability larger than can with certainty be met out of revenues derivable from a rate of taxation not destructive of the industrial interests of the State.

4. That recognizing their obligation, and proclaiming their intention to support and obey the Federal and State Constitutions as the only sure protection of the civil and political rights of the citizen, and the only safe bulwark against encroachment upon the liberties of the residuaries of sovereignty in all popular governments, the Readjusters reiterate their purpose to vindicate and maintain the constitutional rights of the citizen to the exercise of a free and priceless suffrage.

5. That as the voice of the people is the source of all rightful power, so is the first duty of government toward securing and maintaining the popular rights and interests, and we demand at the hands of all departments of the government of Virginia an honest application of constitutional grants to the education of the children of the people, a fostering policy toward the public schools and colleges, and a full and generous recognition of the claims upon public support of the institutions for the insane and unfortunate.

6. That the paramount obligation of the various works of internal improvement is to the people of the State, by whose authority they were created, by whose money they were constructed, and by whose grace they live; and it is enjoined upon our representative and executive officers to enforce the discharge of that duty, to insure to the people of Virginia such rates, facilities, and connections as will protect every industry and interest against discrimination, tend to the development of their agricultural and mineral resources, encourage the investment of active capital in manufactures and the profitable employment of labor in industrial enterprises, grasp for our cities those advantages to which by reason of their geographical position they are entitled, and fulfill all the great public ends for which they were designed.

7. That while looking to the maintenance of the principles and accomplishment of the local objects above set forth as superior to all other considerations with which the Readjusters, as a party, have to deal, there are reasons both of duty and policy why this organization, called into existence by a majority of the people of Virginia, should control as such the voice of this State in national affairs. It is important to a successful issue of the contest in 1881 for supremacy in the Commonwealth that the representatives to and of the Federal Government from and in Virginia should not be found, as hitherto, contesting and obstructing the manifest will of a majority of this people upon domestic questions. To the end, therefore, that power may not fall into the hands of avowed enemies of the cause of readjustment, of liberal government, and of popular sovereignty, this Convention nominates a full ticket of electors, and that it recommends to the party in the several districts of the State to hold conventions and nominate candidates for seats in the Federal Congress.

And believing that the objects hitherto declared, and the interests of all the people of Virginia, are to be best subserved by the election of Hancock and English to the Presidency and Vice-Presidency of the United States, therefore further declare that the electoral ticket nominated by this Convention is instructed in behalf of those candidates, and that they are cordially commended to the earnest support of every member of this organization in Virginia.

8. That the Federal Government in every department should be administered in exact conformity with the Constitution as it is; that it is the duty of the citizen to accept in good faith the results of the war, and that the aim of statesmanship should be to establish peace and good-will between all sections of our common country and all classes of the people; that powers which are granted for the general good can not safely nor rightfully be prostituted to the fostering of classes, and the duties and privileges, the burdens and benefits, of government should be equally distributed; that the tariff and revenue systems of the Government should be reformed to the extent that no interest should be protected at the expense of another; that the Federal tax upon tobacco is an unjust discrimination against the land and labor employed in agriculture, and ought to be repealed.

9. That in the exercise of such powers as the people of Virginia may see fit to bestow upon this party in State or Federal affairs, the Readjusters stand pledged to a faithful observance of the principles and an earnest pursuit of the objects herein set forth.

The simultaneous appearance of two rival electoral tickets in the field, both apparently

Democratic, and both in favor of the national Democratic nominees for President and Vice-President of the United States, being calculated to enable the Republicans to carry the State, the State Executive Committee of the Conservative-Democratic party proposed to the State Executive Committee of the Readjusters the formation of one common electoral ticket, composed of Readjusters and Conservative-Democrats in equal numbers; to be supported by the Conservative-Democrats and Readjusters alike. The plan finally failed of success, by reason, it seems, that the Readjusters insisted on making its ultimate execution depend on conditions which the Conservative-Democracy could not assent to.

The National Democratic Committee, in an address "To the Conservative voters of Virginia," issued late in October, takes notice of the above-mentioned compromise of a fusion ticket proposed by the regular Conservatives to the Readjusters on terms of absolute equality, and defeated by the refusal of the latter to accept it; officially recognizes the electoral ticket nominated by the Conservative-Democratic Convention of May 19th; urges upon the people of the Old Dominion the hearty and united support of the May ticket; and concludes with informing them of the fact that the National Republican Committee, who had previously intended not to make a canvass in Virginia, now, deeming the discord among their political opponents irreconcilable, "announced officially their resolve to make an active and determined campaign." Upon this action of the National Democratic Committee, the chairman of the Readjusters' State Executive Committee, who was also regarded as the chief leader of the party, issued a manifesto which contains, among others, these declarations: "We the Readjusters are fighting for a higher prize than any abstract title to democracy"; and, "We organized to govern this State in our own way."

The Conservative-Democratic ticket was elected by a large majority, the vote having

stood as follows: Whole number of votes polled in the State, 212,693: Conservative-Democratic ticket, 96,912; Readjuster ticket, 81,674; Republican ticket, 84,020. The remaining votes were scattering.

As to the election of State Representatives in Congress, the Conservative-Democratic nominees were elected in the first, third, fifth, sixth, and eighth Congressional districts; the Readjuster nominees in the seventh and ninth districts; the Republican nominees in the second and fourth districts.

By the census of 1880, the population of Virginia is 1,512,203, classified as follows in regard to race, sex, and origin:

Whites.....	880,876	Females.....	766,656
Colored.....	631,827	Natives.....	1,497,565
Males.....	745,547	Foreign.....	14,638

The increase of population within the last decade is about twenty-three per cent.; the aggregate number in 1870 being 1,225,163—whites, 712,089; colored, 513,074.

The population of Richmond, the principal city in Virginia, has been likewise gradually increasing, as appears by the following table:

1830.....	16,060	1870.....	51,088
1840.....	20,159	1874.....	60,705
1850.....	27,570	1879.....	80,000
1860.....	37,707		

Among the foregoing items the last one represents the estimate of the Board of Health.

The growth of Richmond is also steady in reference to her material interests, especially the manufacturing and industrial establishments of all sorts. In 1879 the number of these establishments at work within her limits was 565, employing 14,193 hands, an increase of 2,463 over the previous year; and the sales of their products amounted to \$23,486,640, or \$5,535,590 more than the sales of 1878. In 1880 the increase over 1879 was 137 more establishments, with 2,739 more hands employed, and \$1,218,243 more in the proceeds from sales of their products, although the prices in 1880 were generally lower than in 1879.

W

WEST VIRGINIA. The Republicans of West Virginia met in State Convention at Wheeling on May 12th, for the purpose of choosing a delegate from the State at large to the National Republican Convention that was to assemble at Chicago on June 2d. For the one delegate at large, C. P. Keys (colored) and A. W. Campbell were put in nomination as competitors, and, after a long contest, participated in by large numbers on either side, the decision of it was finally remitted to a vote by counties, which resulted in 933 for Campbell and 530 for Keys. Mr. Campbell was then declared the delegate at large; Mr. Keys was, on motion, declared the alternate.

The following platform was adopted:

The Republicans of West Virginia, in convention assembled, hereby renew their allegiance to the Republican party of the Union, and reaffirm its time-honored principle of free government—a government of the people, by the people, and for the people. Especially do we reaffirm the foundation principle on which our Government rests, and which we hoped the civil war had settled, but now too often called in question, that the United States of America is a nation and not a league or confederacy of States.

We hold to the great saving truth of humanity, that "all men are created equal, and entitled to complete liberty and exact equality in the exercise of all civil, political, and public rights."

We demand the protection of all citizens, native and adopted, wherever the flag of our country floats, at

home or abroad, and that the same protection shall be afforded to the adopted American citizens that is extended to the native-born.

We require that all public officers be held to a rigid responsibility, and the prompt prosecution and punishment of all who betray official trusts or duties.

We regard the public-school system as the bulwark of the American Republic, and safeguard of its citizens, and demand that all public-school funds or property be kept from sectarian control.

We insist that the collection of duties on importations be so adjusted as to promote the best interests of American labor when brought in competition with foreign labor.

We oppose further grants of the public lands to corporations and monopolists, and demand that the national domain be devoted to free homes for the people.

We favor a sound and convertible currency, of which each dollar recognized by the Government shall be the equal of any other dollar recognized by the Government, whether of gold, silver, or paper.

We remember with gratitude the services of those who periled their lives for the country's preservation, and demand that the pledges made to those who died that the country might live, as well as those who survive to enjoy the blessings their valor won, shall be redeemed by pensions and generous emoluments.

We heartily approve the Administration of President Rutherford B. Hayes, and regard him as the highest example of his own declaration that "he serves his party best who serves his country best."

Finally, we deprecate all sectional feelings and tendencies, and, as evidence of our faith and patriotism, hereby pledge our utmost efforts and invite all good citizens of the State to cooperate with us in taking West Virginia out of the solid South, and placing her in the roll of Republican States, her honored birthplace and rightful heritage.

Resolved, That the delegates selected by this Convention to the Chicago Convention be, and they are hereby, instructed to vote for James G. Blaine, and to use all honorable means for his nomination.

The Democrats held their State Convention at Clarksburg on June 10th, and selected delegates to the National Democratic Convention, which was to assemble at Cincinnati on the 22d of that month. Delegate from the State at large, Robert McEldowney; alternate, D. D. Johnson.

The Committee on Resolutions submitted a report "recommending the repeal of the two-thirds rule at the National Convention." A motion "to amend" in favor of the two-thirds rule was lost, and the report of the committee adopted.

In preparation for the general elections in October for State officers and Congressmen, and in November for Presidential electors, the Republicans convened at Grafton, on June 30th, and nominated for Governor, George C. Sturgis; for State Treasurer, Richard Burke; for State Auditor, John S. Cunningham; for Attorney-General, George B. Caldwell; for State Superintendent of Free Schools, A. L. Purvinton; for Judge of the Court of Appeals, Edwin Maxwell; for Presidential electors: State at large, A. W. Campbell and James L. McLean.

The following platform was adopted by the Convention:

The Republicans of West Virginia, in convention assembled, declare that the Democratic party of West Virginia has proved false to its many pledges of re-

form, reduction of taxes, and the inauguration of a policy for the development of the State.

It has forced upon the State a cumbersome, expensive, and abstruse Constitution of difficult and uncertain interpretation and more difficult execution.

It has created a system of county courts that has made the enforcement of law and the redress of private wrongs difficult, costly, and uncertain, and that has brought the administration of justice into contempt.

It has impaired the efficiency of the public schools of the State by hostile legislation and an indifferent administration of the offices connected therewith.

It has enforced a burdensome, unequal, and inefficient system of road laws.

It has increased offices, salaries, and governmental expenses, without any adequate return to the tax-payer.

It has made no earnest effort to promote immigration and encourage capital to develop the resources and wealth of the State.

It has not restrained and limited railway and other monopolies to the legitimate sphere of their corporate powers, and has not held them to a rigid accountability for the exercise of their rights for the good of the citizen and the State.

It has bid for the keeping of criminals of other States, and by the contract system of convict-labor depreciated the wages of honest workers.

It has shown itself indifferent to the interest of the tax-payer, laborer, and producer, and shipper of the State, and that it is controlled by a reactionary and old time policy, and incapable of conceiving or executing a wise, liberal, or progressive policy in the government of the State.

The Republican party pledges itself to reform in State affairs, the reduction of taxation, salaries, fees, and the number of offices to the fullest extent consistent with the proper administration of the laws; to the legal control of all monopolies, while protecting the vested rights of those whose capital is asked to aid in developing the great natural resources of the State.

It declares itself in favor of the abolition of county courts as now constituted and administered, and will endeavor to secure a non-partisan and able judiciary.

It declares that the best interests of the State require that every encouragement by way of liberal laws relative to homesteads, exemptions, industrial associations, and mechanics' liens, should be held out to induce thrift, economy, and investment in homes by every citizen.

It pledges itself to secure more perfect regulations for the protection of miners and workers in all the dangerous occupations.

It will guard and improve the system of free schools, as the most efficient means for the education of all classes, and the security of good government and good morals.

It will endeavor to simplify legislation and the administration of State and county affairs, and at the same time secure their best results.

The Democratic party, pretending to great political wisdom, forced the Constitution of 1872 on the people by fraud and chicanery, thereby reviving that antiquated legal monstrosity called the County Court, which, for eight years, has cursed the tax-ridden people to such an extent that the same party has been compelled, by popular groans, to submit a loose, insufficient, and muddy constitutional amendment to rid us of the present court system, which amendment, without assuming any responsibility for it, our people should support for the time being, and until the Republican party is enabled, by proper legislation, to provide a simpler and less burdensome system.

The Republican party pledges itself, if placed in power, to legislate for the best interests of labor-reform, that honest toil may have the same careful protection and privileges that may be afforded to capital.

We denounce the extortion of monopolies, and any system devised by which the laboring-man is deprived of his just earnings, by prepayments, in any other medium than the legal currency of the country.

Finally, the Republican party pledges itself to labor for the overthrow of Bourbonism, and the inauguration of a wise, liberal, and progressive policy in State affairs, that shall bring West Virginia into harmony with her sister States, and cause her to share in the prosperity, wealth, and growing power of the great States of the North and West.

In conclusion, we heartily approve and endorse the platform of principles adopted by the late National Republican Convention at Chicago, and hereby pledge our best efforts to secure the election of the nominees of that Convention, James A. Garfield, of Ohio, and Chester A. Arthur, of New York.

The Democratic party assembled in State Convention at Martinsburg, on July 28th, to nominate their respective candidates for office, with the following results: For Governor, Jacob B. Jackson; for State Treasurer, Thomas O'Brien; for State Auditor Joseph S. Miller; for Attorney-General, C. C. Watts; for State Superintendent of Free Schools, Bernard L. Butcher; for Judge of the Court of Appeals, Thomas C. Green; for Presidential electors, State at large, Elbridge G. Cracraft and William L. Wilson.

The platform adopted was as follows:

1. The Democratic party, in convention assembled, heartily endorses and approves the platform and principles adopted by the National Democratic Convention, and reaffirms its allegiance to the time-honored principles of the party.

2. We recognize with pleasure the fidelity of the various officials of the State in the administration of the duties and trust imposed on them by the law, and with pride point to the peace, quiet, and general prosperity of the State. The promptness with which the public revenues have been collected and paid into the Treasury, the economy and efficiency with which our public institutions have been managed, are some of the reasons why Democratic rule should be continued in West Virginia.

3. Mindful of the traditions of the party and the danger to be apprehended from the growing power and influence of monopolies, we declare that the Democratic party is now, as it has ever been, the friend of the people and the foe of all monopolies; that we are opposed to any system of legislation that tends to foster the power of such monopolies, and particularly to that species of legislation that discriminates in favor of railroad corporations and against the people.

4. We recognize the proposed amendments to the Constitution as presenting questions above and outside of party politics, and therefore remit them to the unbiased judgment of the people.

The following additional resolutions were also reported by the committee, and adopted by the Convention:

Resolved, That we regard the practice of accrediting any Democrats who may be present at conventions as delegates, as heretofore, as opening the door to fraud and unfairness, and a method which is corrupt and corrupting, and recommend the State Executive Committee to take steps to prevent the same in the future.

Resolved, That in the opinion of this Convention, the practice so common in the State whereby county delegates to State and district conventions are instructed to cast the votes of the county for particular candidates, is open to many serious objections, in that it gives rise to fraud and unfair dealing; to conventions packed in the interest of particular parties; de-

prives opposing candidates of the representatives to which they would be otherwise entitled; produces complaint and dissatisfaction; disorganizes the party, and tends to the defeat of its candidates; that we condemn this practice as being at war with the usages, principles, and best interests of the Democratic party, and should be discontinued by all who have its success at heart.

The Greenback-Labor party, which has a comparatively large number of adherents in West Virginia, nominated their candidates as follows: For Governor, Napoleon B. French; for State Treasurer, Spencer W. Sturm; for State Auditor, George W. Hayes; for Attorney-General, Cyrus Hall; for Superintendent of Free Schools, W. J. Kinney; for Judge of the Court of Appeals, James A. Thompson; for Presidential electors at large, Robert Marshall and S. H. Davidson. Two amendments to the State Constitution, proposed in two joint resolutions passed by the Legislature, were submitted to the people for ratification or rejection at the State election. The first amendment proposed to strike out the eighth article of the Constitution and insert in its stead another, remodeling the whole judiciary system of the State. The second amendment proposed to insert in the third article of the Constitution a substitute for the original thirteenth section, relating to the hearing of "suits at common law where the value in controversy exceeds twenty dollars, exclusive of interest and costs." At the October election, and at that held in November, the Democratic nominees were generally elected. For the office of Governor, Mr. Jackson had a majority of about 15,000 over Mr. Sturgis, the vote having stood 58,000 and 43,000 respectively. The Greenback candidate received some 14,000 votes. The Democrats elected also their electoral ticket, and all of their nominees for Congressmen. They claimed their majority over the Republicans to have been increased by more than 3,000 votes since 1876. The House of Representatives in the Legislature at the next session will consist of 44 Democrats, 17 Republicans, 1 Greenbacker, and 1 Independent.

The two constitutional amendments were ratified by the people. The vote stood: yeas, 57,941, nays, 34,270, on the substitute for Article VIII of the Constitution, and yeas, 56,482, nays, 34,073, on the substitute for section 13 of Article III. Both amendments went into effect from the time of their ratification.

The thirteen Judges of the thirteen new circuits, into which the amendment divided the State, were also chosen at the October election.

The aggregate number of votes cast for President, in 1880, in West Virginia, was 112,714, or 12,775 more than in 1876, when it was 99,939.

The annual receipts, from all sources, and the expenditures, for all purposes, in the two fiscal years ended September 30, 1879 and 1880, were as follows:

Receipts in 1879, including \$318,802.92 cash in the Treasury October 1, 1879..... \$391,712 43
Expenditures..... 771,359 23

Surplus in the Treasury October 1, 1879.... \$220,353 15

Receipts in 1880, including \$220,353.15 cash in the Treasury October 1, 1879..... \$389,140 63
Expenditures..... 615,341 76

Surplus in the Treasury October 1, 1880.... \$253,798 92

The public education of youth in West Virginia appears to be in a most satisfactory condition. A comparison of the public schools, as they are at present, with what they were ten years ago, presents the following results:

PUBLIC SCHOOLS.	1870.	1880.
Number of children between six and twenty-one years old.....	162,432	210,113
Number of children attending school.....	81,330	142,850
General average attendance.....	55,033	91,704
Number of teachers granted certificates.....	2,303	3,679
Number of months taught.....	9,915	13,531
Salaries paid to teachers.....	\$220,753 84	\$522,483 24
General average monthly salary of teachers.....	31 79	23 19
For tuition, cash per pupil, based on enrollment.....	3 01	3 65
Based on enumeration.....	1 62	2 49
Total receipts from State, district levies, and other sources.....	565,207 99	867,693 73
Number of school districts.....	2,567	3,529
Number of common schools.....	2,440	3,680
Number of graded schools.....	74	103
Number of high-schools.....	1	8
Number of schoolhouses:		
Log.....	904	1,319
Frame.....	1,124	2,142
Brick.....	63	93
Stone.....	17	6
Whole number of schoolhouses.....	2,113	3,560
Total value of school property, in grounds, houses, furniture, and apparatus.....	\$1,057,473 94	\$1,670,584 91

In the Hospital for the Insane the number of patients under treatment during the year ended September 30, 1879, was 470; up to the same date in 1880 it was 539. The cost of their support, *per capita*, was \$2.09 per week in the former year, and \$2.18 in the latter.

In the Institution for the Deaf-Mutes and the Blind the average number of pupils, during the two years ended September 30, 1879 and 1880, was eighty-one; the annual cost for the support of each pupil, to the State, having been \$267.18, and \$255.51, respectively.

The fish-culture seems to prosper in West Virginia, and the Commissioners' labors during the last two years have been attended with satisfactory results. The New and Greenbrier Rivers, besides numerous smaller streams, have been abundantly stocked with black bass. Many thousands of salmon, carp, trout, and other esteemed varieties of fish, have also been placed in streams and ponds throughout the State. The hatching-house at Romney is in successful operation.

The United States census of 1880 returns the population of West Virginia at 618,197, showing an increase of 176,183 within the last

ten years, as in the census of 1870 the population was stated at 442,014.

Foreign immigration into West Virginia, for permanent settlement, has well commenced. Several prosperous colonies have been already established in it from abroad, and there is a fair prospect that many more will successively follow. The topography of the State, its climate, soil, and productions, are considered as especially inviting to the Swiss, and to the inhabitants of the mountainous regions of Germany. During the year 1880, three Swiss scientists visited West Virginia in the interest of "The Swiss Commerce and Colonization Society"; their object being to examine and report about the resources of that portion of the State in which the Society proposes to locate colonies.

The three Railroad Commissioners, whom the Board of Public Works appointed in April, 1880, to ascertain the taxable valuation of the various railroads in the different counties of the State, presented their united report, as follows:

Chesapeake and Ohio Railroad:	
Cabell County.....	\$255,985 00
Putnam County.....	116,657 50
Kanawha County.....	356,490 00
Fayette County.....	465,975 00
Summers County.....	301,247 50
Monroe County.....	17,690 00
Greenbrier County.....	243,005 00
Total.....	\$1,759,000 00
Shenandoah Valley Railroad:	
Jefferson County.....	112,264 50
Martinsburg and Potomac Railroad:	
Berkeley County.....	57,000 00
Pennsboro and Harrisville Railroad:	
Ritchie County.....	8,500 00
Laurel Fork and Sand Hill Railroad:	
Wood County.....	22,000 00
Ritchie County.....	11,000 00

WILLIAMS, JAMES D., Governor of Indiana, was born in Pickaway County, Ohio, January 16, 1808. His parents were emigrants from the Old World, seeking to better their fortunes in the New. They had six children, of whom James was the eldest, and they were unable to provide them with advantages for education, such as the humblest can now secure. That part of Ohio was already too thickly settled for them, and in 1818 the Williams family removed to Knox County, Indiana. Not many years after, the father died, and their support devolved upon the eldest son. The responsibilities thus early assumed developed his industry, thrift, and self-reliance, the traits of character which shaped the career of the future Governor. In 1831 he married Nancy Huffman, a country girl of the neighborhood, and they began life on a few acres of uncleared land which he had recently purchased. This stout-hearted couple added field to field, until four thousand acres formed their fertile farm, but during those fifty years their house and home were on the spot where their first roof-tree had been set up. In the county records tract after tract is registered as passing into Governor Williams's possession, but he never parted

with anything that he had once acquired. His first public office was that of justice of the peace for Harrison Township, Knox County, in the year 1838. In 1843 he was elected to represent Knox County in the House of Representatives of the General Assembly. Though a Democrat in a Whig county, he received a majority of votes. This hold upon the popular favor he kept through life. He represented his county in the House during seven sessions, and in the Senate during twelve. He held office almost continuously, and never lost but one election, and then his opponent was judged to have deserved so well of his party that he was rewarded with the speakership. The developing of the agricultural interest of Indiana was his foremost object. Three societies were formed in his county for promoting these interests, and he was elected president of each of them. He was one of the incorporators and President of the State Board of Agriculture. He was also deeply interested in education, and originated many of the laws which have perfected school and college facilities in Indiana. In 1874 he was returned from his district to Congress and served in that body until 1876, when he resigned on his nomination to the office of Governor, though his term as representative had not yet expired, nor was his election sure. During his gubernatorial term, friends and foes alike concede that the conduct of public affairs was honest. He applied to affairs of state the same economy, prudence, and stability, which had built up his private fortunes. He continued unpolished in manner and uncouth in appearance, as when he earned the *sobriquet* of "Blue-Jeans Williams," by which he is widely known through the country, but he kept his integrity and commanded the respect of the people. He mourned over the corruption and venality which have obtruded themselves into elections and the conduct of the Government. One of his last speeches was that, if he had his life to live over again, he would give it to stir up wholesome public opinion, rather than to the development of the material prosperity of the country. He died in Indianapolis, suddenly, on November 20th, while fulfilling his duties as Governor of Indiana, and he was mourned by that people as one wholly identified with the growth and history of the State.

WISCONSIN. The Legislature met January 14th, and adjourned March 29th, having been in session sixty-four days, and enacted 323 bills out of 669 presented. Alexander A. Arnold was elected Speaker of the Assembly. The Senate was presided over by Thomas B. Scott, President *pro tempore*. The tax levy was increased from \$248,000 in 1879 to \$453,000 for 1880, after a reduction from \$405,000 in 1878. The direct appropriations made amount to \$418,753. An official inspection of illuminating oils was ordained, and the test fixed at 120° Fahr. State lands at the head of the Chippewa, Wisconsin, and St. Croix Rivers were reserved to

be used for navigation reservoirs. A grant of swamp lands was given to the projected St. Paul and Eastern Railway, and counties in the northern part of the State were authorized to part with similar lands to promote railroads. Slight changes were made in the game and fish laws. Authority to appeal from the equalizations of county boards of assessors was conferred upon cities and villages. An investigation of charges of mismanagement on the part of the authorities of the State Hospital for the Insane was ordered. The clause in the Revised Statutes which makes railroad companies liable for damages to employees, for accidents due to the negligence of other employees, was repealed. The dog-license tax was abolished. A militia law provides for a force of thirty companies, and for annual encampments. The insurance laws were changed in such way that the Insurance Commissioner is vested with full authority to examine into the condition of any company, and to revoke licenses in case the provisions of the law are not fulfilled. An act was passed empowering United States Commissioners to administer oaths, and take acknowledgments to deeds, which latter power was also extended to registers of deeds. Certain police powers were conferred upon the conductors and other employees on railroad trains. The definition of larceny was so altered as to make it a State-prison offense to steal property of the value of twenty dollars or over, instead of one hundred dollars, which has been the limit heretofore. The "good time" regulations were modified so as to allow long-term convicts to earn more of the time premium by good behavior, but short-term prisoners less; and the penalties for misconduct in the Penitentiary were increased. Agents of the Wisconsin Humane Society were authorized to arrest in certain cases of cruelty to persons or to animals. It was provided in one of the acts that judgments of the Supreme Court may be docketed in the Circuit Courts. Personal property, as provided in another enactment, must be assessed in the town in which the tax-payer resides. A law was passed permissive of the use of barbed-wire fences. Graduates of colleges and universities of the State were given the right to obtain teachers' certificates. The liability of bank stockholders was established. A law against the adulteration of foods and drugs was passed, and the Governor was authorized to appoint a State analyst. A law was enacted which provides that persons alleged to be insane may, at the request of their friends, be tried before a jury, to have their insanity established, before committal to an asylum. The claims of counties against the State for the care of insane persons or paupers were directed to be presented to the State Board of Charities and Reform, to be audited, and reported to the Legislature. A woman-suffrage amendment to the Constitution, to permit female citizens to vote at elections, was adopted by a joint resolution. It must be rati-

fied by the succeeding Legislature before being decided by the people's vote, as must be the amendment providing for biennial sessions of the Legislature, which also passed for the first time. An act was passed relating to writs of *mandamus* and *prohibition*, providing that such writs may be granted in the case of disputed elections, and the rights of persons to certificates of election tested in the courts in the cases of Presidential electors, Congressmen, and members of the Legislature. A change was made in the registry law, so that electors who are not registered may vote upon furnishing proof that they are legal voters. A law was made directing that no disbursements of money by directors or trustees of State charitable or penal institutions can be made except upon specified appropriations, and that no indebtedness can be incurred by such officers in excess of the appropriations of the Legislature.

The direct appropriations voted make the sum of \$418,753, as against \$299,177 appropriated in 1879, and \$339,000 in 1878. The principal items were \$152,411 for the State Hospital for the Insane; \$114,000 for the Deaf and Dumb Institute, of which \$14,000 was to repair losses by fire, and \$70,000 for rebuilding; \$74,218 for the Northern Hospital for the Insane, including \$19,000 for improvements; \$15,000 for improvements in the Industrial School for Girls; and \$19,967 for the maintenance of the Industrial School for Boys.

The receipts of the Treasury, from all sources, for the year ending September 30, 1880, were \$1,744,719; the balance on hand September 30, 1879, \$588,824; together, \$2,333,543. The disbursements for the year, for all purposes, were \$1,872,144. Of the balance remaining September 30, 1880, amounting to \$461,398, \$142,872 was credited to the general fund, \$124,299 to the various educational funds, and \$174,285 to the St. Croix and Lake Superior Railroad trespass fund. The receipts on account of the general fund were as follows:

Direct State tax.....	\$455,881 89
Railroad companies, license taxes.....	418,148 76
Insurance companies, license taxes.....	41,845 15
Counties, for the support of inmates of the several charitable institutions.....	101,181 81
Miscellaneous sources.....	82,899 62
Total.....	\$1,049,406 73
Balance from previous year.....	273,281 49
Total.....	\$1,322,688 22

The expenditures from the general fund—from which are paid, besides the current expenses of the State, the interest on the war debt, and appropriations for the schools and charitable institutions—were as follows:

Salaries and permanent appropriations.....	\$185,759 51
Legislative expenses.....	91,517 75
Miscellaneous purposes.....	224,948 20
Interest on the public debt.....	157,560 00
School fund income.....	7,088 86
Free High Schools.....	25,000 00
State University.....	48,897 18
Benevolent Institutions.....	419,014 52
Milwaukee Insane Asylum.....	75,000 00
Total.....	\$1,179,815 52

Of the excess of \$123,704 over the disbursements of the previous fiscal year, only \$6,917 is chargeable to current State expenses proper, the excess in the appropriations for benevolent and educational institutions having been \$42,785, besides the amount paid to Milwaukee County on account of the construction of its insane asylum.

The condition of the several educational trust funds at the close of the year, showing a gain of \$54,828 over the total amount at the same date in the preceding year, was as follows:

TRUST FUND.	At interest.	On hand.
School.....	\$2,716,226 91	\$31,581 70
University.....	207,375 40	19,085 88
Agricultural College.....	244,519 52	22,511 84
Normal School.....	1,039,542 60	81,181 51
Total.....	\$4,207,699 44	\$104,609 93

The State debt amounted to \$2,252,057, the same as in 1879, but its form has been changed by the substitution of certificates of indebtedness to the Agricultural College fund for most of the original bonds.

The indebtedness of the several counties, cities, towns, villages, and school districts in the State was reported to the Secretary of State as follows:

Railroad aid.....	\$4,500,970 62
Interest unpaid.....	1,276,012 42
School districts.....	276,566 58
All other purposes.....	3,545,518 13
Total.....	\$9,599,067 75

The values of all property in the State subject to taxation, as returned by the assessors for the past two years, are as follows:

PROPERTY.	1879.	1880.
Personal property.....	\$88,127,940 00	\$89,747,571 00
City and village lots.....	85,545,746 50	104,490,711 00
Other real estate.....	282,629,498 50	281,441,861 00
Total.....	\$406,303,185 00	\$425,680,143 00

The gross value of taxable property as estimated by the Board of Assessment was \$445,582,720, which is probably 40 per cent. below the actual aggregate taxable wealth. The value of private property which pays no revenue to the State either by way of direct tax or otherwise is returned by the assessors at \$6,353,014, as follows:

Religious associations.....	\$5,696,090 00
Scientific and literary associations.....	378,455 00
Benevolent associations.....	214,779 00
Agricultural societies.....	63,600 00

The total amount of taxes levied in the State for the year 1879, for all purposes, amounted to \$7,577,767.27, a decrease of \$392,091.73 from the amount levied the previous year, and was at the rate of \$1.72 and 6¼ mills on \$100 of the assessment for that year. The purpose for which these taxes were levied and their respective amounts and rates are as follows:

TAXES.	Amounts.	Rates.
State tax.....	\$457,452 61	\$0.10 4
County tax.....	1,722,033 25	.39 2
Town, city, and village tax.....	2,314,909 56	.52 7
School tax.....	1,924,239 55	.43 9
Road tax.....	1,150,132 30	.26 4
Total.....	\$7,577,767 27	\$1.72 6

These figures represent only the direct taxes levied upon property. The total taxes paid by the people, directly and indirectly, into the State Treasury, were, for the last fiscal year, nearly \$600,000 in excess of the amount here stated. Nothing like this proportion obtains in county, town, and other taxes, but the sums collected by way of licenses and fees are by no means inconsiderable.

The State tax levied in 1880 amounts to \$662,058.63, a large increase over the tax of the preceding year, rendered necessary by extraordinary appropriations. The estimated expenditures for the calendar year 1882 are given as \$988,008, and the estimated receipts under existing laws as \$704,758.

The amount expended for the support of common schools during the fiscal year was \$2,166,368.43, an increase of nearly \$14,000 over the preceding year. Of this sum \$1,567,870.32 were paid for teachers' wages. The whole number of children within the State of school age was reported at 483,198, a slight decrease. The attendance at school increased nearly 6,000, and was reported at 299,258. The number of teachers employed was 10,110. By the terms of the compulsory education law, which went into effect September 1, 1879, all children between the ages of seven and fifteen years not excused for good reason are required to attend a public or private school at least twelve weeks in each year. The number of children between these ages was found to be 229,076; and 170,402, or nearly three fourths of them, attended the public schools during the year. The whole number of pupils in attendance at the four normal schools was 1,880, at an expense averaging \$40.81 per pupil. The number attending Teachers' Institutes was 4,965, a gain of 542 over the attendance for the previous year; and the expense of conducting the institutes averaged less than \$1.50 for each person instructed. The number of students enrolled at the State University in the different departments, October 1, 1880, was 436. The total expenses for fiscal year were \$97,060.04, of which sum \$49,502.40 were paid to instructors, and \$13,192.46 for completion of Assembly Hall. The number of children received in the Industrial School for Girls at Milwaukee during the year was 59; the number attending at the close of the year 109, of whom 23 were infant boys. The current expenses for the year were \$8,300. Since the opening of the institution in 1875, 241 children have been received, and 125 have been returned and are doing well. The number of boys in attendance at the Industrial School at

Waukesha averaged 427 for the year. The whole number received since the establishment of the school in 1860 has been 1,801. The ordinary expenses for the year were \$48,310. A large proportion of the boys sent to this reformatory are not criminals, and for such the Governor recommends that a separate institution be founded.

There were 309 convicts in the Penitentiary on October 1, 1879, and 277 on the same date in 1880, 121 having been received, and 153 released or lost by death during the year. Of those confined during the year, 11 were on the second conviction and one on the third; 32 were strictly temperate, 55 intemperate, and 34 occasional drinkers; 5 were on life sentences, 15 for five years, 25 for two years, and 33 for one year. The receipts of the prison during the year, including \$11,090 balance, were \$49,688; the expenditures, \$44,082. The prison, though smaller than those of other States of equal population, is not half full. The earnings of the convicts were \$27,873.

In the Northern Hospital for the Insane 719 patients were treated during the year, the daily average being 529; and in the State Hospital an average of 550, and 753 altogether. The current expenses of the former were \$129,056; of the latter, \$124,816, and \$48,963 on account of previous liabilities. The committee appointed to investigate the affairs of the latter institution found much to censure in the methods of conducting the business affairs of the hospital, owing in a large measure, they thought, to the system provided by law for the government of State charitable institutions. They recommend that a General Board of Control should be created for the government of all of them instead of several local boards as at present. The Commission of Inquiry found much to commend in the care and treatment of the patients, and only extravagance, not corruption, in the financial management. The Milwaukee County Insane Asylum, just completed, is one of the best-appointed asylums in the country. It has received, since its opening in March, 245 patients, the daily average having been 185. The average cost *per capita* was \$2.90 per week, a lower rate than, it is thought, can be maintained. There is accommodation for 300 inmates. In the Deaf and Dumb Institution there were 156 pupils at the end of the year. The buildings, which were destroyed by fire in 1879, have been reerected. In the Institution for the Education of the Blind there were 77 pupils at the end of the year.

The effect of the inspection of illuminating oils has been that the number of accidents has greatly decreased. Of the oil inspected nine per cent. was found below the standard. The Commissioner of Insurance reports \$150,731,034 fire risks written during the year, \$1,589,472 paid in premiums, and \$1,087,193 losses paid. The mileage of the railroads in the State at the close of the calendar year aggregated

3,183 miles, including 112 miles of narrow-gauge track, but not including 325 miles of sidings. There were 233 miles of track laid during the year. There were carried 2,717,500 passengers, an increase of 284,654; and 4,347,379 tons of freight, an increase of 170,168. The earnings amounted to \$13,655,578, an increase of over \$2,000,000; and the expenses \$7,583,493, an increase of \$550,000, the net increase in earnings being \$1,620,493. The net earnings amounted to nearly five per cent. of the total stock and indebtedness. The Board of Immigration reports about 21,000 foreign settlers in 1880.

The Sturgeon Bay Canal is not yet completed, though it has been opened to commerce. In 1880, 553 vessels passed through it. On the improvements in the Fox and Wisconsin enough has been done to prove that a navigable channel can be established between Lake Michigan and the Mississippi River.

The sales of public lands have been largely increased during the year; 82,000 acres were disposed of by sale, and 64,000 patented to counties. The lands now held by the State, inclusive of about 82,000 acres reserved from sale, amount to 1,455,202 acres, and embrace many thousands of acres of excellent farming lands. Considerable progress has been made in prosecuting the State's claims for additional swamp lands.

The returns of the principal farm products raised in the State in 1879, and growing in 1880, as reported to the Secretary of State by the town assessors, show the following aggregates:

Wheat.—Product of 1879, 21,040,233 bushels; growing in 1880, 1,787,921 acres.
Corn.—Product of 1879, 27,530,121 bushels; growing in 1880, 949,785 acres.
Oats.—Product of 1879, 27,197,579 bushels growing in 1880, 988,898 acres.
Barley.—Product of 1879, 4,246,452 bushels; growing in 1880, 212,626 acres.
Rye.—Product of 1879, 1,369,250 bushels; growing in 1880, 138,181 acres.
Potatoes.—Product of 1879, 5,994,923 bushels; growing in 1880, 88,734 acres.
Cranberries.—Product of 1879, 67,339 bushels; growing in 1880, 17,804 acres.
Clover-seed.—Product of 1879, 263,311 bushels.
Timothy-seed.—Product of 1879, 43,989 bushels.
Flax.—Product in 1879, 17,597,859 pounds; growing in 1880, 44,451 acres.
Hops.—Product of 1879, 1,667,612 pounds; growing in 1880, 5,173 acres.
Tobacco.—Product of 1879, 9,050,954 pounds; growing in 1880, 18,359 acres.
Butter.—Product of 1879, 22,703,349 pounds.
Cheese.—Product of 1879, 16,407,145 pounds.
 (Number of cows, 1880, 399,454.)

These statistics are said to be far from complete. The culture of flax appears to be quite successful, and may lead to the establishment of mills. Tobacco-growing, which was formerly confined to a small portion of the State, has been greatly extended, and is already an important commercial interest. The value of the crop of 1880 is nearly \$1,500,000.

In a case involving the right of a qualified voter who had not registered to vote, the Su-

preme Court delivered an opinion to the effect that an elector possessing the qualifications specified in the Constitution can not be deprived of his right to exercise the franchise by an act of the Legislature.

In the opinion of the Supreme Court, in *Barnard vs. Backhaus*, known as the "wheat-gambling case," the principles governing the case are stated as follows:

Contracts in writing for the sale and delivery of grain at a future day, for a price certain, made with a *bona fide* intention to deliver the grain and pay the price, are valid in law. But when such contracts are made as a cover for gambling, without intention to deliver and receive the grain, but merely to pay and receive the difference between the price agreed upon and the market price at such future day, they come within the statute of gaming and are void in law. To uphold such a contract, it must affirmatively and satisfactorily appear that it was made with an actual view to the delivery and receipt of the grain, and not as an evasion of the statute of gaming, or as a cover for a gambling transaction.

The returns of the enumerators to the Census Bureau make the population of Wisconsin 1,315,480: divided into 680,106 males, and 635,374 females; 910,063 natives, and 405,417 foreign-born, 1,309,622 white, and 5,858 colored—the latter including 16 Chinese, and 3,118 Indians and half-breeds.

The Republican State Convention met at Madison, on May 5th, to select delegates to the National Convention. The Convention was divided, in its choice of a Presidential nominee, between Blaine, Washburne, and the other prominent candidates. The resolutions read as follows:

The Republicans of Wisconsin, in State Convention assembled, reassert their adherence to those principles of liberty and nationality by which the Republican party of the United States has given a higher direction and a sustained progress to the civilization of the Western world.

They declare it to be the duty of the nation to protect every citizen whomsoever, and wherever he may be within its borders, in a free and honest ballot for national officers; and that the peace of the United States should abide with each of its citizens, however humble, and wherever he may go or dwell within the limits of this proud Union.

They rejoice that the resumption of specie payments, making our paper dollars the absolute equivalent of the coin of the precious metals, and accomplished by the Republican party, has brought our country to a new era of prosperity; and are resolved that the principle of convertibility shall be unflinchingly maintained.

They accord to President Hayes the profound admiration and respect which he merits, for the honesty and purity of his Administration; and heartily approve and endorse his course in presenting a determined front against attempts of the dominant party in Congress to curtail the just powers of the national Government.

And recognizing the eminent character and fitness of the gentlemen whose names are prominently mentioned in connection with the Republican nomination for President, and believing the National Republican Convention will decide wisely and for the highest interests of the country, they do not regard it as proper to instruct their delegates to that Convention; but, having full confidence in the wisdom and judgment

of the delegates, there to be assembled, they hereby pledge to the Republican candidate nominated by that Convention their hearty support, and the ten electoral votes of Wisconsin toward his election.

The official canvass of the election returns show that the vote of the State on Presidential

candidates was as follows: Garfield, Republican, 144,399; Hancock, Democrat, 114,656; Weaver, Greenback, 7,982; Dow, Prohibition candidate, 67; Phelps, Antimasonic candidate, 91. Plurality of Garfield over Hancock, 29,743; Garfield's majority, 21,603.

INDEX OF CONTENTS.

A

ABDURRAHMAN KHAN.—Ameer of Cabool, biographical account, 1, 2; early career, 1; his father displaces Shere Ali, 1; Shere Ali succeeds his brother, 1; Abdurrahman's rebellion and exile, 2; his character, 2; genealogy, 3; conferences with the British, 6; coronation, 7.

Acheen.—Rebellion against the Dutch, 554.

Advent Christian Church.—Account of the denomination, 2; publishing societies and missions, 2, 3.

Afghanistan.—Area and population, 3; the Afghan tribes, 3; situation at the beginning of the year, 4; the British in Cabool threatened, 4; movements of Mohammed Jan, 4; British proposition for the selection of an Ameer, 4; conditions of evacuation proposed, 4, 5; hostile engagements, 5; occupation of Ghuznee, 5; attitude of Abdurrahman, 6; the Liberal policy inaugurated, 6; Abdurrahman recognized, 6; Ayoob routed, 7; British withdraw from Cabool to Candahar, 7; Abdurrahman Ameer, 7; battle before Candahar, 7; the heliograph, 8; executions of the murderers of the officers of the embassy, 8; situation of the new Ameer at the end of the year, 9; attitude of Yakob and of Ayoob, 9; debate in Parliament on the Afghan policy of the Imperial Government, 330, 331; cost of the war, 336.

Africa.—Territorial changes, 9; events at the Cape, 9, 10; in Egypt, 10; the Hebrews in Morocco, 10; table of the area and population of the territorial divisions and countries of Africa, 10.

Agriculture.—(See COMMERCE and UNITED STATES.)

Atabama.—Finances, 10; State institutions, 10, 11; law imposing hard labor for failure to pay costs, 11; receipts and expenditures, 11; assessment and taxation, 11; public schools, 12; national or State quarantine, 12; financial difficulties of Mobile, 12; the city's debts and the adjustment, 13; Mobile's commerce, 13; railroads of the State, 13; decision relative to express companies, 14; Democratic Convention, 14; resolutions, 14; Republican Convention, 15; election, 15; Senator-elect Pugh, 15.

ALEXANDER II.—Emperor of Russia, 660; plot to assassinate him discovered in the army, 662; the Winter Palace attempt on his life, 662; the anniversary of his ascent of the throne, 663; his journey to Livadia, 666.

ALEXANDER III.—Emperor of Russia, 660; birth, 660; marriage, 660; his children, 660; other members of the royal family, 660.

America.—Fortune Bay fishery dispute, 15; United States events, 15; Central and South American affairs, 16.

ANDERWEERT, Swiss President-elect.—His suicide, 678.

Anglican Church.—Statistics, 16; Convocation of Canterbury, 16, 17; societies, 17; Irish Synod, 17; Canadian Synod, 18; Synods of Sydney and New Zealand, 18.

Antimony.—Discovery of oxide deposits in Mexico, 18; analysis of the new mineral, 19.

Apaches.—Victorio's war, 27, 28.

Argentine Republic.—Composition of the Government, 19; army and navy, 19; budget, 19, 20; customs receipts, 20; President's statement concerning expenditures, 20; financial condition, 20; revenue and taxes, 20; debt, 21; commercial statistics, 21; railways and telegraphy, 22; immigration, 22; political affairs, 22; the new President's inaugural speech, 22, 23.

ARGYLL, Duke of.—British Cabinet Minister, biographical sketch, 23, 24.

Arkansas.—Pronunciation of the name, 24, 25; Hot Springs adjustment, 25; swamp-land claim, 25; defeated constitutional amendment, 25; political conventions, 25, 26; Democratic resolutions, 26.

Army of the United States.—Statistics, 26; higher character of recruits, 26; deaths and casualties, 27; permanent barracks at frontier posts advocated, 27; schools, 28; militia inspection, 27; Ute troubles, 27; Apache war, 27, 28; Oklahoma colony, 28; surrender of Sioux, 28; Indian population, 28; agricultural production and wealth, 28; education, 28; change in policy of Government regarding the tenure of land and status of Indians, 28, 29; seaport defenses defective, 29; ordnance experiments and improvements, 29, 30; case of Cadet Whittaker, 30.

Asia.—Area and population by geographical divisions and countries, 31, 32; events in Afghanistan, 32; Russian expedition against the Tekke Tartars, 32, 33; foreign policy of China, 33; Persian affairs, 33; situation in Burmah, 33.

Astronomical Phenomena and Progress.—Determination of the sun's parallax, 33; sun-spots, 33; ellipticity of Mars, 33; minor planets, 34; Jupiter's rotation, 34; Jupiter's intrinsic luminosity, 34; red spot, 34; ultra-Neptunian planets, 34; comets discovered, 35; meteors, 35, 36; new stars, variables, and double stars, 36; Warner and Lick Observatories, 36, 37.

Australia and Polynesia.—Area and population, 37; statistics of British colonies, 37; Chinese immigration, 37; transcontinental railway, 38; annexed islands, 38; Victoria, 38, 39; new Ministry, 38; its policy, 38; defeat of the Reform Bill, 39; the former Premier forms a Cabinet, 39; Melbourne International Exhibition, 39; New South Wales, 40; Queensland, 40; New Zealand, 40; French colonies, 40, 41.

Austro-Hungarian Monarchy.—Composition of the Ministries, 41; statistics, 41; universities, 42; the press, 42; statistics of Bosnia and Herzegovina, 42; finances, 42; commerce and navigation, 43; army, 43; railroads, 43; royal betrothal, 43; political situation, 43, 44; Catholics demand a return to denominational education, 43; min-

isterial changes, 44; budget debate, 44; second change in the Cabinet, 45; German demonstrations, 45, 46; provincial Diets, 45; the delegations, 46; affairs of Bosnia and Herzegovina, 46; foreign relations, 46-48.

B

Baptists.—Statistics, 48; societies, 48, 49; Southern Baptist Convention, 49; German Baptist Conference, 49; Free-Will Baptists, 49, 50; the Brethren, 50; British Regular Baptists, 50, 51; General Baptists, 51.

BAKER, JOHN H.—Member of Congress from Indiana, 186; speech on payment of deputy-marshals, 158-160.

Barometers, Water, 51, 52.

Basutos.—Revolt against the English in South Africa, 82.

BAYARD, JAMES ASHETON.—United States Senator, biographical notice, 52.

BAYARD, THOMAS F.—Senator from Delaware, 186; on Confederate disabilities, 188; vote on his nomination for President, 699.

BECK, J. B.—Senator from Kentucky, 186; on tariff commission bill, 173, 182, 183; on a transportation commission, 184-186; on Confederate disabilities, 190.

Belgium.—Royal family, 52; area and population, 52, 53; vital and religious statistics, 53; finances, 53; the school question, 53, 54; the Jesuit question, 54; the bishops' opposition to secular education, 54; the Pope denounces the school laws, 54; legation at Rome withdrawn, 54; elections, 55; semi-centennial of national independence, 55; international conventions, 55; opening of Parliament, 56.

BENEDICT, ERASTUS C.—American educationalist, biographical sketch, 56.

BERNHARDT, SARAH.—French actress, biographical sketch, 57; arrival in America, 58.

BERRY, Indian agent, arrest by Colorado authorities, 118.

BLAIR, HENRY W.—Senator from New Hampshire, 186; on an investigation into the conditions of transportation, 185, 186.

BLAKE, EDWARD.—Canadian statesman, chosen leader of the Liberal party, 211.

Boers.—Revolt in the Transvaal, 83.

Bolivia.—President and Ministers, 58; army, 58; revenue, 58; debt, 58; British adjudication upon the railway loan, 59; American contractors petition Congress, 59; commercial statistics, 59, 60; political and military situation, 60; confiscations for prosecuting the war, 60.

Brazil.—Slave population and the emancipation fund, 61; immigration policy, 61; composition of the Government, 62; army and navy, 62; revenue and expenditures, 62, 63; tariff revision, 63; debt, 63; commerce, 64; Canadian steamship line, 64; railways, 64, 65; speech from the throne, 65.

BREADLAW, CHARLES.—Controversy over his admission to Parliament, 834.

BRIGHT, JOHN.—British Cabinet Minister, biographical notice, 65, 66.

BROCA, PAUL.—French anthropologist, biographical sketch, 66.

BROUGHAM, JOHN.—American actor, biographical sketch, 66.

BROWN, JOSEPH EMERSON.—Senator from Georgia, biographical sketch, 311.

Bulgaria.—Area and population, 66, 67; foreign policy, 67; financial position, 67; meeting of the assembly, 67; formation of a Ministry, 67; movement in favor of amalgamation with Eastern Roumelia, 67, 68; second session of the National Assembly, 68; relations with Russia, 68.

Burmah.—Diplomatic relations, 68, 69; failure of Burmese envoys to reestablish diplomatic intercourse with India,

69; insurrections, 69; warlike demonstration against India, 69, 70.

BURNSIDE, A. E.—Senator from Rhode Island, 186; on Confederate disabilities, 192, 193.

BUTLER, WILLIAM O.—American general and politician, biographical sketch, 70, 71.

C
